Microscopic Appearance.—The sections taken from the right lung showed marked pleomorphism. The normal architecture of the pulmonary tissue was destroyed by infiltration of lymphocytes, plasma cells and polymorphonuclear leukocytes. Several large mononuclear and multinuclear giant cells were found. These cells were undoubtedly Dorothy Reed cells. Throughout

all sections there was dense infiltration of fibrous tissue forming a heavy reticulum. Scattered throughout the sections were areas of necrosis. The hilar lymph nodes presented similar changes.

COMMENT

Hemoptysis is so rare in Hodgkin's disease that it is not discussed in the symptomatology of the disease in textbooks of medicine. Hemoptysis, together with cough and expectoration, was present in 1 of the cases reported by Moolten.¹ Post-mortem examination of this patient showed a massive polypoid growth occluding the right main bronchus. The spitting of blood in this case was apparently due to erosion of the polyp.

In our case, although there was no bronchial growth, there was considerable thickening of the bronchial mucosa suggesting granulomatous infiltration of the mucosa. Apparently spitting of blood was the result of an erosion of the diseased mucosa. The exact site of hemorrhage was not discovered.

The close similarity of the general symptomatology of Hodgkin's disease to that of pulmonary tuberculosis has long been recognized. In this case the presence of hemoptysis in addition to the pleural effusion, cough and expectoration brought about some difficulty in establishing a differential diagnosis.

Pulmonary involvement in Hodgkin's disease occurs in 40 (Verse²) to 60 (Moolten¹) per cent of cases. Kraus³ expressed the belief that the pulmonary involvement is part of the general manifestation of the disease. However, there are reports of cases² in which the clinicopathologic studies indicated that the disease probably started in the lung itself. Our case appears to be one of these.

SUMMARY

In a case of Hodgkin's disease of the lung, hemoptysis was a symptom. Although the anatomic involvement was extensive, it was almost entirely limited to the right lung.

236 Pine Street.

RECURRENT TETANUS SUCCESSFULLY TREATED WITH AZOSULFAMIDE

FREDERICK LEMERE, M.D., AND J. S. ARNASON, M.D.
SEATTLE

The following case is presented because of its significance to wartime medicine. Tetanus is comparatively rare in civil life, and there has been little opportunity to observe the effect of the new sulfonamide preparations in this disease. In the case here reported 110,000 units of tetanus antitoxin was given for the original attack, with recurrence eighteen days later. The second attack was successfully treated with azosulfamide.

REPORT OF CASE

History.—A youth aged 19, a mill worker, seen with Dr. E. M. Chew in consultation, was admitted to the Ballard General Hospital July 29, 1940 with headache, nausea, vomiting, numbness of the hands and chin, abdominal pain, inability to void, mild delirium and tetanic convulsions. The mode of infection was uncertain. A week before he had chafed his thighs while riding a horse and two or three weeks before had bruised a toe and injured a finger while working.

The temperature was normal on admission but rose to 103 F. on the second day and dropped to normal again after the fourth day. Laboratory data were negative, including those on the level of calcium in the blood, the spinal fluid and neutralization tests for encephalomyelitis virus, except that the white cell count was 13,200.

Progress.—A diagnosis of tetanus was made and the convulsions were controlled with sedatives. During the first four days of hospitalization a total of 20,000 units of tetanus antitoxin was given intraspinally, 70,000 units intravenously and 20,000 units intramuscularly. The convulsions stopped on the fourth day and the patient was discharged as having recovered on the thirteenth day.

1. Moolten, S. E.: Hodgkin's Disease of Lung, *Am. J. Cancer* 11: 253-294 (June) 1934.
2. Verse, M., in Henke, F., and Lubarsch, Otto: *Handbuch der speziellen pathologischen Anatomie und Histologie*, Berlin, Julius Springer, 1931, vol. 3, pt. 3, p. 280.
3. Kraus, F., cited by Verse.²

He went back to work, but on August 20 (eighteen days after his last convulsion and treatment with serum) he had a recurrence of the original symptoms, including convulsions. He was readmitted with a temperature of 100 F., which returned to normal the next day. He was given azosulfamide and sedatives and recovered in four days and has been well since. No antitoxin was used in treating the relapse.

COMMENT

Antitoxin has neither a bactericidal nor a bacteriostatic action on the tetanus organisms in the focus of infection. Its action is limited to neutralization of unattached toxin, and only as long as it is present in the circulating fluids in sufficient concentration will it protect the nervous tissues from further damage. The antitoxin must be kept at sufficient concentration as long as toxin is forming at the focus of infection.

Apparently in this case the focus of infection remained active and produced a recurrence of symptoms eighteen days after the last dose of antitoxin. Azosulfamide eliminated this focus and produced recovery without further use of tetanus antitoxin.

SUMMARY

In the case of tetanus presented the symptoms were temporarily controlled by 110,000 units of tetanus antitoxin. Eighteen days later, however, the symptoms recurred. The recurrence was successfully treated with azosulfamide.

706 Medical and Dental Building—2208 Market Street.

DEATH FROM TRANSFUSION OF PLASMA

FRANK MAYNER, M.D., WYANDOTTE, MICH.

Reports of deaths due entirely to transfusion of whole blood are fairly rare. Reports of deaths due entirely to transfusion of plasma are still more rare. I have been unable to find any report of a fatality due to plasma transfusion in the English literature between the years 1927 and 1940. The lack of such reports may be explained by the only too recent enthusiasm over and use of transfusions of plasma.

Fig. 1.—Emboli in terminal vessels and capillaries of lung. Reduced from a photomicrograph with a magnification of 100 diameters.

REPORT OF CASE

A boy aged 4 years entered the hospital on July 31, 1940 because of severe edema. He had been perfectly well until one week before entry, when he acquired a cold the only manifestation of which was a running nose. He did not have a cough, sore throat, rash, articular pains, dyspnea or pains in the chest. Four days before entry he had edema of the ankles which

gradually became generalized. One day before entry it was noticed that the urinary output had diminished. Chickenpox was the only other infectious disease that the patient had had. One brother had died with similar symptoms.

The child assumed the orthopneic position at all times. The blood pressure was usually 120 systolic and 80 diastolic.

Fig. 2.—Emboli in terminal vessels and capillaries of lung. Reduced from a photomicrograph with a magnification of 100 diameters.

Ophthalmoscopic examination gave essentially negative results. Laboratory examination of the urine revealed a large amount of albumin, 2 to 5 white blood cells, 1 to 5 red blood cells and 3 to 6 hyaline, waxy and finely granular casts per high power field. The blood showed 4,520,000 red blood cells per cubic millimeter, 9,100 white blood cells per cubic millimeter, 92 per cent hemoglobin, 51 per cent filamented neutrophils, 7 per cent nonfilamented neutrophils, 40 per cent lymphocytes, 1 per cent eosinophils and 1 per cent basophils. The nonprotein nitrogen level was 26 mg. per hundred cubic centimeters; the total plasma protein was 5.6 Gm. per hundred cubic centimeters, the total plasma albumin was 5.04 Gm. and the total plasma globulin was 0.5 Gm. per hundred cubic centimeters.

Many forms of treatment were instituted. These consisted of dextrose given intravenously; a pneumonia jacket; magnesium sulfate, ammonium chloride and sodium bicarbonate given orally; salyrgan given rectally; a high protein diet, and potassium chloride substituted for sodium chloride in the diet. It was likewise thought advisable to give the patient a transfusion of whole blood. The blood of the patient and the father belonged to Landsteiner class A and cross matched without agglutination. Two hundred and fifty cc. of citrated whole blood was given without any untoward effect. The patient was discharged from the hospital two months after entry with improvement of his edema and urine free from albumin.

After being home for fifty-six days, the patient reentered the hospital because of an infection of the upper part of the respiratory tract which evidently aggravated his edema. This infection promptly subsided. The urine again contained a large amount of albumin and casts. The total plasma protein was 3.16 Gm., the total plasma albumin was 1.82 Gm., the total plasma globulin was 1.34 Gm. and the nonprotein nitrogen was 26.3 mg. per hundred cubic centimeters. The patient was usually sitting up in bed and playing with his toys. The treatment consisted of limiting fluids, restricting salt intake, applying heat to the renal region and giving ammonium chloride orally. It was also thought advisable to give the patient a transfusion of plasma so as to increase his plasma proteins. One hundred and ten cc. of plasma was prepared as follows: The blood of the same donor (the boy's father) was used without cross matching. Fifty cc. of 2.5 per cent sodium citrate in isotonic saline

solution was mixed with 450 cc. of blood and placed in a sterile flask. Two days later the plasma was suctioned off with a sterile needle and syringe and placed in a sterile flask. Six hours later the plasma was administered undiluted without being filtered at a rate of approximately 5 cc. a minute.

After twenty to twenty-five minutes, with about 90 to 100 cc. of plasma having been administered, the patient suddenly became cyanotic and dyspneic, gasped for breath and died despite the administration of stimulants.

AUTOPSY

The gross changes noted at autopsy were as follows: Generalized edema, ascites (500 cc. of clear, colorless fluid) and dilatation of the right side of the heart. The blood squirted up a distance of 7 inches (18 cm.) when the pulmonary artery was cut. There were petechial hemorrhages of the visceral pleura and the epicardium. The kidneys grossly were within normal limits.

Microscopic examination showed multiple emboli of fibrin in the terminal pulmonary vessels and capillaries, as seen in the illustrations, and subacute glomerular nephritis.

COMMENT

The immediate cause of death of this patient was anoxemia due to multiple emboli of fibrin in the capillary system of the lungs. There are only two possible explanations that I can suggest for the resulting condition. The first is improperly prepared and administered plasma. In this case the plasma was evidently prepared satisfactorily, but the failure to use a filter at any time during the procedure cannot be overlooked. This can most certainly explain the presence of fibrin in the lesser circulation. The second consists of using the same donor twice after an interval of only a month or so. This interesting fact was brought out by Plummer¹ and Gutteridge,² who gave whole blood from the same donor to the same patient after a month's rest with similar immediate fatal results. In this case, the interval between the two transfusions was about two and one-half months.

In most of the cases in which death was due to transfusion autopsy has shown hemolysis, hemochromatosis of the kidneys, nephrosis and uremia. I have been unable to find a report of a similar case in the literature.

Wyandotte General Hospital.

SUCCESSFUL SUBLINGUAL THERAPY IN ADDISON'S DISEASE

A CONFIRMATIVE REPORT

DAVID TURNOFF, M.D., AND LEONARD G. ROWNTREE, M.D.
PHILADELPHIA

The recent report of Haymaker and his associates concerning the successful sublingual treatment of Addison's disease with desoxycorticosterone acetate in propylene glycol finds confirmation in our experience in 2 advanced cases of this disease. The patients were given 1 mg. (6 drops) under the tongue six to seven times daily; this preparation was retained for fifteen minutes and then expectorated. Salt was utilized also in the early part of the study but because of edema was discontinued. The good effects observed, we believe therefore, were due entirely to desoxycorticosterone acetate.

REPORT OF CASES 1

CASE 1.—A. S., a white woman aged 43, ailing since 1935, admitted to the Philadelphia General Hospital on Sept. 20,

1. Plummer, N. S.: Six Fatalities from Transfusion, Brit. M. J. 2: 1186-1189 (Dec. 12) 1936.

2. Gutteridge, N. M.: Recent Advances in the Pathology of Transfusion, M. J. Australia 1: 585-589 (April 27) 1940.

From the Philadelphia Institute for Medical Research and the Philadelphia General Hospital.

Ciba Pharmaceutical Products, Inc., provided the medication employed, and the American Philosophical Society gave financial aid from the Daland Fund.

1. These patients were treated in the services of Drs. T. G. Schnabel and D. W. Kramer, respectively, of the Division of Medicine, Philadelphia General Hospital.

1940 complained of anorexia, weakness and a loss of 45 pounds (20.4 Kg.). The pigmentation of the skin and buccal mucous membrane was characteristic. Her blood pressure was 94 systolic and 72 diastolic. A test for the excretion of chloride yielded positive results, and in addition the patient did poorly on a salt-poor diet. She was given Swingle's extract of the adrenal cortex, became stronger and improved clinically in every respect. Intramuscular treatment with desoxycorticosterone acetate, 5 mg. daily given in sesame oil, was also successful. She was then given the old Muirhead regimen: epinephrine to the point of tolerance, by all available routes for ten days. On this regimen she lost weight—from 106¼ to 101½ pounds (48.4 to 46 Kg.)—and became distinctly weaker, and her blood pressure dropped from 102 systolic and 60 diastolic to 90 systolic and 60 diastolic. At this time the sublingual administration of desoxycorticosterone acetate was begun, 6 drops under her tongue being given six times a day, at intervals of three hours. In the beginning she was given in addition 5 Gm. of sodium chloride daily, but later, because of edema, no extra salt was employed. On this regimen she gained weight, her appetite increased and her blood pressure rose. The good effects were repeated after an interlude of two weeks of receiving desoxycorticosterone acetate intramuscularly. At the present time she has been adequately maintained for more than a month with the oral preparation. During the latter period of trial she has been taking 5 drops seven times a day. Her blood pressure is maintained at a satisfactory level, she has gained weight and strength and she feels quite well. Rehabilitation is satisfactory.

CASE 2.—M. H., a white woman aged 44, slightly built, was first admitted to the hospital in February 1939 complaining of nausea after eating. She was nervous and dyspneic on exertion. Her blood pressure was 110 systolic and 75 diastolic, and she exhibited some tenderness over the abdomen, in the costo-vertebral angles and along the long bones and the peripheral nerves. She was discharged with a diagnosis of neurasthenia.

She was readmitted in May 1940 complaining of weakness, fatigue, anorexia, vomiting, vertigo, dyspnea on exertion, swelling of the ankle, loss of weight and abnormal pigmentation of the skin and of the lingual and buccal mucous membrane. Her blood pressure was 82 systolic and 50 diastolic. On a regimen of a diet low in potassium and high in sodium and of adrenal cortex extract she improved immediately and was discharged in June 1940 with a diagnosis of Addison's disease.

On a similar regimen, as an outpatient, she continued to feel well. When, however, her dose of adrenal cortex extract was reduced she began to become ill and her blood pressure to drop. She was therefore readmitted to the hospital on November 8, at which time her blood pressure was 76 systolic and 54 diastolic, but otherwise her physical examination revealed no new changes. Various preparations were used, as in case 1, in an effort to observe the comparative effectiveness of different regimens. She did badly with the Muirhead regimen and satisfactorily with sublingual therapy. She was finally discharged (Jan. 8, 1941) from the hospital, taking a house diet, without extra salt, and desoxycorticosterone acetate by mouth in doses of 5 drops seven times a day. She has been taught to keep the material under her tongue and then to spit it out after fifteen minutes. After one month of following this plan she feels fine, her appetite is one month of following this plan the patient feels fine, her appetite is good and she is no longer lacking in vitality; objectively her weight has been maintained and her blood pressure has increased.

In this report we do not wish to compare the efficacy of the various materials used but rather to call attention to the success attending sublingual therapy and thereby to encourage further clinical trial.

In using the oral route, we have had the same experience recorded by other workers for the intramuscular use of this preparation, viz. the development of edema in both patients when additional sodium chloride was employed. When no extra sodium chloride was given, edema did not appear.

Thirty-Fourth and Pine streets.

PEMPHIGUS VULGARIS: FAILURE OF TREATMENT WITH
RIBOFLAVIN AND SMALLPOX VACCINE

STEWART WOLF, M.D., AND GEORGE M. LEWIS, M.D., NEW YORK

An encouraging report of the treatment of pemphigus vulgaris was recently made by Topping and Knoefel.¹ They administered to their patient orally a flavin concentrate containing 970 Sherman-Bourquin units, or approximately 2.5 mg. of riboflavin daily. This patient had previously been treated by them with neocarsphenamine and sulfanilamide without success. After the administration of riboflavin had been started, however, the lesions cleared up and the patient remained well for several weeks. Later, after treatment was discontinued, the patient suffered a recurrence.² When the drug was resumed, this time in the dose of 5 mg. daily, the lesions cleared up again, and the patient has been apparently well since, nearly fourteen months after the institution of riboflavin therapy.²

On the strength of this favorable report, and since pemphigus is still considered a fatal disease, a patient in the New York Hospital suffering from pemphigus was treated for eleven days with 100 mg. of riboflavin (Merck) by mouth daily, forty times the dose used by Topping and Knoefel. In contradistinction to their patient, who showed improvement at once and suffered no new lesions after the start of treatment, our patient showed no perceptible benefit from the drug and continued to have new lesions. He finally contracted bronchopneumonia and died.

Another therapeutic measure which deserves some comment was tried on our patient. As we were working on the assumption that Grace's³ demonstration of a virus being etiologically concerned with pemphigus was correct, it seemed rational to try nonspecific vaccine therapy in this case. The therapeutic value of smallpox vaccine in the treatment of recurrent herpes simplex is well known.⁴ Accordingly the patient was given five injections of 0.1 cc. of ordinary smallpox vaccine subcutaneously and five injections of 0.1 cc. of Rivers' vaccine⁵ intradermally, without noticeable effect.

REPORT OF CASE

History.—An Austrian Jew aged 53, a bookkeeper, living in the United States for only nine months when he was admitted to the New York Hospital, June 14, 1940, complained chiefly of progressive involvement of the skin with bullae for eight months. His past and his family history were not contributory. The present illness began in October 1939. At that time bullae first appeared in small numbers on apparently normal skin of the trunk and extremities. They came in crops, leaving crusted raw areas which healed poorly. Similar lesions appeared in the mouth and throat. They made for a great deal of discomfort in eating and frequently bled a little. Later the left eye and eyelid became involved in a similar process. Meanwhile the lesions over the trunk and extremities were becoming more numerous. The patient had lost 35 pounds (15.9 Kg.) since the onset of the disease.

Examination.—Physical examination on admission showed him to be emaciated, acutely ill and uncomfortable. His whole body was virtually covered with rounded, denuded, crusted and often secondarily infected lesions. There were a few fresh bullae in areas of apparently normal skin. These varied in size from 1 to 6 cm. in diameter. The Nikolsky sign was present. Touching the open lesions caused a great deal of pain, and they bled easily. The nasal mucosa, as well as the buccal cavity and most of the pharynx, showed bullae and desquamation. The lungs were clear, apart from a few scattered rhonchi. The remainder of the physical examination was not remarkable.

From the New York Hospital and the Department of Medicine (Dermatology), Cornell University Medical College.

1. Topping, M. C., and Knoefel, A. F.: Use of Vitamin G in Pemphigus: Report of a Case of Pemphigus Vulgaris Treated Successfully with Riboflavin, *J. A. M. A.* **114**: 2102 (May 25) 1940.

2. Topping, M. C.: Personal communication to the authors.

3. Grace, A. W., and Suskind, F. H.: Etiology of Pemphigus Vulgaris: Isolation of a Transmissible Agent in a Fourth Case, *J. Invest. Dermat.* **2**: 1 (Feb.) 1939.

4. Foster, P. D., and Abshier, A. B.: Smallpox Vaccine in the Treatment of Herpes Simplex, *Arch. Dermat. & Syph.* **36**: 294 (Aug.) 1937.

5. Rivers, T. M., and Ward, S. M.: Jennerian Prophylaxis by Means of Intradermal Injections of Culture Vaccine Virus, *J. Exper. Med.* **62**: 549 (Oct.) 1935.

Laboratory Data.—The urine showed occasional traces of albumin but no other pathologic conditions. The hemoglobin content of the blood was 13 Gm.; the red blood cells numbered 5.2 million and the white blood cells 8,300 with 25 adult polymorphonuclear cells, 45 immature cells, 18 lymphocytes, 3 monocytes and 9 eosinophils. During the patient's stay in the hospital the proportion of red blood cells and hemoglobin fell slightly while the white blood cell count rose, showing an increase in the proportion of immature polymorphonuclear cells. A count six days before death revealed the hemoglobin content to be 10.5 Gm., the red blood cells 4.6 million and the white blood cells 19,700; the differential count showed 30 adult polymorphonuclear cells, 52 immature cells, 12 lymphocytes, 2 monocytes, 3 eosinophils and 1 basophil. The blood Kline reaction was negative; the blood urea nitrogen level was 11 mg. per hundred cubic centimeters and the fasting level of blood sugar was 103 mg. per hundred cubic centimeters on admission.

Course.—The course in the hospital was progressively downhill. New crops of bullae continued to appear. Apart from the administration of riboflavin and smallpox vaccine, as mentioned previously, the patient was given a tub bath every day in tepid water containing 1 Gm. of potassium permanganate. His entire body was sprayed twice a day with a 1 per cent aqueous solution of gentian violet and his mouth cleaned with staogen oil.^{6a} Bronchopneumonia developed and sulfapyridine (0.1 Gm. every four hours) was without apparent effect. On the thirtieth day after admission his temperature went above 38 C. (100.4 F.) and remained elevated, rising as high as 41 C. (105.8 F.) on the day of his death one week later.

Autopsy.—An autopsy was performed, and a minute study was made of the organs, including the brain and spinal cord. The anatomic diagnoses were pemphigus with excoriation of a large proportion of the cutaneous surface, an acute splenic tumor with focal areas of necrosis, fatty degeneration of the liver and of the heart, bronchopneumonia with consolidation throughout the lower lobes of the left lung, acute bronchitis and hydrothorax.

Other abnormalities noted were slight arteriosclerosis of the aorta and the right coronary and pulmonary arteries, slight calcification of the renal tubules, cholelithiasis, a calcified nodule in the lower lobe of the right lung, thrombosis of the inferior hemorrhoidal veins in the lower portion of the rectum and of the pancreatic veins, focal necrosis of the pancreas with lymphocytic infiltration, a cyst of the pars anterior of the hypophysis and edentia.

It is interesting that pathologic changes in the central nervous system described by other observers⁶ were not present in our patient. Lesions have been found in the spinal cord, especially about the dorsal root, which have led several observers to regard pemphigus as primarily a disease of the central nervous system showing, like herpes zoster, cutaneous bullae as the most obvious external sign. Dr. Louis D. Stevenson examined carefully the brain and spinal cord of this patient, and he was able to find no significant lesions in either.

Furthermore, lesions in the adrenal glands,⁷ described as having a probable etiologic connection with pemphigus vulgaris, were not seen in this case.⁸

COMMENT

This case is reported because it illustrates the failure of a therapeutic measure in pemphigus which has been recommended as efficacious. In addition, a new method of therapy was undertaken, namely vaccination, which was based on the assumption that pemphigus is a virus-borne disease. This measure

5a. A proprietary preparation said to be "an ozonide of olive oil in olive oil."

6. Poirrier, L.: Pathogénie nerveuse des pemphigus chroniques, Thesis, Paris, no. 169, 1904. Covey, G. W.: Pemphigus Vulgaris, with Findings in the Spinal Cord Suggesting the Etiology of the Skin Lesions, *Arch. Dermat. & Syph.* **9**: 305 (March) 1924.

8. Since this paper was submitted for publication, a patient with acute pemphigus has been treated in this hospital with riboflavin without salutary effect from the drug. She was a 58 year old Irish woman, sick for only six weeks before admission. The rash had been present only two days. On admission her skin and mucous membranes were covered with characteristic bullae. She died in four days despite the administration of 50 mg. of riboflavin twice a day for three days. The diagnosis was confirmed by postmortem examination. The case will be reported in detail later.

also met with failure. Pathologic studies in this case failed to reveal the presence of lesions in the central nervous system or in the adrenal glands, sites considered by other investigators to have special significance in pemphigus.

SUMMARY

In the case of pemphigus here reported treatment with riboflavin and smallpox vaccine was tried. The patient died while under treatment. An autopsy failed to reveal lesions in the spinal cord or in the adrenal glands, sites described as characteristic by other investigators.

525 East Sixty-Eighth Street—121 East Sixtieth Street.

Council on Physical Therapy

THE COUNCIL ON PHYSICAL THERAPY HAS AUTHORIZED PUBLICATION OF THE FOLLOWING REPORTS.

HOWARD A. CARTER, Secretary.

RADIO-EAR TYPE C, SPECIAL ELECTRONIC HEARING AID ACCEPTABLE

Manufacturer: E. A. Myers and Sons, Inc., 306-308 Beverly Road, Mount Lebanon, Pittsburgh.

The Radio-Ear Type C, Special Electronic Hearing Aid consists of the following parts:

(a) Combined microphone and amplifier unit M-5375 with volume control switch and battery "economizer," the latter intended to reduce the current drain on new batteries giving full voltage. The microphone amplifier unit is $3\frac{3}{4}$ by $1\frac{3}{4}$ by $\frac{5}{8}$ inches, weighing 85 Gm. A special four prong connector which plugs into the microphone increases the over-all length by $\frac{3}{4}$ inch.

(b) A and B batteries in leatherette zipper case. This case is $4\frac{3}{4}$ by $3\frac{1}{4}$ by $1\frac{1}{4}$ inches and with batteries, weighs 358 Gm. The A battery is Radio-Ear 728, 1.5 volts. The B battery is Radio-Ear 729, 34.5 volts. Connections are made by means of a special three prong plug connector.

(c) Two crystal receivers, C-5172, $\frac{5}{16}$ by 1 inch (diameter) and C-5095, $\frac{5}{8}$ by $\frac{3}{4}$ inch diameter, each with molded earpiece. Bone conduction receiver.

TABLE 1.—Current Drains at Full Voltage

Battery	Economizer Position	Voltage	Current
A.....	Battery used	1.5	100.00 ma.
B.....	Battery used	34.5	0.65 ma.
A.....	Battery new	1.5	85.00 ma.
B.....	Battery new	34.5	0.50 ma.

TABLE 2.—Over-All Amplifications

	128	256	512	1,024	2,048	4,096
At normal ear threshold, $\frac{1}{2}$ full volume.....	nil	nil	20	45	38	19
At approximately 45 decibels above normal threshold.....	?	24	35	49	40	8

The Council's investigation of the unit revealed that:

Battery Drain.—With new batteries giving full voltage, the current drains are as shown in table 1.

Mechanical and Electrical Features.—The instrument is neat in appearance and substantially made. The high degree of amplification makes it extremely sensitive to mechanical shocks, so that the rubbing of the clothing either on the microphone or on the connecting cords results in noise.

Performance tests were made with the "economizer" set in the used battery position.

Amplification.—The over-all amplifications with the M-5375 and C-5172 combination were as shown in table 2.

Radio-Ear Type C, Special Electronic Hearing Aid.

The Council voted to accept the Radio-Ear Type C, Special with C-5172 crystal and bone receiver for inclusion on its list of accepted devices.

AIRCO OXYGEN THERAPY LINE REGULATOR, NO. 806 8681, ACCEPTABLE

Manufacturer: Air Reduction Sales Company, 181 Pacific Avenue, Jersey City, N. J.

The Airco Oxygen Therapy Line Regulator, Number 806 8681, is an oxygen therapy line or "station" pressure regulator for use where a manifold is employed to supply oxygen through a pipe line to several station outlets. The outlet fitting accommodates the standard oxygen therapy flowmeters used on the Council accepted Airco Oxygen Therapy Regulator, Style 8481. Pressure from the oxygen supply is reduced through only a single stage before entering the pipe line.

In the Council's investigation of the regulator, the valve was found to be accurate within reasonable limits when a delivered flow of oxygen (liters per minute) was checked against a large known volume displacement. It must be emphasized that the regulator is a single stage reducing unit, and it would be extremely dangerous to attach it to commercial oxygen tanks of 2,100 pounds pressure or to any line with pressure in excess of 50 pounds per square inch. A metal caution plate warning against the use of the regulator on inlet pressures greater than 50 pounds per square inch is fixed to the regulator.

The Council on Physical Therapy voted to accept the Airco Oxygen Therapy Line Regulator, Number 806 8681, for use on low pressure pipe lines.

Airco Oxygen Therapy Line Regulator, Number 806 8681.

BURDICK SUNLAMP, MODEL QS-4, ACCEPTABLE

Manufacturer: The Burdick Corporation, Milton, Wis.

The Burdick Sunlamp, Model QS-4, generates ultraviolet radiation of an intensity and spectral distribution which renders it suitable for unsupervised use by the layman. The ultraviolet source, an S-4 type bulb manufactured by the General Electric Company, is mounted in an adjustable stand. The reflector is said by the firm to be finished in such a manner as will provide an even and shadowless radiation over the exposed area. The unit operates on the usual house current—alternating current, 115 volt, 60 cycle, 125 watt current consumption. Twenty-five and forty cycle lamps are available. The unit has a 16 inch horizontal arm for extension over a bed or couch, and it is adjustable to a height of from 40 to 66 inches from the floor.

The S-4 type bulb consists basically of a quartz mercury arc about $1\frac{1}{2}$ inches long, enclosed in a special glass bulb which

Burdick Sunlamp, Model QS-4.

Relative Spectral Intensities (Galvanometer Deflections)

Wavelength (Angstroms)	Relative Energy (Average of 3 Lamps)
3,132	7.96
3,024	2.59
2,967	1.15
2,894	0.28
2,804	0.09
Total	12.07

transmits ultraviolet wavelengths of 2,894, 2,967, 3,024 and 3,132 angstroms (and longer wavelengths) but which cuts off most of the wavelengths shorter than about 2,800 angstroms. The lamp

produces the characteristic blue green light of the mercury line spectrum.

The firm states that on the average untanned skin surface, a visible "pink" glow or erythema is produced in less than five minutes at a 30 inch distance.

The Council investigated the radiation characteristics of the S-4 bulb; in this investigation the lamp was placed close in front of the quartz-fluorite achromatic spectroradiometer, and the spectral intensities were measured with a vacuum thermopile. The relative spectral intensities (galvanometer deflections) corrected for absorption in the spectroradiometer are given in the accompanying table.

The radiation at 2,804 angstroms (and shorter if measurable) is about 0.75 per cent of the total of all wavelengths, including 3,132 and shorter. Mounted in an aluminum reflector the radiation at 2,894 and shorter, relative to the total, would be still lower; hence these lamps comply with the Council's requirements for acceptability of a sunlamp for spectral quality of ultra-violet radiation.

The Council voted to accept the Burdick Sunlamp, Model QS-4, for inclusion on its list of accepted devices.

FISCHER INFRA-RED GENERATORS MODELS 2281, 4040 ACCEPTABLE

Manufacturer: H. G. Fischer & Company, 2323-2345 Wabasha Avenue, Chicago.

The Fischer Infra-Red Generators are designed to produce infra-red radiation. The lamps may be used with either a 200 or a 400 watt infra-red element. The firm states that the flexibility of the stand (the two models have similar stands except for the reflectors) permits flexibility application of infra-red radiation. The base and upright of the stand measures 48 inches; the extension bar supporting the reflector is 28 inches long.

Fischer Infra-Red
Generator,
Model 4040.

The adjustment clamp is set by turning the adjustment wing nut. The stands are mounted on casters and are provided with handles for lifting.

Model 2281 is provided with what the firm calls the "regular" reflector, and the 4040 lamp has a "special faceted" reflector. A bakelite covering which

does not become heated is supplied on request. The reflectors are each 11 inches in diameter.

The firm states that the infra-red heating element is made of materials that will not blister or flake. The predominant output of the heating element is in the wavelengths beyond the visible range of the spectrum.

In the Council's clinical investigation of the lamps, they gave satisfactory service.

The Council voted to accept the Fischer Infra-Red Generators, Models 2281 and 4040, for inclusion on its list of accepted devices.

HEIDBRINK OROPHARYNGEAL CATHETER OUTFIT ACCEPTABLE

Manufacturer: The Ohio Chemical and Manufacturing Company, Heidbrink Division, Minneapolis.

The Heidbrink Oropharyngeal Catheter Outfit is designed for the oropharyngeal administration of oxygen. The apparatus is portable and consists of an automatic pressure reducing regulator with adapter for medical oxygen tanks, a flow meter, a humidifying jar, a drip jar and a nasal catheter. The unit is readily taken apart and reassembled; removal of a single nut permits the top to be taken off and thus provides access to the jars, which are of the ordinary fruit jar type.

When the catheter is properly placed, the automatic pressure regulating valve is opened and the oxygen flows through the apparatus at any desired rate up to 11 liters per minute of oxygen or 14 liters of helium-oxygen mixture, as registered by

the dry float type flow meter. In operation, the oxygen is released by the automatic regulator and conducted first to the flow meter for registration of flow rate; next it is bubbled through the water in the humidifying jar. The moisture laden oxygen is then passed through the drip jar, which collects any drops of moisture, and is finally delivered through the nasal catheter to the patient.

The unit was investigated clinically by the Council. This investigation revealed that the meter is accurate within plus 3.5 per cent in the case of oxygen and within plus 7 per cent for the mixture of helium 80 per cent with oxygen 20 per cent. At no time did the apparatus deliver less of either gas or mixture than the meter indicated. The float in this meter showed a tendency to bob up and down at settings indicating 4 to 6 liters per minute of the helium-oxygen mixture.

The claim that relative humidity of more than 50 per cent results from oxygen flows of 5 liters per minute was substantiated by tests in an 8 liter chamber, when the apparatus was used as described in the advertising literature.

The Council voted to accept the Heidbrink Oropharyngeal Catheter Outfit for inclusion on its list of accepted devices.

Heidbrink Oropharyngeal
Catheter Outfit.

Council on Pharmacy and Chemistry

REPORTS OF THE COUNCIL

THE COUNCIL HAS AUTHORIZED PUBLICATION OF THE FOLLOWING
REPORTS. OFFICE OF THE COUNCIL.

PHENYTOIN SODIUM THE NONPROPRIETARY NAME FOR SODIUM DIPHENYL HYDANTOINATE

The Council has adopted the designation "Phenytoin Sodium" (accented "phén-y-tōin sodium") as a nonproprietary name for sodium diphenyl hydantoinate. Acceptance is continued of Dilantin Sodium, the proprietary name under which Parke, Davis & Co. markets its brand of sodium diphenyl hydantoinate as a brand of phenytoin sodium-N. N. R.

SULFADIAZINE AND SULFAGUANIDINE, NON- PROPRIETARY NAMES FOR 2-SULFANIL- AMIDOPYRIMIDINE AND SULFANILYL- GUANIDINE RESPECTIVELY

In view of the recent work that has been done with the sulfonamide derivatives 2-sulfanilamidopyrimidine and sulfanilylguanidine, the Council considered the recognition of nonproprietary names for these substances. For 2-sulfanilamidopyrimidine it adopted the term sulfadiazine and for sulfanilylguanidine the term sulfaguanidine. The latter term was adopted after consultation with Dr. E. K. Marshall Jr., who has done a considerable amount of work with this substance. Dr. Marshall kindly expressed his assent to the Council's recognition of the term.

SUPER D COD LIVER OIL AND SUPER D COD LIVER OIL CONCENTRATE (THE UPJOHN COMPANY) NOT ACCEPT- ABLE FOR N. N. R.

These preparations of the Upjohn Company have not been presented formally for the Council's consideration. In 1933 the Council declared Upjohn's Super D Cod Liver Oil unacceptable for inclusion in New and Nonofficial Remedies because of semi-secret composition, indefinitely designated vitamin potency and

its objectionable name (THE JOURNAL, May 20, 1933, p. 1597). The firm had thus been informed that the term "Super D" is objectionable. It is pointed out that some accepted preparations are as potent if not more potent. Furthermore, recognition of such a term would lead only to the proposal of "Super Super" potencies.

It was brought to the attention of the Council's office by physicians that detail men of the Upjohn Company were making the claim that the Upjohn's Super D Cod Liver Oil and Super D Cod Liver Oil Concentrate were more effective than products utilizing other fish liver oils. The firm was asked for evidence to substantiate such a claim and replied by the citation of evidence which was inconclusive, at the same time asking that the Council offer evidence to support its opinion that all fish liver oils in equivalent dosages are equally effective. It was pointed out to the firm that the burden of proof rests on any one making a claim for such a difference. In this connection the Council's referee authorized transmission to the firm of the following statement:

The opinion that there is no important difference in the antirachitic activity of different fish oils was based in part on the following considerations: There appears to be no satisfactory evidence for the existence of important proportions of more than two forms of vitamin D in fish liver oil. These two forms of vitamin D are identical with the products formed by the activation of ergosterol and of 7-dehydrocholesterol. These two forms of vitamin D are referred to as vitamin D₂ and vitamin D₃ in German literature. Vitamin D₃ appears to account for the entire antirachitic activity of some fish liver oils and predominates in all the oils which have been examined. The relative efficacy of vitamin D₂ and vitamin D₃ in the prevention of rickets has been the subject of extensive clinical study, and there is convincing evidence that there is no important difference in their value for this purpose. Recognition must be given to the difficulties in interpreting clinical data, and conclusions cannot be drawn from a limited number of observations on infants.

The Upjohn Company agreed to delete from its advertising any claim which might be objectionable to the Council but could not agree to control the claims made by its detail men. Furthermore, the firm made no agreement to discontinue the use of the phrase "Super D."

In view of the foregoing, the Council reaffirmed its rejection of Super D Cod Liver Oil (Upjohn) and declared Super D Cod Liver Oil (Upjohn) and Super D Cod Liver Oil Concentrate (Upjohn) unacceptable for inclusion in New and Non-official Remedies.

NEW AND NONOFFICIAL REMEDIES

THE FOLLOWING ADDITIONAL ARTICLES HAVE BEEN ACCEPTED AS CONFORMING TO THE RULES OF THE COUNCIL ON PHARMACY AND CHEMISTRY OF THE AMERICAN MEDICAL ASSOCIATION FOR ADMISSION TO NEW AND NONOFFICIAL REMEDIES. A COPY OF THE RULES ON WHICH THE COUNCIL BASES ITS ACTION WILL BE SENT ON APPLICATION.

OFFICE OF THE COUNCIL.

AMYLCAINE HYDROCHLORIDE.—Mono-*n*-amylaminoethyl-*p*-aminobenzoate hydrochloride. — $\text{NH}_2\text{C}_6\text{H}_4\text{COO}\cdot\text{CH}_2\text{CH}_2\text{NH}\cdot\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{HCL}$.

Actions and Uses.—The actions of amylcaine hydrochloride resemble those of cocaine hydrochloride, but it does not cause mydriasis when the solution is dropped into the eye. In the present state of our knowledge its use should be restricted to the production of corneal anesthesia in those cases in which mydriasis is not desired. The toxicity varies rather widely with the species and with the mode of administration. The anesthesia is induced promptly with little smarting; it does not increase intraocular tension.

Dosage.—A 2 per cent solution is used in ophthalmology when mydriasis is not desired, 1 or 2 drops being usually sufficient.

Manufactured by Novocel Chemical Manufacturing Co., Inc., Brooklyn, N. Y. U. S. patent and U. S. trademark pending.

Amylcaine Hydrochloride 2%.

Amylcaine hydrochloride occurs as a fine, white, odorless powder which, when applied to the tongue, possesses a bitter taste followed by a sense of numbness. It is soluble in water, sparingly soluble in ethanol and insoluble in ether, benzene and chloroform. An aqueous solution is acid to litmus. The free base separates as a solid from amylcaine hydrochloride solutions on the addition of sodium hydroxide or carbonate solutions but not with sodium bicarbonate solution. Amylcaine hydrochloride melts at 173-174 C., and the free base at 65 C.

Dissolve 0.1 Gm. of amylcaine hydrochloride in 50 cc. of water; to one 5 cc. portion add 1 cc. of silver nitrate solution: a white precipitate results, soluble in excess of ammonia water; to another 5 cc. portion add 0.5 cc. of diluted hydrochloric acid, 0.5 cc. of a 10 per cent solution of sodium nitrite and then 10 cc. of ammonia water containing 0.2 Gm. of betanaphthol: an orange precipitate results, soluble in ether; to a 2 cc. portion add 1 cc. of potassium mercuric iodide solution: a white

precipitate results; to a 2 cc. portion add 2 cc. of picric acid solution: a yellow precipitate results. Dissolve 0.1 Gm. of amylcaine hydrochloride in 5 cc. of water, add 2 drops of sulfuric acid and 1 cc. of a saturated solution of sodium nitrite, and heat to 50 C.: a yellow oil separates (distinction from procaine, butyn, cocaine, tutocaine and poncaine). Dissolve 0.1 Gm. of amylcaine hydrochloride in 1 cc. of sulfuric acid: the solution is colorless (readily carbonizable substances). Saturate a solution of 0.1 Gm. in 10 cc. of water with hydrogen sulfide: no coloration or precipitation occurs (salts of heavy metals).

Transfer about 0.5 Gm. of amylcaine hydrochloride, accurately weighed, to a tared platinum dish and dry at 100 C. for six hours: the loss in weight does not exceed 3 per cent. Incinerate about 0.5 Gm. of amylcaine hydrochloride, accurately weighed: the ash does not exceed 0.1 per cent. Transfer a sample of amylcaine hydrochloride, previously dried and accurately weighed, to a Kjeldahl flask and digest with sulfuric acid in the presence of 0.1 Gm. of selenium; dilute, make alkaline with sodium hydroxide solution, distil into standard acid and titrate the excess acid with standard alkali: the nitrogen content is not greater than 9.8 nor less than 9.4 per cent. Transfer about 0.5 Gm. of amylcaine hydrochloride, previously dried and accurately weighed, to a 250 cc. beaker and dissolve in 100 cc. of water. Heat to boiling and add 10 cc. of nitric acid and 20 cc. of silver nitrate solution, digest on the steam bath for three hours, filter, wash, dry and weigh the precipitate: the chloride content is not greater than 12.5 nor less than 12.0 per cent.

PERNOSTON SODIUM.—Sodium *sec*-(butyl- β -bromallyl)-barbiturate. — Sodium-5-(butyl-2)-5- β -bromopropenylmalonylurea. — $[\text{CH}(\text{CH}_2\text{CH}_2\text{CH}_2\text{Br})\text{C}(\text{CH}_2\text{CONNa}\cdot\text{CO}\cdot\text{NHCO})_2]$. The sodium salt of pernoston.

Actions and Uses.—The action of pernoston sodium is like that of pernoston except that the effects are induced almost immediately after its intravenous injection. It is used only when the oral administration of a barbiturate is not feasible either because of interference with swallowing or because prompt action is imperative, as in the presence of convulsions. The effects are delayed for from thirty to forty-five minutes after the intramuscular injection. The intravenous use demands the rigid observance of the proper technic. The contraindications are important.

Dosage.—One cc. of the 10 per cent solution (in ampules) per 12.5 Kg. (27½ pounds) of body weight injected intravenously at the rate of 1 cc. total per minute until the patient sleeps or until the full dose has been injected. The intramuscular dose is the same as that by vein, but it may be injected at once. Ampules containing a deposit should not be used.

Distributed by Riedel de Haen, Inc., New York. U. S. patent 1,739,662 (Dec. 17, 1929, expires 1946); U. S. trademark 266,216.

Ampules Pernoston 10%, 2 cc.

Pernoston sodium occurs as a fine, white, crystalline powder, possessing a bitter taste; soluble in water and alcohol; slightly soluble in ether and chloroform. A 10 per cent aqueous solution is alkaline to litmus and phenolphthalein and has a pH of approximately 9.5.

Transfer 5 cc. of a 10 per cent solution of pernoston sodium to a test tube, add 2 cc. of diluted hydrochloric acid; allow the precipitate to crystallize, filter, wash and recrystallize from an ethanol-water mixture: the melting point of the pernoston is from 130 to 133 C.

Transfer 5 cc. portions of a 10 per cent solution of pernoston sodium to two test tubes and to one add 1 cc. of mercury bichloride solution: a white precipitate results, soluble in 10 cc. of ammonium hydroxide; to the other portion add 5 cc. of silver nitrate solution: a white precipitate results, soluble in 5 cc. of ammonium hydroxide.

Dissolve 0.1 Gm. of pernoston sodium in 1 cc. of sulfuric acid: the liquid assumes a yellow color, changing to brownish red and finally to dark red. Acidify 40 cc. of a 10 per cent solution of pernoston sodium with diluted nitric acid and filter; separate portions of 10 cc. each of the filtrate yield no opalescence with 1 cc. of silver nitrate solution (chloride); no turbidity with 1 cc. of barium nitrate solution (sulfate); no coloration or precipitation on saturation with hydrogen sulfide (salts of heavy metals).

Transfer about 0.5 Gm. of pernoston sodium, previously dried and accurately weighed, to a tared porcelain dish and add 2 cc. of sulfuric acid; evaporate the excess acid, ash the residue and ignite at 900 C.: the weight of sodium sulfate is not less than 21.4 per cent nor more than 22.2 per cent. Transfer about 0.3 Gm. of pernoston sodium, dried and accurately weighed, to a bomb tube, and determine the bromine content by means of the Carius method: the bromine found is not less than 24.3 per cent nor more than 24.8 per cent. Transfer a sample of pernoston sodium, dried and accurately weighed, to a Kjeldahl flask and digest with sulfuric acid in the presence of selenium, dilute, make alkaline, distil into standard acid and titrate the excess acid with standard alkali: the nitrogen content is not less than 8.3 per cent nor more than 8.8 per cent.

PHENOBARBITAL SODIUM (See New and Nonofficial Remedies, 1940, p. 135).

The following dosage form has been accepted:

Ampules Phenobarbital Sodium (Powder) Lakeside, 0.13 Gm. (2 Grains).

Prepared by The Lakeside Laboratories, Inc., Milwaukee, Wis. No U. S. patent or trademark.

Antipneumococcic Serum, Type I (See New and Nonofficial Remedies, 1940, p. 429).

E. R. Squibb & Sons, New York.

Antipneumococcic Serum, Type I (Refined and Concentrated) (See New and Nonofficial Remedies, 1940, p. 431). Also marketed in syringes containing 50,000 units of the type I pneumococcus.

Statistical compilations regarding licensure, medical and allied, are presented annually in the State Board Number of THE JOURNAL. In the following pages will be found the report for the year 1940, which constitutes the thirty-ninth annual presentation. Data are included as usual regarding (a) medical examining and licensing boards of the United States, the District of Columbia, the territories and the possessions of the United States, (b) boards of examiners in the basic sciences and (c) the National Board of Medical Examiners.

Official records which form the basis of these computations have been contributed throughout the year by the medical licensing boards of all states, the District of Columbia, Alaska, Hawaii, Puerto Rico and the Virgin Islands; the homeopathic medical licensing boards of Connecticut, Delaware and Maryland; the sixteen boards of examiners in the basic sciences in operation last year (Arizona, Arkansas, Colorado, Connecticut, District of Columbia, Florida, Iowa, Michigan, Minnesota, Nebraska, Oklahoma, Oregon, Rhode Island, South Dakota, Washington and Wisconsin) and the National Board of Medical Examiners. The homeopathic and eclectic examining boards of Arkansas and the homeopathic examining board in Louisiana did not license any one during the year. Likewise no physicians were registered for civilian practice in the Canal Zone.

The cooperation of the officers of the foregoing boards in making possible the vast amount of reliable information presented in the following pages is gratefully acknowledged. The Council and THE JOURNAL express thanks and appreciation to those who have supplied these data, for without such help the presentation of the calculations presented would not have been possible.

THE JOURNAL publishes each week the dates of future examinations, in the column "Medical Examination and Licensure," of state licensing and basic science boards, special examining boards and the National Board of Medical Examiners. Soon after they are held, blanks for recording such tests are regularly mailed. Such reports remain permanently in the archives of the

(CONTINUED FROM PAGE 2021)

proper entry is made. In the occasional instance in which the applicant, according to the record on file, has not graduated or there is some irregularity, the board is notified. These reports are then used as the basis of the statistical compilations and then permanently filed.

Since 1927 credentials of physicians coming from abroad have been verified by official correspondence. This has been impossible for several years and we are relying on the licensing boards in the various states to determine the authenticity of credentials from medical schools outside the United States and Canada. Later in this presentation statistics have been computed sepa-

ately showing the physicians examined on the basis of certificates obtained in countries other than the United States and Canada during 1940, and also for comparison the number so examined in ten previous years.

More than thirty licensing boards obtain from the Council verification of biographic data and other claims before granting a license or permission to take the licensing examination. This service is available to all boards.

The tables referring to medical licensing boards include figures regarding the number of candidates examined for medical licensure in 1940, the number

licensed and the number added to the profession. The state boards are discussed first, followed by the basic science boards and the National Board of Medical Examiners.

LICENSES ISSUED

In the first table are presented the number of licenses issued in the various states, territories and possessions, both by examination and by reciprocity or endorsement of state licenses or by the certificate of the National Board of Medical Examiners. During the year 1940 there were 9,115 licenses issued for the practice of medicine and surgery in the forty-eight states, the District of Columbia, Alaska, Hawaii, Puerto Rico and the Virgin Islands. Of the 9,115 licenses, 6,277 were issued after examination and 2,838 by reciprocity and endorsement.

Twenty-one states, the District of Columbia, Alaska, Hawaii and Puerto Rico require that applicants for licensure possess a hospital internship (table 20). However, the licensing boards permit the candidate to take the examination and if successful the license is withheld until completion of the internship. The 9,115 licenses issued include, therefore, many candidates who were examined in 1939 and even a few in previous years. Licenses are also withheld for proof of citizenship and minor technicalities. In some states also the licenses of those examined in December are dated and issued early in the following year. The figures in this table will not correspond with those hereinafter given.

New York issued the largest number of licenses, 1,290. Illinois granted 690 licenses, California 608 and Pennsylvania 561. These states are the only ones which registered more than 500. Twenty-four states, Alaska, Hawaii, Puerto Rico and the Virgin Islands issued licenses to fewer than 100. None were licensed by examination in New Mexico or the Virgin Islands. Three were registered in Alaska, 18 in Hawaii, 19 in

Puerto Rico and 6 in the Virgin Islands. Of these, 18 were granted certificates by endorsement of credentials, including 1 in Alaska, 9 in Hawaii, 2 in Puerto Rico and the 6 already mentioned in Virgin Islands. The states of Florida and Idaho grant licenses only on the basis of examination. Massachusetts and Rhode Island have no reciprocity privileges but endorse diplomates of the National Board of Medical Examiners.

Figures for five previous years and 1940 giving totals by years of the number of licenses issued on the basis of examination and endorsement are contained in table 3. Since 1937 fewer licenses have been issued annually. However, licenses issued do not represent individuals since several have been licensed in more than one state during a year. Nor do they represent additions to the medical profession at large since the majority of those licensed by reciprocity and endorsement, with the exception of the diplomates of the National Board of Medical Examiners, have migrated from other states. Table 15 shows how many of those licensed were never before registered and therefore represent the number added to the medical profession in the United States and territories and possessions.

Referring again to table 3, it will be noted that in six years 54,676 licenses have been issued, 37,843 by examination and 16,833 by endorsement of credentials.

CANDIDATES EXAMINED BY MEDICAL
EXAMINING BOARDS, 1940

Table 2 records data referring to those examined for medical licensure by individual states throughout the year and gives the number who passed and failed in each state and the medical school of graduation. There were 7,921 examined, of whom 6,282 passed and 1,639 failed, representing sixty-seven approved medical schools in the United States and nine of the medical schools of Canada, one hundred and two faculties of medicine and four licensing corporations of other

countries, five medical schools now extinct, eight unapproved institutions and eight osteopathic colleges. Osteopaths who are granted the privilege to practice medicine, surgery, or both, by the medical board are included in these statistics, eliminating for instance those osteopaths in California who receive these privileges as physicians and surgeons from an osteopathic board. There were 5,188 graduates of approved medical schools in the United States examined, of whom 5.1 per cent failed; 163 graduates of approved Canadian schools, 20.2 per cent of whom failed; 2,092 graduates of schools outside the United States and Canada,

TABLE 4.—Source of Candidates Examined, 1940

Medical Schools	Number	Number Examined	Number Passed	Number Failed	Percentage Failed
Approved, in United States.....	67	5,188	4,926	262	5.1
Approved, in Canada.....	9	163	130	33	20.2
Extinct.....	5	5	5	..	0.0
Foreign.....	106	2,092	948	1,144	54.7

Totals.....	203	7,921	6,282	1,639	20.7

principally in Europe, with 54.7 per cent failures; five who graduated from medical schools now extinct, all of whom passed, and 473 from unapproved and osteopathic schools, of whom 44.4 per cent failed. These 473 represented 174 graduates of osteopathic schools, of whom 114 passed and 60, or 34.9 per cent, failed and 299 graduates of unapproved schools, of whom 159 passed and 140, or 46.9 per cent, failed. Graduates of osteopathic schools were examined by the medical boards of eight states and the District of Columbia, namely Colorado, Connecticut, Massachusetts, New Hampshire, New Jersey, Texas, Wisconsin and Wyoming, while graduates of unapproved schools were examined in five states and Puerto Rico. These states

nized schools, Massachusetts examined 233 and Illinois 50. All other states examined fewer than 7. Osteopaths in Colorado, Massachusetts, New Hampshire, New Jersey and Texas were examined in medicine and surgery, those in the District of Columbia, Wisconsin

and Wyoming only in surgery, while Connecticut examined 2 in medicine and surgery and 1 in medicine only.

The 7,921 do not represent individuals, since a candidate might take the examination in more than one state and would be counted in each state. This applies to those who pass or fail, or those who fail and later pass in one or more states, or pass in one state and later in the same year fail elsewhere. However, if a candidate fails more than once in a given state within the year he is counted in that state only once as a failure.

Three of the five homeopathic boards in existence, Connecticut, Delaware and Maryland, examined 17 candidates, all of whom passed. The homeopathic boards in Arkansas and Louisiana did not examine any one during the year. The one eclectic board in existence, in Arkansas, did not examine a candidate.

The greatest number of graduates of any one school examined was 187. These were the graduates of the University of Illinois College of Medicine, who were examined in twenty states. Of those examined only 3, 1.6 per cent, failed. The next greatest number, 179, were from Northwestern University Medical School. Here again only 2, or 1.1 per cent, failed. Northwestern graduates took the test in twenty-five states. In another instance 157 graduates of the Hahnemann Medical College and Hospital of Philadelphia were examined in seventeen states. Twenty-five graduates of this school failed to pass the licensure examination, representing 15.9 per cent of those examined.

Fourteen schools in the United States had no failures before medical licensing boards, thirty-two less than 5 per cent, eight between 5 and 10 per cent and thirteen more than 10 per cent. The number examined from many of the schools having a high percentage of failures is small compared to the number of graduates annually

from these schools. This is accounted for by the fact that the majority of their graduates take the examinations of the National Board of Medical Examiners. Table 11 includes figures and percentages of all examined during 1940, i. e. those who were examined by the National Board of Medical Examiners in their final examination as well as those passing state tests.

Graduates of Rush Medical College were examined in the greatest number of states, thirty-three; graduates of the University of Pennsylvania by twenty-eight states; Harvard Medical School twenty-seven, North-

The source of candidates for licensure last year are further tabulated in table 4 giving totals for five groups, namely approved medical schools in the United States and in Canada, medical schools extinct, schools in foreign countries and unrecognized institutions. Of the United States schools 5.1 per cent failed and 20.2 per

TABLE 7.—Source of Graduates of 1938, 1939 and 1940 Examined, 1940

western University twenty-five states, the College of Medical Evangelists twenty-three, Loyola University twenty-two and the University of Illinois and Johns Hopkins University in twenty states. All other schools had their graduates examined in fewer than twenty states. Graduates of Stanford University, the Universities of Southern California, Colorado and Georgia, Albany Medical College, University of Pittsburgh, Meharry Medical College, Vanderbilt and the University of Vermont were examined in less than five states. The Albany Medical College had but three of its graduates examined for licensure in two states, two were tested in Florida and one in Maine and all three passed. Graduates of four schools were examined in three states respectively.

P = Passed; F = Failed.

versity Faculty of Medicine, who were examined in fifteen states: 32 graduates of the University of Toronto Faculty of Medicine in seventeen states, while 22 from Dalhousie University Faculty of Medicine applied for licensure in three states. The highest percentage of

failures was 75, representing 4 graduates examined from each of two schools, Laval University Faculty of Medicine and the University of Montreal Faculty of Medicine. Of these, one passed and three failed. The state of New York examined 71 of the 163 Canadian graduates, California examined 19 and Maine 10. All other states fewer than 10, and in nineteen states fewer than 5.

Further perusal of table 2 reveals that 5 graduates of medical schools now extinct were examined in four

states, Florida, Iowa, Louisiana and West Virginia. None of these examinees failed.

Twenty-two states examined 2,092 graduates of medical schools other than those in the United States and Canada. They were also tested in Puerto Rico. In 1940 also 473 unapproved graduates were examined in eleven states, namely California, Colorado, Connecticut, Illinois, Massachusetts, New Hampshire, New Jersey, Pennsylvania, Texas, Wisconsin and Wyoming, and in the District of Columbia and Puerto Rico.

In 1939, 7,750 were examined, of whom 6,489 passed and 1,261, or 16.3 per cent, failed, as compared with 7,921 examined in 1940, of whom 6,282 passed and 1,639, or 20.7 per cent, failed. Elsewhere are given figures referring to actual licentiates and additions to the medical profession.

GRADUATES OF 1938, 1939 AND 1940 EXAMINED
FOR MEDICAL LICENSURE, 1940

In table 5 are presented figures recording graduates of 1938, 1939 and 1940 examined for medical licensure in 1940. Altogether 5,482 were examined, of whom 4,983 passed and 499, or 9.1 per cent, failed. Repre-

were 320 recent graduates of medical schools other than in the United States and Canada examined of whom 156 passed and 164, or 51.3 per cent, failed. There were also examined 291 graduates of schools not approved by the American Medical Association and graduates of schools of osteopathy, of whom 185 passed

Some states have additional requirements for graduates of schools outside the United States and Canada.

1. 1st P. first papers required; +, full citizenship required.
2. In most cases there is a small additional recording or registration fee.
3. If state of original license grants similar privileges.
4. Internship accepted in lieu of one year's practice.
5. Professional practice required.
6. No professional practice required.
7. Just preceding application.
8. No basic science reciprocity—examination must be within the state.
9. Basic science certificate required either by reciprocity or examination in addition to basic science subjects of National Board.
10. Reserve officers not eligible.
11. Applicant's diplomate certificate must be dated not less than one year or more than ten years prior to the filing date in California of an application; applicant must also have been a resident of some state

or territory of the United States for a period of at least one year after the date of his diplomate certificate.

12. Oral examination required when original license is ten or more years old.
13. Applicant must have resided in the state used as basis of application for one year after date on said certificate.
14. Oral examination required.
15. Unless in practice in another state for five years.
16. Actual practice for a period of three years immediately preceding date of application.
17. Practical, clinical examination required.
19. Regular and Homeopathic boards.
20. Graduates of foreign medical schools accepted if they present also a diploma from an approved medical school in the United States.
21. Regular board.
22. Fee same as applicant's state charges if more than \$50.
23. Oral examination required if applicant's state requires it.

sented were 4,768 graduates of sixty-seven approved medical schools in the United States, of whom 4,560 passed and 208, or 4.4 per cent, failed. From the nine approved medical schools in Canada which offer the complete medical course, 103 were examined, 82 of whom passed and 21, or 20.4 per cent, failed. There

and 106, or 36.4 per cent, failed. These figures will be found in table 8.

Canada 51.3 per cent and unapproved schools 36.4 per cent.

Twenty schools in the United States had no failures among recent graduates applying for licensure, twenty-nine schools had less than 5 per cent and eighteen more than 5 ranging to 28.1 per cent.

Endorsement Policies

changes of which this office has not been advised. For an authentic statement write directly to the medical board.

24. If an applicant passes the examination in the state from which he transfers after the completion of his internship, no practice is required.

25. Internship accepted if served in this state.

26. Internship accepted—considered equivalent to two years' practice.

27. Five years' practice.

25. Conditionally.

29. A two year internship is accepted.

30. License by National Board certificate at examination fee of \$15 unless holding a license from another state.

31. Graduates before 1907 required to take oral examination.

32. Clinical examination required.

S3. Reciprocity applicants only.

34. Supplemental examination required in certain cases when accepting the examination of a state with whom reciprocal relations have not been established.

35. May be licensed after a special (written) supplemental examination.

36. Fee for license on basis of National Board certificate \$25.

37. For matriculants after Oct. 17, 1937.

38. Fee, \$20.

39. While on active duty only.

40. Permanent license withheld until completion of citizenship.

41. Graduates of foreign medical schools effective Sept. 15, 1935.
Canadian schools exempted effective Sept. 19, 1939.

42. Graduates of foreign medical schools are not accepted.

43. Graduates of foreign medical schools must have fulfilled all requirements of California prior to admittance to examination for any certificate used as basis of application to California.

44. A New York license not acceptable.

45. Not applicable to citizens of Canada.

46. Canadian citizens are required to file first papers.

47. Fee, \$15

48. Same as required of Utah candidates applying for licensure.

The greatest number examined by any one state was New York, 807; Pennsylvania was second with 461; Illinois 424, California 353 and Ohio 268.

More than 100 from each of thirteen schools were examined, the highest being 159 graduates of Northwestern University Medical School who appeared before

licensing boards in twenty-five states. Thirty-four graduates of McGill University Faculty of Medicine, the greatest number from any one Canadian school, were tested in eleven states, while only one from the Faculty of Medicine of the University of Montreal appeared for registration. Only 10 medical graduates

of Yale University were examined in seven states and 16 from Duke University School of Medicine were examined in eight states. Very few also from Boston University School of Medicine, Tufts College Medical School, Albany Medical College and the New York

CONSOLIDATED EXAMINATIONS

In table 11 are presented for each approved medical school in the United States and Canada the number of physicians examined for medical licensure, as well as the number who appeared for Part III, the final examination, of the National Board of Medical Examiners in 1940. It will be noted that in some instances schools having a high percentage of failures before licensing

boards had few, if any, failures before the National Board. In some cases also more were examined by the National Board. During the year 4,926 graduates of approved medical schools in the United States were examined by medical licensing boards, of whom 5.1 per cent failed, while in the consolidated figures, 5,939 were examined and 280, or 4.7 per cent, failed. Of the Canadian schools, 20.2 per cent failed state board tests and 18.8 the combined tests. Very little change was effected by combining figures for foreign graduates.

FAILURES BEFORE MEDICAL LICENSING BOARDS
BY LICENTIATES, 1940

In table 12 are presented for each state the number licensed after failing a state licensing examination once and after two or more failures, these two groups being classified by indication whether the failure or failures have been in the state in which they are receiving a license or elsewhere and also if the failure has been in this state where licensed and elsewhere. The total number of candidates examined and licensed or granted

The National Board did not examine any one from unapproved or extinct schools. The total of all examined before medical licensing boards was 7,921, of whom 6,282 passed and 1,639, or 20.7 per cent, failed. For both groups, 8,712 were examined, 7,052 passed and 1,660, or 19.1 per cent, failed. From this table it will be noted that the greatest number examined represented Northwestern University Medical School, 205, only 1 per cent of whom failed. From twenty schools more than 100 were examined. The total percentage of failures has been slightly reduced by including figures for the National Board but very materially so for certain individual schools.

licenses by endorsement or reciprocity in each state is also shown.

Of the 9,115 licenses issued during 1940, 702 had previously been unsuccessful before a licensing board. Of these, 285 were registered after having failed in one examination in the state in which they were licensed and 89 elsewhere, while 239 made more than one attempt to pass the licensing test in the state awarding the 1940 license, 44 elsewhere and 45 failed in the state where licensed in 1940 and also elsewhere.

In the computation of these statistics it was noted that 52 licentiates had failed at least five times. It was revealed that 16 failed five times, 8 had six failures,

9 failed seven and 6 eight times, 3 had nine failures, 3 ten, 3 eleven and 2 failed twelve times. Noteworthy were 2 candidates licensed in Massachusetts, 1 after nineteen and the other after twenty-five failures. The great majority of these physicians were Massachusetts examinees and graduates of unapproved schools. Fifteen received their education in foreign faculties of medicine. Of this group 1 failed seven times, the greatest number. There was 1 graduate of an approved medical school in the United States who made six attempts before securing registration.

Twenty-one states licensed in 1940 only physicians who never failed a state board examination, while New York licensed 358, Massachusetts 149 and California and New Jersey 32 who had already failed. Licensure of candidates having failures occurred in twenty-seven states, the District of Columbia and Puerto Rico. With the exception of California, Connecticut, Massachusetts, New Jersey, New York, Ohio and Texas no state licensed more than 15.

AGE AT LICENSURE

An examination of the records of candidates issued licenses in 1940 revealed the average age at first licensure to be 26 years while for those receiving original licenses by endorsement the age computed was 28.7. It appears that over 600 were born in 1913 and 1915 and more than 900 in 1914. In the endorsement group 67 were born in 1911, 77 in 1913, 62 in 1914 and 101 in 1912.

REGISTRATION BY RECIPROCITY AND ENDORSEMENT

The reciprocity or endorsement policies of the various states, the District of Columbia, Alaska, Hawaii, and Puerto Rico are presented in table 13. Definite reciprocal relations are reported by twenty-five states. Twenty-four states, including four that have regularly established reciprocal relations, will register licentiates who present credentials which correspond to those required by their respective states at the time such licenses were issued. The medical practice acts give the examining boards the privilege of using their discretion in determining the acceptability of a candidate. This chart has proved to be of material assistance to those contemplating moving their practice. In addition, there is also indicated whether diplomates of the National Board of Medical Examiners and retired officers of the government services are eligible for licensure on the basis of their credentials. Specific requirements such as professional practice, basic science certificate, oral examination and internship are recorded, as is also the fee for a license without written examination. For the benefit of physicians migrating to this country there is included a column outlining citizenship requirements. By footnote it can be noted whether physicians of Canadian birth are exempt from the citizenship requisite. In the majority of states graduates of foreign medical schools are not accepted on a reciprocal basis. Delaware, Florida, Idaho, Massachusetts, Rhode Island and Hawaii do not have reciprocal agreements with any state. Massachusetts, Rhode Island and Hawaii, however, will register diplomates of the National Board of Medical Examiners by endorsement. Those desiring licenses by reciprocity or endorsement in Arizona, Arkansas, Colorado, Connecticut, District of Columbia, Florida, Iowa, Michigan, Minnesota, Nebraska, Oklahoma, Oregon, Rhode Island, South Dakota, Washington and Wisconsin are required to obtain a certificate from the board of

examiners in the basic sciences before being eligible for licensure. Other requisites or exemptions are mentioned in the footnotes. Some states also have additional requirements for graduates of schools outside the United States and Canada.

The number of physicians granted licenses in 1940 to practice medicine and surgery without examination on presentation of satisfactory credentials is given in table 10. There were 2,834 so registered who presented licenses from other states, the District of Columbia, Canada and foreign countries, the certificate of the National Board of Medical Examiners, one of the government services, or other credentials. The greatest number of licenses by this method were issued in New York, where 334 were registered. Seven other states endorsed more than 100 such candidates: California 212; New Jersey 164; Illinois 148; Texas 145; Michigan 137; Ohio 136 and Massachusetts 113. The largest group representing the same type of credentials were the 696 diplomates of the National Board of Medical Examiners. More than 100 physicians holding licenses in Illinois, Maryland, Missouri, Nebraska, New York, Ohio and Tennessee, respectively, were licensed in other states. The greatest number, 180, from any one state who secured licenses by endorsement was from New York, while 334 were registered in this state on the basis of credentials. These 334 physicians presented licenses from twenty-six states, the District of Columbia, Puerto Rico, Canada, France and Germany, or the certificate of the National Board of Medical Examiners. Only two licenses were granted during the year by endorsement of a license from Europe. Both were issued in New York. Two also were registered on the basis of Canadian credentials; 1 in New Hampshire presented a provincial license issued in Quebec, and the other licensed in New York on the basis of a dominion certificate. Four states accepted credentials from the territories and possessions of the United States. In the District of Columbia and Texas a licentiate of Alaska was registered, while California registered 1 from Hawaii and New York 1 from Puerto Rico. In addition, 6 were admitted to private practice in the Virgin Islands.

Twelve physicians were registered on the basis of commissions in the government services. Seven holding credentials from the U. S. Navy were given the right to practice without the requirement of an examination, as follows: California licensed 2, Kentucky 1, Texas and Virginia, 2 each. Two, 1 in California and in North Carolina, respectively, were certified on credentials from the U. S. Army and 3, 2 in California and 1 in Wisconsin, by endorsement of connections with the United States Public Health Service.

Not included in the table are 4 osteopaths licensed by the board of examiners in three states, namely 2 in New Hampshire and 1 in Texas granted the right to practice medicine and surgery, and 1 in Oregon was licensed to practice osteopathy and surgery.

Of the five homeopathic boards in existence—Arkansas, Connecticut, Delaware, Louisiana and Maryland—only one issued a license without examination. In Connecticut a diplomate of the National Board of Medical Examiners was so registered. The Eclectic Medical Examining Board in Arkansas did not register any one.

Diplomates of the National Board of Medical Examiners were registered in forty-two states and Hawaii.

New York had the greatest number of its licentiates certified in other states, 53, who were given the right to practice in New Jersey. Alabama, Arizona, Dela-

ware, Florida, Idaho, Montana, New Hampshire, New Mexico, North Dakota, Rhode Island, South Dakota, Utah, Vermont and Wyoming had less than 10 of their licentiates endorsed to other states. Nevada had no physicians endorsed. Delaware had 1 endorsed while Idaho and New Mexico had 2 each and Rhode Island 4.

Included among United States territories and possessions are Alaska, Hawaii, Puerto Rico and the Virgin Islands.

A total of 2,834 physicians secured licenses by endorsement of their credentials in 1940.

The physicians so licensed by reciprocity and endorsement and, in addition, 4 osteopaths registered by medical examining boards, are recorded by school of graduation and state or territory where licensed in table 14. Sixty-seven approved medical schools in the United States were represented, as well as eight in Canada, thirty-four faculties of medicine and two licensing corporations of other countries, twenty-seven medical schools now extinct, one unapproved school and several osteopathic colleges. The largest number of graduates of any one school were from Harvard Medical School, 99, who were licensed in twenty-seven states, Hawaii and the Virgin Islands; Tufts College Medical School had 85 licensed by this method in eighteen states and 82 graduates of St. Louis University School of Medicine in twenty-one states. Those holding degrees from institutions in foreign countries were recognized in fourteen states where 67 were registered on the basis of another state license issued in the United States. Thirty-four from schools now extinct migrated to seventeen states and 31 graduates of unapproved institutions received certificates to practice in eight states.

Of the 2,838 candidates licensed by reciprocity and endorsement, 2,654 were graduates of approved medical schools in the United States, 52 of nine schools so approved in Canada, 67 graduates of foreign medical faculties, 34 of institutions now extinct and 27 of unapproved schools and 4 from osteopathic colleges.

Four schools had fewer than 10 of its graduates registered by this process while forty-six had more than 25. Twenty from McGill University Faculty of Medicine appeared in ten states and the Virgin Islands. None represented the University of Montreal Faculty of Medicine and only 1 Dalhousie University Faculty of Medicine.

LICENTIATES REPRESENTING ADDITIONS TO THE MEDICAL PROFESSION

Licentiates representing additions to the medical profession during 1940 are recorded in table 15. The figures represent candidates examined in 1940 and licensed; also those examined in previous years whose licenses were withheld for lack of internship, citizenship, and so on, and issued in 1940, and those without a previous state license who were during the year certified on the basis of the certificate of the National Board of Medical Examiners, government services, Canadian and foreign credentials. In the main, however, they represent recent graduates. Altogether, 5,879 were added to the profession. The number removed by death annually approximates 4,000. It would appear that about 2,000 were added to the medical profession in 1940. While it is not certain that all those licensed are in practice, it may be assumed that the great majority are. It is interesting to note that of 9,115 licenses issued throughout the year, 5,879 are actual additions to the medical profession. The greatest number in any one

state were added in New York, 1,061; Illinois added 518 and Pennsylvania 408. More than 300 received their first license in California, Massachusetts and Ohio. The states of Indiana, Louisiana, Maryland, Michigan, Minnesota, Missouri, New Jersey, Tennessee, Texas, Virginia and Wisconsin increased their population of physicians by between 100 and 201. Thirty states, the District of Columbia, Hawaii and Puerto Rico added less than 100. Of the licentiates forming additions to the medical profession last year, 5,428 secured this privilege by examination and 451 by the endorsement of credentials. Those licensed by endorsement consist of a few licensed on foreign credentials, but the great majority are diplomates of the National Board of Medical Examiners.

Figures for five previous years and 1940 are shown in table 16 for comparison. In 1935 there were 5,099 added by means of examination and 411 by endorsement of credentials, a total of 5,510. In 1936 there were 667 more added than in the previous year; in 1937, 247 more than in 1936, and 914 more than in

1935. In 1938 there were 165 fewer than in 1937 but 82 more than in 1936 and 749 more than in 1935. In 1939 again 215 fewer physicians were added as compared with 1938. In 1940 also there were 165 fewer than the previous year, and likewise fewer than any year except 1937, in which year 545 more were licensed.

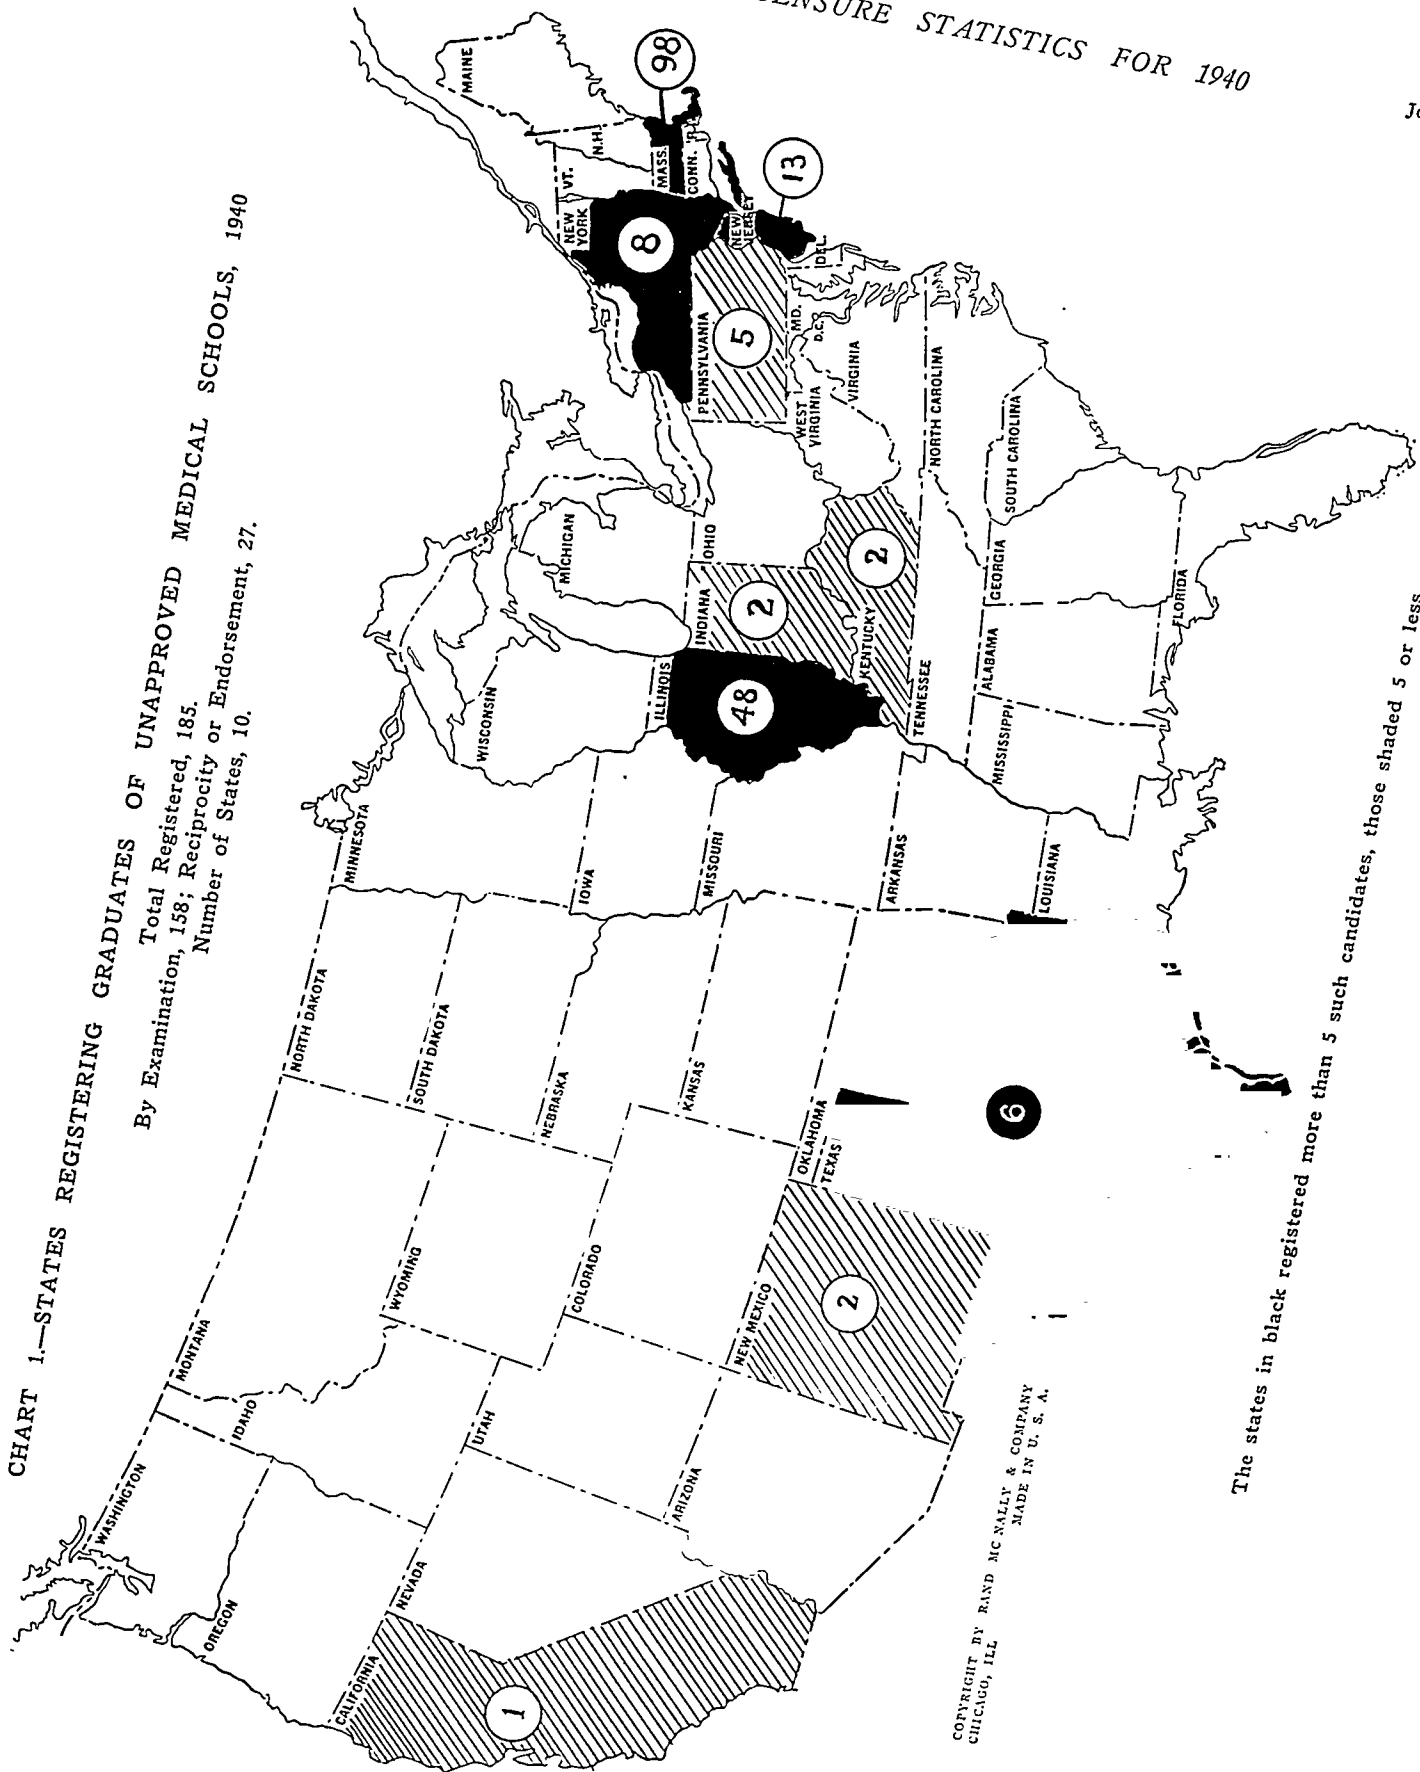

In six years altogether 36,293 physicians received original licenses, 33,229 after written examination and 3,064 by endorsement of credentials. In this same period 54,676 licenses were issued, 37,843 by examination and 16,833 by endorsement of credentials. Of these, 18,383 were previously licensed and 36,293 were not.

Increases in the physician population by means of first licenses are shown in table 17 and arranged in nine geographic divisions; namely, the New England, Middle Atlantic, East and West North Central, South Atlantic, East and West South Central, Mountain and Pacific States and Hawaii and Puerto Rico. The greatest number, 1,648, were added in the Middle Atlantic states. The East North Central group had a total of 1,228, the South Atlantic 627, the West North Central states 579, the New England group 484, the West South Central 430, the Pacific group 420, the East South Central 329 and the Mountain states 116. Seven were added in Hawaii and 11 in Puerto Rico.

* Requires a two year internship.

† M.D. degree conferred on completion of four sessions of thirty-six teaching weeks. Not eligible for licensure until completion of internship.

The 5,879 physicians representing additions to the medical profession included graduates from sixty-seven approved medical schools of the United States, nine approved schools in Canada and others. The greatest number from any one school were 159 from Northwestern University Medical School. The next greatest, 154 from the University of Illinois College of Medicine. Fourteen schools contributed 100 or more. Of the United States schools, Albany Medical College had the fewest, 7, while only one represented Laval

* In addition some states require the internship of graduates of medical faculties abroad and reciprocity or endorsement applicants. See tables 12 and 27.

University Faculty of Medicine and 2, the University of Alberta Faculty of Medicine. McGill University Faculty of Medicine added 43 of its graduates to the physician population of the United States. From the United States schools there were 4,220 graduates added to the profession by examination and 425 by reciprocity or endorsement of credentials, a total of 4,645. From the Canadian schools 105 were added, by examination 98 and without 7. There were 868 graduates of foreign faculties of medicine, 9 from extinct schools and 253 from unapproved schools. Altogether there were 5,428 graduates of all schools licensed by examination and 451 licensed by reciprocity and endorsement, a total of 5,879.

STATE REQUIREMENTS OF PRELIMINARY TRAINING

The minimum requirement for admission to approved medical schools since 1918 has been two years of college training and since 1938 three years has been recommended. With but five exceptions, namely California, Connecticut, Massachusetts, Missouri and Nebraska, the state licensing boards also exact the two year requirement. Although their statutes do not

conform with the two year college prerequisite, these states, with the exception of Massachusetts, do not license other than graduates of approved schools. Table 19 records the preliminary training required by each state medical licensing board. Alaska, Hawaii and Puerto Rico likewise require two years of preliminary training.

REQUIRED HOSPITAL INTERNSHIPS

In tables 20 and 21 are listed the medical schools and state licensing boards now requiring internships for the M.D. degree and state licensure respectively.

Twenty-one states, the District of Columbia, Alaska, Hawaii and Puerto Rico require that all applicants for licensure possess a hospital internship. The first state

exacting this requirement was Pennsylvania in 1914. In addition, other states require graduates of medical faculties abroad and reciprocity or endorsement applicants to have completed an internship.

Twelve schools in the United States and three in Canada require an internship for graduation. Several medical schools will accept research or other clinical work in lieu of hospital service. The University of Minnesota Medical School in 1915 was the first school to adopt the internship as a basis for the M.D. degree. Louisiana State University Medical School, which since the medical school was organized in 1931 has offered

of 1936-1937. The M.D. degree is conferred on completion of four sessions of thirty-six teaching weeks, but the holders of these degrees are not eligible to sit for the licensing examination until the completion of a hospital internship. The M.D. degree is likewise conferred by Duke University School of Medicine after completion of the senior year, but all graduates are required to spend at least two years in a hospital or laboratory after graduation.

Some of the medical schools and licensing boards have their own list of hospitals acceptable for intern training, but the approved list of the Council on Medical Education and Hospitals is generally in use.

CANDIDATES EXAMINED, 1936-1940

The number of candidates examined in the various states, territories and possessions in the five year period from 1936 to 1940 inclusive, showing those who passed and failed, are given in table 22.

In five years, 37,373 candidates were tested of whom 32,177 were successful in their examination. In this period, 5,062 were examined in New York and passed, 2,608 in Pennsylvania, 2,514 in Illinois, 1,899 in California, 1,675 in Ohio and 1,395 in Massachusetts. More than 1,000 were successful also in Michigan, Minnesota and New Jersey. In five years between 500 and 1,000 were examined and passed in each of eight states. Thirty-one states licensed fewer than 500 and ten less than 100. The smallest number, 9, passed the examinations in New Mexico.

The percentage of candidates who failed in the examinations in the past five years is given in the last

column of this table. The percentage of failures in all states has increased from 10 per cent in 1936 to 13.9 per cent. In five years 5,196 failed to pass examinations for medical licensure of 37,373 examined. The greatest percentage of failures occurred in Massachusetts, 46.9 per cent. The high percentage in this state is due to the fact that by law the licensing board is required to admit to its examination the graduates of

The states in black registered more than 5 such candidates, those shaded 5 or less.

unapproved schools, many of whom repeatedly fail. New York had a failure percentage of 34.8 per cent. The high percentage in this state is occasioned by the fact that New York admits a great many graduates of foreign medical faculties to the licensing examination. The third highest percentage of failures was in Connecticut with 31.6. The majority of failures in this state also were graduates of foreign medical faculties. In Florida, 16.8 per cent failed. Florida has no reciprocal relations with any state, all applicants being required to take the licensing examination. Graduates of earlier years experience difficulty in passing examinations. On the other hand, Alabama, Colorado, the District of Columbia, Illinois, Indiana, Iowa, Kansas, Kentucky, Louisiana, Michigan, Minnesota, Mississippi, Missouri, Montana, New Hampshire, North Dakota, Ohio, South Carolina, South Dakota, Tennessee, Vermont, Virginia, Washington, West Virginia and Wisconsin—twenty-five states—had less than 5 per cent. In thirteen of these states the percentage of failures was less than 1 per cent. In five years seven states—Arkansas, Georgia, Nebraska, North Carolina, Oklahoma, Oregon and Utah—had no failures.

A total of 37,373 were examined in the five years from 1936 to 1940 inclusive, of whom 32,177 passed and 5,196, 13.9 per cent, failed.

These figures represent examinations given and not individuals. A candidate who fails more than once in a given year is counted as only one failure, but should he fail in one of the succeeding years in another state he is counted in that year also. Likewise, if a candidate fails and later passes, whether in the same or in a later year, he is counted as failed and passed. It seems likely that with 5,196 failures who apply for reexaminations and physicians who apply for licensure in more than one state, approximately 33,000 individuals were examined. This figure gives a fair estimate of the number of physicians added to the profession in five years by means of licensure after examination. On page 2036 will be found a table giving exact figures for the period 1935 to 1940 inclusive.

REGISTRATION, 1904-1940

A study of totals and percentages for thirty-seven years, from 1904 to 1940 inclusive, is presented in table 23. This tabulation includes figures for each year regarding the number examined and passed, the percentage failed, registered by reciprocity or endorsement and the total registered. There was no marked increase or decrease in the total number of candidates registered from 1904 to 1933, but in 1935 there was a very noticeable increase and also during the following three years, while since 1938 the number registered has decreased. However, the number licensed without examination since 1904 has been increasing owing to the almost universal recognition of the certificate of the National Board of Medical Examiners and the wider use of reciprocity or endorsement privileges. The decrease in the number registered in 1918 was due to the sudden withdrawal of physicians and recent graduates from civilian life. Again in 1922 there was a notable reduction, this figure resulting from the smaller number that began the study of medicine in 1918. The great increases during the years 1935 to 1938 inclusive and many also in succeeding years represent, chiefly, graduates of European medical schools.

The number who passed in 1940 was 207 fewer than in 1939 and also fewer than the two preceding years

Compilation of data furnished by state examining boards. This information is not guaranteed as there may have been changes of which this office has not been advised. For an authentic statement write directly to the medical board.

Refer to chart of "Reciprocity and Endorsement Policies" for further data.

1. Certificate of National Board of Medical Examiners and licensure in country in which school of graduation is located.

2. Internship or one year in medical school in United States.

3. Certificate of National Board of Medical Examiners.

4. For graduates of last five years; if more than five years \$30.

5. Residence of one year in Delaware.

6. Provided similar privileges are accorded licensees of District of Columbia by licensing agency of the jurisdiction from which the applicant comes.

7. Senior year in class A medical school in United States.

8. 1 after Feb. 21, 1941.

9. nly.

10. six months prior to date of examination.

11. Licensed to practice medicine and surgery in country in which school of graduation is located, otherwise required to complete senior year in approved medical school in United States.

12. Diplomates of National Board of Medical Examiners eligible.

13. License to practice medicine and surgery in the country in which the school of graduation is located.

14. Internship and one year graduate work.

15. Diplomates of the National Board of Medical Examiners exempt from special requirements.

16. Applicants from schools in England and Scotland only.

17. Internship completed in foreign countries after July 1, 1934, not acceptable.

18. Rotating internship in approved hospital in the United States or completion of senior year in class A medical school in the United States.

19. These requirements apply also to graduates of Canadian schools.

20. Graduates from foreign medical colleges accepted if they present also a diploma from an approved medical school in the United States.

21. Examination fee, Lansing and Ann Arbor \$25; Detroit \$25.

In most states all foreign credentials must be filed by the American consul.

but 61 more than in 1936 and 589 more than in 1904. The number registered without examination, 2,838, was 34 less than in 1939. Contrasting these figures with those for 1904 will show the greater use being made of this system of licensure. By both methods, examination and reciprocity or endorsement, 9,120 were registered, 241 less than in 1939. The number so registered in 1937, 9,803, represented the largest number of candidates registered in thirty-seven years. Of those examined in 1940, 20.7 per cent failed, as compared with the same percentage in 1906. At that time the high percentage of failures was due to the inadequate training provided by the proprietary schools in existence at that time. The improvement in the quality of training provided by the medical schools of the United States is evidenced by the lower failure percentages in succeeding years. During the last five years at least a great many of the failures represent, in addition to the graduates of unapproved schools, also those who present credentials from faculties of medicine abroad.

While these figures represent those registered in the years given, they do not in all states represent the number licensed in a given year. Licenses are withheld in many states, as indicated in the text describing table 1.

GRADUATES OF APPROVED SCHOOLS AND OTHERS REGISTERED, 1922-1940

The educational fitness of the individuals registered in nineteen years, 1922-1940, is shown in table 24. In the computation of these figures all schools rated as class A and B by the Council on Medical Education and Hospitals since 1907 are classified as approved. In the column "Others" are included graduates of institutions prior to 1907, of foreign faculties of medicine, class C graduates, osteopaths and graduates of schools that have been refused recognition. In 1928 the classification A, B and C by the Council was discontinued and medical schools have since been considered either approved or unapproved.

Of the 9,120 registered by all methods in 1940, 7,753, or 85 per cent, graduated from approved medical schools, and there were 1,367, 15 per cent, other practitioners registered.

The number of graduates of approved schools in the period shown has always been in the bracket above 4,000, while in the other groups it was until 1936 below 700.

Of the 9,120 graduates registered in 1940, 6,282 were registered after examination and 2,838 by reciprocity or endorsement of credentials. Among those examined there were 5,056 graduates of approved medical schools in the United States and Canada, 274 graduates of unapproved institutions and 952 others. Likewise among those registered by endorsement there were 2,697 graduates of approved medical schools in the United States and Canada, 41 from unapproved schools and 100 others. New York registered 722 graduates of approved schools of a total of 1,290. This state licensed the largest number with foreign credentials. Only approved graduates were registered in Alabama, Arizona, Arkansas, Delaware, Minnesota, Montana, Nebraska, North Dakota, South Carolina and South Dakota.

GRADUATES OF UNAPPROVED MEDICAL SCHOOLS REGISTERED, 1935-1940

Data regarding the number of graduates of those institutions which do not meet the standards for approval outlined by the House of Delegates who were

registered as medical licentiates with or without examination from 1935 to 1940 inclusive are recorded in table 25.

Ten states and Puerto Rico registered 186 such graduates in 1940, 159 by examination and 27 by reciprocity or endorsement. One was so registered in California and 2 each in Indiana, Kentucky and New Mexico. Massachusetts licensed the greatest number, 98, followed by Illinois with 48, New Jersey 13, New York 8, Texas 6 and Pennsylvania 5.

In the six year period shown, 1,145 graduates of unapproved institutions secured the right to practice medicine and surgery, 1,030 by examination and 115 by reciprocity or endorsement. The number so registered in 1940 was 9 fewer than in 1939.

Chart 1 on page 2040 indicates by shaded lines those states registering fewer than 6 graduates of unapproved schools and by a solid area those registering more than 5 such candidates during 1940.

GRADUATES OF SCHOOLS OF OSTEOPATHY REGISTERED BY MEDICAL EXAMINING BOARDS,
1935-1940

In table 26 are given the number of graduates of schools of osteopathy granted the privilege of practicing medicine, surgery, or both, by medical examining boards from 1935 to 1940 inclusive, eliminating, for instance, those osteopaths in California and a few other states granted medical or surgical privileges by the osteopathic board.

In 1940 nine states registered such individuals, 114 by examination and 20 by endorsement of credentials; namely, in Colorado, the District of Columbia, Massachusetts, New Hampshire, New Jersey, Oregon, Texas, Wisconsin and Wyoming. In 1939 also 118 secured similar privileges in seven states.

These facts for 1940 are shown graphically in chart 2, on page 2042, indicating by shaded lines those registering fewer than 6 graduates of osteopathic colleges and by a solid area more than 5 such graduates.

In Colorado osteopaths have no separate board. They are admitted to the examination for a license to practice medicine. The statute of Colorado is silent with respect to the scope of practice authorized by a license issued to osteopaths.

The Connecticut statute provides that any registered osteopath may practice either medicine, surgery, or both, as the case may be, after passing a satisfactory examination before the medical examining board.

The Massachusetts statute, by definition, includes osteopathy in the practice of medicine and does not differentiate the type of license issued to an osteopathic applicant. The medical practice act requires that any applicant for license to practice must be in possession of a degree of doctor of medicine, or its equivalent, from a legally chartered medical school which gives a full four year course of instruction of not less than thirty-two weeks in each year. An amendment to the medical practice act providing an approving authority is not yet effective.

In New Hampshire osteopaths are granted the right to practice medicine and surgery by the Board of Registration in Medicine.

In New Jersey, osteopathic licentiates who furnish proof (1) of having served for a period of two years as an intern or resident surgeon in an osteopathic or medical hospital approved by the state board of medical examiners, (2) of having completed a postgraduate

course of two years in a college of osteopathy or medicine approved by the board or (3) of having had at least three years of practice in a hospital approved by the board may be admitted to an examination in pharmacology, therapeutics and surgery and if the examination is passed may obtain a license to practice medicine and surgery. After Nov. 1, 1941, all osteopathic applicants who meet the requirements of the medical practice act will receive licenses to practice medicine and surgery.

The statutes of Texas provide for the issuing of a license to practice medicine only. So far as the statutes indicate, the osteopaths are not restricted in their field of practice.

In Virginia, osteopaths may obtain the right to "perform surgery with the use of instruments" if they satisfy the board of medical examiners that they have had "adequate clinical facilities in their respective college of graduation, or by hospital work to enable them to perform such operations."

In Wyoming, the statutes contain no specific provision for the licensing of osteopaths. The medical practice act provides that the certificates issued to all applicants "shall be deemed licenses to practice medicine in all branches in which the applicant has taken examination in this state."

In the District of Columbia, Oregon and Wisconsin osteopaths are granted the right to practice surgery.

In Indiana the licenses issued to osteopaths authorize the holders to practice osteopathy, surgery and obstetrics. None were reported licensed in 1940.

PHYSICIANS EXAMINED ON THE BASIS OF CERTIFICATES OBTAINED IN COUNTRIES OTHER THAN
THE UNITED STATES AND CANADA

Data recently received from state boards of medical examiners pertaining to the requirements of candidates for medical licensure holding credentials from medical schools outside of the United States and Canada are presented in table 27. Sixteen states report that, because of the inability to evaluate foreign credentials, holders of such certificates are not eligible for licensure while one state reported that no new applications have been accepted since Feb. 21, 1941. Nineteen states require full citizenship and ten states first papers as a condition precedent to taking the state board examination. In some states the requirement is made by rule of the medical board, in others the provision is by statute. In addition, other restrictions are imposed. Eleven states require a certificate in the basic sciences. Nineteen states require a one year internship in a United States hospital approved for intern training. In five states there is a requirement of a senior year's work in an approved medical school in the United States. In six states these graduates are not acceptable unless they can present a license to practice medicine and surgery in the country in which the school of graduation is located.

Table 28 presents figures for those physicians examined on the basis of credentials obtained in countries other than the United States and Canada by licensing boards of the United States and Puerto Rico. The figures represent both American and foreign born physicians educated abroad. It will be recalled that during the last ten years students from the United States have migrated to Europe to pursue medical courses. In 1937-1938, 1,346 citizens of the United States were so enrolled. The majority, however, of those now being licensed represent foreign born physi-

cians. One hundred and two faculties of medicine, including four licensing corporations, of twenty-two European and four other countries were represented. There were 2,092 examined, of whom 948 passed and 1,144, or 54.7 per cent, failed. Graduates of the University of Vienna represented the largest group, 613, and were examined in thirteen states, 50.4 per cent of whom failed. Thirteen states examined 191 graduates of the University of Berlin. Graduates of all other

schools were examined in fewer than ten states. Altogether twenty-two states and Puerto Rico examined physicians educated abroad. The state of New York had the greatest number, 1,429, of whom 535 passed and 894, or 62.6 per cent, failed. Massachusetts examined 223 with 112 successful and 111 unsuccessful results, or 49.8 per cent. Illinois examined 141 of whom 119 passed and 22 failed, or 15.6 per cent. Fifty-six were tested in New Jersey, 51.8 per cent of whom failed. California and Ohio each examined 47 with 21.3 per cent and 31.9 per cent failures, respectively. Other states examining a considerable number of graduates of foreign medical faculties included Connecticut 36, failures 63.9 per cent; Maryland 35, failures 45.7 per cent, and Pennsylvania 27 with 29.6 per cent failures. Thirteen states and Puerto Rico licensed fewer than 11 and ten of these states fewer than 5.

In addition to the figures presented in this table, 67 graduates of foreign faculties of medicine were licensed in 1940 without examination by endorsement of credentials.

Chart 3, page 2044, also shows in graphic form the states which during 1940 registered graduates of foreign faculties of medicine by examination, reciprocity and endorsement. Included in the figures on the chart are 67 granted licenses without examination, with but a few exceptions on the basis of a license obtained in the United States. From a perusal of tables 2, 10 and 14 it can be ascertained how many were licensed by both these means in the various states. The states which licensed more than 5 graduates are indicated by states reproduced in black; those shaded less than 5.

In table 29 are assembled figures showing the standing during the five year period 1935 to 1939 inclusive of the graduates of faculties of medicine outside the United States and Canada admitted to licensing examinations in this country. Included also is a tabulation for 1940. There were represented one hundred and thirty-six foreign faculties and ten of the licensing corporations of Great Britain. During the five year period shown 4,800 were examined and in 1940, 2,092. The largest number from any one school in the five year period shown was from the University of Vienna, 728,

of whom 41.8 per cent failed. There were 498 from the University of Berlin, with 38.6 per cent failures. Large numbers also were examined who represented the Universities of Munich, Breslau, Heidelberg, Paris, Naples, Rome, Basel, Bern and Zurich. There were 231 in the five year period who presented in lieu of an M.D. degree the triple qualification certificate of Scotland. These individuals secured their education in the so-called extramural schools of Scotland. In 1940, many graduates were examined from schools in Czechoslovakia, Germany, Hungary, Italy, Scotland and Switzerland.

Table 30, the last in this group of statistics, records the number of graduates of faculties of medicine abroad examined for medical licensure in the United States in the eleven years 1930 to 1940 inclusive. In eleven years, 7,884 were examined, 4,403 were successful in their examination and 44.2 per cent failed. In 1940 the greatest number were examined, 2,092, 401 more than in 1939, 928 more than in 1938 and 1,925 more than in 1930.

BASIC SCIENCE BOARDS

Legislation creating and setting up basic requirements underlying the practice of the healing art has been enacted in fifteen states and the District of Columbia. These acts provide that certification by a board of examiners in the basic sciences be a prerequisite to eligibility for a license to practice the healing art whether the license is to be issued after examination or on the basis of endorsement or reciprocity. Some basic science boards have reciprocal agreements, but the certificate is obtainable after examination in the majority of instances.

During 1940 basic science boards functioned in Arizona, Arkansas, Colorado, Connecticut, District of Columbia, Florida, Iowa, Michigan, Minnesota, Nebraska, Oklahoma, Oregon, Rhode Island, South Dakota, Washington and Wisconsin.

Basic science requirements were established in Michigan in 1937 but no examinations were given until 1940 because of an injunction which was decided in favor of the board early in 1940. Only one new board was added in 1940, namely Rhode Island. Examinations were held for the first time in Michigan and Rhode

Island in June 1940. The years in which the various acts were enacted are shown in table 1.

Statistics based on the number of candidates certified in 1940 and those who failed to receive certification, together with the totals for other years shown for comparison, are included in the accompanying tables. Similar data have been published in the State Board Number of THE JOURNAL since 1928.

The subjects in which examinations are conducted in the respective states and the District of Columbia are given in table 2. The subjects included in basic science examinations are specified by the statutes. The examination boards may neither add to nor subtract from

such subjects. All boards examine in anatomy, pathology and physiology; fourteen examine in chemistry; twelve in bacteriology, seven in hygiene, two in diagnosis and one in hygiene and public health.

Physicians, osteopaths, chiropractors and unclassified applicants examined during 1940 in these various groups are included in table 3. There were 1,598 candidates

* School of practice undeterminable since names of failures not supplied.

ing for a basic science certificate it is not necessary in most of the states to mention the school of practice, but by checking the biographic records of the American Medical Association and published directories it has been possible to determine what profession the majority of the candidates represented.

Of all applicants examined, 1,293 passed and 305 failed. 19.1 per cent. Of all physicians examined 12.5 per cent failed, of the osteopaths 36.9 per cent failed, of the chiropractors 72.4 per cent, and of those unclassified 45.9 per cent. Among those who passed there were 1,140 physicians, 65 osteopaths, 8 chiropractors and 80 who were unclassified. Minnesota examined the

greatest number, 254 of whom, 29.7 per cent, failed. The next largest number, 215, were examined in Florida, with 14.4 per cent failures. Osteopaths were examined in Colorado, Connecticut, the District of Columbia, Florida, Iowa, Michigan, Minnesota, Nebraska, Oregon, Washington and Wisconsin. In fact, osteopaths were examined in every state except Arizona, Arkansas, Oklahoma, Rhode Island and South Dakota. Chiropractors were examined in eight states, namely Connecticut, Iowa, Michigan, Minnesota, Rhode Island, South Dakota, Washington and Wisconsin.

The highest percentage of failures, 34.1, was in Arizona, which examined 29 physicians and 15 others. It is the policy of the Arizona Board of Examiners in the

recorded in the total column only. Three other states had more than 30 per cent failures.

The number of certificates issued by examination, reciprocity and endorsement are recorded in table 4. A total of 1,293 were granted after examination; 1,140

were issued to physicians or medical students, 65 to osteopaths, 8 to chiropractors and to 80 persons who were unclassified. There were also 346 certified without examination, by reciprocity and endorsement, representing 324 physicians or medical students, 17 osteopaths, 3 chiropractors and 2 who were unclassified. Minnesota accepted the greatest number without examination, 79, of whom 77 were physicians and 2 osteopaths. Arizona, Connecticut, Florida, Oklahoma, Rhode Island and Washington licensed none without examination. Arizona, Florida and Washington have no reciprocal agreements. Chiropractors and those unclassified were licensed without examination in 3 states.

Altogether 1,639 individuals received basic science certificates in 1940 in 16 states, ranging from 22 in South Dakota to 264 in Minnesota.

The number of candidates examined and certified, or certified by reciprocity or endorsement, from 1927 to 1940 inclusive will be found in table 5. Five boards functioning in 1927 examined 305 physicians or medical students, of whom 26, 8.5 per cent, failed and 22 other practitioners, of whom 7, or 31.8 per cent, failed. In 1940, by comparison, 1,639 were certified. During the fourteen year period a total of 12,984 physicians were examined, of whom 10,401 passed and 1,413, 12.0 per cent, failed and 1,429 other practitioners, of whom 52.8 per cent failed. During this period 2,583 physicians were certified without examination, while only 407 other practitioners were so registered.

Altogether 14,065 certificates have been issued by basic science boards since 1927, of whom 12,984 were granted to physicians and 1,081 to other practitioners. During this fourteen year period 11,814 physicians or medical students were examined, of whom 10,401 were registered, and 1,429 other practitioners were examined, 674 of whom received certificates. During this fourteen year period also 2,583 physicians and 407 others received certificates by examination, reciprocity and endorsement.

From the high percentage of failures in the other practitioner group it seems apparent that the enforcement of basic science laws affects mostly this group. The object of such laws is to provide a means of insuring that all candidates seeking the right to care for sick and injured people shall first possess a reasonable knowledge of the sciences fundamental to the healing art.

NATIONAL BOARD OF MEDICAL EXAMINERS

The National Board of Medical Examiners was founded in 1915 by Dr. W. L. Rodman, then President of the American Medical Association. He stated its aims and purposes to be "to establish a standard of examination and certification of graduates in medicine for the whole United States and its territories through which by the cooperation of the state and territorial boards of medical examiners its licentiates may be recognized for licensure to practice medicine."

The National Board was incorporated on March 17, 1922 under the laws of the District of Columbia. Its constitution provides for a membership of thirty. This includes six members representing the federal services, five members nominated by the Federation of State Medical Boards of the United States, three members nominated by the Association of American Medical Colleges and two members nominated by the Council on Medical Education and Hospitals of the American Med-

ical Association. The remaining fourteen members are elected at large, especial attention being given to their geographic distribution.

The certificate of the National Board is accepted as an adequate qualification for a medical license by the licensing authorities of forty-three states and the District of Columbia, Alaska, the Canal Zone, Hawaii and Puerto Rico. Table 1 contains this information in tabulated form. Diplomates are required by some states to meet certain requirements.

The examination of the National Board in the basic sciences are accepted in lieu of the examinations in these subjects given by the basic science boards of Connecticut, Iowa, Minnesota, Nebraska and the District of Columbia.

Diplomates are also admitted to the final examination of the Conjoint Examining Boards of England

and Ireland and the Triple Qualification Board of Scotland. The certificate is accepted by the United States Public Health Service in lieu of the usual written examination.

In the following paragraphs are presented data regarding the examinations of and the issuance of certificates by the National Board of Medical Examiners. Similar data have been presented in the State Board Number of THE JOURNAL for twenty-three years.

The preparation for and participation by the United States in the World War materially interfered with the early development of the work of the National Board, but since 1922 the number obtaining its certificate has been steadily increasing. Up to Dec. 31, 1921 eleven examinations were held and two hundred and sixty-eight candidates were certified. In table 2 are recorded the results of each examination since 1916.

In 1922 the examination plans were changed. The examinations were divided into three separate parts, which must be taken and completed in the following sequence: Part I, a written examination, covers the work of the six fundamental medical sciences, part II, likewise a written examination, in five major clinical subjects, and part III the clinical preparation of the

candidate after at least one year's internship. Examinations in parts I and II are held at approved medical schools where there are five or more candidates desiring to be examined, and part III is held in twenty-two established centers throughout the United States.

The tables hereinafter presented enumerate the results of examinations in parts I, II and III for each calendar year since 1922, indicating those who passed and failed examinations, and those certified.

Candidates are required to take all six subjects of part I at a regular examination period unless entitled to take an incomplete examination or electing to take a divided examination. An incomplete examination is

arranged for candidates taking part I at the end of their second medical year in schools whose third year curriculums include courses in one or two subjects of this part. The examinations in the subjects not yet completed are therefore postponed and may be taken at any examination period after the candidate has completed them in the medical school. Also listed under this heading are those who wish to spend some addi-

tional time on one or two subjects. Any candidate not entitled to take an incomplete examination in part I may, if he so elects, take a divided examination by writing any four subjects at one time and the remaining two within thirteen months, but after at least one semester of study. The number taking divided examinations are included only when the examination has been completed. Incomplete examinations have been enumerated but were not included in percentage computations, since they represent neither a candidate eligible for certification nor a failure.

An average of 75 per cent of the grades attained in the six main divisions is necessary to pass part III. A candidate who fails to make an average of 75 per cent but has received grades of at least 75 per cent in three or more main divisions is required to repeat those divisions, either in whole or in part, in which he received grades below 75 per cent. In such case the candidate is "referred" in this subdivision and required after a three months interval to pass a reexamination. The privilege of a second reexamination is determined in

1940.....	721	770	21	2.7
Totals.....	8,305	7,939	366	4.4

Between 1916 and 1921 a total of 325 were examined, of whom 263 passed and 57, 14.3 per cent failed. Total certificates awarded, 8,207.

each case by the board. "Referred" candidates are likewise excluded from the statistics.

Three examinations in part I were held in 1940. Table 3 contains the results of these examinations together with the totals for eighteen years. In 1940, 1,651 examinations were given; 1,068 candidates passed, 374 were given incomplete examinations and 209, 16.4 per cent, failed.

Four examinations were given in part II, figures for which appear in table 4. Altogether 1,028 were so examined; 963 passed, 9 were reported as taking incomplete examinations and 56, 5.5 per cent, failed.

Since 1922 a total of 20,760 examinations have been given in part I and 11,034 in part II. From 1922 to 1940 inclusive, 13,133 were successful in passing part I and 10,096 in passing part II. The figures cover the totals of each examination given during a calendar year and include some who fail and are reexamined during the same year and also some who pass parts I and II in the same year. They represent therefore examinations conducted rather than individuals examined. In the nineteen year period since 1922 there have been 2,214 failures in part I, 14.4 per cent, and 943 in part II, 8.5 per cent. During this period 5,413 took incomplete examinations in part I and 45 in part II.

The results of examinations in part III for the nineteen year period 1922 to 1940 inclusive are presented

in table 5. In 1940, 791 were examined, as compared with only 22 in 1922. Of those examined in 1940, 21, or 2.7 per cent, failed. The highest percentage of failures was in 1927, when 293 were examined and 21, 7.2 per cent, failed. In nineteen years 8,305 were examined, of whom 7,939 were granted certificates and 366, 4.4 per cent, failed. Here again a candidate having failed may subsequently receive a certificate in the same year.

Between 1916 and 1921, when the examination was not given in three parts, 325 were examined, of whom 268 passed and 57, 14.3 per cent, failed.

Altogether from 1916 up to and including 1940, 8,207 certificates have been awarded. Physicians who earn the certificate are designated Diplomates of the National Board and are privileged to use in any proper manner the designating initials D.N.B. The Diplomates have formed a national organization entitled "The Associated Diplomates of the National Board," which meets at the time and place of the annual meeting of the American Medical Association. A membership emblem in the form of a gold key has been adopted.

Totals.....	37,168	28,890	5,187	3,091	9.7

The number of persons examined during any one year is given in table 6. The classification as passed or failed, in cases in which more than one examination has been taken in a given year, was based on the results of the last examination during the year in question. For example, if in 1940 a candidate passed part I but later in 1940 failed part II, he is listed as having failed. Taking this into consideration, there were 3,186 who took at least one of the examinations of the National Board of Medical Examiners during 1940, as compared with 525 in 1922. A total of 37,168 individuals were examined in one or more of the examinations in the nineteen years shown, of whom 28,890 passed, 5,187 took incomplete examinations and 3,091, 9.7 per cent, failed.

Examinations were held during 1940 at which 770 were successful. Graduates of fifty approved medical schools in the United States and three in Canada, and of fourteen faculties of medicine abroad were represented. Table 7 records the number of diplomates from each school certified in 1940. At the College of Medical Evangelists, students are required to pass parts I and II as a prerequisite to receiving their diploma. The comprehensive qualifying examination or part I of the examination of the National Board has been required of all medical students entering Yale University School

of Medicine since the fall of 1937. Students of Georgetown University School of Medicine are urged to take the examinations of the National Board. Students admitted to Boston University School of Medicine subsequent to 1937 are required to pass part I in order

to supplement the qualifications for promotions to the third year class. All students before entering the senior class at the New York Medical College must have taken part I of the examination of the National Board. Albany Medical College requires students to take part I and urges them to take part II. The University of Buffalo School of Medicine has required its students to pass part I since 1937. While the certificate is not required by these schools, their graduates and, in addition, those of Harvard, Tufts and Duke universities, represented the majority of those certified.

Diplomates licensed on the basis of their credentials increased from 2 in 1917 to 696 in 1940, 6,156 having been so licensed since the National Board was formed. However, 8,207 have received the certificate of the board. In 1940 diplomates were registered on the basis of credentials in forty-one states, the District of Columbia and Hawaii. The number so registered in each state are recorded in table 8.

SATURDAY, MAY 3, 1941

DEMAND AND SUPPLY OF PHYSICIANS

The national defense program, which contemplates the training of an army of 1,400,000 men, will require, according to the statement made by Major Swift before the Senate Committee on Military Affairs, from seven to eight thousand reserve medical officers for each of the next three or four years. Assuming, as it does, that 50 per cent of the reserve medical officers would remain on active duty at the end of each year, there would be in 1944 some three thousand fewer available than the army would require unless additional recruits are secured for the Medical Officers Reserve Corps.

In the accompanying table are shown for each of the past six years the number of graduates from the approved medical schools of the United States and the number of physicians licensed for the first time (representing actual additions to the profession).

Annual Additions to the Medical Profession

Year	Graduates of United States Schools	Total Licentiate
1935	5,101	5,510
1936	5,183	6,177
1937	5,377	6,424
1938	5,194	6,259
1939	5,089	6,044
1940	5,097	5,879
Totals	31,041	36,293
Average	5,173	6,049

The number of medical graduates has remained nearly constant. The yearly average is 5,173. The number of physicians receiving their first licenses fluctuates more widely, but the average for the six years is 6,049. The difference, approximately 850, is accounted for by the graduates of foreign schools.

Whether or not the country can continue to recruit the medical profession from the available source is uncertain. However, if the supply of physicians trained in our own medical schools should be cut off or even diminished, a serious shortage of doctors would inevitably result with consequent impairment of the health both of the military forces and of the civilian popula-

tion. Since, under the Selective Service Law of 1940, medical students are not exempt at the end of the current academic year, they will all have to be reclassified. Unless the local boards uniformly take the position that medical students are in training for an occupation necessary to the national health, many of them will be drafted into the army and in succeeding years the number of available physicians will be correspondingly decreased. The protection of the people's health is essential in any program of national defense. A well trained medical profession is the basis of all provisions for both military and civilian medical service.

MEDICAL STUDENTS AND THE
SELECTIVE SERVICE

Notwithstanding the hearings that have been held before the Senate Committee on Military Affairs and the interest taken by innumerable agencies, official action has not yet been taken which will with any certainty insure the deferment of medical students and interns from acceptable medical schools and hospitals. From time to time the Committee on Medical Preparedness of the American Medical Association has sent resolutions to officials of the United States Army and of the Selective Service, urging some positive action. Now a general memorandum has been issued by the National Headquarters of the Selective Service System, directed to all state directors. It emphasizes the fact that the proper classification of students and other registrants in training or preparation constitutes one of the major problems of the Selective Service System. Deferment of students as a group expires on July 1. Prior to that date it will be necessary for local boards to reclassify them.

The memorandum points out that the intelligent deferment of registrants and their intelligent selection as the national interest may require constitute the fundamental purpose of the Selective Training and Service Act. The regulations that have been issued provide that a registrant shall be placed in class II-A if he is found by the local board to be a necessary man in any industry, business employment, cultural pursuit, governmental service, or any other service or endeavor or in training or preparation therefor, the maintenance of which is necessary to the national health, safety or interest. Local boards, it is expected, will give proper weight to this provision in dealing with claims for deferment of necessary men engaged in training or preparation for activities necessary to the national health. The memorandum offers this definite suggestion to state directors:

Students or other registrants undergoing instruction may be deferred in class II-A by the local board where the activity for which the registrant is in training or preparation is one essential to the national health, safety, or interest, and the registrant is found to be a necessary man. The necessity of providing

the required replacements for and additions to those men deemed by local boards as being engaged in essential activities should be considered by local boards in making their determination in individual cases. In determining whether or not a student is a necessary man within the provisions of paragraph 351, the local board should give due consideration to such factors as the length of time which the student has been pursuing the course in question, his relative progress and standing in such course, and his relative chances for employment or placement in the activity for which he is preparing. This latter factor may be evidenced by contracts of employment or other reasonable assurance that the registrant will engage in an essential activity.

The period of deferment in class II-A may not exceed six months but such deferment may be renewed from time to time if the local board finds that such continuance is justified under the regulations.

In a supplementary memorandum, all state directors have been further advised as follows:

Among the students and other registrants now undergoing instructions will be some who on or about July 1, 1941 will have completed their course of instruction but who will then be in training or preparation for examinations held under public authority for persons desiring to be licensed in various professional and technical fields. To avoid great hardship to the registrant and in keeping with the national interest, local boards in their discretion may defer such a registrant in class II-A for a relatively short period pending such examination.

OBITUARIES OF PHYSICIANS PUBLISHED IN 1940

The number of obituaries of physicians published in *THE JOURNAL* during 1940 was 3,633, of which 3,450 were of the United States and 183 of Canada. Four died in Puerto Rico, 3 each in China and Mexico, 2 each in Italy and Hawaii, 1 each in Africa, Brazil, India and the Philippine Islands. The obituaries of 122 women physicians were published, as compared with 116 in 1939. The number of graduates of medical schools in the United States for the fiscal year ended June 30, 1940 was 5,097. Deducting the number of physicians whose obituaries were published, there was a net addition to the profession for the year of 1,647, not including physicians coming to the United States from abroad.

Ages.—The average age at death of those classified as of the United States was 66.3, as compared with 66.1 in 1939. Twenty-five physicians died between the ages of 25 and 29, 41 between 30 and 34, 62 between 35 and 39, 91 between 40 and 44, 131 between 45 and 49, 208 between 50 and 54, 349 between 55 and 59, 500 between 60 and 64, 592 between 65 and 69, 523 between 70 and 74, 397 between 75 and 79, 312 between 80 and 84, 147 between 85 and 89, 59 between 90 and 94, 10 between 95 and 100 and 3 were 100 or more.

Causes.—Heart disease was again the leading cause of death, as it has been for many years. Some contributory causes are also included in the tabulation as they have been in former years. For example, when a report of the cause of death gave chronic nephritis

and heart disease, it was published as such in *THE JOURNAL* and was reported on the statistical charts under both diseases. Thus heart disease was reported as a cause of death in 1,515 cases. Coronary thrombosis or coronary occlusion was specified in 641 cases, endocarditis or myocarditis in 357, angina pectoris in 50 and pericarditis in 1. Other diseases of the heart caused 466 deaths. Arteriosclerosis was the second most frequent cause, with 431. Cerebral hemorrhage was the third most frequent cause reported with 358 deaths; 16 additional deaths were reported as due to paralysis. Fourth on the list was cancer with 343 deaths; the prostate gland was reported affected in 60 cases, the stomach and liver in 58, the intestine in 34, the female genital organs in 4, the buccal cavity in 1; in 186 cases the part affected was not specified. Pneumonia was reported as the cause of death in 253 cases, of which 91 were specified as bronchopneumonia. Nephritis was the cause in 124 cases. The number of cases in which hypertension was reported was 123, embolism and thrombosis exclusive of coronary thrombosis 122, diabetes 75, uremia 75 and other diseases of the genitourinary system 62, tuberculosis 62 and other diseases of the respiratory system 14, cirrhosis of the liver 51 and other diseases of the liver 6, diseases of the prostate other than cancer 43, senility 26, ulcer of the stomach and duodenum 25 and other diseases of the stomach 4, leukemia 21, influenza and intestinal obstruction 19 each, arthritis and hemorrhage 18 each, edema 17, brain tumor 16, peritonitis 15, appendicitis and septicemia 14 each, other diseases of the digestive system 12, gangrene, cholecystitis and aneurysm 10 each, abscess of the lung, asthma, hernia and paralysis agitans 9 each, pernicious anemia and meningitis 8 each, other diseases of the spinal cord 2, biliary calculi and abscess 6 each, benign tumors, alcoholism, multiple sclerosis and esophageal varix 5 each, bronchitis, diverticulosis, encephalomalacia and streptococcic infection 4 each, amyotrophic lateral sclerosis, cerebral sclerosis, diseases of the veins, diverticulitis, empyema, encephalitis, myasthenia gravis and typhus 3 each, brain abscess, epilepsy, emphysema, hemolytic anemia, mastoiditis, pleurisy, poliomyelitis, shock and typhoid 2 each. Other diseases causing 1 death each included Addison's disease, amebiasis, anaphylactic shock, aplastic anemia, bacillary dysentery, biliary cirrhosis, carbuncle, cerebral edema, chronic dilatation of the esophagus, encephalomyelitis, erysipelas, exhaustion, exposure and starvation, gas bacillus infection, goiter, granulocytopenia, Hodgkin's disease, infection of the hand, infectious jaundice, Laënnec's cirrhosis, lateral sclerosis, locomotor ataxia, malaria, manic depressive psychosis, neuronitis, osteomyelitis, paresis, pellagra, perinephric abscess, periostitis, petrositis, progressive muscular atrophy, pulmonary cyst, pulmonary infarct, purpura haemorrhagica, pyloric

obstruction, ruptured aorta, ruptured esophagus due to hiccup, ruptured spleen, infected tonsils, spontaneous subarachnoid hemorrhage and tumor of lung.

Accidental Deaths.—One hundred and seventy-three physicians died as the result of accidents in 1940, compared with 159 in the previous year. Automobile accidents accounted for 105 deaths, falls 24, drowning 5, burns 3, airplane accidents, illuminating gas, overdoses of medicine and shooting 2 each, train accident and cut artery 1 each. In 18 cases unexplained fractures were given as causes of death. One physician was killed during a machine gun attack on a missionary station in North Africa; 1 swallowed a chicken bone; 1 died of injuries received when he dived into shallow water; 1 was suffocated when a mattress caught fire; 1 was killed when his horse was struck by an automobile; 1 died of a broken back, and 1 was injured when his gun exploded.

Suicides and Homicides.—Suicide was the cause of 65 deaths in 1940. Bullet wounds accounted for 31 of these deaths, hanging 9, poison 6, cut artery 5, overdose of medicine 3, gas 3, drowning, stabbing and injection of unknown drug 1 each. In 5 cases the method was not reported. In addition, there were 14 cases which could not be classified because of insufficient information, for which the following causes were given: bullet wounds 5, overdose of medicine and morphine poisoning 2 each, cut artery, poison and carbon monoxide 1 each. In 2 cases the method was not reported. There were 4 homicides.

Civil Positions.—Among the decedents were 223 physicians who were or had been teachers in medical schools, 370 who had served in the World War, 75 veterans of the Spanish American War and 10 veterans of the Civil War. One hundred and fifty-seven were or had been health officers, 98 members of boards of education, 62 members of boards of health and 20 members of state boards of medical examiners. There were 63 who were or had been coroners, 42 mayors, 41 authors, 32 bank presidents, 31 members of state legislatures, 21 editors, 11 missionaries, 10 police surgeons, 9 pharmacists, 9 postmasters, 8 members of city councils, 6 clergymen, 5 dentists, 3 lawyers, 2 judges, 2 justices of the peace. One had served as U. S. minister to Panama and Portugal and 1 had been aide to Governor Lehman of New York and to President Roosevelt when he was governor of New York. There were 23 physicians who had served in the U. S. Navy, 20 in the U. S. Public Health Service, 14 in the Veterans Administration, 12 in the U. S. Army Medical Corps and 3 in the Indian Medical Service.

Association Officers.—Among those who died who were or had been officers of the American Medical Association were 2 presidents, 1 vice president, 1 treasurer, 6 section officers, 3 members of councils and 2 trustees. Fifty-two members or former mem-

bers of the House of Delegates died during the year. There were also 35 presidents or former presidents of state medical associations and 6 secretaries. Two chairmen of state military preparedness committees died.

Current Comment

THE U. S. GOVERNMENT VERSUS A. M. A.—NEXT STEP

On May 2 attorneys for the American Medical Association are scheduled to submit to the District Court three motions together with argument. The motions are: 1. A motion to set aside the verdict of guilty and to enter judgment in favor of the two corporate defendants. 2. A motion in arrest of judgment. 3. A motion for a new trial. No doubt the court will take these motions under advisement with a view to handing down the decision at a later date.

INTERNSHIPS AT COOK COUNTY HOSPITAL, CHICAGO

Until recently the internships at Cook County Hospital were limited to residents of Cook County who were graduates of medical schools in Chicago. By action of the Civil Service Commission the residence requirement has recently been waived and consequently the internships of the County Hospital are now open to graduates of approved medical schools in any part of the country. Cook County Hospital, the largest general hospital in the United States, has a capacity of 3,300 beds and 225 bassinets. In 1940 the admissions totaled 81,154, births 4,818, average daily census 3,108 and outpatient visits 255,724. The hospital, which is currently approved for intern training and residencies in communicable diseases, medicine, obstetrics, ophthalmology, otolaryngology, orthopedic surgery, pathology, pediatrics, psychiatry, radiology and surgery, has a house staff of one hundred and two interns and approximately ninety resident physicians. The internship is a rotating service of eighteen months in which each intern has a progressive assignment of six months as junior in medicine and surgery, six months as middler in specialties and six months as senior in the medical and surgical divisions. Thirty-four interns enter the hospital on January 1 and July 1 of each year. General maintenance, including uniforms, is furnished without stipend. Candidates for appointment are required to take a one day written competitive civil service examination covering medicine, surgery, obstetrics and laboratory subjects. Students may procure application blanks through the office of the dean of their medical school. The blanks will be sent to all approved schools before the end of the current college session. Requests for further information should be sent to Dr. Marshall Davison, Medical Director, Cook County Hospital, Chicago. This new regulation should be instrumental in advancing the quality of the internship, as it will broaden the intellectual horizons of young men associated in this large institution in the future.

MEDICAL PREPAREDNESS

In this section of The Journal each week will appear official notices by the Committee on Medical Preparedness of the American Medical Association, announcements by the Surgeon Generals of the Army, Navy and Public Health Service, and other governmental agencies dealing with medical preparedness, and such other information and announcements as will be useful to the medical profession.

MINIMUM PSYCHIATRIC INSPECTION

MEDICAL CIRCULAR NO. 1—REVISED

Selective Service System, Washington, D. C., May 1941.

The purpose of this circular is to present to physicians of Selective Service, the great majority of whom are not psychiatrists by profession, methods whereby they may suspect the existence of incapacitating mental and personality factors in registrants coming before them and may either eliminate such individuals or refer them to the psychiatrist of the medical advisory board for examination.

The military forces can use persons with many varieties of temperament and experience, but there is no place in an efficient army for the psychopath, the feeble-minded or the insane. Many persons so unfortunately affected may do quite well in civil life, in accustomed jobs and in familiar circumstances, but when they are introduced into the unfamiliar environment of military life, with its necessary regimentation, close contact with other persons, separation from their families and inability to escape without fear of grave penalties, they develop various types of mental disorder. These individuals then become a source of trouble to their superiors, exert a deleterious influence on their associates and occupy a disproportionate amount of hospital space. The experience of the World War showed that mental disorder in soldiers was one of the main problems present both in the United States and in the Expeditionary Forces.

The selecting out of the mentally unfit should begin at the time the candidate appears for the local board physical examination. In many instances the registrant and his circumstances will be known to the board members and physicians, belonging as they do to the same community, and this knowledge should assist greatly in reaching a wise decision as to his acceptance or rejection. Pertinent information may be obtained from various charitable and welfare agencies in the community.

The following minimum psychiatric inspection revises the original plan offered Selective Service Headquarters by the William Alanson White Psychiatric Foundation to conform with War Department, Surgeon General's Office Circular Letter No. 19, March 12, 1941.

A MINIMUM PSYCHIATRIC INSPECTION OF REGISTRANTS

Mental or personality difficulties are revealed in the person's performances with other people who have come to mean something to him. Strangers may be met with an effective protective mask, a conventional manner. The examiner is a stranger unless and until he has overcome this reserve. This approach to the registrant can seldom be achieved by a show of force or authority. A pose of artificial friendliness is also unfortunate. The most successful approach is often one of straightforward professional inquiry coupled with real respect for the registrant's personality and due consideration for his feelings—which does not mean diffidence.

Whenever possible, the psychiatric examination should be made outside of easy hearing of other men. Matter of diagnostic significance is often concealed when the registrant feels that he must be impersonal and give replies that will not impress listeners with his peculiarity.

Questioning should begin with something that is obviously relevant to the immediate situation. One tries to elicit the difficulties which the registrant has been experiencing in his relations with others and with himself in his work and in his spare-time activities. The questioning might, for example, be

somewhat as follows: The registrant being a machinist whose left index finger is badly scarred, the examiner asks how the injury occurred. There may follow a question as to just what job he has been doing; how many others are similarly employed in the shop; is it a pretty good crowd; does he like the work; is the employer fair? Have they treated him right; if not, secure details. What does he do with his spare time? With whom? Sociable, or prefers his own company? Try to discover how he is esteemed by his intimates; respected or otherwise. Is he self-reliant, sure of himself or diffident, uncertain, chronically perplexed about something, shy? With men, with women or both? If anything at all unusual comes to light, pursue the topic until it is understood. Has the registrant gotten into any bad habits? Did he "break them"? Can he, e. g., stop smoking whenever he wishes? Is he ashamed of his "weakness"? Has he a low opinion of himself and, if so, why? What do his friends think of him? Does he like the idea of being trained for the national defense? The examiner pays close attention to content and implication of everything said and to any other clues, and in a matter of fact manner follows up whatever is not self-evidently commonplace.

The examination is directed toward detecting any one of eight categories of handicap. The probable presence of some of these can often be detected by observing the registrant's behavior. In other cases one would not be able to suspect the presence of any morbid condition without some knowledge of the person's history. In the following summary the first three types of ailment are detectable, as a rule, only on the basis of the history, except in cases of decided feeble-mindedness. The last two types, however, may often be suspected as a result of alert observation, if the observer knows what to look for and what to regard as significant.

It must not be supposed that any of the various kinds of behavior or items of personal history described in the following summary are absolutely and definitely diagnostic of anything in every case. The items are to be regarded as suggestive, often highly and importantly so, of the presence of the morbid condition indicated. It is possible that the presence of the behavior or the item of history in some particular individual may have little diagnostic significance. When the examining physician is in doubt, he should refer the registrant to the medical advisory board for further examination.

GROUP I. Mental defect or deficiency is suggested by slowness or stupidity in complying with clear instructions. The school record often reveals poor learning ability. The registrant may show lack of general information concerning native environment; inability to reason, to calculate, to plan, to construct, and the like; defect in judgment, foresight, language, output of effort; suggestibility, untidiness, lack of personal cleanliness, muscular awkwardness. The occupational history often shows a low level of employment, shifting jobs and an inability to hold positions which require responsibility and initiative. The psychiatrist of the medical advisory board will make or arrange for a psychometric test, if required.

GROUP II. Besides those who are deficient in intelligence, there are persons of average intelligence who are more or less incapable of profiting from experience. Again and again such a person has proved unreliable and disappointing to friends and family. The life history shows evidence of recurrent difficulties at home, at school and at work. He is unable to respond in an

adult social manner to the demands of honesty, truthfulness, decency and consideration of his fellows; is egocentric, impatient in demands for immediate gratifications without real regard for the future; may be a habitual liar and may have a criminal record. He may talk well, but his record shows that he has been undependable and has habitually evaded responsibilities. He has always been deflected from his goals by rebuffs and disappointments. He is inadapted to employment or to enduring group life and is wholly disqualified for any form of national service. Such an individual has a psychopathic personality.

GROUP III. Major abnormalities of mood are shown by episodes of unreasonable elation or depression which have tended to recur without obvious connection with events. People who are known to be so mercurial in mood that their judgment is seriously impaired during the up or down swing of their moods should be rejected. Registrants known to have received medical or nursing care because of a morbid excitement or a depression should be rejected.

GROUP IV. Psychoneurotic disorders are a more difficult diagnostic problem. The signs and symptoms fall more or less clearly into one or another of three major categories—the hysterical, whose physical signs and symptoms, often so dramatic that they may seem fraudulent, do not follow anatomically understandable patterns; the morbidly anxious, made up of various signs and symptoms of fear; and the obsessional, which include such varied conditions as hypochondriacal states (pre-occupational with one's ill health), morbid fears (phobias) and rituals of action and thought which they feel compelled to carry out.

These conditions are likely to escape notice unless one is particularly looking for them. Circumstances which might suggest the possible existence of such conditions are as follows: The hysterical individual is eager to make known his physical ailment and is apt to tell of miraculous, last-minute escapes from impending death—e. g., he tells of abdominal cramps that "nearly killed him," of a heart attack in which he was "nearly a goner," and so on. The morbidly anxious individual, as a reaction to being examined, may show unusual sweating, obviously not due to being overheated, tremors or a pulse rate indicating undue excitement. The obsessional individual may show insistence, usually in a somewhat embarrassed manner, on performing some simple act in an unusual way or in answering a question in a peculiarly circumstantial or indecisive fashion.

For purposes of classification, there are to be placed in this group persons showing the so-called psychosomatic disorders, mental or personality difficulties chiefly characterized by signs and symptoms of systemic disease—respiratory, gastrointestinal, cardiac, genitourinary or dermatologic. These include many cases of asthma, urticaria, "neurasthenic states," neurocirculatory asthenia, "effort syndrome" or disordered action of the heart, paroxysmal tachycardia, gastric hyperacidity, pylorospasm, gastric and duodenal ulceration, spastic constipation and diarrhea, mucous colitis, impotence, urinary urgency or frequency, and incontinence of semen. Look for a clear relationship in the history of attacks coinciding with periods of personal stress, and of improvement with separations from the accustomed stressful surroundings. These conditions sometimes appear early in the course of prepsychotic states discussed under group V.

GROUP V. The fifth category comprises the grave mental or personality handicaps. Prepsychotic and postpsychotic personalities and those actually suffering a schizophrenic ("dementia praecox") mental disorder manifest their condition by obscurely motivated peculiarities of behavior and thought. Of these, the so-called deteriorated states are the most obvious. Here belong the numerous shiftless, untidy, perhaps morose, sometimes nomadic individuals who had what was regarded as quite a normal childhood. Somewhere between the ages of 12 and 25 they underwent a change, acute or insidious, with dilapidation of their social interests and the habits in which they had been trained. They may or may not have received treatment in a hospital for mental diseases.

The paranoid personalities are another large division. These people cling to fantastic beliefs in their overweening importance and often feel that people are persecuting them or otherwise

interfering with their career or well-being. Some of them believe that they are in communion with supernatural beings. Others believe that they are victims of plots, secret organizations, spy rings or religious or fraternal groups. They are often quite plausible in supporting these delusions by clever misinterpretation of facts. Some of them are very evasive and skilful at concealing the pattern of their disorder. A morbid suspiciousness of any one who takes an interest in them is frequent. They may become tense and hateful when interrogated. An attitude of unusual cautiousness or suspiciousness toward the examining physician, toward others in the local board office or toward fellow-registrants should suggest the possibility that the person may be paranoid.

The catatonic and prepsychotic states may present great difficulty in diagnosis. Perhaps the only obvious sign of these conditions is the impression of queerness which the person makes on any one who seeks to get acquainted with him. The actual oddities of behavior or thought may be subtle; it may be difficult, in retrospect, to point to any particular instances of the unusual. The most striking signs of these conditions may, in fact, come out in connection with the physical examination. The physician, at some stage of the physical examination, may observe a peculiar reaction which on questioning may awaken a suspicion of a prepsychotic state. These individuals frequently entertain unfounded convictions as to bodily peculiarities or disorders which they attribute to excessive sexual acts of one sort or another. These beliefs, sometimes hard to elicit, are often medically incredible and bizarre. Questioning them on intimate personal matters often leads to great embarrassment, confused speech or actual blocking of thought, so that they do not know what to say.

GROUP VI. Chronic inebriety may be either addiction to narcotic drugs or chronic alcoholism. A registrant is to be regarded as a drug addict if he is or has recently been a habitual user of any of the opium preparations, cocaine or cannabis indica (marihuana). Recent needle marks are suggestive; scars from the needle, abscesses on the arms, shoulders, buttocks or thighs are important, but are not always present. No diagnostic weight can be placed on the condition of the pupils. The use of heroin is most common among city gangsters.

A registrant will be regarded as a chronic alcoholic addict if he habitually or recurrently used alcohol to the point of social disablement as evidenced by loss of jobs, repeated arrests or a verified history of either repeated hospital treatment for acute alcoholic intoxication or institutional care because of chronic alcoholism.

GROUP VII. Any form of syphilis of the central nervous system is disqualifying. Look for the early signs such as pupillary changes, differences in the activity of the deep reflexes on the two sides, absence of knee and ankle jerks, tremors of hands, tongue and face, and speech defect, rather than for fully developed clinical pictures, and refer all suspected cases for full serologic study, including examination of spinal fluid.

GROUP VIII. Any active, existent organic disease of the brain, spinal cord or peripheral nerves is disqualifying. After-effects of such diseases are not disqualifying if they do not prevent satisfactory fulfillment of military duties, unless the disease is likely to recur. The epilepsies and epileptic equivalents are often overlooked.

Inquire for fainting spells, fits, convulsions, spasms, falling-out spells. There may be a history of continued bromide, phenobarbital or dilantin medication. Look for scars on the tongue and scalp. The personality type is not diagnostic but the epileptic individual may be egocentric, selfish, rigid and irritable with a tendency to excessive religiosity. A history of epileptic equivalents taking the form of temper tantrums, dazed reactions, confused states and excitements may be obtained.

Early signs and symptoms of the following conditions should be kept in mind:

Diseases of the brain:

- The epilepsies and epileptic equivalents.
- Postencephalitic syndromes.
- Multiple sclerosis.
- Cerebral vascular disease and residuals.
- Brain tumor.
- Chronic degenerative diseases.

Diseases of the spinal cord:

- Poliomyelitis.
- Tumor.
- Amyotrophic lateral sclerosis and progressive muscular atrophy.
- Subacute combined degeneration.
- Syringomyelia.

Diseases of the peripheral nerves:

- Injuries.
- Neuralgias.
- Multiple neuritis.
- Cranial nerve disease:
- Optic atrophy.

Ophthalmoplegia.

Facial palsy.

Deafness due to intracranial pathologic conditions.

The local examining physician should request the reference to a medical advisory board of any registrant whose mental or nervous fitness or unfitness he cannot definitely determine. Registrants who manifest any of the following deviations should be referred to the advisory board psychiatrist: instability, seclusiveness, sulkiness, sluggishness, discontent, lonesomeness, depression, shyness, suspicion, overboistrousness, timidity, sleeplessness, lack of initiative and ambition, personal uncleanness, stupidity, dulness, resentfulness to discipline, nocturnal incontinence, sleep walking, recognized queerness, suicidal tendencies either bona fide or not, and homosexual proclivities.

ARMY RESERVE OFFICERS ORDERED TO ACTIVE DUTY

FIRST CORPS AREA

The following additional medical reserve corps officers have been ordered to extended active duty by the Commanding General, First Corps Area, which comprises the states of Maine, Vermont, New Hampshire, Rhode Island, Massachusetts and Connecticut:

ABODELLY, Robert A., 1st Lieut., Worcester, Mass., Fort Devens, Mass.
HAINES, Hilton D., Captain, Greenwich, Conn., Fort Devens, Mass.
KNAPP, Allen H., 1st Lieut., Calais, Me., Camp Edwards, Mass.
MANGIONE, Bernard J., Captain, Fall River, Mass., Fort Devens, Mass.

SECOND CORPS AREA

The following additional medical reserve corps officers have been ordered to active duty by the Commanding General, Second Corps Area, which comprises the states of New York, New Jersey and Delaware:

ADLER, Howard E., 1st Lieut., New York, Fort Benning, Ga.
BERKOWITZ, Joseph J., Captain, New York, Fort Bragg, N. C.
BREZIN, David, 1st Lieut., New York, Fort Bragg, N. C.
BRUNDAGE, Donald W., 1st Lieut., Binghamton, N. Y., Pine Camp, N. Y.
BURGER, Harold, 1st Lieut., Bronx, N. Y., Fort Bragg, N. C.
CIOFALO, Frank I., Captain, New York, Fort Benning, Ga.
CLAYMAN, Sigmund J., 1st Lieut., Forest Hills, L. I., N. Y., Camp Blanding, Fla.
CLYNE, Irving M., 1st Lieut., Far Rockaway, N. Y., Fort Monmouth, N. J.
COSTA, Joseph A., 1st Lieut., Bedford Hills, N. Y., Fort Jackson, S. C.
COYLE, Francis R., Captain, Buffalo, Pine Camp, N. Y.
DeGRACE, Francis H., 1st Lieut., Passaic, N. J., Camp Claiborne, La.
DERMON, Harry, 1st Lieut., New York, Camp Claiborne, La.
DEUTSCH, Nathan S., 1st Lieut., Plainfield, N. J., Fort Bragg, N. C.
DURYEA, Lyman C., 1st Lieut., New York, Pine Camp, N. Y.
ELKIND, Mortimer M., 1st Lieut., Brooklyn, Camp Croft, S. C.
FEITELL, Arthur, 1st Lieut., New York, Camp Livingston, La.
FINKEL, Milton M., 1st Lieut., Brooklyn, Camp Shelby, Miss.
FLICKER, David Jr., 1st Lieut., Kearney, N. J., Camp Blanding, Fla.
FRIEDMAN, Herbert S., 1st Lieut., New York, Fort Benning, Ga.
GALLER, Herman F., 1st Lieut., Brooklyn, Camp Claiborne, La.
GASNER, Walter G., 1st Lieut., Mount Vernon, N. Y., Mitchel Field, N. Y.
GILBERTSON, Robert L., 1st Lieut., Morrison, N. J., Pine Camp, N. Y.
GOLDBERG, Joseph D., 1st Lieut., New York, Fort Moultrie, S. C.
GURNEE, Quinby D., 1st Lieut., Hawthorne, N. J., Fort Monmouth, N. J.
JAMES, John T., 1st Lieut., Princeton, N. J., Fort Dix, N. J.

FOURTH CORPS AREA

The following additional medical reserve corps officers have been ordered to active duty by the Commanding General, Fourth Corps Area, which comprises the states of Tennessee, North Carolina, South Carolina, Alabama, Georgia, Mississippi, Florida and Louisiana:

BENNETT, William M., Captain, Ruffin, S. C., Camp Wheeler, Ga.
EVANS, John W., Jr., 1st Lieut., Bells, Tenn., Camp Wheeler, Ga.
FINKELSTEIN, David J., Captain, Ridgeland, S. C., Fort McClellan, Ala.
HALL, James T., 1st Lieut., Memphis, Tenn., Camp Croft, S. C.
HOUSE, Nathaniel C., 1st Lieut., Belzoni, Miss., Mississippi Selective Service, Jackson, Miss.
IRWIN, Winston H., 1st Lieut., Birmingham, Ala., Fort Bragg, N. C.
JAMES, Lemuel P., Jr., 1st Lieut., Soperton, Ga., Fort Benning, Ga.
JOHNSON, Pearce S., 1st Lieut., New Orleans, Fort Oglethorpe, Ga.
JONES, Craig S., 1st Lieut., Cliffside, N. C., Camp Croft, S. C.
KOPFLER, Marion E., 1st Lieut., New Orleans, Camp Shelby, Miss.

NEWTON, Louis, 1st Lieut., Bridgeport, Conn., Fort Devens, Mass.
ODDY, John G., 1st Lieut., Lawrence, Mass., Fort Devens, Mass.
POWELL, Platt R., 1st Lieut., Milton, Vt., Camp Edwards, Mass.
RYNARD, William M. W., 1st Lieut., Stamford, Conn., Fort Devens, Mass.
SELESNICK, Sydney, 1st Lieut., East Milton, Mass., Fort Devens, Mass.
SNEIDMAN, George I., Captain, Hartford, Conn., Fort Devens, Mass.
WIESNER, Ernest E., 1st Lieut., Brockton, Mass., Fort Devens, Mass.
WHITNEY, Royal A., 1st Lieut., White River Junction, Vt., Fort Devens, Mass.
YOUNG, Morris N., Captain, Lawrence, Mass., Fort Devens, Mass.

JOHNSON, Wallace M., 1st Lieut., Newark, N. J., Fort Benning, Ga.
KALAMARIDES, John J., 1st Lieut., Brooklyn, Fort Jackson, S. C.
KNOPF, Albert A., 1st Lieut., Jackson Heights, N. Y., Camp Stewart, Ga.
KRAKOWER, Irving, 1st Lieut., Brooklyn, Camp Blanding, Fla.
LEARN, Marshall L., 1st Lieut., Hamburg, N. Y., Camp Shelby, Miss.
LERNER, David L., 1st Lieut., New York, Camp Claiborne, La.
LOEB, Edward A., 1st Lieut., Atlantic City, N. J., Camp Blanding, Fla.
LONGWORTH, Edmund F., 1st Lieut., Pelham, N. Y., Camp Forrest, Tenn.
MACKENZIE, Locke L., 1st Lieut., New York, Fort Benning, Ga.
MAHONEY, Cornelius A., 1st Lieut., Forest Hills, N. Y., Camp Claiborne, La.
MAYERS, Albert N., 1st Lieut., New York, U. S. Army Recruiting Office, Albany, N. Y.
MINER, Walter A., 1st Lieut., Baldwin, L. I., N. Y., Camp Livingston, La.
MUSHABAC, Irving R., 1st Lieut., Bronx, N. Y., Camp Croft, S. C.
NIGHTINGALE, Arthur B., 1st Lieut., New Hyde Park, N. Y., Camp Livingston, La.
RACHLIN, Irving H., 1st Lieut., New York, Camp Shelby, Miss.
RAVITS, Everett C., 1st Lieut., Fairlawn, N. J., Fort Monmouth, N. J.
ROSENBERG, Harold W., 1st Lieut., New York, Camp Blanding, Fla.
ROTH, Daniel B., 1st Lieut., Bronx, N. Y., Fort Benning, Ga.
RUBIN, William, 1st Lieut., New Brunswick, N. J., Camp Claiborne, La.
SAFIR, Samuel S., 1st Lieut., Jackson Heights, N. Y., Camp Blanding, Fla.
SAMUEL, Jerome H., 1st Lieut., Newark, N. J., Fort Dix, N. J.
SATULSKY, Emanuel M., 1st Lieut., Elizabeth, N. J., Pine Camp, N. Y.
SCHULTZ, Jacob P., 1st Lieut., New York, Camp Shelby, Miss.
SHAPERO, Edward B., 1st Lieut., Brooklyn, Pine Camp, N. Y.
STEINREICH, Otto S., 1st Lieut., Newark, N. J., Fort Bragg, N. C.
WELTCHER, Herbert, 1st Lieut., Elizabeth, N. J., Camp Claiborne, La.
WILLIAMS, George D., 1st Lieut., New York, Fort Bragg, N. C.
ZUKAUCKAS, Edward W., 1st Lieut., Brooklyn, Fort Dix, N. J.

MARCHBANKS, Vance H., Jr., 1st Lieut., Tuskegee, Ala., Fort Bragg, N. C.
MARTIN, Robert B., III, 1st Lieut., Cuthbert, Ga., Fort Oglethorpe, Ga.
MASTERSON, Rodney G., 1st Lieut., Alexandria, La., Camp Polk, La.
McLAURIN, James W., 1st Lieut., Baton Rouge, La., Fort Bragg, N. C.
McTURNAN, Robert W., 1st Lieut., Tampa, Fla., Stark General Hospital, Charleston, S. C.
PARSONS, Hugh E., 1st Lieut., Tampa, Fla., Camp Shelby, Miss.
ROWELL, John P., 1st Lieut., St. Petersburg, Fla., Fort Bragg, N. C.
STEGALL, Oscar B., 1st Lieut., Memphis, Tenn., Camp Wheeler, Ga.
STRONG, Robert A., Colonel, New Orleans, Headquarters 3d Military Area, New Orleans.
VAN HOOSER, John L., 1st Lieut., Smithville, Tenn., Fort Benning, Ga.
WAGNER, Rudolph T., 1st Lieut., Miami Beach, Fla., Fort Oglethorpe, Ga.
WARD, Thomas G., Captain, Thibodaux, La., Camp Wheeler, Ga.
WEAVER, Thomas S., 1st Lieut., Nashville, Tenn., Fort Bragg, N. C.
WORLEY, James H., 1st Lieut., Asheville, N. C., Fort Benning, Ga.
WRIGHT, Leonard D., 1st Lieut., Memphis, Tenn., Camp Claiborne, La.

SEVENTH CORPS AREA

The following additional medical reserve corps officers have been ordered to extended active duty by the Commanding General, Seventh Corps Area, which comprises the states of North Dakota, South Dakota, Minnesota, Nebraska, Iowa, Kansas, Missouri, Arkansas and Wyoming:

ANDERSON, Martin Frederick, 1st Lieut., Hastings, Neb., Carlisle Barracks, Pa. (1 Mo.) then to 42d Evacuation Hospital, Fort Leonard Wood, Mo.
ANDREWS, William Wallace, Jr., 1st Lieut., Kansas City, Kan., 4th Cavalry Brigade, Fort Riley, Kan.
ARBuckle, Millard Fillmore, Lieut. Col., St. Louis, Fort Leonard Wood, Mo.
BESS, George Calvin, Captain, St. Louis, 41st Division, Camp Murray, Wash.
BOLLER, Galen Charles, 1st Lieut., Traer, Iowa, Carlisle Barracks, Pa. (1 Mo.) then to 43d Engineers, Camp J. T. Robinson, Ark.
CAMPBELL, Louis Scott, 1st Lieut., Scottsbluff, Neb., 41st Division, Camp Murray, Wash.
CAPETTI, Alexander Pasquale, 1st Lieut., Crane, Mo., Fort Des Moines, Iowa.
CHALLED, Don Sheridan, 1st Lieut., Cedar Rapids, Iowa, 1st Medical Regiment, Fort Ord, Calif.
CORNELL, Dale Duane, 1st Lieut., Greenfield, Iowa, 41st Division, Camp Murray, Wash.
DOMINICK, DeWitt, 1st Lieut., Cody, Wyo., Carlisle Barracks, Pa. (1 Mo.) then to 74th Surgical Hospital, Fort Francis E. Warren, Wyo.
DONOHUE, Edmund Stephen, 1st Lieut., Sioux City, Iowa, Engineer Replacement Center Infirmary, Fort Leonard Wood, Mo.
DREYER, William Francis, 1st Lieut., Webster Groves, Mo., Camp J. P. Robinson, Ark.
ELKINS, Ronald Flagg, 1st Lieut., Springfield, Mo., Fort Leonard Wood, Mo.
EVANS, Arthur Wilbur, 1st Lieut., Norton, Kan., Fort Leonard Wood, Mo.
FERGUSON, James Taylor, Jr., 1st Lieut., Kansas City, Mo., Fort Snelling, Minn.
FINNEY, Charles Herman, 1st Lieut., Fort Smith, Ark., Fort Snelling, Minn.
GALEOTA, William Richard, 1st Lieut., Maryville, Mo., Fort Snelling, Minn.
GAY, Ellery Clarke, Captain, Little Rock, Ark., C. A. S. C. Station Hospital, Fort Leonard Wood, Mo.
GILSDORF, Amos Ray, 1st Lieut., Dickinson, N. D., Fort Leonard Wood, Mo.
HAMILTON, Caldwell Kiskaddon, 1st Lieut., St. Louis, Mo., Fort Crook, Neb.
HANKINS, Charles Robert, 1st Lieut., Omaha, Engineer Replacement Center Infirmary, Fort Leonard Wood, Mo.
HELLEWELL, Joseph Spencer, 1st Lieut., Evanston, Wyo., 217th General Hospital, Fort Riley, Kan.
HENRICH, Melvin Celsus, 1st Lieut., Riverton, Wyo., Fort Francis E. Warren, Wyo.
HOFFMAN, Jacob Samuel, 1st Lieut., Kansas City, Mo., Jefferson Barracks, Mo.
HOMAN, Richard William, 1st Lieut., Fort Meade, S. D., Fort Francis E. Warren, Wyo.
HYATT, Robert Fee, 1st Lieut., Monticello, Ark., 3d Cavalry Brigade, Fort Riley, Kan.
HYNDMAN, Henry Harold, 1st Lieut., Wichita, Kan., 3d Cavalry Brigade, Fort Riley, Kan.
KANE, Thomas Edward, 1st Lieut., Boone, Iowa, C. A. S. C. Station Hospital, Fort Leonard Wood, Mo.

KING, Jack Arthur, 1st Lieut., Elaine, Ark., Reception Center, Jefferson Barracks, Mo.
KNOLL, Albert Henry, Captain, Dubuque, Iowa, 41st Division, Camp Murray, Wash.
KOZBERG, Oscar, 1st Lieut., Moose Lake, Minn., Camp J. T. Robinson, Ark.
LINDBLOM, Alton Edwin, 1st Lieut., Minneapolis, Fort Crook, Neb.
MACK, Marvin Arnold, 1st Lieut., Crete, Neb., 35th Division, Camp J. T. Robinson, Ark.
MALLES, Albert Conrad, 1st Lieut., Lewisville, Ark., Engineer Replacement Center Infirmary, Fort Leonard Wood, Mo.
MARTIN, Lee Fred, 1st Lieut., Talmage, Neb., Engineer Replacement Center Infirmary, Fort Leonard Wood, Mo.
MATER, Dwight Albert, 1st Lieut., Knoxville, Iowa, Induction Station, Jefferson Barracks, Mo.
McDOWELL, Edward Alphonso, 1st Lieut., St. Louis, 4th Cavalry Brigade, Fort Riley, Kan.
McKINSTRY, Karl Virgil, 1st Lieut., DeSoto, Mo., 3d Cavalry Brigade, Fort Riley, Kan.
MOLLERS, Theodore Peter, 1st Lieut., Mountain Iron, Minn., Camp J. T. Robinson, Ark.
MURRAY, Robert Anthony, Captain, Aitkin, Minn., Engineer Replacement Center Infirmary, Fort Leonard Wood, Mo.
NEUMAIER, Arthur, 1st Lieut., Lindstrom, Minn., 4th Armored Division, Pine Camp, Watertown, N. Y.
NIERLING, Richard DePuy, 1st Lieut., Jamestown, N. D., Jefferson Barracks, Mo.
NOONAN, William Joseph, 1st Lieut., Minneapolis, Fort Leonard Wood, Mo.
OMEYLA, Patrick Maynard, 1st Lieut., Sioux City, Iowa, 1st Medical Regiment, Fort Ord, Calif.
PALLETT, Harold Anthony, 1st Lieut., Kansas City, Mo., C. A. S. C. Station Hospital, Fort Leonard Wood, Mo.
PLATOU, Ralph Victor, 1st Lieut., Minneapolis, C. A. S. C. Station Hospital, Fort Leonard Wood, Mo.
PUTZ, Arthur Eugene, Captain, Edgewood, Iowa, Engineer Replacement Center Infirmary, Fort Leonard Wood, Mo.
REID, James Armand, 1st Lieut., Kansas City, Kan., Fort Leavenworth, Kan.
RICHARDSON, Lyman King, Captain, Kansas City, Kan., Fort Leonard Wood, Mo.
ROSENTHAL, Leonard George, Captain, St. Louis, C. A. S. C. Station Hospital, Jefferson Barracks, Mo.
RUSSELL, Allen Rutledge, 1st Lieut., Pine Bluff, Ark., C. A. S. C. Station Hospital, Fort Riley, Kan.
SATTERFIELD, Benjamin W., 1st Lieut., St. Louis, 4th Cavalry Brigade, Fort Riley, Kan.
SAXE, Earl, 1st Lieut., Topcka, Kan., Jefferson Barracks, Mo.
SCANNELL, Raymond Christopher, 1st Lieut., Carroll, Iowa, Engineer Replacement Center Infirmary, Fort Leonard Wood, Mo.
SHARPE, Don Carlyle, 1st Lieut., Dubuque, Iowa, Engineer Replacement Center Infirmary, Fort Leonard Wood, Mo.
SHERRILL, Sion Frederick, 1st Lieut., Belle Fourche, S. D., 41st Division, Camp Murray, Wash.
SMITH, James Albert, 1st Lieut., Cedar Rapids, Iowa, Engineer Replacement Center Infirmary, Fort Leonard Wood, Mo.
SNYDER, Glen Edgar, 1st Lieut., Grimes, Iowa, Carlisle Barracks, Pa. (1 Mo.) then to 214th General Hospital, Camp J. T. Robinson, Ark.
STEELE, Hugh Henderson, 1st Lieut., Deadwood, S. D., Carlisle Barracks, Pa. (1 Mo.) then to 214th General Hospital, Camp J. T. Robinson, Ark.
STRAUS, Maurice Lockhart, 1st Lieut., St. Paul, Minn., 41st Division, Camp Murray, Wash.
SWAILS, John Goldsborough, 1st Lieut., Wathena, Kan., Carlisle Barracks, Pa. (1 Mo.) then to 217th General Hospital, Fort Riley, Kan.
THORNELL, Harold Edgar (Negro), Captain, St. Louis, 4th Cavalry Brigade, Fort Riley, Kan.

EIGHTH CORPS AREA

The following additional medical reserve corps officers have been ordered to extended active duty by the Commanding General, Eighth Corps Area, which comprises the states of Colorado, Arizona, New Mexico, Oklahoma and Texas:

ADAMS, Richard Martin, 1st Lieut., Tulsa, Okla., Camp Wallace, Texas.
ANDERSON, Vetalis Vernon, 1st Lieut., Del Norte, Colo., 200th Coast Artillery, (AA) Fort Bliss, Texas.
ATKINS, Paul N., Jr., 1st Lieut., Muskogee, Okla., 52d Signal Battalion, Fort Sam Houston, Texas.
BASS, James W., Major, Dallas, Texas, 2d Division, Fort Sam Houston, Texas.
BELL, Robert H., Major, Columbus, Texas, Station Hospital, Camp Wallace, Texas.
BRADFORD, Sidney W., 1st Lieut., Tyler, Texas, 2d Division, Fort Sam Houston, Texas.
CARRITHERS, Clem Milburn, 1st Lieut., Bruni, Texas, 36th Division, Camp Bowie, Texas.
BOX, Otho N., Jr., 1st Lieut., Grandfield, Okla., 36th Division, Camp Bowie, Texas.
COHEN, Edmond F., 1st Lieut., Denver, Station Hospital, Fort Bliss, Texas.
COX, Arlo K., 1st Lieut., Watonga, Okla., 36th Division, Camp Bowie, Texas.
CRANE, Francis S., 1st Lieut., Wilburton, Okla., 1st Cavalry, Fort Bliss, Texas.
CULLYFORD, James S., 1st Lieut., Denver, Corps Area Laboratory, Fort Sam Houston, Texas.

DONOVAN, Mark Hamilton, 1st Lieut., Oklahoma City, Station Hospital, Fort Sill, Okla.
HARRIS, Gracchus, Jr., 1st Lieut., Navasota, Texas, 2d Division, Fort Sam Houston, Texas.
KELLY, Marcus G., 1st Lieut., Phoenix, Ariz., 2d Division, Fort Sam Houston, Texas.
LINDSEY, Ray Harvey, 1st Lieut., Pauls Valley, Okla., Camp Wallace, Texas.
MARTIN, John Dennis, 1st Lieut., Clint, Texas, Ellington Field, Texas.
MAYS, Alan Lanning, 1st Lieut., Sterling, Colo., Station Hospital, Fort Bliss, Texas.
ROBERTSON, David Lyle, 1st Lieut., Wichita Falls, Texas, Station Hospital, Camp Wallace, Texas.
RYAN, William Emmett, Captain, Midland, Texas, 2d Division, Fort Sam Houston, Texas.
SARZUNE, Benjamin, 1st Lieut., Eunice, N. M., 1st Cavalry Division, Fort Bliss, Texas.
SHERMAN, Joseph Harrison, 1st Lieut., Denver, Colo., 113th Cavalry, Camp Bowie, Texas.
SIPTAK, John E., 1st Lieut., Caldwell, Texas, 36th Division, Camp Bowie, Texas.
WALKER, John Hicks, 1st Lieut., Muskogee, Okla., Station Hospital, Fort Sill, Okla.
WILCOX, Melvin Rae, Jr., 1st Lieut., Jacksonville, Texas, Ellington Field, Texas.
WILLIAMS, Harold Murphy, 1st Lieut., Fort Worth, Texas, Camp Wallace, Texas.
WOODS, Haddon Benjamin, Captain, Refugio, Texas, 265th Coast Artillery, Fort Crockett, Texas.

NAVAL RESERVE OFFICERS ON ACTIVE DUTY

The following medical officers of the U. S. Naval Reserve have reported for active duty since March 17:

ARNOLD, Walter F., Lieut., M. C.-V. (S.), Long Beach, Calif., Naval Hospital, Mare Island, Calif.
BEHR, Irving S., Lieut. (j. g.), M. C.-V. (G.), Belleville, N. J., Norfolk Naval Hospital, Portsmouth, Va.
CREVELLO, Albert J., Lieut. (j. g.), M. C.-V. (S.), North Warren, Pa., U. S. Naval Hospital, Philadelphia.
DE SANTO, Dominic A., Lieut., M. C.-V. (S.), New York, Naval Hospital, Brooklyn.
FURMAN, Matthew R., Lieut., M. C.-V. (G.), New York, Third Naval District, New York.
KRAFT, George L., Lieut. (j. g.), M. C.-V. (G.), San Juan, P. R., 10th Naval District, San Juan, P. R.
MILAM, Ernest B., Lieut. Comdr., M. C.-V. (S.), Jacksonville, Fla., Naval Air Station, Jacksonville, Fla.

SELECTIONS FOR PROMOTION IN
THE NAVY

A Naval Medical Corps Selection Board has made recommendations for promotion as vacancies occur of forty-two lieutenants to the grade of lieutenant commander and fifty-one lieutenants (junior grade) to the grade of lieutenant, and the recommendations of the board have been approved by President Roosevelt. The Navy Medical Selection Board, of which Capt. Richard A. Warner, M. C., U. S. Navy, was president, selected the following officers for promotion:

LIEUTENANTS TO LIEUTENANT COMMANDER

Irving J. Warmolts	Warren E. Klein
Otto L. Burton	Norris M. Hardisty
Louis E. Gilje	Cameron L. Hogan
O. Henry Alexander	Gerard B. Creagh
Herman A. Gross	Anselm C. Hohn
Edward S. Lowe	Thomas Q. Harbourn
Robert J. Vaughn	James G. Neff
Frank P. Gilmore	Craig B. Johnson
Paul Vaughan	Clarence L. Blew
Oscar D. Yarbrough	Herbert G. Shepler
Carr E. Bentel	William P. Stephens
James D. Boone	Jack R. George
Warren G. Wieand	Ferrell H. Johnson
Albert R. Behnke Jr.	Edward C. Kenney
Omar J. Brown	John D. Foley
George W. Dickinson	Garland A. Gray
John R. Weissner	Benjamin N. Ahl
Kenneth H. Vinnedge	Charles M. Parker
Milton R. Wirthlin	James R. Sayers
Thenton D. Boaz	William C. Baty Jr.
William L. Berkley	Wade S. Rizk

LIEUTENANTS (J. G.) TO LIEUTENANTS

John F. McMullin	Philip J. McNamara
James B. Shuler	Edward E. Hogan
John F. Foertner	Merrill H. Goodwin
Gordon M. Perisho	LeRoy J. Barnes
Jerome F. Smith	Landes H. Bell
Robert S. Poos	Thomas J. Canty
Francis L. Phillips	Clifford P. Phoebus
John L. Hatch	Richard W. Garrity
Charles F. LeComte	Russell H. Walker
Gordon K. Lambert	William S. Francis
Walter Welham	Ellwood V. Boger
Herbert H. Eighmy	Shakeeb Ede
Richard R. Rall	Charles F. Gell
Thomas F. Woodward	Alexander S. Angel
Stephen J. Ryan	Samuel J. Wisler
James G. Bulgrin	Joseph A. Syslo
Emmanuel Rollins	Nicholas E. Dobos
Roy R. Powell	Arthur L. Lawler
Murray W. Ballenger	Charles F. McCaffrey
Clark J. Jeffers	Alfred L. Smith
Thomas P. Connelly	Marion E. Roubush
Marion T. Yates	Edward Patrick McLarny
Marshall Cohen	Earle E. Metcalfe
Eugene P. Harris	Jefferson Davis
Harold R. Berk	Joseph M. Hanner
Walter R. Miller	

AVIATION MEDICAL EXAMINERS

A routine course of instruction to qualify medical officers for duty as Aviation Medical Examiners began at the School of Aviation Medicine, Randolph Field, Texas, April 14. The course will continue for six weeks. The names of the officers enrolled, with the stations to which they are assigned, follow:

AUERBACH, Sidney, 1st Lieut., M. C. R., Fort Jackson, S. C.
BENNETT, Bruce H., 1st Lieut., M. C. R., Mitchel Field, N. Y.
BOSWORTH, Joseph M., Jr., Captain, M. C., Florida N. G., Camp Blanding, Fla.
CRAWFORD, Walter J., 1st Lieut., M. C. R., Camp Shelby, Miss.
DANIELS, John Q. A., Captain, M. C. R., McChord Field, Wash.
DICKINSON, Louis E., 1st Lieut., M. C. R., Fort Douglas, Utah.

MILLER, Julius Y., Lieut. (j. g.), M. C.-V. (G.), Chelsea, Mass., Naval Training Station, Newport, R. I.
PORTER, Joseph I., Lieut. Comdr., M. C.-V. (G.), Benicia, Calif., 2d Marine Division, Marine Corps Base, San Diego, Calif.
RABSON, Salem M., Lieut. Comdr., M. C.-V. (S.), New York, Naval Hospital, Brooklyn
ROSENBERG, Irving G., Lieut. (j. g.), M. C.-V. (S.), Long Beach, Calif., Naval Dispensary, Long Beach, Calif.
SLAGLE, Thomas D., Lieut., M. C.-V. (S.), San Juan, P. R., 10th Naval District, San Juan, P. R.
SULLIVAN, Daniel F., Jr., Lieut., M. C.-V. (S.), Woodland, Calif., Naval Dispensary, Long Beach, Calif.
WEST, Walter B., Lieut., M. C.-V. (S.), Fort Worth, Texas, Naval Air Station, Corpus Christi, Texas.
WILLIAMS, Richard J., Lieut. (j. g.), M. C.-V. (G.), Cumberland, Md., Destroyer Division 21.

DOMINICK, John F., 1st Lieut., M. C. R., Randolph Field, Texas.
DRUMMOND, N. Robert, 1st Lieut., M. C. R., Randolph Field, Texas.
DUDNEY, Lester R., 1st Lieut., M. C. R., Randolph Field, Texas.
ENGELHARDT, David M., 1st Lieut., M. C. R., Allan Hancock College of Aeronautics, Santa Maria, Calif.
EPSTEIN, Ernest D., 1st Lieut., M. C. R., Chanute Field, Ill.
ERDEL, Milton W., Captain, M. C. R., Fort Benning, Ga.
ESTES, Woodrow B., 1st Lieut., M. C. R., MacDill Field, Fla.
FERRIS, James W., Captain, M. C. R., Camp Livingston, La.
FLEMING, Frank R., Captain, M. C. R., Fort Jackson, S. C.
FLORETH, Nelson K., 1st Lieut., M. C. R., Camp Beauregard, La.
FOSTER, Furman L., 1st Lieut., M. C. R., Randolph Field, Texas.
FRENCH, James B., 1st Lieut., M. C. R., Randolph Field, Texas.
GIFFORD, Byron L., Captain, M. C. R., Camp Murray, Wash.
GORDON, Devitt L., 1st Lieut., M. C. R., Patterson Field, Ohio.
GRAYSON, Morris, 1st Lieut., M. C. R., Langley Field, Va.
HELLAMS, Alfred A., 1st Lieut., M. C. R., Fort Sam Houston, Texas.
HENRY, Lewis M., Captain, M. C. R., Fort Sill, Okla.
HOLTZ, Paul R., Major, M. C. R., Fort Leavenworth, Kan.
HOWE, George E., 1st Lieut., M. C. R., Headquarters 6th Corps Area, Chicago.
KELLY, Delbert C., 1st Lieut., M. C. R., Selfridge Field, Mich.
KING, James T., 1st Lieut., M. C. R., Barksdale Field, La.
KNAPP, Howard C., Captain, M. C. R., Fort Sam Houston, Texas.
KOSSMANN, C. E., 1st Lieut., M. C. R., Randolph Field, Texas.
LASKY, Mortimer, Major, M. C., New York N. G., Madison Barracks, N. Y.
LIPIN, Raymond J., 1st Lieut., M. C. R., Langley Field, Va.
LOWREY, Robert W., 1st Lieut., M. C. R., Brooks Field, Texas.
LUCAS, Richard A., 1st Lieut., M. C. R., Louisiana N. G., New Orleans.
MAGRUDER, Roger G., Captain, M. C. R., Langley Field, Va.
MENDEL, Charles L., 1st Lieut., M. C. R., Randolph Field, Texas.
POMERANCE, Joseph B., Captain, M. C. R., Camp Beauregard, La.
POPELAR, Melville V., Captain, M. C. R., Fort Sill, Okla.
RICKLES, George Abraham, 1st Lieut., M. C. R., McChord Field, Wash.
SANDERS, Zal H., 1st Lieut., M. C. R., Scott Field, Ill.
SARFATY, Isaac J., Captain, M. C. R., Milwaukee.
SELIGMAN, Ewing, Captain, M. C. R., Camp Shelby, Miss.
SMITH, Tom J., 1st Lieut., M. C. R., Scott Field, Ill.
THOMPSON, Roger S., Captain, M. C. R., Camp Murray, Wash.
TILDEN, James F., 1st Lieut., M. C. R., Fort Sam Houston, Texas.
WALDOCK, James L., Captain, M. C. R., Fort Benning, Ga.
WHITE, Fletcher H., 1st Lieut., M. C. R., Mitchel Field, N. Y.

ADVISORY BOARD FOR SELECTIVE
SERVICE

A medical advisory council has been created to cooperate with national headquarters of the Selective Service system on problems connected with the physical examinations of registrants, it was announced March 31. Members of the council are:

Dr. Francis X. McGovern, Washington, D. C., chairman of the executive board of the Medical Society of the District of Columbia.
Dr. Henry C. Macatee, Washington, D. C., past president of the District society.

Dr. Thomas S. Cullen, professor emeritus of gynecology, Johns Hopkins University School of Medicine, Baltimore, and a Trustee of the American Medical Association.

Dr. Harvey B. Stone, associate professor of surgery at Johns Hopkins.

Dr. Robert A. Bier, secretary of the Medical Advisory Council and liaison officer between the council and national headquarters, Selective Service system.

Mr. Theodore Wiprud, executive secretary of the District society.

The purpose of the council is to provide liaison between national headquarters of the Selective Service system, the American Medical Association and the medical profession at large and to acquaint them with the medical needs for the most effective administration of the Selective Service system. A primary need is the obtaining of suitable medical personnel for the examination of registrants. At the first meeting of the council, April 1, various proposed plans for the correction of physical defects of rejected registrants were considered.

MEDICAL REPLACEMENT TRAINING CENTER AT CAMP GRANT, ILLINOIS

After months of preliminary work, a tremendous program of training Medical Department enlisted personnel at Camp Grant, Illinois, has been launched, and at present more than six thousand Medical Department trainees are undergoing intensive training. During the coming year about thirty thousand enlisted men will be trained there. Each training period covers thirteen weeks in the replacement center. After receiving training, which is mostly basic in character, the trainees will be assigned to field medical organizations and fixed hospitals in camps elsewhere.

Construction of the replacement training center is complete and about two hundred and fifty buildings of semipermanent type are now in use. The trainees are organized into seven battalions, two of which will train men for assignment to fixed hospitals, one for service with mobile hospitals, another for service with the Air Corps, another for service as attached medical troops and with veterinary hospitals, and two for service as army medical regiments.

Each battalion is organized into four companies, each of which has the capacity to house and train two hundred and twenty-two selectees. The training schedule provides for forty-four hours of instruction each week for the thirteen weeks period. It includes, among many other subjects, twenty-one of training in elementary anatomy and physiology, twenty hours in field sanitation, twelve hours in material medica and pharmacy, sixteen hours in medical and surgical nursing, sixty-seven hours in bandaging, dressing and splinting, eight hours in the treatment of gas casualties, ten hours in ambulance loading and litter drill, and five hours in preparation of field medical records; one hundred and twenty-two hours of unit training will complete the course.

In addition, schools for bakers and cooks, mess sergeants, clerks, chauffeurs and motor mechanics are being conducted.

At present the headquarters administrative staff consists of:

Lieut. Col. Joseph I. Martin, M. C., executive officer.
Lieut. Col. Frank E. Brundage, M. R. C., assistant executive officer.
Lieut. Col. A. B. Crane, A. G. D., adjutant.
Major John F. Bohlender, M. C., plans and training officer.
Major Lynn Dodge, M. R. C., assistant plans and training officer.
Capt. Roland B. Peck, Inf., classification officer.
First Lieut. J. B. Pierce, A. G. D., personnel officer.

The battalion commanders are:

Lieut. Col. Thomas Harold Reagan, M. C.
Lieut. Col. William Alexander Smith, M. C.
Lieut. Col. George E. Lindow, M. C.
Major Howland A. Gibson, M. C.
Major Howard S. McConkie, M. C.
Major Clement F. St. John, M. C.
Major Frederic B. Westervelt, M. C.

In addition to these officers there are approximately one hundred and seventy-five others assigned to the various companies in the center.

It is expected in the near future that a brigadier general will be assigned as commanding general of the training center.

MEDICAL SUPPLIES FOR COUNTRIES AT WAR

Medical service equipment for new clinical laboratories and hospitals throughout England has been requested by the British Red Cross in a cable forwarded by the American Red Cross to the Medical and Surgical Relief Committee of America, which has headquarters at 420 Lexington Avenue, New York. The committee is soliciting contributions of about sixty specific items, including pipets, tubes, burets, Petri dishes, dissecting needles, bottles, glass tubing and syringes. In the first quarter of 1941 this committee disclosed that contributions in cash and medical and surgical supplies received amounted to \$97,168.56. Of this amount \$79,156.67 in the form of drugs, surgical instruments and other medical supplies were shipped overseas for civilian relief among noncombatants in Great Britain and the allied countries. The committee, formerly known as the Medical and Surgical Supply Committee of America, recently changed its name to emphasize the charitable nature of its work.

INDUSTRIAL SURVEYS IN DEFENSE PROGRAM.

The Maryland State Department of Health has inaugurated a series of surveys on health and occupational hazards in industrial defense plants as part of the national defense movement in cooperation with the U. S. Public Health Service. Dr. Robert H. Flinn, Bethesda, assistant surgeon, and Harry E. Seifert, assistant public health engineer of the Public Health Service, have been assigned to supervise the work. Wherever necessary, follow-up studies will be made to determine concentrations of hazardous dusts, fumes and gases in the workroom air or other health hazards and their effects on the workers, it was reported. Special efforts will be made to provide technical advice and services to plants too small to afford medical and engineering personnel. Surveys have already been started at several plants.

CONFERENCE OF PSYCHIATRISTS

Psychiatrists connected with medical advisory and army induction boards in New York held a conference at the New York Academy of Medicine, April 5. The speakers included Col. Patrick S. Madigan, M. C., U. S. Army; Dr. Harry Stack Sullivan, president of the William Alanson White Psychiatric Foundation; Dr. Martin J. Cooley of the Veterans' Administration; Dr. Karl M. Bowman, director of the psychiatric division of Bellevue Hospital; Dr. Howard W. Potter, clinical professor of neurology and psychiatry, Long Island College of Medicine, and Col. Samuel J. Kopetzky, chief of the medical division of the New York Selective Service System.

NEW MEDICAL RELIEF COMMITTEE

Organization of the Physicians' Committee of Greater New York as a branch of the British War Relief Society was announced, April 14, following a meeting at the New York Academy of Medicine. Officers of the committee are Drs. Adolph G. G. De Sanctis, chairman; Nathan B. Van Etten, John E. Jennings, Charles Gordon Heyd, Harry P. Mencken and Herbert A. J. Cochrane, vice chairmen for the five counties in Greater New York; Benjamin Wallace Hamilton, secretary, and Kirby Dwight, treasurer.

MEDICAL TECHNOLOGISTS

A reserve of medical technologists, both men and women, is being built up by the War Department with the cooperation of the American Red Cross. As of February 1 a total of two thousand and seventy-two civilian medical technologists had been enrolled by the Red Cross as a reserve for the Army Medical Corps to supplement the several thousand enlisted medical technicians already on duty.

NEW HOSPITALS IN CANAL ZONE

Two of the largest single unit type hospitals ever built in the Panama Canal Zone have been started at Fort Clayton and Fort Gulick. Both hospitals will be fireproofed, equipped with the latest hospital accessories, and supplemented by barracks and officers' and nurses' quarters.

SYMPOSIUM ON MILITARY MEDICINE

The St. Louis Medical Society devoted its April 15 meeting to a symposium on military medicine. Organization was discussed by Dr. Fred T. Murphy, Grosse Pointe, Mich.; the surgical aspects by Dr. Malvern B. Clopton; medical, Dr. Walter Fischel, and roentgenologic, Dr. Edwin C. Ernst.

MEETING AT ARMY MEDICAL CENTER

Dr. Ferris Smith, Grand Rapids, Mich., addressed the U. S. Army Medical Department officers in Washington and vicinity at the Army Medical Center, April 21, on "An Obligation to the Soldier and to Society."

MARCH 26—MORNING

The Court ruled that the Dr. Trinder manuscript was inadmissible.

TESTIMONY OF DR. PRENTISS WILLSON
DIRECT EXAMINATION

By Mr. Laskey:

Prentiss Willson said he is a physician, he graduated in 1905. He is 59 years old. He graduated from Georgetown University. He was in the Army, during the last war, and in 1919 when he left the Service he specialized in obstetrics and gynecology. He is Attending Obstetrician in the Columbia Hospital for Women. He joined the District of Columbia Medical Society in 1908, and became much interested in it and its affairs shortly after that time. He was corresponding secretary for a time, served as chairman of the Committee of Censors, served several terms on the Executive Committee. He was chairman of the Executive Committee several times. He was chairman for a time of the Committee on Medical Economics of the Medical Society, some five or six years ago, and finally in 1933 was elected president of the Society and took office the first of July for the fiscal year of 1933-1934. It was the custom of the Society to elect the retiring president as a member of the Executive Committee for a term of three years. He was a member of the board of the Health Security Administration and the Medical-Dental Service Bureau, which were eleemosynary institutions which the Medical Society had a part in forming.

Q.—With reference to a change in the constitution or by-laws, what is the procedure with reference to them? A.—A member who wishes to attempt to have a constitutional change made or propose an amendment to the constitution, must propose it at a certain stated meeting, and then, under the provisions of the constitution, that proposed amendment is referred to the Executive Committee and the Executive Committee is obligated to make a report concerning it at the next ensuing stated meeting of the Society, either recommending its adoption or recommending adversely to its adoption.

Q.—What knowledge have you of Chapter 9, Article 4, Section 5? A.—As to its history in the Society?

Q.—Yes. A.—That particular amendment to the constitution which was denominated Chapter 9, Article 4, Section 5, was first proposed to the Society at the meeting in November—

Q.—Before you start on that, Doctor, would you identify it a little more particularly, with respect to its substance? It is in evidence, I understand. A.—Its substance was—its purpose, rather, I know was to afford the Society better facilities for controlling the practice of its members in relation to the Workmen's Compensation Law.

Q.—Will you proceed with its history? A.—It was first proposed before the Medical Society at the stated meeting in November, which would be the first meeting in November 1935.

THE COURT:—I imagine the jury will remember it, but I think it is well to identify its terms just in a general way so that the jury will know exactly what you are talking about.

The Witness:—If your Honor please, I can read it.

THE COURT:—Have you got it handy?

Mr. Laskey:—Yes, sir.

THE COURT:—I would like the jury to understand it. I dare say they will remember it.

Mr. Laskey:—Following your Honor's suggestion I will read to the ladies and gentlemen of the jury Section 5:

"No member of the Society shall engage in any professional capacity whatsoever with any organization, group, or individual, by whatever name called or however organized, engaged in the practice of medicine within the District of Columbia or within ten miles thereof, which has not been approved by the Society. The Executive Committee is authorized and directed to prepare an approved list of organizations, groups, and individuals, by whatever name called and however organized, engaged in the practice of medicine within the District of Columbia or within ten miles thereof, and the same shall be kept in the office of the secretary-treasurer. Before any such organization, group, or individual can be placed on the approved list of the Society, such organization, group, or individual, or the member of the Society proposing professional relations therewith shall submit to the Compensation, Contract and Industrial Medicine Committee such evidence as the Committee or the Society may require concerning the character, activities, financial condition and ethical standards of said organization, group, or individual, and after considering the same said committee shall make a report of the investigation and findings to the Executive Committee for such action as it may deem necessary."

By Mr. Laskey:

Q.—Now, with that so identified, will you please proceed to give us the history of it? A.—In its original form the amendment was proposed at the stated meeting of the Society on the first Wednesday in November 1935. Under the provisions of the constitution it was referred to the Executive Committee for report at the next stated meeting, which would be the stated meeting in January. At that time I was a member of the Executive Committee to which this proposed amendment was referred, and the amendment was given consideration in the Executive Committee and was vigorously opposed, so far as its adoption in the constitution was concerned, by a group of that committee, of which I was one, and the Executive Committee reported it to the Society at the stated meeting on the first Wednesday in January 1936 adversely. Despite that adverse recommendation of the Executive Committee the Society adopted it, so that it became a part of the constitution in January 1936, for the first time. Its proponents then realized that there was not proper machinery in the constitution to effect the purposes of the amendment which had just been adopted, and at the stated meeting of the Society in March 1936, two months after its adoption, another amendment was proposed. I cannot give you the exact chapter and article, but another amendment was proposed to the constitution to put into it machinery to make effective the provisions of the amendment which had been adopted. At the same meeting in March 1936, an ex-president of the Society, Dr. A. B. Bennett, proposed a further amendment to the constitution, to strike out Chapter 9, Article 4, Section 5, which had just been adopted two months before; and under the provisions of the constitution those two amendments were referred again to the Executive Committee. The Executive Committee met, I still being a member of it, and the matter of the attitude of the Executive Committee toward this original amendment and these two new amendments was referred to a subcommittee of the Executive Committee of three to prepare a report for the consideration of the Executive Committee to submit to the Society, with its reasons for any action it might see fit to take. That committee consisted of myself, Dr. Bennett, and Dr. Don Johnson, I believe, who had a legal degree in addition to his medical degree. The subcom-

mittee met and gave careful consideration to the two amendments, the one striking out the one that had just been adopted, and the enabling amendment to provide machinery to make it operative, and prepared a formal statement of its reasons for the position it recommended the Executive Committee taking, and recommended that the amendment to strike out Chapter 9, Article 4, Section 5, be adopted, and that the proposed amendment to provide machinery to make it operative be not adopted. That was the action of the subcommittee. The report of the subcommittee was brought to the attention of the Executive Committee and it was adopted by the Executive Committee for recommendation to the Society with a further amendment which was offered in the full committee to the effect that the whole matter, after it had adopted the recommendation of the committee that the new amendment be not adopted and the old one be stricken out again, be referred to a special committee of the Society for study during the coming summer. That special committee was to consist of the president of the Society, who was elected to take office on July 1, 1936, the chairman of the Executive Committee, the chairman of the Compensation, Contract and Industrial Medicine Committee, which you have heard mentioned, the counsellor of the Society, who was Colonel Frederick A. Fenning, and two attorneys who were in practice at the local bar. These gentlemen were nominated to the Executive Committee and the Executive Committee was to elect.

Q.—Was that done, with reference to the two attorneys?

Mr. Lewin:—We object to that, if your Honor please. It does not matter whether it was done or not. It is perfectly immaterial.

THE COURT:—Objection overruled. The witness is giving the history of the matter.

The Witness:—Following the usual constitutional procedure, this recommendation of the Executive Committee which I have just outlined to the jury was brought into a full meeting of the Society and my impression is now that it was the latter part of May, because I think that the stated meeting that year had been postponed because of the fact that the Society was holding its annual scientific session early in the month. My impression is that it was on—it doesn't make any difference, I suppose. It was brought in before a meeting of the full society in May. The action of the Society was to again overrule the recommendation of the Executive Committee in that it refused to strike out Chapter 9, Section 4, Article 5. It did adopt the new proposed amendment which was to provide machinery for its operation, but it then also adopted the suggestion of the Executive Committee that the whole matter be referred to a committee such as I have outlined, for study during the summer, and report to the Society in the fall. After the July change of office in the Society the committee was organized. It consisted of Dr. William Mercer Sprigg, ex officio as president of the Society, Dr. J. Lawn Thompson, ex officio, as chairman of the Executive Committee, Dr. R. Arthur Hooe, ex officio, as chairman of the C. C. and I. M. Committee, Colonel Frederick A. Fenning as counsellor of the Society and, under the provision of the action of the Society this group nominated Mr.—I can't give the first name—Mr. Wheatley and Mr. Flannery.

Mr. Lewin:—May I break in simply to ask the witness to fix the time. Are you not talking about the year 1936?

The Witness:—Yes, Mr. Lewin; 1936. Those nominations were made to the Executive Committee and agreed to, so that that was the personnel of the committee which was to study this whole subject. As I recall it, the subject for study was the relations of the Society to its members engaged in contract practice under the Workmen's Compensation Law, and the best method of controlling that practice to make it conform to the ethics of the local organization and the American Medical Association. The committee studied the matter during the summer.

I might say, Mr. Laskey, there—I think this is as good a place to bring it in as any—that because of serious differences of opinion in the Society and in the Executive Committee centering somewhat around this matter that I am discussing now and somewhat regarding other matters, that at the meeting of the Society on April 22, 1936 I resigned from the Executive Committee and from every other position and office I held in connection with the Society, although my resignation did not take effect until the first of the following May. I attended one meeting of the Executive Committee after that resignation. So that after the first part of May 1936, although my elective term on the Executive Committee had 14 months yet to run, the term for which I was elected, I resigned from the committee and not only from that, but from every office I held in the Society. Therefore I had nothing to do with the deliberations of this committee or with its activities or with the activities of the Executive Committee with respect to it, following the first part of May 1936.

The committee gave the matter consideration during the summer, and at the meeting of the Society in October 1936 it merely made a progress report and asked for more time to give the matter further consideration. That was granted by the Society, and at the stated meeting of the Society, as I recall it, in November 1936, the committee, the composition of which I have just given you, made its final report to the Society in which it suggested certain minor modifications in Chapter 9, Article 4, Section 5 which then had been in the constitution since the preceding January.

That report of the committee was received and given the status of the first reading of a proposed amendment, because it did make certain minor changes in the wording of Chapter 9, Article 4, Section 5. It was given the status of a proposed amendment, and at the meeting of the Medical Society, the stated meeting, in January, the matter came up. In the meantime there had been proposed, as I recall it now, some further minor modifications in the wording of the amendment, and the action of the Society was to return it to the committee, I believe, with instructions to consult the legal counsel further, and the matter finally came up before the Medical Society at the stated meeting on the first of March 1936, and it was then adopted.

By Mr. Laskey:

Q.—By the first of March, do you mean the first day of March? *A.*—I mean the first stated meeting, on the first Wednesday in March 1937.

Q.—When adopted was it in the form that I have just read to the jury? *A.*—My impression is that it was in the form that you read to the jury, and it was, so far as my understanding of its wording is concerned, the only minor modifications which had ever been introduced into that provision of the constitution which first went into the constitution of the Medical Society on the first Wednesday in January 1936, and had been in the constitution continuously for 14 months before action by the Society in March 1937. It had been in the constitution in that form for 14 months.

Q.—There was nothing done with Chapter 9, Article 4, Section 5 after its final adoption, was there? *A.*—So far as I know, it has never been touched since then. I might say, as I told the jury, I was opposed to the original amendment. I fought it in the Executive Committee. I signed every adverse report that was made concerning it. I was in favor of its being stricken out of the constitution, every time it came up. If my recollection serves me correctly there were three different occasions on which amendments were proposed to strike it out of the constitution, and I voted for approval of them, and I continued to oppose it up to the time of its final adoption in March 1937.

Q.—When did you first hear of G. H. A.? *A.*—From my own memory I cannot fix the date definitely, although it can be fixed for me in the testimony, because it was upon the occasion of the meeting in Dr. William Gerry Morgan's office to which reference has been made, if you can give me that date.

Q.—It was the last part of May, was it not?

Mr. Kelleher:—May 16, 1937?

The Witness:—May 16, 1937. To the best of my recollection and belief, that is the first occasion on which I ever heard of such an organization as the G. H. A. even being contemplated.

By Mr. Laskey:

Q.—Did the introduction of the amendment and the final passage in its present form, of Chapter 9, Article 4, Section 5, have anything to do with G. H. A.? *A.*—Obviously not, because it was in the constitution 14 months before March 1937. I never heard of the G. H. A. until May 1937. So there is almost 18 months that it was in the constitution before I ever heard of G. H. A.

Q.—Do you recall a letter introduced by Dr. Sprigg which was proposed to be sent to the hospitals, in the fall of 1937? *A.*—Very well. Dr. Sprigg first proposed sending that letter at a meeting of the Society in October, I think, around the middle of the month of October 1937.

Q.—Was it acted upon at that meeting? *A.*—It was not acted upon at that meeting, because Dr. Groover made the point that it was entirely too important a matter for the Society to take action on prior to all the members of the Society having been notified that the matter was coming up, so that anybody who was interested in it, either for or against it, might be present to express his views and to vote. And that was the action of the Society. So that the letter which Dr. Sprigg proposed sending to the boards of directors of the various local hospitals went over and became a matter on the agenda. As I recall it, it was definitely postponed for consideration until the stated meeting on the first Wednesday in November following.

By Mr. Laskey:

Q.—Did you attend that meeting on Nov. 3, 1937? A.—I certainly did.

Q.—Do you recall what you did prior to going to the meeting and how you happened to do it? A.—That is, of course, in connection with this proposed letter to the boards of directors of the various hospitals, and I should like to give the details of that to the members of the jury as clearly as I possibly can.

Mr. Laskey:—It has been suggested by Mr. Richardson that I read the Sprigg letter. I am going to ask Mr. Richardson to read it for me.

Mr. Richardson:—Dr. Sprigg read the following letter addressed to the boards of directors of the various hospitals in this city:

"The Medical Society of the District of Columbia desires to call attention to Chapter 9, Article 4, Section 5 of the constitution, as follows"—

Then follows in the letter the same section 5 which Mr. Laskey just read to the jury. Then follows this:

"Whereas the Medical Society is using its earnest efforts to give to the people of the District of Columbia the most advanced and best possible medical care, we therefore ask your cooperation by aiding us to carry out this principle. In view of the above section of the constitution of the Medical Society of the District of Columbia we hope your board will see the advisability of making such reservations in your hospital so that it may be in accord with and support our efforts."

Mr. Kelleher:—Does not that letter also quote Chapter 9, Article 4, Section 1?

Mr. Richardson:—The copy I had did not differentiate. Here is also a portion of it:

"Members shall not accept appointment to or continue to serve upon the medical staff of any hospital or dispensary which is not approved by the Society. A list of approved hospitals and dispensaries shall be available in the Society's office."

By Mr. Laskey:

Q.—Now, with respect to that letter, was it on the agenda for action on Nov. 3, 1937? A.—It was.

Q.—My last question, I think, asked you to state what, if anything, you did with respect to that meeting; what you did before you got there. A.—At that time, that is, the fall of 1937, I had office hours three afternoons a week, Mondays, Wednesdays and Fridays. It was my invariable custom, almost, to complete my office hours, so I got through late in the afternoon on Wednesday. I was living pretty well out in the suburbs, and I usually dined in town with my friend Dr. Hough whom I had known for many years and who shared my office. We used to go to Harvey's for dinner and attend the meetings of the Medical Society. On this particular Wednesday afternoon of Nov. 3, 1937 I got through with my last patient somewhat after 5 o'clock in the afternoon. In the meantime, to the best of my recollection and belief, I had even forgotten that the Sprigg letter was coming up. But when I got through with my last patient I picked up the mimeographed notice of the meeting for the Medical Society that night to see what was the business that was to come before the Society, and I read many other items that were up for discussion with the proposal of Dr. Sprigg to send this letter to the boards of directors of the various hospitals which also would come up for action, as has just been called to your attention through the reading of Chapter 9, Article 4, Section 5. The letter was calling the attention of the boards of directors to this particular provision of the constitution which, as I have testified previously, I had always been opposed to. The thought suddenly sprung into my mind, Would it be possible to take any action at the Society on this night which would prevent the sending of that letter? And I pulled a piece of scratch paper over toward me and picked up a pencil, without consulting with anybody in the world, and on the spur of the moment I scratched down this resolution which was introduced that night which has been read to you several times and which on its face shows that it was very crudely and carelessly drawn. I then may have taken that pencil draft across through my waiting room to Dr. Hough's office, which was on the other side of the office, in the same suite. I may have shown it to him. I have no distinct recollection of that. I want to be absolutely honest about it. I may have shown it to him, or I may not have shown it to him until we had dinner together that night. In any event, I had my secretary type it. It was then almost six o'clock, and I had her call Dr. Christie's office, which was two blocks from me, to see if he was still in the building, because I knew that Dr. Christie was also opposed, as I was, to the sending of that letter. I found that he was still in his office, and I walked over to 1835 I Street, two blocks from my office, and saw Dr. Christie. I asked him if he was opposed to the sending of the letter, and he said he was. I asked him if he would

second this resolution. First, I asked him if he thought the resolution as drawn might prevent the sending of the letter. He said he thought it might, and I asked him if he would be willing to second it, and he said he would. I then returned to my office and met Dr. Hough and we went to Harvey's for dinner and I went to the Medical Society that night.

At the meeting that night there was a further recommendation, among much other business, brought in from the Executive Committee which it seemed to me was proposing action along the same line as this letter; and I arose and asked if the proposal of the Executive Committee were in lieu of the proposed letter. As far as the record goes, as I have seen it, there was no answer to that question. But, in any event, I immediately proposed this resolution.

Q.—Prior to the proposing of that resolution by you at the meeting of the Society that night, what, if anything, did Dr. Stanton do? Do you remember the Stanton resolution? A.—Yes. There was a resolution introduced by Dr. Stanton, but it had nothing to do with this particular matter. That was another matter.

Q.—Proceed. A.—You want me to discuss the resolution?

Q.—Yes; proceed with the discussion of what happened there.

THE COURT:—It might be well to read enough of the resolution to identify it to the jury.

Mr. Richardson:—This is the resolution, I think, that you are testifying about, Doctor:

"WHEREAS, The Medical Society of the District of Columbia has an apparent means of hindering the successful operation of Group Health Association, Inc., if it can prevent patients and physicians in its employ from being received in the local private hospitals;

"WHEREAS, The Medical Society of the District of Columbia has no direct control over the policies of such hospitals as are determined by their lay boards of directors, except through control of its own members serving on their medical staffs; and

"WHEREAS, Conflicts between the Medical Society of the District of Columbia and any local hospital arising from an attempt to enforce the provisions of Chapter 9, Article 4, Section 5 of the constitution should be assiduously avoided if possible because of the unfavorable publicity which would accrue to its own members. "Therefore be it

Resolved, That the Hospital Committee be, and is hereby, directed to give careful study and consideration to all phases of this subject and report back to the Society at the earliest practicable date its recommendations as to the best way of bringing this question to the attention of the medical boards of directors of the various local hospitals in such manner as to obtain the maximum amount of practical accomplishment with the minimum amount of friction and conflict."

By Mr. Laskey:

Q.—What was your purpose in introducing that resolution, Dr. Willson? A.—The one purpose, solely, was to prevent, if possible, the sending of Dr. Sprigg's letter to the boards of directors of the hospitals.

Q.—Was there discussion of that resolution? A.—Oh, yes; there was considerable discussion of the resolution. The wording of the resolution was deliberately chosen—I mean to say, deliberately for anything that was done so spontaneously on the spur of the moment as this resolution was drawn—because there was a wide divergence of view within the Society as to this whole situation with respect to the G. H. A. My own personal feeling was—I may have been right or I may have been wrong—that this method of approach to the hospitals in connection with G. H. A. was inexpedient and calculated to engender friction rather than any real assistance in the problem; and the wording of the resolution was deliberately employed, as far as its "whereases" were concerned, for the sole purpose of getting enough votes to send it through the Society. The necessity for some such parliamentary tactics in the meeting is shown by the fact that the vote was quite close, 68 to 53.

Q.—Was that vote in favor of the resolution or against it? A.—In favor of the adoption of the resolution,—

Q.—All right, go ahead. A.—And the sole provision of the resolution which I wished to get over was merely to get the thing into a committee; that I felt, not being in any way connected with the policy forming duties of the Society at that time, that to my mind was the way possibly to choke the thing off, and prevent it from being sent to the hospitals.

Q.—Did it have that effect? A.—Yes, it had that effect to this extent: that the Hospital Committee took the resolution under advisement in conformity with the action of the Society, and at a meeting—what was the date, November 11, was it?

Q.—November 11, right. A.—November 11, the committee reported to the Society; there was considerable discussion and it was re-referred to the committee with instructions to consider it further; and at the next, I think, the next business meeting of the Society in December the committee finally reported. I don't even recall whether I was present at that meeting. I may have been. The action proposed finally—

Q.—Are you referring to the meeting of December 1, the first meeting of the Society in December? A.—Yes, as I said the committee reported the evening of November 11, and it was re-referred to the committee, and then on December 1 the committee made the report which was to the effect that the attention of the Boards of the hospitals, as I recall, the medical boards of the hospitals should call the attention of the Boards of Directors to what has been called, as I learned subsequently, the Mundt Resolution.

Now, may I trace my connection with that situation from that point on?

Q.—Yes. That resolution which came up on December 1, that was adopted? A.—It was adopted. As I said, I may have been there; I have no recollection of that meeting. I have a distinct recollection of the meeting of November 11.

Mr. Laskey:—Gentlemen, there is no question that that resolution was adopted on December 1.

Mr. Lewin:—No question.

Mr. Richardson:—May we read that?

THE COURT:—Yes.

Mr. Richardson:

"That as a matter of educational policy the Medical Society of the District of Columbia strongly recommends that all hospitals engaged in the teaching and training of residents, interns, and nurses, where possible, follow the recommendation of the American Medical Association regarding the constitution of their entire medical staffs, namely, that each appointee be a member of the Medical Society of the District of Columbia or a local Medical Society in this immediate neighborhood and a member of the American Medical Association."

Q.—Was there any further action with respect to your resolution which you recall? A.—None whatsoever. The only further action with which I had any connection personally was in connection with the action on this proposal which was just read, which was the final action of the Hospital Committee; that is so far as it concerned my connection with Columbia Hospital.

Q.—Doctor, do you recall a local physician by the name of Scandiffo? A.—I do.

Q.—Do you recall that his name came up before the committee with respect to charges that had been made? A.—Oh, yes, I remember all that. I had nothing to do with it. I wasn't on the Executive Committee. As I say, I had resigned from everything in connection with the Society, from all the committees, just retained my membership, but I knew that he was charged by the Society and tried by the Executive Committee, and the recommendation of the Executive Committee was that he be expelled, and that came up at the Society meeting.

Q.—Were you at that meeting? A.—At which the matter I have just referred to came up?

Q.—Yes. A.—I was.

Q.—What was the recommendation? A.—The recommendation of the Executive Committee was that he was guilty of the charges and the recommendation was that he be expelled from the Society.

Q.—Do you recall with what he was charged? A.—He was charged with having violated Chapter IX, Article IV, Section 5, and also two or three other charges of violations of certain provisions of the Constitution.

Q.—Do you recall whether they were sections 1 and 2 of Article III of that Chapter IX? A.—I couldn't recall at all from my own recollection what the numbers were.

Q.—Well, do you recall what in substance those charges against Dr. Scandiffo were? A.—My recollection is that one of them involved a violation of the code of ethics of the American Medical Association, in that he had contracted to give his services under circumstances under which he could not render good service. I believe that was one.

Q.—Do you recall anything about the requirements that a physician file his contract with the Society? A.—Yes, that was the other one; that he had failed to file his contract with the Society, the C. C. & I. N. Committee, as required by the Constitution. Yes, I remember that now.

Q.—Did you know Dr. Scandiffo prior to that? A.—I imagine that some years ago I met Dr. Scandiffo, but even at that time I had no recollection of him individually, and I doubt if he came in this courtroom now I would recognize him.

Q.—How did you vote on that matter? A.—I voted reluctantly for his expulsion.

Q.—You say "reluctantly"; why do you say that? A.—Because I felt it was incumbent on the Society to protect itself, and to set an example. It had adopted a constitution. Its members had applied for membership voluntarily in the Society and had voluntarily obligated themselves to obey the provisions of the constitution; and while I didn't like the provisions of Chapter IX, Article IV, Section 5, he had violated that and violated

other provisions of the constitution, as far as I could determine from the report of the Executive Committee and, as I say, with reluctance, I voted for his expulsion.

Q.—As a result of that action of the committee what, if any, effect has that had upon your permitting Dr. Scandiffo to attend children, babies, whom you delivered in Columbia Hospital, whose mothers were his patients? A.—Dr. Scandiffo is a pediatrician and he was associated personally with a very intimate friend of mine, who was one of the leading pediatricians here in Washington for a good many years; and while I didn't know Dr. Scandiffo very well, he had been a pupil of mine at Georgetown and had been, as far as my knowledge went, well trained and, as I say, he had been associated with this very distinguished pediatrician for some years, and at the time this whole business was boiling in the Medical Society I had from the very beginning many patients in my private practice who were members of G. H. A.—and that was from the very beginning of G. H. A. down to the present time—and on several occasions during that period patients of mine in the hospital would say they would like to have Dr. Scandiffo see their babies and I invariably told them that so far as I was concerned he was a competent and able pediatrician and I had no objection to him seeing them, their babies, if he wished, and he did, as a matter of fact, see babies of several patients of mine on several occasions.

Q.—When you say he did "see" them, what do you mean? Do you mean he just viewed them or treated them professionally? A.—I am using that in a medical sense; technical sense. When a physician sees a patient, as was the case with Dr. Scandiffo, he does so for the purpose of taking charge of the patient. The sooner I get rid of them, the babies after they are born, the better I am pleased.

Q.—Was that the close of your contact with the Scandiffo incident? A.—Yes.

Q.—What was your connection with Columbia Hospital in the years 1937 and 1938, that is the Columbia Hospital for Women? A.—My official title was Attending Surgeon. There are eight attending surgeons, four of whom have a surgical service on women, and four of whom are attending obstetricians, and I was one of the latter, and, as such, a member of the Medical Board of the hospital.

Q.—What classifications of surgical medical services did they have there at Columbia at that time? A.—You mean with respect to the qualifications on the courtesy staff?

Q.—Yes. A.—You see, they had an attending staff which was constituted as I have indicated, plus the fact that they had a pathologist and a senior anesthetist and an attending pediatrician, to take charge of the nursery; and, in addition, they had a courtesy staff, and the courtesy staff was classified in three categories, three groups—one, two and three.

Class 1, individuals who had privileges to practice in the hospital on the courtesy staff who were entitled to do any operative procedure they wished in gynecology. That is any particular surgical treatment of women for diseases peculiar to women.

Q.—Does that classification include the most serious operations? A.—It includes everything, everything connected with surgery on the organs peculiar to women.

The second qualification was major obstetrics, which meant that that individual who had such privileges to practice in that class was entitled to do a craniotomy for instance, or destroy the unborn baby, and remove the uterus at the same time. In other words, he could do anything to take care of a woman in labor.

And the third classification; class 3, members of the courtesy staff who enjoyed privileges under class 3, were permitted to come into the hospital to handle women in labor as long as the labor was progressing normally and satisfactorily. However, if the labor were too much prolonged or delayed, or hemorrhage or convulsions, or any complications developed, then that individual was required to have consultation, and it was the duty of the staff of the hospital—I mean the attending obstetricians and their associates—to provide that consultation for them, and free of charge to the patient if the patient was unable to pay for it. Those were the three classifications.

Q.—Do you recall Dr. Selders' application for courtesy staff privileges at Columbia Hospital? A.—Oh, yes, I recall the fact that he applied. I would like to say before I start discussing the matter that, of course, that is some years ago, and I have tried to refresh my memory from the minutes of the Medical Board of Columbia Hospital, but I think I will be in agreement with counsel when I say they are in a hopeless mess. There is very little I could get out of them. I welcome the opportunity to discuss Dr. Selders' application from start to

finish, but I doubt if I can pin it down to definite dates. I would be very glad to have counsel point out to me any error I may make in that connection.

Q.—Irrespective of the date, you recall the application having been made to that hospital by Dr. Selders? A.—Yes, very well.

Q.—Will you please state what, if anything, you had to do with that application? A.—Dr. Selders, if my recollection is correct, and I am sure it is, Dr. Selders applied to Columbia Hospital for the privilege of doing general surgery, major gynecology, major obstetrics and normal obstetrics. In other words he applied for privileges in classes 1, 2 and 3, you see, and, in addition to that, he packed on the application to do general surgery in the hospital, which meant he could take out a brain tumor or do a thyroid, or operate for an empyema in the chest; anything. Now, Columbia Hospital does not have on its staff of the hospital anything corresponding to my position: I mean it has no general surgery, you see. There are general surgeons who can practice there, but they are on our consulting staff. In other words, we have a consulting staff of general surgery and in the event a patient for whom the hospital is responsible, is in the ward, developed, for instance, an empyema from pneumonia, following childbirth, and we haven't our own, then we would call in a consultant because we wouldn't know about it, it not being in our line; so Dr. Selders applied for the whole works: 1, 2, 3—everything—and as far as I know there isn't any such animal existing in the United States; they just don't come; and the action of the Board was, however, to give consideration to the application.

Now, as an obstetrician and gynecologist I wouldn't set myself up as competent to determine the ability of a man to do general surgery; I do not know enough about it to even gage his ability from the credentials he presents and, for instance if he said he was or had been attending such and such a clinic, unless it was say the Mayo, with which I happen to have some knowledge—I probably wouldn't even know enough about the standing of the clinic he referred to, to intelligently pass on it; so the application as regards general surgery, despite the fact that we didn't have any such individual on our staff, was referred to the Washington Academy of Surgery for the guidance of us as to what his qualifications were.

Then, the question of his ability to do major gynecology was something that modestly I think I have some ability to gage. However, that was referred also to the Washington Gynecology Society for an advisory committee in the same way we had referred the surgery application to the Washington Academy of Surgery, because it was our custom to do that even when we felt competent to examine credentials on that point. The net result of it was that the Academy of Surgery advised us adversely as to his qualifications in general surgery. The Washington Gynecology Society advised us adversely as to his qualifications to do major obstetrics and gynecology, which was in accordance with the opinion of the Medical Board, as to those qualifications; and since he had applied for all three groups, the Board, which only acts in an advisory committee—the directors, the board of directors can put anybody on there it pleases—advised the board of directors against granting of the privileges desired. That, I recall, was the action of the board.

Q.—After Judge Bailey's decision in the Group Health case in July 1938 was an application of Dr. Selders for courtesy privileges at Columbia Hospital for Women renewed? A.—Well, I couldn't time it exactly as to just when it was renewed. I do happen to know, and furthermore my impression is that the application was received from the Group Health Association rather than Dr. Selders; that is my impression now.

Q.—In respect to your action on the second application, you may proceed. A.—As I say, I don't recall just when it was, and my recollection may be wrong, but I think that the renewal application came directly from some authority in G. H. A. I don't think it came from Dr. Selders direct.

Q.—Mr. Kelleher informs me that it was on Sept. 2, 1938 Dr. Selders wrote to Mr. Ashburn, the superintendent. A.—Was it Dr. Selders? It seems to me that there was some correspondence directly from some official of G. H. A. regarding the application, but the gist of it was that they then considered that this application should be treated separately for each group; they wanted to consider each class separately; and I saw something in the minutes of the medical board where the matter came up at a meeting in September 1938 and there was a motion made before the medical board that Dr. Selders' application for privileges 1 and 3—that was the motion as it appears in the minutes, be considered; that would be major gynecology and minor obstetrics, that is normal obstetrics, and would leave out major obstetrics; and the motion was made

that it be considered; and it was recommended adversely to the Board of Directors. Thereupon, I moved that the Board of Directors be advised that the medical staff didn't think it advisable to act on the application at that time, and by a divided vote that recommendation or motion prevailed. The recommendation was sent to the Board of Directors. The Board of Directors acceded to it, and the net result was that Dr. Selders was permitted privileges pending final disposition of it and, pending that period, he was permitted to handle normal obstetrics in the hospital.

My position with respect to that matter was this. I remember very distinctly when that second application came before the Board, I said to the Medical Board this: I said there isn't any question in my mind but that this man is not competent to do general surgery in this hospital, but that is out; and I equally convinced that he has not shown any evidence that he should be granted the privilege of doing major gynecology, or to handle desperate cases of childbirth, but were he a member of the Medical Society of the District of Columbia you would grant him privileges or at least recommend him for privileges in Class 3—

Q.—Being what? A.—Normal obstetrics, and, in my judgment,—I have absolutely this recollection, of taking this position,—in my judgment, this situation should be handled in the same way. These men on G. H. A. should not be admitted to practice in any hospital, including this one, if they cannot show they possess the qualifications which entitle them so to do, the same as other men in or out of the Society; and, incidentally, at the very time Dr. Selders' application was before the hospital board at Columbia we turned down a much more competently trained man who was a member of the District Medical Society, and the Board of Directors sent the application back to us under pressure from members of Congress and various high officials, and the Medical Board stuck to its guns and refused to alter its position; and that man was a member in good standing in the Medical Society of the District of Columbia. But that is a diversion. My opinion was that none of these men should be admitted to staff privileges unless qualified to do the work for which they apply; that the same test should be applied to them as to any other man who makes application, but if they were qualified the fact that they were on the staff of G. H. A. should make no difference; that the board should take a position comparable to the one as related by Dr. Macatee was taken at Garfield. They should either be admitted to practice pending the outcome of the question of legality of G. H. A. or they should be kept out of the hospital altogether; and I think I was right about that.

Q.—Now, in respect to the claim of members of G. H. A. to have their complaints and illnesses treated in the hospital by a G. H. A. physician: how, at all, does that vary from the right of any citizen of the District of Columbia, not a member of G. H. A., to go into a hospital in which he has not courtesy staff privileges and there treat a patient? A.—Well, of course, that I think is one of the most outstanding examples of the way this G. H. A. group—I am not referring to their medical staff now; I am referring to the crowd that had the thing in control and who were going to ride roughshod over the situation in Washington in connection with the hospitals; because there isn't a member of this jury who if taken ill tonight could call up a hospital and get in there and be treated by a physician of their choice unless that physician is admitted to courtesy staff privileges in that hospital, but the G. H. A. organization proceeded to take the position that because an individual was a member of G. H. A. they were different and they were entitled to have a privilege denied to every other citizen in the District of Columbia; it boils right down to that.

Q.—What privilege is that to which you refer? A.—The privilege of calling a hospital and saying "Dr. Blank is my physician, and I want to get in there and he is going to take a tumor out tomorrow," and the hospital would have nothing to say whether the doctor was competent to do it or whether the patient was committing hari-kari.

Q.—What was the final action on Dr. Selders' application, if you recall? A.—I recall no action after that action taken in September 1938. I know that Dr. Selders did attend some normal obstetrical cases in the hospital.

Q.—Dr. Willson, did you, at any time, engage in an unlawful combination and conspiracy with any of your co-defendants or with any other person, organization or society, to undertake to restrain trade in the District of Columbia, in violation of the Sherman Anti-trust Act? A.—I did not, and I never contacted anybody in the American Medical Association in this matter in the period covered by the indictment, on that subject or any other; and, so far as my co-defendants are concerned,

with two or three of them I discussed the matter casually from time to time, but I never did more. I was out of office, held no office in the Society; out of any responsible committees, and any conversation I had with any of my co-defendants was in the way of disagreement with some of the steps which were being taken.

Q.—Dr. Willson, you know who your co-defendants are, do you not? A.—Well, I don't know whether I can name them all, but I recognize them.

Q.—I don't want to repeat the names: you may not be able to repeat the names, but you knew all of the co-defendants, individuals and societies, and associations? A.—All of them.

Q.—Now, I want to ask you whether you at any time combined and conspired with your co-defendants, or with any member of the Medical Society of the District of Columbia, not named as defendants, or with any person or persons to the grand jury known or unknown, to restrain trade in the District of Columbia; that is to say, for the purpose of restraining Group Health Association, Inc. in its business of arranging for the provision of medical care and hospitalization to its members and their dependents on a risk-sharing prepayment basis? A.—I never did; never took any action concerning G. H. A.

Q.—Or for the purpose of restraining the members of Group Health Association, Inc. in obtaining by cooperative effort adequate medical care for themselves and their dependents from doctors engaged in Group Health medical practice on a risk-sharing prepayment basis? A.—Never did.

Q.—Or for the purpose of restraining the doctors serving on the medical staff of said Group Health Association, Inc., in the pursuit of their calling? A.—I never did.

Q.—Or for the purpose of restraining doctors not on the medical staff of Group Health Association, Inc., practicing in the District of Columbia, including the doctors so practicing who are made defendants herein in pursuit of their calling? A.—I never did.

Q.—Or for the purpose of restraining the Washington hospitals in the business of operating said hospitals? A.—I never did.

Q.—Dr. Willson, did the Columbia Hospital have any rule or regulation requiring all members on its staff, either regular or special, to be members of the Medical Society of the District of Columbia? A.—Mr. Laskey, as far as my knowledge goes, they never had any such rule until—the only thing I know in that connection about Columbia Hospital is this: that following the final recommendation of the hospital committee, as a result of my motion of November, the secretary sent a communication to the hospitals calling their attention to what I now know as and recognized as the Mundt Resolution of the House of Delegates of the American Medical Association.

Now, the record of the minutes of the Medical Board of the hospitals shows that that matter came up before a meeting of the Medical Board on March 10. I don't know why it was so long getting there, but the minutes of the Medical Board show that on March 10, Dr. Crowley, who is not a defendant here, and who is a member of our staff, moved that the Medical Board recommend to the Board of Directors that it adopt this policy, which was in the Mundt resolution. The Board of Directors evidently received that recommendation and sent back a request to the Medical Board that it rescind that recommendation, and that, according to my best recollection and as refreshed from the minutes, came up before the Medical Board of Columbia Hospital at its meeting of March 28 or 30, 1938, that would be—yes, the action was December 1937: yes, that is right, March 28-30, 1938, and the record in the minutes show that Dr. Willson moves that the Medical Board rescind that, and that action was taken.

CROSS EXAMINATION

By Mr. Lewin:

Q.—I am having difficulty getting all these hospital documents in order, so I may have to proceed rather slowly. Dr. Willson, do you know about the efforts of the defendant Dr. Cutter to get your hospital to adopt and observe what you later learned was the Mundt Resolution in November 1937?

Mr. Richardson:—We object to that and we desire to have the language of Dr. Cutter stated. He made no effort to get that or any hospital to adopt and observe the Mundt Resolution.

By Mr. Lewin:

Q.—I am simply asking whether he knows about the correspondence between Colonel Ashburn, your superintendent, and Dr. Cutter, as to what you later learned to be the Mundt Resolution. A.—I have no recollection as to that; it is a perfect blank, so far as I am concerned.

Q.—You didn't know at all about this letter of Colonel Ashburn, the superintendent, to the defendant Dr. Cutter, dated November 5 saying:

"As for demand that 'physicians on the staff of hospitals approved for intern training should be limited to members in good standing in their local county medical societies,' it meets with the approval of the Medical Board as regards future appointments."

A.—I have no recollection of it. It may have come before the meeting. There were a great many meetings of that Medical Board I never attended; and it is possible that it may have come before a meeting which I did attend. If so, I have no recollection of it.

Q.—You were, however, a member of the Medical Board? A.—Yes.

Q.—And this letter I am referring to you was written two days after that famous resolution of yours?

Mr. Laskey:—I object to the characterization of the resolution as "famous."

Mr. Lewin:—I withdraw it.

THE COURT:—I wish counsel would refrain from characterizations.

The Witness:—From a literary point of view I would say it was infamous.

By Mr. Lewin:

Q.—Well, this doesn't recall anything to your mind at all? A.—No.

Q.—But it rather indicates, doesn't it, that from November 5 on— A.—(Interposing) I didn't read the letter.

Mr. Laskey:—I submit that the witness has testified that he never saw the letter, to his recollection, and now he is being asked if it doesn't indicate something.

THE COURT:—It is argumentative; asking what the action of the superintendent in writing a letter indicates. He says he knows nothing about it.

By Mr. Lewin:

Q.—Well, you wouldn't deny that about that time the Medical Board did say that this so-called demand met with its approval, so far as future appointments were concerned?

Mr. Laskey:—Objected to: it is argumentative.

THE COURT:—Yes. He has stated what the action of the Board was, and his particular action with respect to that.

Mr. Lewin:—All I wanted to find out is whether his position is that the Board didn't pass that approval, or whether he simply doesn't know about it.

THE COURT:—You may ask him that.

By Mr. Lewin:

Q.—Did you intend to deny that the Medical Board— Mr. Laskey (interposing):—That is not what your Honor indicated he might ask.

THE COURT:—He may state whether or not this letter changes his recollection as to what the Medical Board did. I think that would be satisfactory.

The Witness:—Mr. Lewin, the only recollection I have—I assume you are referring to the Mundt resolution—the only recollection I have about the matter is what I testified to on direct examination as to the meeting with Dr. Crowley, and that I moved that the action of the Board be rescinded; that is my only recollection about that. I am definite about that, because I recall also I stated to the Medical Board that it took in people who could pay their dues; it would tend to keep them out, and I wasn't for it.

By Mr. Lewin:

Q.—You did see Dr. Selders' application, made in the fall of 1937? A.—You say I saw it?

Q.—Yes. A.—I couldn't say I saw it. It was probably read. It was undoubtedly read; it must have been read.

Q.—It was referred to the Medical Board, of which you are a member? A.—Yes.

Q.—And I suppose you voted with regard to the recommendation on the application? A.—Every time I was present I voted; I do not mean to intimate that I was ever present and did not vote.

Q.—So it would be safe to say that you read it and knew its contents? A.—Safe to say I knew its contents.

Q.—And isn't it true that the application followed the usual form and gave you information as to his birth, his education and his experience; his teaching experience; his hospital experience, and then his references? A.—So far as I know. I have no recollection to the contrary.

Q.—And don't you remember that he gave you the names of certain gentlemen, doctors to whom you might write to get

information with regard to him and his qualifications? *A.*—I have no recollection as to that. I assume he did; I have no recollection of any names of individuals.

Q.—Do you have any recollection now of having received any letters from his references? *A.*—No. Well, now, I have recollection that such letters were received and read to the Board, but other than that—as to who wrote them—I have no recollection.

Q.—And that must have entered into your consideration of his application? *A.*—Well, that question I couldn't answer because I have no recollection of their contents.

Q.—Don't you know, as a matter of fact, that the only two persons listed on the application to which the Columbia Hospital wrote were the Worcester City Hospital and the Harris County Medical Society? *A.*—Well, within the last few weeks, within the last two weeks, my recollection; from my discussion with a fellow member of the Medical Board, my memory has been refreshed on that point, but if it had not been for that, I would have no recollection.

Q.—It would be the usual thing and expected thing for your board to communicate with the references that are given? *A.*—I think so, if there is any question involved in the applicant's fitness that probably would be done.

Q.—And this application leaves a space for the names of references, so it contemplates references should be furnished? *A.*—I have no visual picture of the application blank at the present time; I have no idea what it looks like, what it calls for.

Q.—You would think if you were going to investigate the qualifications of a doctor that would be one of the sources you would turn to? *A.*—Yes.

Q.—But you have refreshed your recollection so that you know that the references were confined to the Worcester Hospital and Harris County Society? *A.*—Are you referring now to his qualifications in surgery?

Q.—I am referring to all his qualifications. *A.*—I want to be perfectly fair. I have no recollection about this thing, that is as to his surgical qualification, except the thing was referred to the Washington Academy and that was their responsibility.

Q.—Now, I am going to show you what purports to be a letter which Colonel Ashburn, the secretary of the medical board, wrote to the Houston Medical Society, that would be the Harris County Medical Society? *A.*—I assume so.

Q.—He says, doesn't he:

"I am directed by the Medical Board of this hospital to seek your aid in determining the qualifications of Dr. Raymond E. Selders, who practiced in Houston from 1928 to 1935, for doing major and gynecological surgery and operative obstetrics.

"Dr. Selders is an employee of a medical cooperative or insurance organization recently formed by employees of the Home Owners Loan Corporation. This movement has received national attention and has excited much opposition in local medical circles. Dr. Selders, while apparently a generally well trained man, has not submitted evidence of the special training and experience usually demanded by this hospital of men seeking the privilege of doing operative work in gynecology and obstetrics.

"Because of the special circumstances of the particular case and the Board's desire to act in a fair and judicial manner, any assistance you can give it will be greatly appreciated and will be held confidential.

"Very truly yours,
"P. M. Ashburn, M.D."

Q.—Now, were you a member of the Medical Board that gave instructions to Colonel Ashburn to write that sort of a letter? *A.*—What is the date?

Q.—Nov. 25, 1937. *A.*—I was a member of the Board but whether I was at that meeting I have no recollection, and I have no recollection of giving any such instructions.

Q.—As a matter of fact, you would say it was true, and known to the Medical Board? *A.*—As you read it, I heard nothing that wouldn't be true, and it is under Colonel Ashburn's signature.

Q.—It calls attention to G. H. A.? *A.*—Yes.

Q.—And that is the "movement" which he says has received national attention and has excited much opposition in local medical circles? *A.*—Yes.

Q.—I wonder whether you are familiar with the letter which the secretary of the Harris County Medical Society wrote back in answer to this letter. It is dated Dec. 2, 1937. Here is a letter from Secretary Coole of the Harris County Medical Society. Did that come to the attention of the Medical Board? *A.*—It may have done so. I think I would have recognized that signature if I saw it before. I have no recollection of it.

Q.—You would say in ordinary course this information would generally be given you. Doesn't he tell you this:

"Dr. Selders is a member of this society in good financial standing. His record here is clear and shows that he is academically and professionally well qualified. I have been given to understand that recently

he completed his Master's degree in Surgery at the University of Pennsylvania which should further qualify him."

And then he says:

"The Harris County Medical Society strongly condemns any such practice and if the allegations are found to be true, Dr. Selders will be subject to disciplinary action on the part of the Society."

Q.—Does that refresh your recollection that that information came as a result of that reference? *A.*—None whatsoever. I have no recollection of having seen it before.

Q.—You think perhaps you voted without that information and knowledge before you? *A.*—I am afraid you will be getting me in bad with the Board of Directors but the fact is I didn't attend many meetings, especially at this time.

Q.—Didn't Colonel Ashburn on the same day that he wrote the Harris County Medical Society send a similar letter to the Worcester City Hospital? *A.*—All I can say is I recognize his signature here. I have no recollection of that. Understand, I may have known about it at the time, but the matter wasn't of sufficient importance to me to make any definite impression. It was a few years ago, and I just don't remember.

Q.—I wonder if this information which Dr. McIver forwarded came to your attention? *A.*—Neither could I answer that. I can say that within the last week I learned, or my memory was refreshed to the effect that there had been a communication from the Worcester Hospital, but as of November 1937 I have no recollection of it as of that date.

Q.—Your memory has been refreshed as to those facts then? *A.*—No, my recollection is that I was informed here recently that there was a communication from some individual in Worcester.

Mr. Richardson:—We object to this method of examination. The witness has said over and over again he knows nothing about this, and counsel continues to examine him with reference to it.

THE COURT:—Yes, the witness disclaims any knowledge of the letter; therefore as to him its contents are not a proper basis for question.

Mr. Lewin:—He said he had refreshed his recollection as to the letter fairly recently.

THE COURT:—He says that he has not refreshed his recollection; he says his recollection is that he was informed recently of something of the sort.

The Witness:—I beg your pardon. I didn't say it refreshed my recollection about that particular letter. I said it refreshed my recollection that there had been some letter from Worcester.

Mr. Lewin:—All I want to know is whether he knew about this before voting on Dr. Selders' application.

THE COURT:—Ask him that.

Mr. Richardson:—He has replied three times that it doesn't refresh his recollection.

THE COURT:—Ask the question.

By Mr. Lewin:

Q.—Does this refresh your recollection as to the facts which the Worcester City Hospital supplied the Medical Board and your hospital?

Mr. Richardson:—I suggest the witness be permitted to read the letter and then answer the question.

THE COURT:—Yes, that is the proper method. If it doesn't refresh his recollection there is no basis for examining the witness about it.

The Witness:—Now, what is your question?

By Mr. Lewin:

Q.—I want to know whether the letter refreshes your recollection that these facts were before the Medical Board some time before you voted against Dr. Selders. *A.*—I couldn't say. It doesn't refresh my recollection as to whether this specific letter or these specific facts were before the Board the result of this letter, but I know that such facts were before the Medical Board. Whether they came from this particular source or not, I could not say.

Q.—Were these facts before the Board: that Dr. Selders had served a residency in the Worcester City Hospital in surgery between the dates July 1, 1936 and July 1, 1937, coming to that institution from the Pennsylvania Post-Graduate School, where he had taken a course in surgery the previous year? That as to the number of operations he performed, the only accurate figures would have to be gained from a survey of a large number of records, but scanning the operating schedules for the year he was listed at the Worcester Hospital to operate on 273 cases, of which a hundred and ninety might be classed

as major and 83 as minor. That these figures did not necessarily mean that he had performed these operations himself.

"He may have elected to assist someone else in the operation, or does it mean that this is all the operating that he participated in. He may have assisted or otherwise participated in considerably more than are shown here."

Doesn't it also give you these facts:

"Dr. Selders was a resident on the surgical service here and, therefore, did not figure to any particular extent in obstetrical work. Gynecology is here absorbed in general surgery and one may assume that he had considerable contact therefore with gynecological surgery."

Those facts, you say, were before the Board as to his experience in the Worcester City Hospital at the time they denied his application? *A.*—I assume that similar facts were before the Board, but I have no recollection of these specific facts. I could comment on them if you want me to, but it would not be a question of recollection.

Q.—You are not sure then whether the Board knew of Dr. Selders' experience at the Worcester City Hospital? *A.*—I assume that is absolutely true, but you ask me to recall things from my memory as far back as 1937, which I am frankly unable to do.

Q.—I appreciate that. I am not trying to overtax your memory; I am trying to refresh it. *A.*—It is easy to overtax it.

Q.—I think you did say that you referred this application to the Washington Academy of Surgery, in so far as it was for general surgical privileges? *A.*—Yes.

Q.—And is it not true that the response which the Washington Academy of Surgery gave you was simply this: I am reading now from Government's Exhibit 447-A. It is dated Jan. 31, 1938:

"I have today been informed by the Committee on Hospital Privileges that they recommend the disapproval of the application of Dr. Raymond E. Selders to do general surgery.

"Very truly yours,
"F. C. Fishback."

Q.—You didn't receive from the Washington Academy the grounds on which his application was turned down? *A.*—Evidently not; I certainly have no recollection of the grounds being discussed before the Board.

Q.—I think you testified on direct examination that you referred the application to the Gynecological Society, as regards his application for obstetrics and gynecology. *A.*—I have a recollection that was done; I know it was the usual thing. I am not sure how I learned it was before the Gynecological Society but I know it was. It was the usual routine to do it.

Q.—How long had it been usual routine? *A.*—It wouldn't go back very far because the Gynecological Society had not been in existence only, I should say, a matter of six or seven years.

Q.—Six or seven years? *A.*—Yes.

Q.—As a matter of fact, didn't it go back only to 1937, and just one month—the same month, as this application; that is this custom to send applications to the Gynecological Society? *A.*—I thought your question had reference to how long the Society had been in existence.

Q.—I got the impression from you that Dr. Selders' application was sent to the Gynecological Society pursuant to a course of dealing that had carried on from six to seven years. *A.*—If I made that statement it was an inadvertence. As to our custom, I have no recollection as to when it started.

Q.—As a matter of fact, wasn't that practice started just at that time, the time of the Selders application? Do you think I can refresh your recollection as to that at all? *A.*—I don't know whether you can or not. I begin to have a hazy recollection as to the matter of referring such applications to the Gynecological Society having been discussed with the Board, but my memory couldn't be refreshed as to when it occurred, except to recognize that this signature here on this communication is authentic.

Q.—Let me show you Colonel Ashburn's letter to the Society, referring to Dr. Selders' application.

"I am directed by the Medical Board to request your cooperation and advice as proffered by your letter of Oct. 19, 1937?"

A.—I would say the signature of Colonel Ashburn is absolutely authentic.

Q.—It indicates, does it not, that this was the first time gynecology was resorted to? *A.*—I wouldn't say that, but it indicates it was in November 1937.

Q.—That in 1937 you got an offer from the Gynecological Society that it would consider applications if referred to it for the first time?

Mr. Laskey:—Does it say anything about the first time?

Mr. Lewin:—I can go further into it if you want. I was merely trying to shorten this up.

The Witness:—I wouldn't question this at all. I may have been in error in thinking it was earlier adopted, but I have no recollection of it.

By Mr. Lewin:

Q.—Well, it says here:

"I am directed by the Medical Board to request your cooperation and advice as proffered by your letter of Nov. 19, 1937."

That, of course, would be the Gynecological Society's? And here, "in the matter of obstetrics." *A.*—I would say it was absolutely authentic, but I still say I have no recollection of it whatsoever.

Q.—I see. Again with the Washington Gynecological Society, when it reported it simply recommended against Dr. Selders without giving any ground for the recommendation, did it not? *A.*—I have no recollection of their having stated any ground.

Q.—You do remember that the Medical Board did not consider any grounds as mentioned by the Gynecological Society? *A.*—None.

Q.—Did you interview Dr. Selders yourself? *A.*—No.

Q.—You didn't? *A.*—My experience with Dr. Selders consisted of seeing a strange doctor in the corridor once and asking a nurse who he was and being informed that he was Dr. Selders.

Q.—You didn't observe his operations or his technic? *A.*—He didn't do any operations; he handled a few normal obstetrics.

Q.—Of course, that would be one way to judge his qualifications, to see him in action? *A.*—Very decidedly, if the action was sufficiently broad.

Q.—As a matter of fact before your medical board passed on this application: let me ask you whether or not you had anything more before you than simply the turn down unexplained of the Washington Academy of Surgery, and the turn down unexplained by the Gynecological Society?

THE COURT:—What do you mean by the "turn down"?

Mr. Lewin:—The refusal of the Academy and the Gynecological Society.

THE COURT:—I think it is better for counsel not to characterize these words and these actions.

Mr. Lewin:—It is simply a question of my faulty English; I don't think there is anything else in it.

THE COURT:—Go ahead.

Mr. Lewin:—I will strike the question altogether.

By Mr. Lewin:

Q.—Did you have anything before you when you voted against Dr. Selders' application except this unexplained recommendation of the Washington Gynecological Society, the unexplained recommendation of the Washington Academy of Surgery, and possibly this information with regard to his experience at Worcester, and the information contained on his application? *A.*—Well, as far as my recollection goes that would be a true statement of facts, the proviso, of course, being that you will recall that he applied in the four categories—general surgery, major obstetrics, gynecology and normal obstetrics and, as far as his qualifications in obstetrics and major gynecology were concerned, as I testified on direct examination, I didn't require the reference to the Gynecological Society, because I could gage that myself.

Q.—You could gage it without meeting the man or seeing him operate? *A.*—I could gage it on that letter you just showed me. He doesn't say anything there about obstetrics.

Q.—What about gynecology? *A.*—Shows worse; shows training in a hospital where gynecology was absorbed in general surgery, and if there is any worse training for a gynecologist than that, I can't tell you what it is.

Q.—It does show that his training in gynecology might be considerable though, doesn't it? *A.*—It shows him in general surgical service, and I would say it would certainly not be considerable from the point of view of putting a man in a position of turning him loose in a hospital in gynecology. It wouldn't show he was competent to do that at all.

Q.—You remember it did give this information: this is from the superintendent of the hospital, "One may assume that he had considerable contact, therefore, with gynecological surgery?" *A.*—I testified that wouldn't mean a thing to me, because, as stated in the letter, that was all absorbed in general surgery.

Q.—But you didn't go any further to find out what that considerable contact with gynecological surgery might be? *A.*—I am talking about this letter you let me read; I am not talking about my other conclusions.

Q.—The point is you didn't make any investigation to find out whether he was qualified or not? A.—I wouldn't say that; I think we made a very good investigation.

Q.—The one you told me of here in this testimony? A.—Entirely sufficient for passing on that candidate, under the circumstances disclosed in his application and in this letter. Remember, this is a special hospital. It is one that has a very wonderful record throughout the country in obstetrics and gynecology, and it is not taking any chances in putting a man of uncertain ability on its staff.

Q.—Did your hospital admit him to the courtesy staff? A.—Yes. As I testified, when he separated his requests, when it came up as a separate proposition. The first time, it was coupled with his request for general surgery and major obstetrics and gynecology. When it came up as a separate proposition, I have already testified that motion was made to consider the application and he was turned down, and I moved to advise the board of directors that it was inadvisable to take any action at that time, and the result of that motion was that he did have privileges in the hospital in normal obstetrics during the pendency of his application.

Q.—But he was not admitted to the courtesy staff at any time? A.—Only indirectly. As I testified, he did see patients there, Mr. Lewin.

Q.—Was he ever admitted to the courtesy staff of the hospital to do anything? A.—No, except that the result of that action was that he did bring patients in. It is hair-splitting, it seems to me. He was not formally placed on the courtesy staff, but he did have the privilege of bringing normal cases in there for a time.

Q.—Did this letter come to your attention, the letter from Dr. Selders to the hospital, dated April 23, 1938, supplying you with more details in regard to his abilities (handing a paper to the witness)? A.—I have no recollection of ever having seen that letter in my life.

Q.—Did you know that Colonel Ashburn wrote to Dr. Selders in April 1938 asking for more information? A.—I may have known it, but I have no recollection of it.

Q.—Does this letter refresh your recollection as to the facts? A.—Not the least bit.

Q.—Before the Medical Board? A.—No. It is apparently brand new to me. I have no recollection of it whatsoever; none.

Q.—Did you know that Dr. Selders, some time in the spring of 1938, withdrew his application for operative obstetrics? A.—As I testified, I knew that at some time; I could not state when it was. His request was separated into the different categories.

Q.—And he finally asked simply for privileges in normal obstetrics and in major surgery; is that true? A.—In gynecology, was it not? Major gynecology and normal obstetrics.

Q.—Did you see this letter of Dr. Selders of Sept. 2, 1938, Government Exhibit 389? Only a portion of it, I believe, is in evidence, however.

Mr. Laskey:—Will you point out to the witness, please, the portion that is in evidence?

Mr. Lewin:—Yes. This is in evidence (indicating). These things with circles around them are not (indicating).

A.—Am I to consider what is not in evidence?

By Mr. Lewin:

Q.—I think you can consider it all and see whether it refreshes your recollection. A.—This letter I don't recall ever having seen, but it refreshes my recollection to the extent that I know there was a request made for separation of his application into different classes. I think that there is an inadvertent error here on Dr. Selders' part, where he says here that—

"I wish to renew my request for permission to do major surgery in Columbia Hospital for Women."

I suppose he means there, Class 1 in gynecology. I do not know whether he means general surgery. He says major surgery.

Q.—Does he not follow that by a statement of his training which refers to general surgery? A.—Well, as far as the context goes, it looks as though he was referring to general surgery; but the action of the Medical Board in the same month of September 1938 was based on an application in Class 3, which was normal obstetrics, and Class 1, which is major gynecology, and does not refer to major surgery in the sense of general surgery.

Q.—Is it not true that he specifically in another communication withdrew his application for operative obstetrics? A.—I have no recollection of it, Mr. Lewin; but I assume it is true, from the fact that he did not come before the Medical Board at that meeting.

Q.—Look at his letter of April 23, 1938 and see if you remember that. Did I show you that before? A.—I think you did.

Q.—Let me show you this particular paragraph (indicating). A.—Yes.

Q.—Does not that rather indicate that he withdrew his application for operative obstetrics? A.—It definitely indicates that. He says he withdraws his request.

Q.—So that his broad request had been narrowed considerably, had it not? A.—By that letter, yes. I testified that I knew it had been narrowed, but I didn't know when it occurred. That refreshes my memory.

Q.—But the fact that it was narrowed still did not give him his admission? A.—It finally gave him the privilege of attending cases in Class 3.

Q.—Tell us something about the Washington Gynecological Society. Is not that a society whose membership is composed exclusively of members of the District of Columbia Medical Society? A.—My recollection of its constitution is that it is a requirement for membership that a member of the Gynecological Society should be a member of the District of Columbia Medical Society.

Q.—So that when the hospital referred Dr. Selders' application to it, it was simply referring it over to a group of the District of Columbia Medical Society?

Mr. Laskey:—Is it not better to suggest that it was referring it over to a group, each member of the group being a member of the Medical Society?

Mr. Lewin:—I will adopt that suggestion.

A.—Yes. That leaves out the word "simply," and that is all right. That is proper.

By Mr. Lewin:

Q.—Who were the active men in the Washington Gynecological Society in the fall of 1937 when Dr. Selders' application came before it? A.—I can say in a general way that it would be the leading specialists in that line in Washington, but as to what particular group of them were active at that time I have no recollection. I am afraid that my attendance at meetings of that organization was very poor.

Q.—Let me see if I can refresh your recollection a little bit from my notes of the minutes of the Council of the Washington Gynecological Society, Nov. 18, 1937. A.—Where was that held, Mr. Lewin?

Q.—I do not know that.

Mr. Lewin:

Q.—Was Dr. Crowley your chief of staff at Columbia? A.—We do not have a chief of staff. We have a president of the Medical Board.

Q.—Was he the president of the Medical Board? A.—At that time?

Q.—Yes; in the fall of 1937 and the spring of 1938. A.—He very well may have been, only because I know that he brought back from the board of directors the Mundt Resolution request that we rescind our action, and the minutes said Dr. Crowley brought that back. Therefore if he attended a meeting of the board of directors he would have been the president of the Medical Board at that time.

Q.—Let me see if I understand that. When the resolution of December 1 of the Medical Society which recommended that your staff be limited to members of the A. M. A.—A.—That was the recommendation of the Hospital Committee.

Q.—Dr. Crowley was a member of the Hospital Committee, was he not? A.—That I could not say.

Q.—I think it appears in evidence that he was. A.—He may have been.

Q.—At any rate, when it came to your hospital he was a director of your hospital at that time? A.—That I have no recollection of. I testified that I could not understand that that action was taken the first of December 1937—wasn't it?

Q.—Dec. 1, 1937. A.—But my recollection of the resolution which was adopted by the society on the advice of the Hospital Committee, its ever being before the Medical Board, was refreshed by looking at the minutes of March 10, and I am at a complete loss to understand what happened to it in the meantime. I have no recollection, you see.

Q.—Apparently, though, your Medical Board, in the spring of 1938, recommended its adoption to the directors. A.—It did at the meeting of March 10 on the motion, as I recall it, of Dr. Crowley.

Q.—And on your Medical Board, in addition to yourself, was Dr. Sprigg, one of the defendants in this case? A.—He was a member of the board at that time. Whether he was present at the meeting or not I don't know. There is no evidence that I was present at the meeting, and I have no recollection of it.

Q.—And then the directors suggested that the request from the Medical Board be withdrawn and you moved to withdraw it, and it was withdrawn; is not that correct? *A.*—That is correct. That was at a subsequent meeting, in October.

Mr. Richardson:—Mr. Lewin, I think you are slightly in error. His motion was not that it be withdrawn. His motion, after it was withdrawn, was that their previous action be rescinded.

The Witness:—That is correct. The request came from the board of directors to the Medical Board that it rescind its action in recommending the adoption of that policy, and I moved that that action be taken. That is correct.

By Mr. Lewin:

Q.—That policy would be identical with the Mundt Resolution, and you so understood it? *A.*—The policy that we were asked to rescind?

Q.—Yes. *A.*—I would think so, absolutely. But, as I say, I never heard of the Mundt Resolution until I was in this court room.

Q.—Did you know that Dr. Hulburt, a Group Health Association doctor, applied for obstetrical privileges at your hospital? *A.*—I have a hazy recollection of it. I wouldn't recognize the name. I do know that there was some younger man, late in 1938, that applied; but that is as far as my recollection goes.

Q.—I wonder if I could refresh your recollection by showing you my notes of the minutes of the Executive Committee of April 18, 1938 (handing papers to the witness). *A.*—What is this—the meeting of the Executive Committee of the Medical Board?

Q.—Let me show you the minutes of the board on April 14, 1938. *A.*—Have you anything that shows the officers of the board at that time, when Crowley was president?

Q.—I understand Crowley was president.

Q.—Dr. Sprigg was there. He was a member of the board of directors, was he not? Or did he have privileges of the meeting? *A.*—Then there must have been two of them privileged to attend, Dr. Crowley and Dr. Sprigg. My recollection is that at one time one member only of the Medical Board served on the board of directors, and then later on it was changed to two. I don't remember when that occurred.

Q.—Let me go back to the minutes of the Medical Board of April 14, 1938. Does not that refresh your recollection that the application of Dr. A. S. Hulburt for privileges in Class 3 was tabled? *A.*—No; I have no recollection of it at all. The minutes may show whether I was present at that meeting. There were a whole lot of meetings that year particularly that I never attended, and I may not have been there; so I have no recollection of it at all.

Q.—Did you know that he resigned from Group Health Association on April 25? *A.*—I may have known it at the time, but I have no recollection of it.

Q.—Did you know that he was given Class 3 privileges at your institution in early June 1938? *A.*—I have no recollection of that, Mr. Lewin. You see, this whole thing was minor, as far as I am concerned.

Q.—Perhaps it was, but I am trying to get the facts. *A.*—That is all right. I am merely trying to excuse myself for not remembering well.

Q.—Will you look at my notes on the minutes of the meeting of the Medical Board on June 9, 1938? Dr. A. S. Hulburt's application was approved for Class 3 on that date, was it not? *A.*—What are you asking me?

Q.—Whether that refreshes your recollection that after April 25, to wit, in June of 1938, he was approved for Class 3 in your institution. *A.*—I am terribly sorry. All it does is to bring back a hazy recollection to me of having heard that name before the Medical Board.

Q.—Is not your hazy recollection this, that Dr. Hulburt applied when he was a member of Group Health Association and was not given privileges, and his application was tabled until after he resigned from Group Health Association, and then a little over a month afterwards he was given privileges there? Is not that your recollection? *A.*—It is awfully hard for me to separate in my mind what I remember and what I know now; but it begins to clear up in my mind a little; yes.

Q.—Would you say that my question is correct? *A.*—I have no doubt it is correct. In fact, if you ask me if it is so, I would say yes, undoubtedly, because the record seems to show it.

Q.—Would you testify that his connection with Group Health Association had something to do with postponing it until after he had resigned? *A.*—I have no recollection of that.

Q.—Dr. Halstead, another Group Health Association doctor, testified that he applied at your hospital. Do you recall that? *A.*—I do not even have any recollection of there ever having

been a Dr. Halstead connected with the G. H. A. or having applied.

Q.—Were you not present at the meeting of the Medical Board on Dec. 9, 1938? My notes show that you were. *A.*—Maybe I was, but I have no recollection of it.

Q.—Dec. 9, 1938. Do not these notes refresh your recollection to this extent, that on that day the application of Dr. Clark D. Halstead for Class 3 privileges was postponed pending further information? *A.*—I have no recollection whatsoever.

Q.—Would you say that you attended that meeting? *A.*—If the minutes say so. I have no recollection of it at all. I do not know any more about where I was on December 9 than you do, I guess.

Q.—I suppose you would not question that that was the treatment that was given his application? *A.*—No.

Q.—Would you say that his connection with Group Health Association had something to do with deferring action from August, when he applied, to December 1938, and then deferring it further at that meeting? *A.*—What was he applying for?

Q.—Class 3 privileges, normal obstetrics—isn't it? *A.*—That is normal obstetrics. And you are asking me what?

Q.—Whether, in your opinion, his connection with Group Health Association accounted for the fact that although he applied in August his application was deferred until Dec. 9, 1938? *A.*—I cannot answer that positively. There were other factors coming in at that time. Everybody who was applying there at the same time was postponed because the hospital staff was so full that we could not take care of patients. Whether that action was in connection with this or not I don't know. I have no recollection of any discussion about the G. H. A. in connection with Dr. Halstead, or anything about it. I don't even recollect that there was such a man.

Q.—Coming back to the Washington Gynecological Society and the people active there, would you say that Dr. Jacob Kotz was active in the Washington Gynecological Society? *A.*—I know he is a member of it, but I have no—what do you mean by active, Mr. Lewin?

Q.—I was going to call your attention to the people present at the Nov. 18, 1937 meeting which seems to have preceded this offer of the Gynecological Society. You have already stated that Dr. Crowley was there. What about Dr. Sylvester? *A.*—What about him?

Q.—Was he on the staff of Columbia? *A.*—Yes.

Q.—A member of the Medical Society of the District of Columbia, of course? *A.*—Right.

Q.—Dr. Pagan? *A.*—He is not a member of our staff at Columbia, but I assume he is a member of the Medical Society—yes; I know he is a member of the Medical Society.

Q.—Dr. Jacob Kotz? *A.*—He is not a member of our staff at Columbia. He may have been at that time—not of our senior staff. He may have been an associate or something.

Q.—Was he not vice-president of the District of Columbia Medical Society at that time? *A.*—He may have been; I don't know.

Q.—Dr. Stanton—was he a member of your staff at Columbia? *A.*—No. I am sure he has courtesy privileges there, but he is not a member of the staff. You get mixed up between what you mean when you say "staff"—between the courtesy and the attending staff. He undoubtedly has courtesy privileges.

Q.—How about Dr. McNitt? *A.*—He was a member of our attending staff.

Q.—He was the man to whom Colonel Ashburn wrote with reference to Dr. Selders' application to the Washington Gynecological Society, and he is the man—*A.*—I suppose he was the secretary of the Gynecological Society.

Q.—Is not this his letter (indicating), saying that the Washington Gynecological Society does not consider these doctors qualified for operative obstetrics? *A.*—Yes. He was a member of the staff.

Mr. Laskey:—What doctors?

Mr. Lewin:—Dr. Oliver Cox, Dr. Richard Castell and Dr. Raymond E. Selders.

Q.—I am not sure how you testified on your direct examination with regard to the action which was taken Sept. 19, 1938, by your Medical Board. See if I can refresh your recollection about it. Is it not true that at that meeting there were present Dr. Crowley, Dr. Sylvester, Dr. McNitt, Dr. Willson, Dr. Sprigg, Dr. Mondell, Dr. Cajigas, Dr. Copeland and Colonel Ashburn? *A.*—That is the way the minutes read.

Q.—These are my notes. *A.*—I have no recollection of it. For instance, Mr. Lewin, I have no recollection of this meeting at all, except that it is in the minutes, and I might refresh my recollection from it. I certainly could not say who was there. There is the list (indicating), and I have no doubt they were all there.

Q.—Refreshing your recollection further, is it not true that Dr. Sprigg moved to reconsider Dr. Selders' application for Classes 1 and 3 and that he be not endorsed? *A.*—That is undoubtedly so.

Q.—And is it not true that it was discussed by various members present, including yourself? *A.*—I assume so, from the minutes.

Q.—Did you not move a substitute resolution that the board consider it inadvisable to act at this time on the application? *A.*—That is right.

Q.—And that resolution was carried, was it not? *A.*—It was carried before the Medical Board and received the approval of the board of directors. The net result was that Dr. Selders, instead of being denied privileges in Class 3, practically got privileges in Class 3 during the pendency of his application, as I understand it.

Q.—As a matter of fact, you remember that when that resolution that you sponsored came before the directors the superintendent reported that Group Health Association had again asked for the granting of privileges to these doctors? Were you there? *A.*—I don't suppose I was. No; I would not be present at that meeting.

Q.—I understood you to say on your direct examination that when you first learned of Group Health Association on May 16, 1938 it was at Dr. Morgan's office; and with reference to Section 5—and I am going to call it Section 5 for brevity, and not go through the rest of it. That is the only Section 5 involved, is it not? *A.*—Yes. Thank you very much.

Q.—Section 5 of the constitution had been in force for 14 months? *A.*—It had been in force a year before the preceding January. That was in 1937, was it not?

Q.—Did you not mean by that testimony that it had been in force as Section 5, but in a radically different form and substance? *A.*—No; I did not. I testified that it had been modified.

Q.—You testified it had been modified only in some minor particulars. *A.*—It seemed to me to be minor.

Q.—Is not this the way it read when it was adopted Jan. 8, 1936:

"No member of the Society shall engage in any professional capacity whatsoever with any organization, group, or individual engaged in the practice of medicine unless the Society has received proof that the profits from such practice inure to the benefit of the medical profession only."

A.—I assume it was. I know it was a different form.

Q.—Did it not remain in exactly that form until March 3, 1937 for a period of fourteen months? *A.*—That is my recollection, precisely.

Q.—Is it not true that so worded it would not be a justification for withholding contact with Group Health Association?

Mr. Laskey:—I object to that as argumentative, your Honor.

THE COURT:—Objection sustained.

By Mr. Lewin:

Q.—Were you not aware, when you heard about Group Health Association and as you discussed it later, that it was a nonprofit organization and that there were no profits to accrue to anybody? *A.*—I probably did.

Mr. Laskey:—If he proposes to connect that with this action, your Honor, the witness has testified that he first heard of Group Health in May, six months after this action.

Mr. Lewin:—My offer is to show that this section of the constitution, which was in force all through 1936 and the early part of 1937, could not have any relation whatever to Group Health Association, but I want to follow that up by showing that the change could bring Group Health Association directly under it.

THE COURT:—That may be, but his testimony is to the effect that he knew nothing of Group Health until after March 1937.

Mr. Lewin:—Yes; that is correct.

THE COURT:—Then, how could that connect his knowledge with Group Health?

Mr. Lewin:—All I want to show now is the simple fact that when he did learn about Group Health Association he found it was a nonprofit organization.

Mr. Laskey:—Ask him what he did find about it.

Mr. Lewin:—I have him on cross examination and I am permitted to lead him.

Mr. Laskey:—I do not object to your leading him.

Mr. Richardson:—Let me make my position clear, if your Honor please. My objection is that the legal proof here is to the contrary as to Group Health Association being a nonprofit organization.

Mr. Lewin:—Will you state to the court what that proof is?

Mr. Richardson:—I have in mind the brief which you filed in the Court of Appeals in which you urged that it was a profit corporation.

Mr. Lewin:—Certainly my brief is not proof in this case, your Honor. I have not referred to the brief for some time, but I seriously question any such representation in it.

THE COURT:—Let us not go back to that. Put your question.

By Mr. Lewin:

Q.—When you learned about Group Health and when you discussed it, did you not understand it to be a nonprofit organization? *A.*—I think so; definitely; yes.

Q.—So that if Section 5 had remained unamended it could not apply to Group Health Association. Is not that clear?

Mr. Laskey:—I object as argumentative.

THE COURT:—Objection sustained. It is purely argumentative.

Q.—On March 3, 1937 it was amended to read as follows, was it not:

"No member of the Society shall engage in any professional capacity whatsoever with any organization, group, or individual by whatever name called or however organized, engaged in the practice of medicine within the District of Columbia or within ten miles thereof, which has not been approved by the Society."

I will not read the rest, because that is with reference to the machinery. But is not that the way it read when you amended it? *A.*—I assume it did. I never carried it in my mind.

MARCH 26—AFTER RECESS

TESTIMONY OF DR. PRENTISS WILLSON

CROSS EXAMINATION (RESUMED)

By Mr. Lewin:

Q.—Dr. Willson, I was questioning you when we adjourned with regard to the amended Section 5. Now, isn't it true that on March 3, 1937, that section became substantially changed from what it had been before? *A.*—Well, Mr. Lewin, that was never my understanding of the matter. The section was introduced originally, and was so understood in the Medical Society always, as a method for controlling the practice of members and the relations of the Society to members who were engaged in contract practice under the Workmen's Compensation Law.

Q.—But by its terms it was not limited to Workmen's Compensation clinics, was it? *A.*—Oh, no, but I mean that was what lay back of its ever having been introduced.

Now, to continue to answer your question, I personally never had the feeling—I don't recall the wording of the thing in either form in my mind—but I never had the feeling that it was substantially changed.

Q.—Before March 3, 1937, it applied only to organizations where profit accrued to laymen, whereas after that date it applied to all persons practicing medicine and to all organizations practicing medicine whom the Society did not approve of for any reason it chose; is that right? *A.*—May I compare them? Will you show me where the two are?

Q.—So that we will be clear about it, isn't this true: that before the change it simply limited your members from having participation in clinics where profit from those clinics went to laymen, whereas after the change it forbade members from having any participation whatsoever with any persons practicing medicine if those persons were not approved by the Society for any reason?

Mr. Richardson:—We object to the question on the ground that it calls for a conclusion of the witness and is purely argumentative; further, the documents speak for themselves.

Mr. Lewin:—I am simply asking for the understanding of the witness.

THE COURT:—I think that is strictly true, Mr. Richardson; however, the doctor has stated his understanding to be that there was no substantial change, and it may be that this cross-examination is reasonable.

By Mr. Lewin:

Q.—Isn't it true that before the change it forbade your members from having anything to do merely with clinics that had a profit, where some of that profit went to laymen, whereas after the change it forbade your members from having anything to do with any persons practicing medicine unless they were approved by the Medical Society, for any reasons the Medical Society saw fit? *A.*—Well, I testified, and I think as I read this now, that this latter provision seems to me to be more inclusive, from the point of view of its wording; but from the point of view of my understanding of the practical application of the thing, I never had any opinion that there was any difference.

Q.—But I want to be clear about this, and I should like to have a direct answer, if you can make it, to my question. *A.*—I think I stated that: that I thought that more inclusive. The language here was more inclusive.

Q.—But isn't it so inclusive as to bring about the result which I have indicated in my question?

Mr. Richardson:—I object to that as leading and calling for a conclusion of the witness.

THE COURT:—Yes, I think that is true. I think the doctor has explained his previous answer, and it now reduces itself to a mere comparison of the words or the language.

Mr. Lewin:—It seems to me that it leaves it in some confusion, with the testimony simply being that it was more comprehensive later. I should now like to have a definite expression.

THE COURT:—You have the answer. You, of course, could pick out anybody in the courtroom and ask him to give you his understanding of the language of those two sections, and the result would be the same. It is purely an opinion of language.

Mr. Lewin:—Well, I wanted to get the practice under it.

THE COURT:—I think it has gone far enough. He has told you the practice. He has told you he understood that its application was intended for the same purposes.

By Mr. Lewin:

Q.—Didn't you understand that its application would apply to the Group Health Association? A.—No, never in the world, because I had had no knowledge of Group Health Association for two months later or more.

Q.—But when you did get knowledge of Group Health Association, didn't it occur to you that this language would apply to Group Health Association?

Mr. Laskey:—I object to that.

THE COURT:—Objection is sustained.

By Mr. Lewin:

Q.—As a matter of fact, didn't you invoke this other section with regard to Group Health Association? A.—I never did.

Q.—Didn't you? Well, let's see. You testified that you presented this resolution, did you not? A.—Yes.

Q.—At the November 3 meeting of the Society? A.—That is right.

Q.—That was directed to Group Health Association, wasn't it? A.—No, sir.

Q.—What? A.—No, sir.

Q.—Is was not? A.—No, sir.

Q.—Was it directed to Group Health Association doctors? A.—No, sir.

Q.—What did you mean by this language:

"WHEREAS, The Medical Society of the District of Columbia has an apparent means of hindering the successful operation of Group Health Association, Inc., if it can prevent patients of physicians in its employ being received in the local private hospitals?"

A.—I meant just what it says: that it has an apparent means.

Q.—Wasn't your resolution addressed to the Group Health situation? A.—Except indirectly, it had no connection with the Group Health Association situation whatsoever.

Q.—What was the purpose of reciting at the very start that you had "an apparent means of hindering" its operation? A.—As I explained in my direct testimony, the reason for bringing in that resolution, except the "Resolved" down here (indicating), was that the thing be referred to a committee, which would present a resolution at the Medical Society, which would prevent the sending of that letter to the boards of directors of the hospitals, and to obtain enough votes, as an old medical organization man, familiar with what had to be done to get things in the Society—to get enough votes to get it passed and get that letter—proposed letter—stopped. There was the whole thing with reference to that resolution, and nothing else but that.

Q.—All right. Now, do I understand that you knew you could not get enough votes for your resolution unless you made it appear that it was directed against Group Health Association? A.—I didn't know anything of the sort. How could I know how many votes I would get? All I knew was that there was a great deal of difference of opinion and a great deal of turmoil in the Society, and any number of different views on the subject. What I wanted to do was to present a resolution which would attract enough votes to stop the sending of that letter and bury the whole thing in the committee.

Q.—Wasn't this turmoil in the Society, turmoil with regard to the Society's attitude toward Group Health? A.—It was the clashing views of many different individuals and convictions as to the threat involved in G. H. A. Some thought it was no threat at all; some thought it was a great threat. Some wanted to attack the problem one way, and some another. I felt it was making a mistake, as far as the Society was concerned, and my resolution was certainly not to protect G. H. A., neither was it to attack it. It was to protect the Society against a course of action which, in my judgment, could not be sus-

tained and would only, if it were put through, make the Society ridiculous.

Q.—You mean a course of action with regard to Group Health Association? A.—I mean a course of action with regard to calling the attention of the lay boards of hospitals to the provision of the constitution, which, as I have testified, I was always opposed to. I was opposed to this thing ever getting into the constitution. I tried to get it out, and for months and months after any of the G. H. A. situation developed, I was persistently and consistently opposed to the application of that provision of the constitution to the G. H. A.

Q.—You knew that the Sprigg letter, which you opposed, was directed to Group Health Association, did you not? A.—It was directed to the lay boards of the hospitals, but I know what you mean: it was motivated by the G. H. A. situation.

Q.—Yes, the purpose was to take care of the G. H. A. situation? A.—I don't know what the purpose was in the mind of the proponents, but it was certainly, in my judgment, connected with the G. H. A. situation; it couldn't be anything else.

Q.—It couldn't be anything else? A.—I don't think so.

Q.—You could not think of any other purpose for it?

Mr. Laskey:—For what?

By Mr. Lewin:

Q.—For the Sprigg letter? A.—At that particular time—Of course, it could have been applied to many other situations with respect to the hospitals, but at that particular time the natural assumption was that it applied to the G. H. A.

Q.—As a matter of fact, you don't know of any other situation to which it was applied? A.—Not at that particular time, no.

Q.—You were offering this resolution as a substitute for the Sprigg letter, weren't you? A.—That is right.

Q.—So, your resolution, too, then, was directed to taking care of the Group Health Association? A.—I have testified, Mr. Lewin, and you can't make me say that, because it isn't true. I testified that my sole purpose in this resolution was to stop the sending of that letter. The fact it was concerned with the G. H. A. situation was purely coincidental.

Q.—You believed what you stated here, didn't you, in recital No. 1? A.—Yes, I did—that it had the apparent means. Just underscore that word "apparent."

Q.—You believed that on Nov. 3, 1936, didn't you? A.—That they had the apparent means? Yes.

Q.—On November 3, when you had that belief, it preceded by five days or eight days Dr. Selders' application to your hospital; isn't that so? A.—I have no more idea of that relationship in time. I have no recollection of any such relationship.

Q.—When you got Dr. Selders' application, you still thought, didn't you, that your Society had the apparent means of hindering Group Health Association, if you could prevent Dr. Selders from being in the hospitals? A.—Oh, I don't know, because this language you refer to in this first paragraph occurred to me about 20 minutes past 5, for the first time, on the afternoon I introduced it.

Q.—But after you put it into the resolution, you still had that possibility in mind, didn't you, when you considered Dr. Selders' application, which I believe was sent to your hospital on November 11, you had in mind this belief, didn't you, that the Medical Society had an apparent means of hindering Group Health Association if it could prevent any of the Group Health doctors from being received into the local hospitals? A.—I certainly did not, because I had advocated an entirely different—As far as my opinion was concerned, the matter of G. H. A. physicians in hospitals should have been handled in an entirely different manner. I can tell you what I thought about it, if you want me to.

Q.—I think you have told us a lot about it. Didn't you also say that the Medical Society has some control over the policies of the hospitals? Didn't you say in substance that it had some control over the policies of hospitals by its control over the members serving on the staffs? A.—I said it has no direct control over the policies of hospitals as determined by their boards of directors except through its control of its own members serving on the medical staffs.

Q.—So, you did believe it had that much control? A.—That is exactly what I did not believe, and that is the reason the resolution was introduced, to keep the Society from getting into a ridiculous position with the hospitals. What would have been the result of sending this letter? Suppose the boards of directors said to the Medical Society, "You go and attend to your own business; we will attend to ours." The situation had come up—exactly the same situation—before, when I was on the executive committee, and the Medical Society, as my recollection goes now, on the advice of the

American Medical Association and the American College of Surgeons, had to back down.

Q.—What do you mean by this: "except through its control of its own members serving on their medical staffs"? A.—Mr. Lewin, I meant what it says. The only method of control—direct control—over the policies of hospitals which the Medical Society could possibly exert would be through the control of its members serving on those staffs.

Q.—But you meant it did have that much control? A.—I just testified I didn't feel it had that much control, because I had seen the thing come up before, and the Medical Society had to back down, because it proved it didn't have it, for the reason that it was my opinion throughout this whole controversy that if it ever came to a showdown between the Society and the members of the Society who were hospital staff physicians, they would stick with the hospital rather than with the Society.

Q.—Then, why didn't you say it didn't have any control at all about anything, about any of the staffs? A.—Because it never would have gone through the Society in that form. In other words, the letter would have gone out, and the motion would have been lost.

Q.—In other words, you mean to say you were not really sincere? A.—I was subtle; let us put it that way.

(There was laughter in the courtroom.)

THE COURT:—Young man, I don't want any more outbursts of laughter like that. Haven't you been in the courtroom before? A Man in the Courtroom:—Yes, sir.

THE COURT:—Well, you learn not to laugh, or else you will go out.

By Mr. Lewin:

Q.—Do I understand that it is your testimony that although you put those two recitals there in the resolution, you did not mean them? Is that what it comes down to? A.—Well, I wouldn't go that far, Mr. Lewin.

Q.—Did you mean them, or didn't you mean them? A.—I said in the first one—the gist of the words—

"Whereas, The Medical Society of the District of Columbia has an apparent means of hindering the successful operation of Group Health Association, Inc."

Q. (Interposing)—Did you mean that? A.—I meant just that, if you underscore the word "apparent." It appeared on the surface that it had.

Q.—It is not underscored, but let us assume it is underscored. Did you mean it as it is written if you underscore the word "apparent"? A.—Yes.

Q.—Now, the second one. Did you mean that? A.—"Whereas, The Medical Society of the District of Columbia has no direct control over the policies of such hospitals as determined by their lay boards of directors, except through its control of its own members serving on their medical staffs; . . ." That is a statement of fact. That is the only possible way they could control the hospital.

Q.—Did you mean that? A.—I meant that—just as it reads.

Q.—Now, then, did you mean this statement in the third recital:

"Whereas, Conflicts between the Medical Society of the District of Columbia and any local hospitals arising from an attempt to enforce the provisions of Chapter IX, Article IV, Section 5, of its Constitution should be assiduously avoided, if possible, because of the unfavorable publicity that would accrue to its own members?" A.—Yes, I certainly did.

Q.—Did you mean that that was the reason why you were offering the resolution: to avoid unfavorable publicity? A.—No, there were many other reasons, as I have testified; this was one of them.

Q.—Did you give any other recitals in that recital? A.—I gave them in my testimony; I didn't give them in there. But please remember this thing was done in 15 or 20 minutes on my desk late in the afternoon, and I am not proud of it as a literary effort.

Q.—I am not questioning its literary merits. I am trying to see what was meant by it. The reason you gave there, and the only reason, was that conflicts would bring unfavorable publicity? A.—Conflict should be avoided for any reason, because it would bring unfavorable publicity.

Q.—That Section 5 was the same Section 5 amended March 3, 1937? A.—This is November 1937, and therefore this refers to the final adoption in March; that is correct.

Q.—So, here you have a resolution to take care of the Group Health situation, and the thing you refer to is Section 5; isn't that so? A.—It is not to take care of Group Health Association at all; it is to take care of an intramural situation within the Medical Society which had to do with Group Health. Beyond that I will not go, because it is not true.

Q.—The resolving part of the resolution was referred to the Hospital Committee in the first instance? A.—That is right.

Q.—Why did you refer it to the Hospital Committee? A.—That is the first one that came into my mind. There was no ulterior motive in that. It was a group of physicians each one of whom was on the staff of a hospital, and who were therefore familiar with the situations that develop between staffs and hospitals, and so forth, and it seemed to me that they were the very group of men in the Society who would probably succeed in smothering this effort to send out this letter of which I disapproved so heartily.

Q.—You did not refer it to the Hospital Committee to smother the letter, did you? You moved this resolution in lieu of the letter, and that killed the letter? A.—I moved it in lieu of the letter, because I didn't want the letter—If this motion prevailed, the letter does not go out.

Q.—Precisely. A.—The letter I left in the hands of the Hospital Committee.

Q.—No, the letter has gone. A.—Well, I mean the letter matter is left—Toward whatever the letter was aimed is left in the hands of the Hospital Committee; and not being an officer or member of a committee of the Society, my responsibility was completed there, as far as I was personally concerned. If they had never reported it out, it would have suited me ideally.

Q.—You don't mean that you would refer it to the Hospital Committee for the Hospital Committee to deal with the letter, do you? A.—". . . to all phases of this subject," and naturally the purport of the letter and all phases of this subject could not refer to anything but the letter, and that was the matter of approaching the lay boards of the hospitals.

Q.—You knew that the Hospital Committee had one representative of the attending staff of each one of the hospitals, didn't you? A.—Oh, yes. Yes, I was thoroughly familiar with it.

Q.—So, if you were going to bring pressure, as you say, or any control over your members serving on the staffs, that would be the logical committee, and that was why you picked it out? A.—That is not true.

Q.—Do you mean to say you just picked out the Hospital Committee because it happened to be the first committee which came to mind? A.—I already explained that.

THE COURT:—He has explained his reasons for it. Let us not go back and start all over again, please.

Mr. Lewin:—All right, your Honor.

By Mr. Lewin:

Q.—Now, you wanted the Hospital Committee to make recommendations as to the best way of bringing this question to the attention of the Medical Boards. What did you mean by "this question"? A.—This question that was proposed in the letter. That was the reference to—What do you call it?

Q.—Group Health Association? A.—No, the section. Section 5?

Q.—Yes. A.—Yes.

Q.—Doesn't "this question" mean the Group Health Association question? A.—No, to Section 5, I suppose. Let me read it:

"Resolved, That the Hospital Committee be, and is hereby, directed to give careful study and consideration to all phases of this subject"

Now, this resolution was in lieu of the letter, and the subject was proper on the boards of various hospitals—

"and report back to the Society, at the earliest practicable date, its recommendations as to the best way of bringing this question to the attention of the medical boards and boards of directors of the various local hospitals in such a manner as to insure the maximum amount of practical accomplishment with the minimum amount of friction and conflict."

I can't say exactly as to what I had in mind. I can only say that if the Hospital Committee had brought in a report that the matter should be handled along the lines, for instance, I testified this morning that it had been at Garfield, about their letting them in upon determination—

Q.—Letting whom in? A.—The staff physicians.

Q.—Of whom? A.—G. H. A.

Q.—Oh. A. (Continuing)—Either give them privileges in the hospital if qualified—now, please note that: if qualified—or keep them out.

Q.—Do you say anything about it? A.—No, I don't say anything about it. You asked me what I had in mind. I am trying to tell you. I say if the Hospital Committee had brought in a report and said, "We recommend that these men all be excluded pending determination of the legality of their practice; or if they be found qualified, they be admitted pending determination of the legality of their practice," that would have satisfied

me a hundred per cent, because I thought it was the way the situation should be handled.

Q.—When you say, "That the Hospital Committee be, and is hereby, directed to give careful study and consideration to all phases of this subject," do you mean by this subject the Group Health Association controversy? A.—No, I meant the proposed approach to the hospitals.

Q.—Wasn't the only proposed approach to the hospitals in connection with Group Health? A.—I have already stated that.

Q.—The resolution reads:

"Resolved, That the Hospital Committee be, and is hereby, directed to give careful study and consideration to all phases of this subject and report back to the Society, at the earliest practicable date, its recommendations as to the best way of bringing this question to the attention of the medical boards and boards of directors of the various local hospitals,"

and there, by "this question," wasn't the question this approach to the hospitals in connection with Group Health? A.—In connection, first, with the Section 5 as it applied to Group Health, if you will say that.

Q.—I am agreeable to that. As applied to Group Health Association? A.—I think so.

Q.—As I have just stated, it was within a month that you got this Selders application? A.—I don't know when it was. I have no recollection of when it came at all.

Q.—Well, we went over that this morning.

THE COURT:—I think that has all been gone over—

The Witness:—If you are asking me if this resolution—

Mr. Laskey:—Wait a minute, Doctor; the judge is speaking.

THE COURT:—I say, I suggest you do not take that up again.

By Mr. Lewin:

Q.—Didn't Dr. Smith speak there in favor of your resolution in this way: Didn't he say he felt that this information could be conveyed to them orally, when they would have nothing to fight back with? Do you remember that? A.—No, I have no recollection of it, but it is apparently in the minutes. I suppose he said something like that. I have no control over what he said.

Q.—Do you remember Dr. Hooe, a defendant in this case, saying this:

" . . . he was of the opinion that Dr. Willson's substitute offered some sound points, one in particular that which suggests that this committee be composed of members of the hospital staffs. He thought it was inconceivable that the hospitals would not acquiesce to reasonable principles. Another objection he had to Dr. Willson's resolution was that the committee is delegated to take its time and report back to the Society."

Do you remember that discussion? A.—Only because I have read this over, and it has been recently refreshed in my mind. I have no control over what Dr. Hooe said.

Q.—Didn't you yourself say this with regard to the Sprigg letter, when you were urging adoption of your substitute:

" . . . he felt that the letter carried a veiled threat to the effect that if the hospitals did not comply the Society would unstuff them." A.—I think if it is there I certainly said it.

Q.—Did you continue and say that you hoped the Society could control its own members? A.—What did I say after that?

Q.—Sometimes you had a little doubt. A.—I had a great deal of doubt. That is the reason I introduced the resolution.

Q.—But you hoped for it? A.—I hoped the Society was important enough to its members so that they would stick with it rather than with anything else, but I doubted it and still do.

Q.—Right after that didn't you hear Dr. John A. Reed say that he was informed that every hospital in the city was cooperating with the medical profession against the Group Health Association, with one exception? A.—Well, I may have heard it. I have read it recently, but I have no independent recollection.

Q.—You remember a discussion of that character occurring? A.—I remember a discussion; that is all.

Q.—Then, you say, you were present on November 11, I believe, when the Hospital Committee reported? A.—That is my recollection, yes.

Q.—The chairman of that Hospital Committee was the defendant Warfield; is that so? A.—I believe so.

Q.—Wasn't he reporting pursuant to the requirements of your resolution, which had been passed? A.—Absolutely.

Q.—Do you remember that his report was rejected because it was not strong enough? A.—I remember it was rejected on a motion of somebody.

Q.—Wasn't it rejected because it simply said— A. (Interposing)—What was the language?

Q.—Well, let us find it.

"Dr. J. Ogle Warfield, Jr., chairman of the Hospital Committee, was recognized. He submitted the following report, pursuant to the resolution which was adopted by the Society on the evening of November 3."

That was your resolution? A.—That is my recollection.

Q. (Reading):

"In view of the resolution adopted by the Medical Society of the District of Columbia on the evening of Nov. 3, 1937 the Hospital Committee held a meeting, at my office, on the evening of Nov. 9, 1937 and recommends that the Medical Society of the District of Columbia send the following resolution to the Boards of Directors of those hospitals"—

A. (Interposing)—No, to the Medical Boards.

Q. (Continuing reading):

"to the Medical Boards of the various local hospitals for interpretation to the Boards of Directors of those hospitals."

A.—That was a change right there, you see, from the original proposal, which was a direct approach to the boards of directors.

Q.—You mean this was a direct approach? A.—No, the letter for which mine was a substitute was a direct approach to the boards of directors.

Q.—Your substitute contemplated approaching the boards of directors through the medical staffs? A.—Not at all. The original letter contemplated that. My motion tried to stop it being done.

Q.—Doesn't this do that same thing? A.—No: ". . . send the following resolution to the Medical Boards" of the different hospitals.

Q.—Isn't that what you advocated? A.—No, I didn't advocate any action; I simply made the resolution.

Q.—I don't know what your point was with regard to the letter. The letter was to go directly to the directors? A.—That is what I am trying to say. The Sprigg letter was to go directly to the directors.

Q.—You didn't like that? A.—I didn't like its going out at all. I didn't like its referring to Section 5, which, as I have testified, was not in my favor. Then, here, the original proposal was to approach the boards of directors. My resolution stopped that and referred the matter to the committee, and then the committee came in on November 11 and urged sending the following resolution to the medical boards of the hospitals, which is a different proposition.

Q.—Your resolution had pointed out that the way to approach the problem was through the medical boards? A.—No, that is not my recollection.

Q.—Except for the control exercised over the medical staffs? A.—Over its own members—control over its own members of the Society who happened to be serving on hospital staffs. That would include, of course, more than the medical board; it would include the courtesy staff as well.

Q.—And courtesy staffs have no influence as to who is to be elected to the staffs of hospitals? A.—No. My statement referring to the control of the Society over its members on hospital staffs included the attending staffs and the courtesy staffs.

Q.—This was what Dr. Warfield suggested: "That the hospitals accept patients from Group Health Association, Inc., provided that Group Health Association, Inc., is responsible for their financial obligations." A.—Yes.

Q. (Continuing):

"That these patients only be treated by the attending, associate, assistant and courtesy staff physicians of the respective local hospitals."

A.—Yes. Now, what is it?

Q.—That would mean, would it not, that the Group Health Association patients could be treated by people like Dr. Scandifio, who was on the courtesy staff of Sibley, for instance? A.—Yes, or—Yes.

Q.—Then, is it not true that one doctor in the discussion, Dr. Daniels, said that he was of the opinion that members of the local medical staffs of hospitals were required to be members of the Medical Society of the District of Columbia, and that he would inquire if any of the members of the staff of Group Health Association were now members of the Society? Do you remember that? A.—It is so recorded in the minutes. I have refreshed my memory of it recently; I have no independent recollection of it.

Q.—Don't you understand his point to be that under that resolution suggested by Dr. Warfield, or that communication suggested by Dr. Warfield, a man like Dr. Scandifio, who was still a member of the District Medical Society, might be a member of the courtesy staffs of some of the hospitals and, therefore, could treat Group Health Association patients? A.—

Yes. He apparently was trying to get information as to whether any of the staff of Group Health Association were still members of the Medical Society of the District of Columbia.

Q.—Didn't the chairman, Dr. Neill, give him that information and say—

Mr. Richardson:—We object to this examination as being simply a repetition of what is in the minutes.

THE COURT:—Yes. You are asking for his interpretation of what other men said in that meeting. You might as well ask for my interpretation or the interpretation of any other person in the room. After all, it is a matter of reading the language and getting the appraisal of the particular individual. It is not evidence at all. It is not proper cross-examination.

Mr. Lewin:—I am sure that the strict rule would confine a great deal of the examination to the contents of the documents, but I understood your Honor to—

THE COURT:—(Interposing) I will allow you to examine within reasonable points, Mr. Lewin, but I want to try to avoid your putting to other witnesses the words of some other person. When it comes to dealing with their own language, I want to give you considerable leeway, because that at times involves motive.

Mr. Lewin:—I was not suggesting that Dr. Willson said these things. I have been pointing out who said them, and I understood Dr. Willson was present.

THE COURT:—Well, I will have to sustain the objection.

Mr. Lewin:—May I ask this:

By Mr. Lewin:

Q.—Do you recall what Dr. Neill said in answer to that question? A.—No.

Q.—Could you refresh your recollection by looking at the minutes? A.—It would call up no recollection independent of the fact that I would assume the minute was correct if it were read to me. I would have no recollection of it, I am sure.

Mr. Lewin:—If I may, I should like to read that portion to the jury as a basis for questions.

THE COURT:—I do not think it can be the basis of questions unless it involved his own recollection. How could it be?

Mr. Lewin:—Because I think it leads up to something else: to what happened to that resolution, which was the outgrowth of his resolution.

THE COURT:—What is your question?

Mr. Lewin:—I should like to read now a paragraph of that which is in evidence already. I thought that was the procedure being followed.

THE COURT:—Well, read it and see what becomes of it.

Mr. Laskey:—In that connection, your Honor, the only question was whether it refreshed his recollection. He said he did not know it.

Mr. Lewin:—This is the procedure that has been followed on cross-examination time and time again because of these lengthy documents.

THE COURT:—That is very true, but there has got to be some limit. I have indicated the limit: that they are those things which bear upon the witness' own testimony, upon his own acts in those meetings, or his words—what he may have written or what he may have said—but it is going far beyond what I have ever intended, if you should read something there in the minutes that somebody else said and ask the witness on the stand to interpret it.

Mr. Lewin:—I was not asking for an interpretation.

THE COURT:—That is what it seems to come down to. I will sustain the objection.

By Mr. Lewin:

Q.—Do you know what happened to that resolution of Warfield's? A.—It was rereferred. I know that it was rereferred to the committee.

Q.—Do you know the grounds on which it was rereferred? A.—It was rereferred to the committee. I know there was some discussion about it, and my recollection is again refreshed from having read these things over in the last few weeks. There was a question as to whether the provision of the original report would cover G. H. A. physicians practicing at the hospitals—I mean some way to prevent their practicing, or would not prevent it; something of that sort. That is my recollection of it. It was along that line.

Q.—Then, wasn't a motion made by Dr. Yater to recommit it because there was no assurance given that Group Health Association doctors were not on the staffs? A.—That is my recollection.

Q.—Did you vote for it? A.—I have no recollection, Mr. Lewin. Let me see it. No, I have no recollection one way or the other. My best belief would be that I didn't, because it wasn't—because I wasn't in sympathy with that method of approach at all.

Q.—The resolution was seconded and finally adopted, according to the minutes. Do you know who seconded it? A.—No, I don't.

Q.—Isn't it true, then, that on December 1, when you were also present, Dr. Warfield's committee made a further report pursuant to that resolution recommitting it? A.—Yes. Well, Mr. Lewin. I remember distinctly having been present at the meeting of November 11. I have no independent recollection of having been at that meeting of December 1. I may have; I simply don't recall whether I was there or not.

Q.—But you do know, do you not, that pursuant to that report of December 1 the resolution was adopted? A.—Oh, yes. At least, I know that from the minutes, yes.

Q.—You do know that the effect of that was— A.—(Interposing) To call the attention—To request the medical boards of the hospitals to call the attention of the boards of directors to what I have now learned was the Mundt Resolution.

Q.—That meant, did it not, that if the hospitals adopted that, no person who was not made a member of your Society, or any person who should be expelled from your Society, would automatically lose his courtesy staff privileges or fail to gain them?

Mr. Laskey:—I object to that as calling for a conclusion.

THE COURT:—The objection is sustained.

By Mr. Lewin:

Q.—What was your understanding of the purpose of calling the hospitals' attention to the Mundt Resolution? A.—Well, Mr. Lewin—

THE COURT:—(Interposing) That is the same question, is it not?

Mr. Laskey:—The only difference is that now he asks him if it was not his understanding.

THE COURT:—It seems to me to be the same question.

Mr. Laskey:—We object to it.

Mr. Lewin:—Is the objection sustained to that question?

THE COURT:—Yes.

By Mr. Lewin:

Q.—Did you follow out the rest of the procedure followed by the Hospital Committee under that resolution? A.—I don't believe I understand your question, quite, Mr. Lewin. What procedure?

Q.—Did you know that later, in February of 1938, a resolution was passed by the Society, asking for a report on what the status of Group Health doctors was in the various hospitals? A.—I believe that that matter has again been refreshed in my memory from various minutes recently. I have no recollection of it. You misunderstand. The resolution I had made was just to prevent action by the Medical Society which I disapproved of. My interest has waned from there on. I have done my best to accomplish what I wanted, and I wasn't materially interested in the matter one way or the other.

Q.—Did you object to the later proceedings taken by the Hospital Committee and the Society after your resolution with regard to admitting Group Health doctors into hospitals? A.—Well, the proposal—As I have testified, I don't even remember being present at that meeting when it came up; and when it got to the hospital boards, as I testified this morning, it was apparently in my absence, and the first chance I had anything to do with it was when the medical board came back with the recommendation that we move to rescind it, and I moved to rescind it.

Q.—But you knew that there was such a recommendation at the time you were passing on Group Health doctors' applications? A.—No, I have no recollection of that at all. I don't even remember when I was passing on Group Health applications.

Q.—Didn't you know that if that recommendation was followed, Group Health doctors could not be in the hospitals, regardless of their personal qualifications? A.—It didn't make any difference what I knew about it. I was the one who moved that it be rescinded, so I couldn't have been very much in favor of it, since I moved to rescind it.

Q.—Well, did you ever move to rescind the action of the Hospital Committee? A.—What action?

Q.—The action of the Hospital Committee in sending out questionnaires and getting facts as to the status of Group Health doctors in the hospitals? A.—I don't even know. I was present at those meetings and had no interest.

Q.—I think you testified that you did not raise any objection to Dr. Scandiffo's treating babies whom you had delivered? A.—That is correct.

Q.—As a matter of fact, isn't the ordinary practice of an obstetrician to carry the case through until after the birth of the baby and then to give the case, as far as the health of the baby is concerned, up? A.—It varies greatly in different

jurisdictions and according to the practice of different individuals. I know one very prominent obstetrician in town who refuses to let a pediatrician get into the hospital over his dead body to look at a baby he has delivered. As far as I am concerned, as I told you this morning, the sooner I get rid of them, the better. But if there is no pediatrician in attendance—I mean if the patient—the father or the mother of the child—does not request a pediatrician, I naturally, to the limited extent of my ability with babies, keep track of them as long as they are in the hospital, to see that they are doing all right until they go home, and then I have them call a pediatrician.

Q.—But you do not call Dr. Scandifio yourself? A.—No, the patient calls him; I wouldn't call him in. I follow the usual procedure of telling the nurse to call him up. I never contact pediatricians.

Q.—You do not contact Dr. Scandifio yourself? A.—No, I have no recollection of having asked him.

REDIRECT EXAMINATION

By Mr. Laskey:

Q.—Dr. Willson, was your action in voting as you did with respect to Dr. Scandifio influenced or controlled by the fact that he was a G. H. A. doctor? A.—Not at all. It had nothing to do with it. It was controlled by the fact that he had violated, as I testified—he had violated provisions of the constitution. On this violation of Section 5 I was very reluctant to vote for his expulsion, because I disliked it so, but I did vote against him on the whole ground of the sustaining of charges of violating three or four different provisions of the constitution.

Q.—Was your action with respect to voting as to Dr. Selders, whether he should be admitted to the staff, courtesy or otherwise, of the Columbia Hospital, controlled or influenced at all by the fact that he was a G. H. A. doctor?

Mr. Kelleher:—We object to that as being leading, your Honor.

THE COURT:—The objection is overruled.

The Witness:—Will you repeat the question?

(The pending question, as above recorded, was read by the shorthand reporter.)

The Witness:—No. There was no question in my mind whatsoever that he was not qualified in his original application to do the work he requested to do; therefore, there was no necessity of the other thing coming up. When he separated his requests and came up—

THE COURT:—I would not go all through that again. The question is whether his connection with G. H. A. influenced you in any way.

The Witness:—No.

THE COURT:—That is his question.

By Mr. Laskey:

Q.—Who is Dr. H. J. Russell McNitt? A.—He is a member of the staff and one of the attending surgeons in gynecology at Columbia Hospital, now on duty with the army in Denver, and a member of the Washington Gynecological Society and a member of the Medical Society of the District of Columbia.

Q.—How long have you known him? A.—Oh, I should say fifteen years.

Q.—What do you know, if anything, about his qualifications to pass on the medical efficiency of a doctor who applies for hospital privileges?

Mr. Lewin:—That is objected to. There is no evidence that Dr. McNitt did pass on him. He simply transmitted the gynecological disapproval.

By Mr. Laskey:

Q.—Was Dr. McNitt a member of the gynecological board? A.—Society?

Q.—Society? A.—Yes.

Mr. Laskey:—I think that is some evidence that he passed on it.

Mr. Lewin:—Well, he was a member along with I don't know how many others.

THE COURT:—Mr. Laskey, the doctor has said that the society was made up of experts in that line.

Mr. Laskey:—Yes, I do now recall that in a general way.

Mr. Richardson:—There is just one thing further: Mr. Lewin intimated that all the doctor relied on was the letter of Dr. McNitt. I wanted to show that that was some reliance.

THE COURT:—Well, you may ask him what confidence he had in Dr. McNitt.

By Mr. Laskey:

Q.—Tell us what, if any, confidence you had in any recommendation that Dr. McNitt might make. A.—Well, I know Dr. McNitt very well, and I know of his work on the staff of

the hospital, and I also know that he is a diplomate of the American Board of Obstetrics and Gynecology, and that he has the highest evidence of professional ability in that specialty that any man can provide in the United States of America.

Q.—Just what does that mean? A.—It means that he has passed an examination before the American Board of Obstetrics and Gynecology—written, oral, and practical—and is certified as a specialist in obstetrics and gynecology, being competent to do so, and is limiting his work to that specialty.

Q.—Is that a national organization? A.—That is a national organization.

Mr. Laskey:—I will ask to have this letter of Dec. 30, 1937 from Dr. McNitt to Colonel Ashburn, marked as Defendants' Exhibit 51.

Mr. Laskey:—I will ask Mr. Richardson to read it.

Mr. Richardson:—This is under the letterhead of the Washington Gynecological Society, Washington, D. C., and is dated Dec. 30, 1937 from the Office of the Secretary:

DEFENDANTS' EXHIBIT 51

"Col. P. M. Ashburn
Supt. Columbia Hospital
Washington, D. C.

"Dear Col. Ashburn:

"I am directed to report on the following physicians whose names were submitted to the Society for advice, concerning qualifications for courtesy privileges on your staff: Drs. Oliver C. Cox, Richard Castell, Raymond Selders.

"We do not consider them qualified to do operative obstetrics.

"Sincerely yours,

"H. J. Russell McNitt, M.D.,
"Secretary."

RE-CROSS EXAMINATION

By Mr. Lewin:

Q.—Dr. McNitt, being a member of the staff at Columbia, was available to you right there in Columbia to pass on applications, was he not? A.—As far as his individual—You mean in an individual capacity?

Q.—Yes. A.—Oh, yes, yes.

Q.—It was not necessary in order to get his individual judgment on Dr. Selders, to send his application anywhere, was it? A.—No; that is correct.

The jury left and the attorneys conferred at length with the Court who gave them the following record of his decision:

DEFENDANTS OFFER OF PROOF

On the question of the illegality of Group Health Association, Inc., and the receipt by it from Home Owners Loan Corporation of \$40,000 illegally, the defendants offer to prove as facts and circumstances known to these defendants during the times herein involved:

1. The charter of Group Health Association, Inc., and the amendments thereto which are contained in a stipulation herein.

2. The By-laws of Group Health Association, Inc., and amendments thereto which were in effect during the period of the indictment and which are contained in a stipulation herein.

3. The facts known to these defendants pertaining to the actual operations of Group Health Association, Inc., which the defendants say tend to show that Group Health Association, Inc., was a corporation practicing medicine contrary to law and engaged in the business of insurance contrary to law. The said facts will show among other things the following:

(a) That Group Health Association, Inc., entered into contract with Home Owners Loan Corporation wherein it offered as a corporation to render and deliver to Home Owners Loan Corporation certain medical services therein described for a consideration of \$40,000.

(b) That Group Health Association, Inc., as a corporation contracted with its members to furnish them medical service, and that Group Health Association, Inc., did furnish medical service to its members.

(c) That Group Health Association, Inc., as a corporation employed doctors to work in a clinic, rented and operated by Group Health Association, Inc., there to treat and render medical service to the members of Group Health Association, Inc., pursuant to the contract between Group Health Association, Inc., and its members.

(d) That the trustees of Group Health Association, Inc., together with the lay administrator and other lay employees of Group Health Association, Inc., dominated and directed the rendering of medical service by Group Health Association to its members.

(e) That no doctor could be employed or discharged by Group Health Association, Inc., without the consent and approval of the board of trustees, all of whom were laymen.

(f) That Group Health Association, Inc., as a corporation, was practicing medicine and was not a broker which brought

together the members of Group Health Association and the doctors who rendered medical service to them.

4. That Group Health Association, Inc., was subsidized by Home Owners' Loan Corporation and received from Home Owners' Loan Corporation money and other things of value belonging to the United States, contrary to law.

5. That Group Health Association, Inc., entered into a contract with Home Owners' Loan Corporation wherein it promised to perform certain medical service for Home Owners' Loan Corporation and, in return, received money and things of value belonging to the United States, contrary to law.

6. The members of Group Health Association, Inc., assigned to Group Health Association portions of their salaries, due or to become due, from Home Owners' Loan Corporation, contrary to law, and that deductions were made from the said salaries by Home Owners' Loan Corporation and paid to Group Health Association, Inc., contrary to law.

7. Resolutions were passed by Home Owners' Loan Corporation authorizing contract and amended contract with Group Health Association, Inc., for the furnishing of medical service by Group Health Association to Home Owners' Loan Corporation, all without authority of law. That resolutions were passed by Home Owners' Loan Corporation approving By-Laws of Group Health Association, Inc., which in substance and in effect provide that said Group Health Association, Inc., should at all times have on its board of trustees at least two members thereof who were designated and appointed by Home Owners' Loan Corporation, all without authority of law.

8. That Home Owners' Loan Corporation received legal opinion from its attorneys in substance holding and conceding that Group Health Association, Inc., was engaged in the insurance business, contrary to law, and engaged in the practice of medicine, contrary to law, unless and until its By-laws were changed, and as a result thereof said By-laws were so changed, and that these alleged conditions, or part thereof, existed until at least May 2, 1938.

9. That the Acting Comptroller General of the United States held and found that the payments by Home Owners' Loan Corporation to Group Health Association were made and incurred without authority of law to the knowledge of the defendants. That said Acting Comptroller General also held and found that the aforesaid contract between Group Health Association, Inc., and Home Owners' Loan Corporation was a contract for the sale of medical service, contrary to law to the knowledge of the defendants.

10. That a duly authorized proper committee of the House of Representatives of the United States held and found that payments by Home Owners' Loan Corporation to Group Health Association, Inc., were an illegal diversion of the money of the United States, to the knowledge of the defendants.

11. That the United States District Attorney of the District of Columbia and the Corporation Counsel of the District of Columbia held and found that the operations of Group Health Association, Inc., were contrary to law up to the time of the entry of the decree in Group Health Association, Inc., vs. Moor, et al., to the knowledge of the defendants.

12. That several attorneys consulted by defendants advised that the operation of Group Health Association, Inc., was contrary to law, and defendants so believed.

13. That several attorneys consulted by defendants advised that Chapter 9, article IV, section 5, of the constitution of the Medical Society of the District of Columbia was a legal provision, and defendants so believed.

14. That several attorneys consulted by defendants advised that the Principles of Ethics of the American Medical Association and all thereof were legal, and defendants so believed.

15. That several attorneys consulted by defendants advised that they had a legal right to enforce chapter 9, article IV, section 5, of the constitution of the Medical Society of the District of Columbia, and defendants so believed.

16. That all of defendants' acts and doings were for the purpose of advancing their own interest and to protect their own society association rules of ethics and method of distributing medical services and to repel an assault on the same by Group Health Association, Inc., as distinguished from the purpose of restraint as alleged in the indictment.

17. That the defendants believed that the \$40,000 and other things of value paid by Home Owners' Loan Corporation to Group Health Association, Inc., was an illegal diversion of the money of the United States.

18. That belief on the part of the defendants that Group Health Association, Inc., was illegally engaged in the practice of medicine, had received public funds unlawfully, and illegally engaged in operating an insurance company, was in part the basis for the following acts of defendants:

(a) Enforcement of chapter 9, article IV, section 5, of the constitution of the Medical Society of the District of Columbia, by disciplinary proceedings.

(b) The issuance of the so-called "white list."

(c) Refusal, if any, to consult with the doctors employed by Group Health Association, Inc.

(d) Enacting and distributing a resolution of the Medical Society of the District of Columbia dated Dec. 1, 1937.

(e) The correspondence conducted between the defendants and between defendants and third persons relating to Group Health Association, Inc.

(f) Discussions, remarks, motions, and other pertinent acts of defendants, relative to Group Health Association, Inc., its doctors, memberships and operations.

19. That because of the belief of the defendants in the illegality of the operation of Group Health Association, Inc., and the illegality of the payment of certain moneys by Home Owners' Loan Corporation to Group Health Association, Inc., the acts and doings of defendants in the premises were reasonable argument and persuasion, or reasonable regulation of professional practice.

20. That the illegality or belief in the illegality of Group Health Association, Inc., brought into operation chapter 9, article IV, section 5, of the constitution of the Medical Society of the District of Columbia. The said section 5 is valid and it was and is lawful for the Medical Society of the District of Columbia to refuse to approve a contract between one of its members and a corporation illegally practicing medicine, or which it reasonably thinks is illegally practicing medicine. If this were not true, the Medical Society of the District of Columbia would be required to approve a contract between one of its members and a corporation illegally practicing medicine. The result of such an approval would subject the doctor in question and the Medical Society to a prosecution for violation of a law. The action of the Medical Society of the District of Columbia in refusing to approve such a contract is not evidence of a conspiracy in restraint of Group Health Association, Inc., but directly an effort to prevent its members from contracting with a corporation illegally practicing medicine. If the Medical Society of the District of Columbia cannot so enforce the provisions of its constitution it will be destroyed.

PRESENT RECORD ON ISSUE OF ILLEGALITY AND HOME OWNERS' LOAN CORPORATION PAYMENT

The illegality of Group Health Association, Inc., and of the Home Owners' Loan Corporation's payment to Group Health Association, Inc., are substantially in issue in the record.

The contract between Group Health Association, Inc., and Home Owners' Loan Corporation under and by virtue of which Group Health Association, Inc., sold medical service to Home Owners' Loan Corporation for \$40,000 has been widely discussed in the record. (R. 21, 24, 25, 561, 566, 589, 603, 632, 639, 692, 709, 729, 791, 794, 804, 810, 1395, 1536, 1537, 1551, 1696, 1705, 1724, 3524, 3581, 3607.)

The payment of \$40,000 made by Home Owners' Loan Corporation to Group Health Association, Inc., has also been developed in evidence. (R. 94, 603, 687, 702, 749, 810, 1720, 1772, 1773, 1774, 1778, 1783, 1784, 3519, 3598, 3612.) (And see U. S. Exhibits 203, 114, 112, 113, 136, 157, 159, 195, 196, 197.)

The question of the economic soundness of Group Health Association, Inc., due to the Home Owners' Loan Corporation's payment referred to, appears in the record. (R. 587, 588, 615, 686, 701, 748, 1472, 1723.)

The illegality of the operations of Group Health Association, Inc., has been substantially opened up in the record. (R. 737, 739, 795, 797, 1590, 1646, 1649, 1655, 1658, 1669, 1679, 1679-A, 1680, 1695, 1698, 1699, 1700, 1703, 1704, 1708, 1716, 1719, 1721, 1722, 1723, 1725, 1730, 1770, 1772, 1773, 1774, 1776, 1778, 1783, 1784, 1789, 1795, 2025, 2027, 2155, 2232, 2332, 2333, 2334, 2464, 3597, 3598, 3609, 3610.)

The Government offered evidence to show that the decision of Justice Bailey on the question of illegality was published. (R. 2025, 2027, 2500, 2572.)

Likewise the Government offered evidence to show that various hospitals based their action on the pending question of illegality. (R. 2452, 2025, 2027.)

The refusal of Group Health Association, Inc., to furnish copies of its By-laws and other pertinent information to defendants, and the necessity for revamping such By-laws to overcome apparent illegality also is developed in the record. (R. 794, 797, 798, 829, 600, 688.)

Testimony is in evidence showing illegal operations based on unprofessional practice as identified in the opinion of the Court of Appeals. (R. 317, 318, 321, 1444, 615, 742.)

The record citations noted establish that the issue of illegality, both with respect to the operations of Group Health Association, Inc., in the practice of medicine and the doing of an insurance business, as well as the illegality of payment received from Home Owners' Loan Corporation, appear at length in the minutes, correspondence, resolutions, and hospital testimony, which has been read to the jury. This is particularly true with respect to the correspondence of the officials of the American Medical Association and the so-called Woodward article, which has been offered and read to the jury by the Government.

The summary of evidence which we propose to introduce is intended to complete the issues before the jury under the testimony already submitted.

MEMO: RE DEFENDANTS' OFFER OF PROOF

The immediate question involves admissibility of certain evidence set forth in defendants' offer of proof. By understanding between court and counsel the offer covers in detail a broad range of evidence. In connection with evidence already in, it forms the basis for defendants' claim that Group Health Association, Inc., was illegally engaged in the practice of medicine. It is contended that the Anti-Trust Act does not embrace a business illegal in its nature, and that the restraints forbidden relate only to lawful trade and commerce.

Further, it is contended that even if it be held that Group Health Association, Inc., was not an illegal enterprise, nevertheless defendants honestly believed it to be so, and therefore in defense may rightfully justify their acts by proving such beliefs and the facts supporting them, including advice of their counsel, an opinion of the Comptroller of the Treasury and a report of a congressional committee. It is argued that evidence of this kind is material and competent to refute a criminal intent, by showing that defendants' acts were taken only to protect themselves, the profession and the public interests against supposed illegal activities of Group Health Association, Inc., and that if restraints did result they were under the circumstances reasonable.

The questions thus presented are important. The future course of the case awaits their determination. For obvious reasons my views must be but briefly stated.

1. As to illegality of Group Health Association, Inc., I do not think it was engaged in medical practice. It should be regarded merely as a convenient medium adopted by a group of persons for concerted action to secure for themselves and their dependents medical care on a fixed prepayment plan. The association did not render medical service. It simply provided the personnel and facilities pursuant to the corporate plan adopted by the members. Licensed physicians so employed treated the patients without interference of the lay officers. Nor were the cooperative non-profit features of the plan calculated to commercialize or exploit the practice of medicine. In an actual, realistic sense, which I think is contemplated by the "Healing Arts Practice Act," the doctors alone rendered the medical service. Only they were practicing medicine.

The situation was not altered by the contract whereby \$40,000 were furnished by Home Owners' Loan Corporation. If we assume the transaction to have been a wrongful diversion of public funds, that did not outlaw the business of Group Health Association, Inc., any more than would have been the case had a private trustee misapplied trust funds to the benefit of Group Health Association, Incorporated. However culpable, it would not have the effect of transforming the corporate business into a lawless venture.

2. I do not think evidence of defendants' belief as to illegality of Group Health Association, Incorporated, or the reasons on which it rested, is material. At best it could bear only on motive—not intent. However impelling the reasons which may lead one to commit a criminal act, they cannot legally justify or excuse, though they may mitigate. Motive, that ultimate desire or purpose which leads to the formation of the intent to do a prohibited act, is often easily confused with the intent itself; but the two are distinct, and only the latter presents a relevant issue. Then too, mistake of law will not ordinarily excuse. I do not understand that counsel dispute this general rule. But they do argue that one element of the offense here charged is a specific intent to restrain trade, hence that defendants' belief becomes material as bearing on the particular purpose alleged. I doubt that as defined by the statute the offense technically involves a specific intent; but if so, it is not of a nature to bring the case within the very limited field in which ignorance or mistake of law can legally bear upon the intent.

3. Further, I understand the argument to be that an honest and reasonable belief that Group Health Association, Inc., was operating illegally would, under the appellate court's decision,

afford the defendants a proper ground to justify restraints "as reasonable regulations of professional practice" to protect and support their standards, methods, and economic interests. But the thesis is too broad. The language of the court has reference to the right of medical societies to reasonably regulate and discipline their members, to the end of raising and maintaining high standards of medical practice. Control, of course, is over the members only, and that must be limited to reasonable restraints in their practice of the profession. Even within that field I fail to see how defendants' belief, or the grounds giving rise to it, can have any relevancy to a question concerning the reasonableness of such regulatory controls. Reasonableness of belief is not the issue.

4. Finally, it is urged that the belief of illegality would supply a reason to support defendants' right of persuasion and argument in protecting their standards of professional practice and their economic interests. Of course legitimate argument and persuasion was and is available in seeking those objectives. But the contention is beside the point, for no restraint based on argument and persuasion is alleged, nor could it constitute a legal charge.

The reasons stated lead me to the conclusion that the proof offered by defendants is not admissible on any of the grounds urged. Therefore the Government's objection is sustained and the offer rejected.

The offer of proof, as I have treated it, is the written paper filed March 14, 1941 as orally amended, revised and explained by counsel for the defendants. Many of the documentary items contained in the written offer are already in evidence. They can be dealt with later in keeping with this decision.

JAMES M. PROCTOR, Justice

Dated March 17, 1941.

(Whereupon, at 2:50 o'clock p. m., the court adjourned until Thursday, March 27, 1941, at 10 o'clock a. m.)

MARCH 27—MORNING

TESTIMONY OF DR. ELIJAH WHITE TITUS

DIRECT EXAMINATION

By Mr. Leahy:

Elijah White Titus said he has been a practicing physician in Washington since 1911. He graduated from George Washington University Medical Department in 1910. He had one year and three months at the Columbia Hospital for Women and in the fall of 1919 received an appointment as resident gynecologist of one of the hospitals in the city of New York and had one year there. He then began to limit his work to obstetrics and gynecology. From 1912 until 1919 he was assistant deputy coroner part of the time and deputy coroner part of the time. He belongs to the District of Columbia Medical Society and is a fellow of the Washington Gynecological Society and also of the Galen Hippocrates Society. In the gynecologic society he has held the office of president. He was chairman of a committee in 1937. Its primary object was to assist hospitals in determining the qualifications of applicants for the privilege of practicing on the hospital staffs. This committee was appointed by the society. The society felt that such a committee was necessary. The hospitals had a definite responsibility to the public in the men that they admitted to practice, and especially in the special branches. So the society approved a form letter which was sent out, inviting the hospitals, if they had applications to send them. The witness was made a member of that committee in 1936. Dr. Kane was chairman. The committee consisted of the witness, Dr. Jacob Kotz and Dr. Mundell. In 1937, in October, that committee was dismissed and the witness was appointed chairman of the committee along with other members—Dr. Kane, Dr. Kotz, Dr. Martel and Dr. Sylvester and was fairly active that year.

Q.—How long have you been on the staff of Columbia? A.—I have had some connection with the staff since I left there as a resident, which was in 1911. I now am one of the attending gynecologists and chairman of the medical board and at the present time I am a member of the board of directors of the hospital.

Q.—Do you recall now whether your committee which you just told us had anything to do with the investigation of the qualifications of Dr. Selders? A.—Yes. I remember that quite well.

Q.—Can you just tell us what your committee did toward determining the qualifications of Dr. Selders?

A.—Our committee received a request from Columbia Hospital for Women and we had a copy of the application which gave his references and, at the same time, made certain statements as to the amount of surgery which he had done, both in Houston, Texas, and Worcester, Mass. Shortly after we

received that communication we set out to follow up the references in Houston, Texas, and Worcester, Mass., and got replies from those sources.

Q.—Do you recall how many replies you received? A.—We received two.

Q.—Do you recall from whom you received them? A.—One was from Dr. Robert A. Johnson, a rather prominent obstetrician and gynecologist in Houston. The other was a letter from a Dr. Berry, one of the surgeons on the staff of the Worcester City Hospital, and it came to me through Dr. Edward Bullard of the surgical staff of the Women's Hospital, for this reason. I knew no one in Worcester. I knew Dr. Bullard was a very prominent man who got around a great deal, reading papers and visiting other medical societies, and he probably would have someone he knew there; and Dr. Berry was the man he wrote to, and he forwarded Dr. Berry's letter to me.

Q.—Did the letter from Dr. Johnson at Houston come directly to you? A.—It came directly to me.

Q.—Have you the letter here? A.—I have not.

Q.—Do you know where it is now? A.—Dr. Johnson made a request that the letter be destroyed.

Q.—Did you destroy it in accordance with that request? A.—Well, he gave his reasons why he requested it, and I did destroy it.

Q.—Why did he request you to destroy it? A.—His statement was that the contents of this letter were so unfavorable and he had made a frank statement of the thing, and he felt he would rather have it destroyed for those reasons.

Q.—Did you destroy it? A.—I did.

Q.—Without going into the character of the contents, were they favorable or unfavorable to Dr. Selders? A.—They were quite unfavorable. That is the reason he asked me to destroy it, he said.

Q.—Did you get any letter from Dr. Berry through Dr. Bullard? A.—I did.

Q.—What did you do with that letter? A.—I have it in my pocket.

Q.—Will you produce it, please? A.—There is a personal note here that I do not think you want (producing papers).

Q.—Is this (indicating) the one dealing with the qualifications of Dr. Selders? A.—Yes.

Q.—Do you have the original of this? A.—No; I never did have the original of it. The letter was addressed to Dr. Bullard and he made a copy and sent it to me.

Mr. Leahy:—If your Honor please, I offer the letter in evidence as Defendants' Exhibit 52.

DEFENDANTS' EXHIBIT 52

"Dr. Edward A. Bullard,
580 Park Avenue,
New York City, New York.
"Dear Cindy:

"Your letter comes inquiring about Dr. Raymond Selders. I have discussed him with the superintendent, Dr. MacIver and with one of the chief surgeons of the Worcester City Hospital. He was resident there from July 1, 1936 to July 1, 1937. The story goes that he was a graduate of the University of Oklahoma and then practiced in Dallas, Texas, for ten years. Apparently he took a surgical internship in there somewhere. Then he went to the University of Pennsylvania, where he had, they think, two years of a basic postgraduate course in surgery. He came from there here for the completing year in practical surgery.

"While here, he is listed as having taken active part in two hundred and seventy-three operations, one hundred and ninety of which would be classed as major and eighty-three as minor. Dr. MacIver does not know whether he did any more or whether he did all of these and they could not discover this point without going through all the records. This gives an approximate idea. One gets the impression that he is taking a good deal of time in preparation for his life's work. He is about 46 years of age and now contemplates further preparation. They think he has been married twice.

"The story while here in Worcester is somewhat as follows: when he first came, he seemed to feel the need of expressing his importance. He tried to convey the idea that the surgical interns should look to him for instruction and material. The discrepancy between his age and that of the interns exaggerated their objection to his policy and thus early in his residency there was engendered lack of harmony. This lack continued on through his year of service. He himself was somewhat of an emotional and breezy type which found everything going well some days, while at other times he acted out of sympathy with the world.

"This slightly unstable disposition was evidenced at times in his operative work. Sometimes he showed proper skill while at other times a seeming conceit led to careless and hasty surgery. The visiting men, either through this trait or through the animosity engendered among the house officers, hesitated to trust him with as much work as they would have liked to have done.

"In retrospect, these two men whom I talked with felt that much of his trouble was due to his failure to fit into the picture when he first came. If he had been a bit more thoughtful and patient, he would have gotten off on the right foot and then the resulting harmony would have carried him along in a happy way. Finding himself out of harmony, there was a tendency to get worse rather than better. They feel that perhaps they made a mistake in taking a man so much older than the interns.

"Dr. MacIver felt that he showed perhaps an average skill in his surgical work but that there was certainly nothing startling either about this

skill or about his constructive research efforts. He did not go to Dr. MacIver from time to time in a complaining spirit but stuck it out as best he could.

"I judge this picture fits somewhat with the opinion you have already formed about him. Placed under certain conditions I would gather that he could do good and faithful work, but put into a group that is somewhat self sufficient, where he is a stranger feeling it necessary to establish his own importance in the scheme of things, he might repeat the difficulty he had here and find his experience lacking in harmony and efficiency.

"I hope this report will help you. Both the men I talked with were anxious not to injure his chances for the appointment he is seeking. But I told them that you deserved as honest a statement as could be secured and I think I have correctly interpreted their feeling. Dr. MacIver felt that some of the staff liked him better than others and I judge that the member of the staff whom I picked was one of those who liked him the least. He would wish you to give the man all the credit you could. You will have to conclude as to whether this particular type of worker is fitted for the task he is seeking."

"Cordially yours,
"Gordon Berry, M.D."

(There was extended discussion of the possibility of securing a copy of the letter from Houston, Texas.)

Mr. Lewin:—Then I think we ought to wait for the letter to see whether we have any objections to it, rather than to have it characterized now.

THE COURT:—I assume it would be better to wait a reasonable time to see if it comes.

Mr. Leahy:—I am perfectly willing to wait. We have been trying to get it for a week.

By Mr. Leahy:

Q.—Doctor, acting on the information which you received, both from Worcester and from Houston, did your committee form a recommendation as to whether Dr. Selders should be admitted to privileges for general surgery? A.—We formed a conclusion, and on the basis of that conclusion we so advised the hospital.

Q.—Did you advise that Dr. Selders was qualified or unqualified? A.—Unqualified.

Q.—That was Columbia Hospital? A.—That was Columbia Hospital.

Q.—Were other hospitals similarly advised? A.—Our committee did not send any conclusion concerning Dr. Selders, as far as I can recall.

CROSS EXAMINATION

By Mr. Lewin:

Q.—Doctor, how much weight did you give this letter from Dr. Berry to Dr. Bullard which has been received in evidence, when your committee came to pass on the application of Dr. Selders? A.—I could not very accurately answer that in terms of percentages, but I will say we gave it less weight than the one that came from Houston.

Q.—But you did give this some substantial weight in arriving at your opinion, Doctor? A.—It influenced us to a certain extent, in view of the fact that we had received one a little stronger than that, from Houston.

Q.—How did you happen to pick out Dr. Johnson to write to? A.—I happened to know that he was a very prominent man in subjects of gynecology at Houston. I had met him.

Q.—Did Dr. Selders give his name as a reference? A.—No. He gave us on his application blank a statement saying that he had been in general practice in Houston for, I think, seven years, and in that time had performed something like four hundred and thirty operations. He did not classify them as to whether they were major or minor operations.

Q.—Of course on his application he gave Dr. MacIver's name as a reference, did he not? A.—Not on the application he sent to Columbia Hospital, I am sure.

Q.—Did you see the letter that Dr. MacIver sent to Colonel Ashburn of Columbia? A.—I did not.

Q.—That was not passed over to you at all? A.—No; it was not.

(The cross examination next covered the hospital connections of various members of the Committee.)

Q.—Did you know Dr. Selders personally? A.—Never saw him but one time, and that was one evening at Columbia Hospital that he had a case of labor. I didn't see him to speak with. I went up the hall and asked one of the nurses who that man was, and she said that was Dr. Selders. That is the only time I ever saw him.

Q.—You did not talk with him? A.—No, I did not. I was going in the other direction at that time.

Q.—Did you permit him to come before your committee? A.—We didn't invite him to, and I am sure he didn't make a request to.

(There was then some discussion of rumors concerning the case of Miss Tew.)

Q.—Were you an active member of the District Medical Society in the latter half of 1937? *A.*—I went out of office. I was chairman of the Hospital Committee for one or two years; I don't know when it was. Dr. Warfield succeeded me, if you have that record. And I hate to say it, but I think I have been there three times since. There is always something that interferes.

Q.—Do you remember the dates on which you attended meetings of the District Medical Society?

THE COURT:—I think this goes far beyond the direct examination. The cross examinations are quite long because they go beyond the scope of the direct examination.

Mr. Lewin:—Don't you think, your Honor, that a question of this kind bears on the interest of the witness?

THE COURT:—I think membership has been shown. You have shown that he was a member of the society. That may or may not influence him. It is in evidence that he was a member.

Mr. Lewin:—It would be interesting to me to know what meetings he attended in the fall of 1937 when Group Health was being discussed.

THE COURT:—I will not permit any such detailed cross examination as that. I will permit you to ask him whether he was concerned with any matter with reference to G. H. A. that dealt with Dr. Selders before this.

By Mr. Lewin:

Q.—Did you have any knowledge of the controversy with regard to Group Health Association in the District of Columbia Medical Society? *A.*—I did have. Not from attending meetings. I don't think I attended meetings of the District Medical Society while that was going on.

RE-DIRECT EXAMINATION

By Mr. Leahy:

Q.—Did you not tell us also that you had some other information with reference to Dr. Selders, the subject of which occurred at Columbia Hospital, which you also took into consideration?

Mr. Lewin:—He did not tell us that here.

Mr. Leahy:—I thought he did.

A.—I remarked that my impression was that this woman was transferred from Garfield, I believe, with the diagnosis of acute appendicitis, and the gentleman who took the case over for operation found—

Mr. Lewin:—Just a minute.

A. (Continuing)—something different.

THE COURT:—I think you better not go into that.

(The remainder of the re-direct examination dealt with reports of difficulty of Dr. Selders with operative obstetrics.)

RE-CROSS EXAMINATION

By Mr. Lewin:

Q.—Doctor, is it very unusual for an expert operator in gynecology to remark when he sees an abnormality that he has not seen one of those for a long time?

Mr. Leahy:—I object.

THE COURT:—Objection sustained.

TESTIMONY OF JAMES F. MITCHELL

DIRECT EXAMINATION

By Mr. Leahy:

James F. Mitchell said he has been a practicing physician and surgeon in Washington since 1903. In preliminary training at Johns Hopkins hospital in 1893 he was head nurse in the operating room as a medical student. He graduated in 1897 and stayed on until 1903. He is chief surgeon at Emergency.

Q.—How long have you been chief surgeon at Emergency? *A.*—I think it was 1919 I came back from France and took over there.

Q.—How long were you in France? *A.*—I was only four or five months.

Q.—In what capacity did you serve in France? *A.*—I was chief of surgery in the Evacuation Hospital No. 32.

Q.—In what part of France? *A.*—I was near Toul, and Sabastopol Hospital, near Lemar.

Q.—Do you hold any office on any of the boards of Emergency? *A.*—I am on the board of directors; executive and surgical staffs.

Q.—Just what are the duties or functions of the executive staff at Emergency Hospital? *A.*—The executive staff has to do mostly with the finances and business affairs of the hospital.

Q.—And the board of directors functions for what purpose? *A.*—The board of directors is the board of last appeal; they regulate everything.

Q.—You have an attending staff and a courtesy staff, do you, at Emergency? *A.*—Yes.

Q.—Doctor, do you know whether there are any particular rules or regulations governing the right of applicants for privileges on the courtesy staff at Emergency? *A.*—Yes, there are.

Q.—What is that rule? *A.*—The rule as it now stands was passed in April 1936. We had been having a good deal of trouble with people who were not competent coming in to do work, and we considered it quite a while, the matter of having some regulation to restrain this sort of thing. So that in April 1936 a resolution was passed by the board of directors that any applicant for courtesy privileges would have to present his application, show that he was licensed in the District of Columbia, show that he carries a medical degree, that he is a member of the Medical Society, and must present evidence of his ability to practice in the particular field for which he applies for privileges.

Q.—Do you recall who was on the board of directors when that regulation was passed? *A.*—I think there were fifty members; I couldn't name them all. Mr. Blair was president.

Q.—Now, Doctor, you stated that in accordance with that regulation one of the requisites was that the applicant for privileges should show that he was qualified. What steps were taken by the hospital to determine the qualifications of an applicant? *A.*—The procedure was this: a man first made application. That was turned over to what we call the Courtesy Committee, consisting of three men who investigated it to the best of their ability; then they reported to the staff and the name was brought up before the full staff at a meeting and the case was discussed; each man was gone over that way. Usually it was very simple. The man applying for medicine was referred to Dr. Kaufman. He would say, "I know him. I know he is good, very capable." That settled it. He was admitted to those privileges. If it was gynecology, Dr. Darner handled it in the same way. If, however, he was not known to any of them and we weren't satisfied as to his professional ability, then we would appeal to the Academy of Surgeons and they would give us a report on him, and he would be considered again.

Q.—Now, with reference to the qualifications, the one that applicants should be a member of the local Medical Society, did you vote for that regulation as a member of the board of directors when it came before the board? *A.*—I wasn't present at that board meeting; I voted for it at a staff meeting when it was brought up to present it to the board.

Q.—I think you stated one of the reasons why the regulation was adopted: could you tell us how, in your judgment, membership in the local medical society would take care of the situation of incompetents that you found existing at that time? *A.*—A man applies for membership in the medical society. His record is looked into there also and the fact that he is a member of the medical society shows that he is reputable, and that obviates the necessity for a good deal of investigation on our part.

Q.—Now, when was it, if you can recall now, Doctor, the hospital first availed itself of the privilege of the Academy of Surgery for the purpose of making investigations into the qualifications of applicants? *A.*—I think that was in 1937.

Mr. Lewin:—I was going to object to this as not relevant in view of the evidence already in the record. May we approach the bench?

Q.—Doctor, I think you were at the point in your examination where I was asking you with reference to the hospitals availing themselves of the facilities of the Academy of Surgeons, with reference to investigations into the qualifications of applicants for surgical privileges where the applicant was not known to the staff: do you recall that? *A.*—Yes.

Q.—Why was it that the hospitals sought the facilities of the Academy of Surgery in the investigation of the qualifications of surgeons? *A.*—Because the Academy of Surgery made these investigations and thereby saved us a great deal of work.

Q.—Do you recall when it was that the hospital first began availing itself of the facilities of the Academy of Surgeons? *A.*—I think in 1936.

Q.—Following the adoption of the rule that you have just stated requiring membership in the local medical society as one of the prerequisites to privileges, do you recall whether or not there were upon the staff of Emergency Hospital those who were not members of the local Medical Society? *A.*—You mean the courtesy staff?

Q.—Yes. *A.*—There were, probably, because originally there was no courtesy staff; we just allowed them to come in; and there were probably some very excellent men who had been coming in who were not members of the medical society, or were members of other medical societies. I don't know any

exactly; I couldn't name any to save my life, but it is quite possible there were.

Q.—But following the adoption of the rule in 1936, what was the policy of the hospitals with reference to new members who made application? *A.*—They had to be members of the medical society and present proper references as to their ability.

Q.—Do you recall whether you personally, Doctor, had anything to do with the consideration of the application of Dr. Raymond E. Selders for privileges at the hospital? *A.*—Yes.

Q.—Do you recall now for what privileges he applied? *A.*—I think general surgery and gynecology; in fact, all branches of surgery, as I remember it.

Q.—How broad are those privileges, Doctor, to practice general surgery and gynecology? *A.*—They are pretty broad; they would cover any branch of surgery.

Q.—Doctor, in your judgment what should be the qualifications of a man who is to be the sole surgeon for two thousand five hundred or three thousand persons to do general surgery and general gynecology?

Mr. Lewin.—Objected to. The issue is whether he had sufficient qualifications to get into the hospital, that is the only issue here.

THE COURT.—I think the question is as to the requirements of the hospital, and the considerations which went into the particular case and decision.

By Mr. Leahy:

Q.—What would be the considerations which would enter into the granting of privileges to an applicant for general surgery and general gynecology? *A.*—We don't grant privileges in two branches like that. A man is either a surgeon or gynecologist, an eye man or throat man. It is against our policy to let a man have more than one set of privileges.

Q.—A man who has made application to practice general surgery in the hospital: What considerations enter into the granting or refusal of that application? *A.*—We must have word from some one who knows him that he has done surgery, and good surgery, and is capable of doing surgery.

Q.—Do you recall whether Dr. Selders' application showed he was a member of the local medical society? *A.*—He was not.

Q.—Do you recall whether that matter was also discussed on the question of his application? *A.*—It was, yes.

Q.—When his application for surgical privileges was being discussed, did the fact that he was a member of the staff of G. H. A. enter into the discussion against him? *A.*—Not at all, sir.

Q.—Do you recall, Doctor, now, whether there was any correspondence had between your hospital and Mr. Penniman? *A.*—Yes, Mr. Blair wrote letters to him and he letters to Mr. Blair.

Q.—Have you any recollection now that you personally saw any such letters? *A.*—Yes.

Q.—I am going to show you three which have been introduced in evidence here, Government's Exhibits 370, 373, and 391. The first one, 370, is dated Nov. 15, 1937, on the letterhead of Emergency Hospital stationery, signed by Gist Blair. Would you look that over for us, please, Doctor, and see if you can identify it? *A.*—Yes, I remember this very well.

Q.—Do you recall what the letter was which was referred to in this communication, in which Mr. Blair says:

"Replying to your letter of November 8, requesting permission to admit patients who are members of Group Health Association, 'upon the request of the medical director,' and saying that Dr. Raymond E. Selders is on the staff of Group Health Association, I beg to say that Emergency Hospital has adopted, by its rules, a so-called courtesy list of physicians who are subject to the control of our staff under practically all conditions.

"This courtesy list is based upon certain fundamental requisites, laid down by our staff, and, while I have every friendly wish toward some of your objects, and feel satisfied that the executive committee and board of this hospital are in many ways sympathetic with the purposes of your organization providing medical and surgical care, and, when necessary, hospitalization in recognized hospitals of high standing, we do not feel at present that we can make any changes in our rules. This hospital, as are other hospitals in this city, is open to the reception of all patients.

"Dr. Selders or other representatives of Group Health Association must first be placed on our courtesy list before they can treat patients in this hospital. Your letter and Dr. Selders' credentials have been referred to the proper authorities."

A.—I do.

Q.—Now, Doctor, when he says that:

"Dr. Selders or other representatives of Group Health Association must first be placed on our courtesy list before they can treat patients in this hospital,"

was this rule applied any differently to the staff of Group Health Association than to any other applicant for privileges? *A.*—No, sir, that is our general rule.

Q.—This also is written to Mr. Penniman, William F., by Gist Blair, is it not? *A.*—Yes.

Mr. Leahy:—

"Dear Mr. Penniman:

"With further reference to your communications, requesting that Emergency Hospital furnish hospitalization to patients who are members of Group Health Association, Inc., I beg to advise that there can be no question about Emergency Hospital offering its services to any patient, regardless of color, race or creed, and its doors are open twenty-four hours every day throughout the year.

"However, as is consistent with every well regulated hospital, and in conformity with the rules of the American College of Surgeons, the Emergency Hospital does undertake to exercise authority and care to see that physicians, who are granted the privilege to treat patients on its premises, are qualified in every respect in their particular branch of the profession and are so recognized by the medical profession.

"In accordance with this idea, and in order to safeguard the patient, the Board of Directors, at its regular meeting, held April 17, 1936, unanimously adopted a resolution, providing that any physician who desires to treat patients in Emergency Hospital must make formal application, that his professional qualifications must be satisfactory to the professional staff, and as an index of his professional training and integrity that he must be a member in good standing of the District of Columbia Medical Society.

"The Emergency Hospital will be glad to have any physician make application for courtesy privileges, and if his qualifications meet our requirements, I feel sure that all privileges will be extended to him.

"Since Dr. Selders' application does not meet these requirements, the Board has not seen fit to grant him the privileges which he requested.

"Very truly yours,
Emergency Hospital.
Gist Blair, President."

By Mr. Leahy:

Q.—I want to ask you, Doctor, to what does it refer in this letter where it says:

"In accordance with this idea, and in order to safeguard the patient, the Board of Directors, at its regular meeting, held April 17, 1936, unanimously adopted a resolution, providing that any physician who desires to treat patients in Emergency Hospital must make formal application,"

et cetera.

Mr. Lewin.—Objected to as already covered.

Mr. Leahy.—I haven't completed my question yet.

Mr. Lewin.—I thought you had.

By Mr. Leahy:

Q.—How does the safeguarding of a patient have any relation to the resolution of April 17, 1936, adopted by your hospital?

Mr. Lewin.—That has already been covered.

Mr. Leahy.—Not by this witness. I haven't asked him about it.

THE COURT.—I thought it had, but let him answer it if there is any question about it.

The Witness.—Simply that we wanted to be sure men who had the privileges could render their patients the proper services.

Q.—Take Government's Exhibit 391, Doctor. This is another one of Feb. 3, 1938, from Gist Blair, this time directed to Mr. Kirkpatrick. *A.*—Yes, I remember this letter.

Q.—Now, was the result of this communication of Feb. 3, 1938, that you had this conference with Mr. Kirkpatrick which you stated you were present at? *A.*—Yes.

Mr. Leahy.—That letter states:

"Mr. dear Mr. Kirkpatrick:

"Your letter of February 2 has been received, and today the same was brought to the attention of the executive committee at its regular session at the hospital, and by resolution the committee authorized Dr. James F. Mitchell and myself to confer with you or any member of your board of trustees, and if you will telephone the superintendent at this hospital, and have arrangements made which will be convenient to Dr. James F. Mitchell, who is very much occupied, and myself, we will be glad to meet you.

"In your letter, relating to Dr. Raymond E. Selders, you suggest that your board of trustees meet with our board of trustees, and I would suggest that this is not practical since our board of trustees will not meet for several months, and matters of this kind are referred to our executive committee to decide what is advisable for the hospital to do under the circumstances.

"Very truly yours,
Gist Blair, President."

By Mr. Leahy:

Q.—Who attended that conference that you remember now?

Mr. Lewin.—It has all been covered. He stated Russell and Kirkpatrick, Blair and himself.

THE COURT.—Well, he may answer.

By Mr. Leahy:

Q.—Who attended that meeting? *A.*—Mr. Russell and Mr. Kirkpatrick; Mr. Blair and myself.

Q.—Do you recall what the subject matter of the conference was? *A.*—I remember very little about it, except they were urging the appointment of Dr. Selders to the courtesy staff.

Q.—On what ground? Do you now recall? *A.*—That I don't remember. Mr. Russell did most of the talking. Mr.

Blair was very sympathetic and told them again just what he told them before in his letters, and so on, that a man to do work there as a member of the courtesy staff had to fulfil certain requirements, which Dr. Selders did not do.

CROSS EXAMINATION

By Mr. Kelleher:

Q.—Dr. Mitchell, did you make the verbal communication yourself to the Washington Academy of Surgery? A.—No, sir.

Q.—Who did? A.—It was done through our secretary, Dr. Lyons.

Q.—As a matter of fact whatever communication the Washington Academy made concerning the application of Dr. Selders, that was not the ground on which he was denied privileges at Emergency? A.—It simply showed us he was not qualified.

Q.—Please answer my question: That was not the ground on which Emergency denied him privileges, was it? A.—The grounds were his qualifications.

Q.—The qualifications were that he was not a member of the Medical Society? A.—That was part, and also that he was not surgically qualified.

Mr. Kelleher:—Exhibit 663 are the minutes of the executive staff meeting of Emergency Hospital, Dec. 21, 1937. I will read only the last paragraph. The minutes show that Dr. Mitchell was present.

"Two letters from Mr. William Penniman, President, Group Health Association, Inc., were read. These letters requested, first, that patients of the Group Health Association be admitted to Emergency Hospital upon the request of Dr. Henry Rolf Brown, director, and, second, that Dr. Raymond E. Selders, surgeon, be permitted to attend these patients while hospitalized. The staff recommended that Mr. Penniman be informed that patients of the Group Health Association would be admitted to Emergency Hospital upon the request of Dr. Henry Rolf Brown, director, and that he be further informed of the regulation adopted by the board of directors on April 17, 1936, requiring that all physicians placed on the courtesy list must be members of the District Medical Society, and that since Dr. Selders is not a member of the District Medical Society, he could not be placed on the Courtesy List of the hospital."

By Mr. Kelleher:

Q.—Now, Dr. Mitchell, is it not true that this was the first meeting of the executive staff at which Dr. Selders' application was considered? A.—I really couldn't say.

Q.—Was there any discussion at this meeting of December 21 other than the facts as shown in the minutes? A.—I shouldn't think so; I didn't read them carefully.

Q.—And there isn't anything in the minutes to show that the recommendation of the Washington Academy of Surgery was considered? A.—Nothing there that I see. That was certainly not the only decision on Dr. Selders.

Q.—Isn't that the decision of the executive staff? A.—I imagine so, yes.

Q.—That decision was based on the fact that he did not have membership in the local medical society? A.—It was not by us, as I remember. That may have been sent to the society, but we always, in considering any man, consider his qualifications.

Q.—But, as a matter of fact, when Mr. Penniman was notified by Major Blair on Dec. 30, 1937, the ground stated was that he was not a member of the local society? A.—Does Blair say that in his letter?

Q.—Will you look at exhibit 373?

THE COURT:—That was read just a short while ago. That is what the letter stated. It does not do any good to ask the doctor about it. The letter itself shows what it says.

By Mr. Kelleher:

Q.—As a matter of fact, then, Dr. Selders was denied privileges because he was not a member of the local medical society? A.—One reason, yes, sir.

Q.—And the only reason given in the minutes and in the letter to him? A.—That may be.

Q.—You knew, did you not, that Dr. Selders was a member of the Harris County Medical Society and of the American Medical Association? A.—I saw that in his application, yes.

Q.—Will you identify this as the minutes of the meeting of Oct. 14, 1937, of the executive staff? It is a photostatic copy. Can you identify this as the minutes of that meeting? A.—Yes.

Mr. Kelleher:—U. S. exhibit 664 is a photostatic copy of the minutes of the regular meeting of the executive staff of Emergency Hospital, held on Oct. 14, 1937. From these minutes I read the following:

"Attention of the staff was called to the matter that occasionally an applicant for courtesy privilege will be a member of his local medical society, but not of the District Medical Society. It was ruled that ordi-

narly this would meet the requirement of the hospital that a man be a member of the District Medical Society."

By Mr. Kelleher:

Q.—Dr. Mitchell, as a matter of fact, with respect to Dr. Selders' application, this interpretation adopted on Oct. 14, 1937 was not applied, was it? A.—I beg your pardon; of the local medical society?

Q.—The interpretation put on that regulation of Emergency at the meeting of Oct. 14, 1937, that membership in another local medical society of the A. M. A. would ordinarily be sufficient. A.—Isn't it in his own local medical society, or is it another one?

Q.—"It was ruled that ordinarily this would meet the requirement of the hospital that a man be a member of the District Medical Society." A.—That is local.

Q.—Wasn't Dr. Selders a member of the Harris County Medical Society? A.—No, he was practicing in Washington.

Q.—Wasn't that his local medical society? A.—It had been; it wasn't then.

Q.—As a matter of fact, Emergency Hospital did not require that all applicants be members of the Medical Society of the District of Columbia? A.—Yes, of the local society of the district in which he was practicing at the time. We have men in Virginia, for instance, who are members there.

Q.—Finish your answer. A.—We have men in Virginia—neighboring Virginia—and neighboring Maryland who do not belong to the District Society but do belong to the local societies in the districts in which they are practicing.

Q.—Do you permit them to practice in Emergency Hospital? A.—We let them come to Emergency Hospital.

Q.—Isn't it also true that as late as June of 1938 there were members of the staff of Emergency Hospital who were not members of the local medical societies? A.—Not on the staff; they may have been courtesy; but I don't know, as I explained before.

TESTIMONY OF DR. A. MAGRUDER MacDONALD

DIRECT EXAMINATION

By Mr. Leahy:

A. Magruder MacDonald said he is a practicing physician in the District of Columbia. He graduated in 1915 from Georgetown University. He was at the Emergency Hospital as an intern and resident physician there for a period of two years. Subsequently he was superintendent of Casualty Hospital for a year. Subsequently he went into the service and was abroad, first with the British army and then with the American army, and returned to the States. He remained in the service at Camp Lee, was then discharged from the service, and then entered into the practice of medicine. He was appointed coroner in 1934. Prior to that time he had been deputy coroner, and prior to that, in the period from about 1920, he had been doing autopsies and postmortems for the District government in the coroner's office. He is on the council of Sibley Hospital, and on the staff at Casualty Hospital, and has privileges of treating patients in other hospitals in the city. His appointment on the council of Sibley was done at an interim; it was not done at the usual time of appointment of the staff of council. His recollection is that it was in March of 1937. At Casualty, he is classed as an associate in surgery. In 1937 he was on the intern committee, and in 1938 was on the credentials committee.

Q.—When you speak of the credentials committee, will you kindly tell us what the functions of that committee are or were in 1938, when you were a member of it? A.—My understanding of the functions of the credentials committee was to review the credentials of any individual who had been referred to it by the staff for their determination and recommendation to the staff.

Q.—Recommendation for what purpose? A.—For admission with the privileges of treating patients in that institution.

Q.—Do you recall when you first became connected with Casualty Hospital, Doctor? A.—I think it was in February of 1917.

By Mr. Leahy:

Q.—Doctor, do you recall whether or not while you were on the credentials committee at Casualty the application of a Dr. Raymond E. Selders came before your committee for investigation and report? A.—It did.

Q.—Have you any independent recollection of about when that application came before your committee? A.—Yes, it was in June, I believe, 1938.

Q.—Did you personally know Dr. Raymond E. Selders? A.—I did not. To my recollection, I have never seen the gentleman. If I have seen him, I didn't know who he was.

Q.—Do you recall now having made an investigation into or an examination of the qualifications of Dr. Selders? A.—The investigation that I made consisted of this: that certain letters and statements were presented to me for my consideration.

Q.—Did you pass on those letters in considering the qualifications? A.—I did.

Q.—Did you make your recommendation as to what those qualifications indicated? A.—I did.

Q.—Did you recommend for or against the granting of courtesy privileges to Dr. Selders at Casualty? A.—I recommended against.

Q.—On what was that recommendation based?

Mr. Lewin:—The recommendation is in evidence, in writing.

Mr. Leahy:—I think I may ask him on what he based his writing.

THE COURT:—The recommendation itself may be there, but he may ask him on what it was based.

Mr. Lewin:—I think the witness testified that he considered only certain letters that were laid before him. Now, they must have passed on those letters, and if those letters are in existence we ought to have them.

THE COURT:—It may have been based on his conclusions. If so, would he not have a right to state his conclusions?

Mr. Lewin:—I think they are in the written report.

THE COURT:—There is no objection to his stating the conclusions on which the recommendation was based. Suppose they had been stated in the letter; wouldn't they be evidence?

Mr. Lewin:—Yes.

THE COURT:—It may be that the letters should be produced if they are available. I am not passing on that.

Mr. Leahy:—Will you read the question, please?

The Reporter:

"Question. On what was that recommendation based?"

The Witness:—On my interpretation of these letters.

Mr. Leahy:—Do you have handy those letters that are in evidence?

Mr. Lewin:—We have copies of them.

By Mr. Leahy:

Q.—I am now going to show you copies of letters, Doctor, and ask you whether you can identify them as letters which you had before you. I cannot give you exhibit numbers, but I can give dates. One of them is dated April 25, 1938 and is from the Worcester City Hospital, Worcester, Mass. The other is from Dr. J. C. Alexander of Houston, Texas, and is dated April 28, 1938. A.—Yes, sir. These letters were the ones that I saw at that time.

Q.—Were there any other letters than those two which I have shown you which you now recall that you had before you? A.—My recollection is that there was another one. There were three.

Q.—Can you recall now from what other source that letter came? A.—The University of Pennsylvania. I think that is the letter.

Mr. Leahy:—While they are getting this letter dated April 27, I will read the letter dated April 25, 1938, from the Worcester City Hospital, over the signature of George A. MacIver, addressed to Miss E. M. Rogers, Superintendent of Casualty Hospital:

"Dear Miss Rogers:

"Dr. Raymond E. Selders served as surgical resident in this hospital for one year ending June 30, 1937, coming to us highly recommended from the Post-Graduate School of the University of Pennsylvania.

"He participated in the surgical work of the hospital considerably and had an opportunity to gain considerable competence. Our operating schedules show that two hundred and three cases were assigned to him for operation. This does not mean, however, that he actually performed these operations. He may have elected to assist in some of them. There is record that he actually performed and dictated one hundred and thirty-three operations, one hundred and five of which were classified as major. From the above I think you can conclude that his surgical training is such as to give him competence.

"Yours very truly,

"George A. MacIver,

"Superintendent."

This is the letter of April 28, 1938, from Dr. J. C. Alexander, in the Shell Building, at Houston, Texas:

"Dear Mr. Rogers:

"In reply to your letter regarding the qualifications of Dr. Raymond E. Selders, I beg to advise that his professional qualifications in surgery are well above the average and ethically and morally he has always been above reproach. During his several years of practice here he made many valuable lay and professional friends.

"He is now a member of the Harris County Medical Society here.

"Yours truly,

"J. C. Alexander."

By Mr. Leahy:

Q.—Doctor, here is the third letter which you mentioned. I will bring it to your attention. It is dated April 27, 1938 and is from the University of Pennsylvania. I will ask you if that is the letter to which you just referred. A.—Yes, sir.

Mr. Leahy:—That letter is a copy of an original on the letterhead of the University of Pennsylvania Graduate School of Medicine. It is addressed to the superintendent of Casualty Hospital.

"Dear Mr. Rogers:

"Dr. Raymond E. Selders was a student in the surgical group of the Graduate School of the University of Pennsylvania during 1935-1936, and he completed this basic year satisfactorily. He then went to Worcester, Mass., and spent a year in clinical training, and I understand that his work there was satisfactory to his preceptor.

"Personally, I know nothing about his ability as a surgeon beyond this basic training which he had in Philadelphia, and I am sure you have a full account of his training before he came here. This training, according to his records, was broad, and he is a man of mature age and general experience.

"Very truly yours,

"Walter Estell Lee."

By Mr. Leahy:

Q.—Doctor, as a member of the credentials committee of the Casualty Hospital, do you recall whether you had any other information with reference to the qualifications of Dr. Selders than what is set forth in these three letters, copies of which I have just brought to your attention? A.—I believe that during the discussion Dr. Caylor, who was on that committee, and who was connected with Providence Hospital, stated that the matter had also been referred by them to the Washington Academy of Surgery and that they had obtained an adverse report.

Q.—Doctor, what have you to say with reference to the sufficiency of the qualifications for one applying for general surgical privileges, as disclosed in those letters? A.—Well, from my observation, that a surgical resident usually performs those operations—

Mr. Lewin (interposing):—That is objected to. I do not think we ought to have testimony about general surgical residents.

THE COURT:—The question is what considerations entered into his findings with reference to this matter. He may state that.

The Witness:—I believe, your Honor, that was my intention, to state why: that in my observation the surgical residents perform these operations under supervision of the staff, and certain cases are allotted to them by the staff to perform. In other words, in my opinion, that action is not always independent. Now, it may have been in this particular case; I don't know; but I was going by a general rule, and it was my opinion that if that were true, this man should have had more actual contact with patients and responsibility before he went out into general surgery; that he should still serve an apprenticeship with some other surgeon for a period of time.

By Mr. Leahy:

Q.—Do you recall now, Doctor, whether you had any knowledge as to Dr. Selders' qualifications coming to you from anything which was done at Casualty Hospital? A.—I am not positive about anything of that nature.

Q.—Did you also serve in any capacity whatsoever in Sibley Hospital in passing on the qualifications of Dr. Selders? A.—I did.

Q.—By virtue of what office which you held in the hospital was it that you aided or assisted in the investigation into the qualifications of Dr. Selders? A.—As a member of the council. I was assigned to three committees and still am assigned to those three committees: the committee on surgery, the committee on x-ray, and the committee on laboratory. The method at Sibley Hospital consists of this: When an individual applies for courtesy privileges at the hospital, a form is sent to us, which is a notice that so and so has applied for courtesy privileges of major surgery and minor surgery—that is what is checked on my particular blank—and that full information is in the office. I received that in November of 1937, and my notation on that was this: "Not approved. Need more information"; because there was nothing there—no letters or no information—except this application of this individual, and I knew of nobody whom I could inquire from who had seen this man perform any operations.

Q.—Did you know of any source to which you could go in order to obtain information about Dr. Selders or his qualifications? A.—Well, as I say, that was not my particular duty. In referring back to the hospital, "more information" or "need

more," or something—that is the apparent reason that I gave. I mean by "apparent," I can't recall the exact words, but I wanted more information. Then the hospital's duty is to supply me and each individual of that committee with more information.

Q.—Do you recall whether or not any more information was ever supplied to you, Doctor, through Sibley Hospital? A.—The case, to my recollection, was never referred back to me after I had put in this original paper.

Q.—Doctor, in passing on the qualifications of Dr. Selders, and in coming to the conclusions which you reached at Casualty Hospital, what relation had those conclusions which you formed to G. H. A.? A.—I might state this: that I believe that I came out and said this: that in view of certain controversies that had existed over a period of months, those things should be discarded from our minds and that we should consider this applicant from the information at hand.

Q.—Who finally passes on the application? A.—First the staff and then the board of directors.

By Mr. Leahy:

Q.—In coming to your conclusions at Sibley, where you noted "further information required," or words in substance to that effect, what relation did you concluding that you needed further information bear to G. H. A.? A.—Well, I didn't know very much about G. H. A. at that time. I believe it was just being organized in November. I personally did not know the real function of the organization.

Q.—Did G. H. A. enter into your conclusions, as far as Sibley was concerned? A.—It was noted on this notice that was sent to me that this individual was an employee of G. H. A.; but having no information or recommendation, that did not enter into my mind at that particular time, because I wanted the information so that I could pass on him in justice to the man and to myself.

CROSS EXAMINATION

By Mr. Lewin:

Q.—Dr. MacDonald, there is in evidence, I believe, a letter from President Taylor, of Sibley, to Dr. Selders, dated Feb. 24, 1938, to the effect that his application had been again submitted to the executive committee of the medical council for reconsideration of their action in refusing same.

"I regret to inform you that the committee did not reverse its action, and your request has been refused."

Were you a member of that executive committee? A.—No, sir. No; I can explain that.

Q.—So, these references at Sibley, which were before the executive committee on the reconsideration, were not referred to you? A.—Not to me, no, sir.

Q.—Were they available to you, Doctor? A.—Yes. I think they could have been available to me if I had inquired about it, but they were not, because the executive committee is a separate committee, and I was only a subcommittee member. Can I explain that a little further?

Q.—Yes, indeed. A.—The chairman of each committee is a member of the executive committee, and I was only a sub-member of a particular committee; therefore, the executive committee action would not be known to me, because they have their meetings, and this other memorandum is sent out individually, which we carry into the hospital.

Q.—At the time you made your recommendation at Sibley, Dr. Selders' references had not responded; isn't that true? A.—Well, I would say that they weren't there.

Q.—I show you what purports to be a photostatic copy of the reference to you and your report. A.—That is my signature. "Not approved. Further information required."

Q.—That is dated Nov. 27, 1937? A.—That is right.

Q.—It says:

"Applicant's credentials on file in the office of the President.

"Attention of the committee is called to the fact that above applicant is one of the salaried physicians of the Home Owners' Loan Corporation Group Health Association and that information as to his qualifications and correspondence in connection with his application will be found on file in the president's office available to members of the various committees concerned for their information."

A.—Yes.

Q.—When you went to the office to do that, you found letters had been written but that the references had not responded? A.—I won't say that; I don't know when the letters went out. All that I can state is this that in the folder was the application and no other correspondence. I don't know where that other correspondence, if it existed, was kept; but in the folder was only the man's application and no letters.

Q.—As a matter of fact, you never saw the responses from his references at Sibley? A.—I did not.

TESTIMONY OF DR. JAMES A. CAHILL

DIRECT EXAMINATION

By Mr. Leahy:

James A. Cahill of Washington, a practicing surgeon, graduated from Georgetown University in 1915. Following graduation he was in St. Elizabeths Hospital, at Youngstown, Ohio; Providence Hospital, Washington, D. C.; Georgetown University Hospital, in Washington; and in the Army for two years. He is a Fellow of the American College of Surgeons, also the Washington Academy of Surgery. He is chief surgeon at the Georgetown University Hospital, chief surgeon at Providence Hospital, consulting surgeon at Gallinger Hospital, consulting surgeon at Columbia Hospital, and professor of surgery at Georgetown University School of Medicine.

Q.—Do you recall, Doctor, that in the year 1937 there came a time when you wished to establish a residency in surgery in both Georgetown and Providence Hospitals? A.—I do.

Q.—Have you an independent recollection, so that we will not have to take the time to get the documents out to show you, of the fact of writing to any one in connection with that matter? A.—Yes, I have.

Q.—To whom did you direct your correspondence? A.—I wrote a letter to Dr. William Cutter, in Chicago. He is the head of the Council on Medical Education of the American Medical Association. I wrote to him requesting an inspector.

Q.—Did you request Dr. Cutter to do anything with respect to your establishing these residencies? A.—Yes, I did. I asked Dr. Cutter to inspect both the Georgetown University Hospital and the Providence Hospital with reference to approving the residency in surgery at both of those institutions.

Q.—Doctor, at the time you made this request for approval of both Providence and Georgetown hospitals, did your request have any connection whatsoever with G. H. A.? A.—I never heard of G. H. A. at that time. This request came along in January, as I recall, of 1937.

Q.—Did there finally come a time when such an inspection was made of the hospitals? A.—Yes, there was.

Q.—Did you personally come in contact with anybody who made this inspection? A.—I came in contact with Dr. Peterson, who was sent by Dr. Cutter.

Q.—Do you know whether Dr. Peterson investigated or made an inspection of both Providence and Georgetown hospitals? A.—He did.

Q.—Did you at that time discuss the matters with Dr. Peterson? A.—I did.

Q.—I will put the question directly to you, Doctor: Did any of your discussions relate to anything at all about G. H. A.? A.—None whatsoever.

Q.—Do you know about the Mundt Resolution, so called? A.—I don't know the Mundt Resolution as such; I couldn't recite it; but I have heard of such a resolution.

Q.—Do you recall now whether there came a time when Dr. Peterson made a report of what he found on the inspection of those two hospitals? A.—Yes, there did come a time.

Q.—Do you recall whether that report came under your official attention and for your official consideration? A.—It came under my consideration.

Q.—Without going into details about the report with respect to either or both of the hospitals, Doctor, do you recall whether any suggestion was contained in a letter transmitting the report with reference to members of the staffs of local hospitals being members of the local medical society? A.—Yes, in that letter there was a suggestion made that the members of the staff at the Providence and Georgetown Hospitals should become or were asked to become members of the local society—the Medical Society.

Q.—You, I take it, are also on the staffs at both Providence and Georgetown? A.—I am.

Q.—Which staff were you on in either or both of the hospitals? A.—Surgical.

Q.—Do you recall whether the report which we have just referred to came under the attention of the staffs—the surgical staffs—of both those hospitals? A.—The report came under the consideration of the surgical staff and also the general staff.

Q.—Are you on the general staffs of both hospitals? A.—Yes, I am; the executive staff.

Q.—So, the question about this request or suggestion that the members of the staffs should become members of the local Medical Society came before the staffs for discussion? A.—That is right.

Q.—I will ask you, Doctor, if you considered that there was any threat contained in the resolution which was set forth in the letter transmitting these reports, that approval would not be accorded you unless all the members of the staffs became members of the local society.

Mr. Lewin:—I object to that. The letters speak for themselves.

Mr. Leahy:—The letters definitely speak for themselves; it is the interpretation which we want to show, if your Honor please.

Mr. Lewin:—He did not write the letters.

THE COURT:—I think he may state whether or not they regarded that as a requirement.

The Witness:—There was absolutely no threat, there was no coercion, there was no duress—

Mr. Lewin:—That is objected to. That is not answering the question.

The Witness:—I am making my answer emphatic; I beg your pardon, sir.

Mr. Lewin:—I move that it be stricken out.

Mr. Leahy:—No.

Mr. Lewin:—That is outside the scope of your Honor's ruling.

THE COURT:—I think it comes within the scope. Perhaps it is a little broad, but the question is whether they acted under the feeling that they were required to do it; whether there was any element of coercion, so far as they were concerned; whether they acted freely, without any such feeling. I think that is appropriate.

Mr. Lewin:—But do you not think it ought to be confined to how this doctor acted?

THE COURT:—Unless there was a discussion in the meeting which expressed the views of other members. I think then he may state it.

By Mr. Leahy:

Q.—Doctor, were you present at the staff meetings when this suggestion was discussed, if it was discussed at the staff meetings? *A.*—Yes, I was.

Q.—I will ask you whether or not the staff of each hospital finally voted on the suggestion.

Mr. Lewin:—Just a minute, Doctor. I think the minutes would show what happened in the staff meetings, your Honor.

Mr. Leahy:—Well, they do; that is true.

Mr. Richardson:—What is the difference?

Mr. Lewin:—Can you show any minute which shows that?

Mr. Richardson:—There is no best-evidence rule with respect to minutes, and you know it.

THE COURT:—I think the best evidence rule as to such matters applies only when you are attempting to impress some obligation of liability on a corporation; but for general purposes, whoever was there and would have heard what went on is a proper witness. There is a distinction in the best-evidence rule, but it is rather narrow. If the hospital were being sued with respect to some such action, then, of course, the best-evidence rule would be applied with regard to the obligation of the hospital.

Mr. Lewin:—May we have fixed the time of this meeting, so that we may have some access to the minutes?

MARCH 27—AFTER RECESS

TESTIMONY OF DR. JAMES A. CAHILL

DIRECT EXAMINATION (RESUMED)

By Mr. Leahy:

Q.—Doctor, just before luncheon I think I was asking you whether or not the recommendation which was contained in the letter which accompanied the report to Providence Hospital was considered by the staff at Providence Hospital? *A.*—Yes, sir; it was.

Q.—Were you present at the time it was considered? *A.*—Yes; I was.

Q.—What was the consideration given to the recommendation of the American Medical Association in the letter which accompanied the report on the inspection of the hospital? *A.*—That they were willing to cooperate in helping to make the hospital better.

Q.—What if any consideration was given to it as a threat that unless cooperation were given the approval of the residency would not be granted?

Mr. Lewin:—Objected to. It has been covered. He said the hospital was willing to cooperate.

THE COURT:—Objection overruled.

A.—There was no threat.

By Mr. Leahy:

Q.—Do you recall whether, as a result of the inspection which was made of Georgetown Hospital on its application for a residency in surgery there, that letter which accompanied the report was likewise considered by any members of the staff of Georgetown Hospital? *A.*—It was considered by the staff.

Q.—Were you present at the staff meeting at which that was considered? *A.*—Yes; I was.

Q.—What consideration was given to that recommendation? *A.*—The same consideration—they were willing to cooperate.

Q.—Did the staff consider that there was any threat contained in the letter which accompanied the report? *A.*—There was no threat.

Q.—Subsequently, Doctor, was Providence Hospital approved for the residency in surgery? *A.*—The Georgetown University Hospital was approved first. Providence Hospital was asked to make certain changes for the betterment of that institution, and then it was approved.

Q.—And then it was approved? *A.*—Yes; it was.

Q.—Do you recall when it was that Georgetown was approved, Doctor? *A.*—I couldn't say exactly; I don't recall the date, but I know that Dr. Peterson—it was after the first inspection, and then an inspector came later to inspect Providence, and after that inspection they were approved.

Q.—Do you recall, Doctor, whether at Georgetown a rule was adopted in substance to the effect that members of the courtesy staff should be members of the local medical society also? *A.*—There was a rule passed asking them to become members of the District Medical Society.

Q.—Do you recall whether there was a rule adopted at Providence? *A.*—They had the same rule adopted there.

Q.—Do you recall, as a matter of fact, whether all members of the courtesy staff of Providence Hospital are members of the local District Society? *A.*—No; they are not. I mean, there are members on the staff now and were members of the staff then, at the time of the inspection, that were not members of the District Medical Society or the American Medical Association.

Q.—Is that true with reference to Georgetown Hospital? *A.*—It is true.

Q.—Doctor, we have had some evidence here with reference to questionnaires which were sent out by the Hospital Committee of the District Medical Society. Do you recall whether or not at any time any questionnaire was received by Providence and considered by the staff of Providence? *A.*—I never saw a questionnaire at Providence.

Q.—Did you ever see a questionnaire at Georgetown? *A.*—I never did.

Q.—Do you recall, Doctor, now, whether at any time the so-called Mundt Resolution has even been used against anybody on the staff of either Providence or Georgetown? *A.*—No; it has never been used.

Q.—In the adoption of the so-called Mundt Resolution, either at Georgetown or at Providence, did it have any connection whatsoever in its adoption in the board meetings which you have told us about, with G. H. A. or any members of the staff of G. H. A.? *A.*—Not at all.

Q.—Do you recall whether or not in the discussions with reference to the adoption of a regulation that membership in the local medical society should be asked of those on the courtesy staffs, what it was which induced the members of the board to adopt such a resolution?

Mr. Lewin:—What resolution is that?

Mr. Leahy:—That they should be members of the local medical society.

A.—It was believed that the members of the local medical society should be members in the practice of medicine who were interested in advancing the betterment of the hospital so that patients could be treated better and so that advancements in science could be recognized when they were brought out.

CROSS EXAMINATION

By Mr. Lewin:

Q.—Dr. Cahill, do I understand that sometime after the receipt of Dr. Cutter's letter the Georgetown Hospital for the first time required membership in the District Medical Society for its courtesy staff? *A.*—After Dr. Cutter's letter; yes.

Q.—Is the same thing true with regard to Providence Hospital? *A.*—The same thing would be true regarding Providence. They asked their cooperation.

Q.—And then for the first time you put that rule into effect with regard to Providence? *A.*—I think that is true.

(To be continued)

OFFICIAL NOTES

RADIO BROADCASTS

The next three programs to be broadcast in the series "Doctors At Work" are as follows:

- May 7. So Mothers May Live.
- May 14. Physician to the Community.
- May 21. The Doctor in Arts and Letters.

The program is scheduled over the Blue Network of the National Broadcasting Company Wednesday at 10:30 p. m. eastern daylight saving (9:30 eastern standard) time (9:30 Chicago daylight saving, 8:30 central standard, 7:30 mountain standard, 6:30 Pacific standard time).

ADDRESSES BY OFFICIAL STAFF

DR. PAUL C. BARTON:

- May 12—Dane County Medical Auxiliary, Madison, Wis.
- May 14—George Williams College, Chicago.
- May 20—LaVerne T. Perrottet Post, American Legion, Wheaton, Ill.

DR. W. W. BAUER:

- May 3-5—National Education Association Yearbook Commission, Philadelphia.
- May 6—High School Assembly, Greensburg, Pa.
- May 6—Rotary Club, Greensburg, Pa.
- May 6—Westmoreland County Medical Society, Women's Auxiliary and Hospital Auxiliary, Greensburg, Pa.
- May 8—Cudahy Health Department, public meeting, Cudahy, Wis.
- May 12—Indiana University Convocation, Bloomington.
- May 19—Hampden County Tuberculosis and Health Association, Springfield, Mass.
- May 20—National Congress of Parents and Teachers, Panel, Boston.
- May 21—National Congress of Parents and Teachers, Panel, Boston.
- May 23—Wisconsin Alumni Association, Madison, Wis.
- June 3—Joint Committee of the National Education Association and the American Medical Association Symposium, Cleveland.
- June 4—American Medical Association, Woman's Auxiliary, Cleveland.

DR. MORRIS FISHBEIN:

- May 5—Executives Club, Asheville, N. C.
- May 6—Executives Club, Columbia, S. C.
- May 7—Executives Club, Augusta, Ga.
- May 8—Executives Club, Montgomery, Ala.
- May 9—Executives Club, Mobile, Ala.
- May 10—Julius Friedlaender Fund, Columbus, Ga.
- May 12—West Virginia Medical Association, Charleston.
- May 13—Woman's Auxiliary West Virginia Medical Association, Charleston.
- May 13—Executives Club, Bluefield, W. Va.
- May 19—North Dakota Medical Association, Grand Forks.
- May 22—Executives Club, Nashville, Tenn.
- May 22—Radio Address WSM, Nashville (5 to 5:15 p. m.).

DR. FRANK H. LAHEY:

- May 1—Edwin A. Jarecki, Memorial Lecture, Jewish Hospital, Philadelphia.
- May 7—Essex North District Medical Society, Centennial Meeting, Lawrence, Mass.
- May 13—American Association for the Study of Goitre, Boston.
- May 14—New Hampshire Medical Society, 150th Anniversary, Manchester, N. H.
- May 15—National Gastroenterological Association, New York.
- May 20—Society of State of North Carolina, Pinehurst, N. C.
- May 21—Massachusetts Medical Society, Boston.
- May 28—Rhode Island Medical Society, Newport, R. I.

DR. PAUL A. TESCHNER:

- May 8—Fair Oaks Presbyterian Church, Oak Park, Ill.
- May 12-15—Texas State Medical Association, Fort Worth.

DR. NATHAN B. VAN ETEN:

- May 10—Polyclinic Medical Society, New York.
- May 15—Iowa State Medical Society, Davenport, Iowa.
- May 21—Massachusetts Medical Society, Boston.
- May 25—American Jewish Physicians Committee, New York.
- May 28—National Board of Fire Underwriters, New York.

EXHIBITS FROM HEADQUARTERS

- May 1 —School Health Review, Joliet, Ill.:
Human Factory.
Your Personal Health.
- May 3-5 —Wayne County Chiropractic Society, Detroit:
Posture.
- May 5-8 —California Medical Association, Del Monte (annual meeting):
Dangers of Self Diagnosis and Self Medication.
"Patent Medicine" Testimonials.
Silicosis and Pneumoconiosis.
- May 5-8 —Nebraska State Medical Association, Lincoln (annual meeting):
Syphilis.
- May 7-12 —New Haven Hospital, New Haven, Conn.:
Respiratory System in Health and Disease.
Food Fads.
- May 9-12 —Iowa State College of Agriculture, Ames:
Pathology of Tularemia.
Spread and Control of Tularemia.
- May 10-18—Phillips-Exeter Academy, Exeter, N. H.:
Human Factory.
- May 12-14—West Virginia State Medical Association, Charleston (annual meeting):
Human Factory.
Heroes of Medicine.
Information About Syphilis.
Heart Disease.
Prevention of Burns.
Medical Discoveries.
- May 12-15—Kansas Medical Society, Topeka (annual meeting):
Cutaneous Granulomas.
Cutaneous Manifestations of Syphilis.
Hygeia Exhibit.
- May 12-15—Texas State Medical Association, Fort Worth (annual meeting):
Use and Abuse of Barbiturates.
- May 12 —Parkland Hospital, Dallas, Texas:
Your Health.
- May 12 —Sedgwick County Medical Auxiliary, Wichita, Kan.:
Information About Health.
- May 13-16—Georgia Medical Association, Macon (annual meeting):
Hospital Exhibit.
- May 15-20—Tehama County Fair, Red Bluff, Calif.:
Dangers of Self Diagnosis.
"Patent Medicine" Testimonials.
- May 15-30—Cleveland Health Museum, Cleveland:
Periodic Health Examinations.
Dangers of Self Diagnosis.
Your Personal Health.
The Public Health.
Your Bones and Muscles.
- May 19-21—North Dakota State Medical Association, Grand Forks (annual meeting):
Spread and Control of Tularemia.
Anesthesia.
- May 20-22—Illinois State Medical Society, Chicago (annual meeting):
Mechanical Nostrums.
Use and Abuse of Barbiturates.
Cutaneous Manifestations of Tuberculosis.
Hygeia Exhibit.
- May 22-24—Minnesota State Hospital Association, St. Paul (annual meeting):
Prevention of Eye Injuries.
Prevention of Accidents.
- May 26-28—Minnesota State Medical Association, St. Paul (annual meeting):
Physical Therapy.
Prevention of Eye Injuries.
Prevention of Accidents.

THE CLEVELAND SESSION

Symposium on Health Problems in Education

The Symposium on Health Problems in Education, under the sponsorship of the Joint Committee on Health Problems in Education of the National Education Association and the American Medical Association, together with the Section on

Ophthalmology, the Section on Laryngology, Otology and Rhinology, the Section on Pediatrics and the Section on Preventive and Industrial Medicine and Public Health of the American Medical Association, will be held in the Ball Room, Fourth Floor, Cleveland Public Auditorium, at 2 p. m., Tuesday, June 3.

MEDICAL LEGISLATION

STATE MEDICAL LEGISLATION

Florida

Bills Introduced.—H. 156 proposes to enact a separate massage and physiotherapy practice act and to create an independent board of massage and physiotherapy examiners to examine and license applicants for licenses to practice massage and physiotherapy. While the bill proposes to permit such licentiates to utilize numerous agencies of physiotherapy, it does not permit "methods or instruments for diagnostic purposes, nor permit the use of the x-ray." H. 245 proposes to establish at Avon Park, in Highlands County, an additional state institution for the curable cases of mentally deranged persons. H. 256 proposes to appropriate \$10,000 annually to the state board of health for distribution of insulin to persons suffering from diabetes or kindred diseases and who are financially unable to purchase the drug. H. 274 proposes to require "all doctors and midwives . . . to use an effective solution of silver-nitrate in the eyes of every new born baby." H. 283 proposes to require each party to a proposed marriage, as a condition precedent to obtaining a license to marry, to present a certificate from a licensed physician (1) that within twenty days next prior to the application for a license to marry he has examined the party as to the existence or nonexistence in such person for venereal diseases and (2) as to whether or not the party is suffering from any communicable venereal disease, as nearly as may be determined by a thorough examination and by the application of recognized clinical laboratory tests of scientific research. H. 294 proposes to require every expectant mother at least six months prior to the expected date of birth of the child to submit to a physical examination by a licensed physician to determine whether or not the mother has any disease that may be communicated or transmitted to the offspring. A physician making such physical examination is to furnish any treatment that may be indicated. If, however, the expectant mother is an indigent person, the physician is to certify the fact to the state board of health, which is to arrange immediately for necessary treatment. Any midwife who may be called into attendance on any expectant mother must call into attendance a duly licensed physician, if the examination referred to has not as yet been made. H. 472 proposes to require the annual examination of domestic servants to determine the presence of contagious, infectious or communicable disease.

Illinois

Bills Introduced.—S. 412 proposes a procedure whereby the state may reimburse nonprofit hospitals caring for indigent persons injured in motor vehicle accidents. S. 411 proposes that any surplus remaining in the state treasury after the principal and interest on road bonds have been paid from the receipts of motor registration fees shall be used to finance the reimbursement to nonprofit hospitals called for in S. 412. S. 417, to amend the Uniform Narcotic Drug Act, proposes so to define narcotic drugs as to include barbitol, as defined in the bill.

New Jersey

Bills Introduced.—A. 402 proposes to prohibit any person other than a licensed physician from treating or prescribing for a case of venereal disease and any person, other than a licensed pharmacist, from dispensing or selling a drug, medicine or remedy for the treatment of such a disease. The bill further proposes that such medicine or remedy shall be supplied only on the prescription of a duly licensed physician. Nothing in the bill, however, is to prevent a physician, if he deems it advisable, from dispensing any drug, medicine or remedy for the treatment of a venereal disease under his immediate supervision. A. 408 proposes to penalize any person, firm, corpora-

tion or association who publishes, delivers or distributes an advertisement concerning a venereal disease, lost manhood, lost vitality, impotency, sexual weakness, seminal emissions, varicocele, self abuse or excessive sexual indulgence.

MEDICAL BILLS IN CONGRESS

Changes in Status.—S. 194 has been ordered reported by the Senate Committee on Education and Labor, proposing to authorize research by the United States Public Health Service with respect to the cause, diagnosis and treatment of dental diseases. S. 1290 has been reported to the Senate, providing that any person, whether or not in the employ of the United States, who shall furnish blood from his or her veins for transfusion into the veins of a person entitled to and undergoing treatment at government expense, whether in a federal hospital or institution or in a civilian hospital or institution, or who shall furnish blood for blood banks or for other scientific and research purposes, shall be entitled to be paid therefor such reasonable sum, not to exceed \$50, for each blood withdrawal as may be determined by the head of the department or agency concerned, from public funds available to such department or independent agency for medical and hospital supplies. H. R. 2475 has passed the House, proposing to prohibit prostitution within such reasonable distances of military or naval establishments as the Secretaries of War or Navy shall determine.

Bills Introduced.—S. 1375, introduced by Senator McCarran, Nevada, proposes a federal appropriation of \$150,000,000 to provide for certain community facilities made necessary by the exigencies of national defense, the term "community facility" being defined to include (a) buildings, grounds and incidental equipment for grammar schools, high schools, hospitals and clinics, (b) sewerage and water systems and (c) facilities, including buildings, grounds and incidental equipment, to provide for the welfare of members of the land and naval forces of the United States. H. R. 4337, introduced, by request, by Representative Lesinski, Michigan, proposes to grant permanent and total disability ratings to disabled men of the Army, Navy, Marine Corps and the Coast Guard suffering from severe industrial inadaptability as a result of active service. H. R. 4477, introduced by Representative Weaver, North Carolina, provides for domiciliary, medical and hospital treatment to certain former members of the Army, Navy, Marine Corps and Coast Guard. H. R. 4476, introduced by Representative May, Kentucky, provides for sundry matters affecting the military establishment. Among other things, this bill proposes to provide for the employment of interns in the Medical Department of the Army at not to exceed \$720 a year. H. R. 4484, introduced, by request, by Representative Camp, Georgia, would authorize the Administrator of Veterans' Affairs to grant a disability rating of at least 1 per cent to any enlisted man of the Army, Navy, Marine Corps or Coast Guard who has been discharged for physical disability or on medical survey for disability adjudged to have occurred in line of duty, provided the disability renders the enlisted man unacceptable for reenlistment. H. R. 4485, introduced by Representative Collins, Mississippi, provides that the federal contribution to states for aid to crippled children under the Social Security Act shall be determined according to financial need for assistance. H. R. 4523, introduced by Representative Connery, Massachusetts, proposes to authorize the President to issue an appropriate medal and ribbon to be awarded to members of the armed forces of the United States during the World War who in the interest of humanity and science acted as voluntary subjects for experimentations during the trench fever investigations in France.

ARKANSAS

Prize for Interest in Meetings.—Dr. Ira W. Ellis, Monette, received a radio recently from the Craighead-Poinsett Counties Medical Society. The award was based on attendance at meetings during 1940, interest and willingness to cooperate.

CALIFORNIA

Anesthetists Wanted.—A civil service examination to fill positions as head anesthetist and anesthetist in the Los Angeles County General Hospital, Los Angeles, is announced, applications to be filed by May 20. To qualify for the examination for head anesthetist, candidates must have the degree of doctor of medicine from an approved medical school and have satisfactorily completed at least one year's internship in an approved hospital. A residency or advanced training in the specialty of anesthesia and certification by the American Board of Anesthesiology is desirable. In addition, at least two years' recent practice in the specialty of anesthesia in a hospital of not less than two hundred beds is required. The salary will be \$265 a month. Medical training and a one year internship is required for the position of anesthetist. Special training or experience in anesthesia service is desirable though not essential. The salaries for positions in this service are \$225 and \$240 a month. Application blanks and additional information can be obtained from the Los Angeles County Civil Service Commission, Room 102, County Hall of Records, Los Angeles. Arrangements may be made to hold the examinations outside Los Angeles County if a sufficient number of applications are received from persons in other sections of the country. The usual requirement concerning residence in the county has been waived.

CONNECTICUT

State Medical Meeting.—The one hundred and forty-ninth annual session of the Connecticut State Medical Society will be held at the Hotel Stratfield, Bridgeport, May 20-22, under the presidency of Dr. Arthur B. Landry, Hartford, and with the Fairfield County Medical Association acting as host. The following will participate:

Dr. William E. Studdiford Jr., New York, Chemotherapy in Pelvic Inflammatory Diseases.
Dr. Catharine Macfarlane, Philadelphia, Progress Report on an Experiment in the Control of Cancer of the Uterus.
Dr. Cornelius G. Dyke, New York, Interpretation of Encephalograms, Particularly in Relation to Trauma.
Dr. Henry K. U. Beecher, Boston, Relationship of Anesthesia to Surgical Shock.
Dr. Anthony J. Lanza, New York, Health Plans for Small Industries.
Dr. Jacob H. Fine, Beverly, Mass., Fluid Balance in the Preoperative and Postoperative Patient.
Dr. Wesley Bourne, Westmount, Que., Breathing in Anesthesia.
Dr. Walter Freeman, Washington, D. C., Surgical Treatment of Mental Disorders.
Dr. Donald Ewen Cameron, Albany, N. Y., Problems of Civilian Mental Health.
Dr. Martin S. Kleckner, Allentown, Pa., Facts and Fallacies Regarding Proctologic Conditions.
Dr. LeRoy A. Schall, Boston, Cancer of the Upper Respiratory Tract.
Dr. Anthony C. Cipollaro, New York, Skin Diseases of Childhood.
Dr. Ross Golden, New York, Roentgen Ray Examination in the Treatment of Ileus with the Miller-Abbott Tube.
Dr. Hattie E. Alexander, New York, Treatment of Influenzal Meningitis.
Dr. Marius N. Smith-Petersen, Boston, Sciatica from an Orthopedic Point of View.
Dr. Theodor Blum, New York, Rhinology and Oral Surgery, Their Interrelation and the Necessary Cooperation of Both Specialists.
Mr. James E. Bryan, executive secretary, Medical Society of the County of Westchester, New York, A General Practitioner's Section.
Dr. Madge C. L. McGuinness, New York, Physical Therapy in Some Gynecologic Conditions.
Dr. Arthur M. Yudkin, New Haven, Vitamin Therapy in Ophthalmology.

There will be a conference of selective service physicians with Col. Ernest L. Averill, director of selective service for Connecticut, discussing operation of the service, and Dr. Eugen Kahn, New Haven, "Psychiatric Suggestions Concerning Selection for Military Service." Major William B. Smith, Wethersfield, medical officer attached to the selective service system, will conduct a question and answer period. Gov. Robert

A. Hurley will address the annual dinner of the society and Remsen B. Ogilby, Litt.D., president, Trinity College, Hartford, will speak on "Education Begins at Thirty." Hugh P. Beirne, commissioner of pharmacy, for the state, will address a general luncheon on "Interprofessional Relations," and Dr. Sydney E. Sinclair, New Haven, will speak under the auspices of the Hezekiah Beardsley Pediatric Club on "Severe Infections Due to the Organism Causing Influenzal Meningitis." Mr. James A. Hamilton, director of New Haven Hospital, will also address one dinner session. Organizations meeting as guests of the state medical society include the Connecticut Hospital Association, the Woman's Medical Society of Connecticut, American Society of Anesthetists, Connecticut Occupational Therapy Society, Hospital Medical Record Librarians' Association of Connecticut and the Connecticut branch of the American Association of Medical Social Workers.

GEORGIA

State Medical Meeting in Macon.—The Medical Association of Georgia will hold its annual scientific session in Macon at the Municipal Auditorium, May 13-16, under the presidency of Dr. Job Caldwell Patterson, Cuthbert. The Bibb County Medical Society will act as host. Among the speakers will be:

Dr. Hervey M. Cleckley, Augusta, The So-Called Psychopathic Personality.
Dr. James G. McDaniel, Atlanta, Air Embolism as a Cause of Death.
Dr. James E. Baylis, colonel, medical corps, U. S. Army, Medical Preparedness.
Drs. Allen H. Bunce, Mark S. Dougherty Jr., and Robert C. Davis, Atlanta, Clinical Studies of Secondary Anemia.
Dr. Russell L. Cecil, New York, The Plight of the Arthritic.
Dr. Daniel C. Elkin, Atlanta, The Special Field of Cardiac Surgery.
Dr. Virgil P. W. Sydenstricker, Augusta, Multiple Factors in Deficiency Disease.
Dr. Louis L. Williams Jr., U. S. Public Health Service, Public Health and the Defense Program.
Dr. James Elliott Scarborough Jr., Emory University, Cancer of the Mouth.

One discussion will be held on problems of the kidney with the following speakers: Drs. Samuel J. Sinkoe, Atlanta; Rudolph Bell, Thomasville, and Spencer A. Kirkland, Atlanta. The Abner Wellborn Calhoun Lecture will be delivered Wednesday May 14 by Dr. John Alexander, professor of surgery, University of Michigan Medical School, Ann Arbor, on "The Management of Intrathoracic Tumors." Dr. Patterson will give his presidential address Thursday at noon on "Georgia's Medical Problems of Today." Dr. Roy R. Kracke, Emory University, and Dr. Sydenstricker will conduct a luncheon panel discussion Thursday on internal medicine and Drs. Thomas C. Davison, Atlanta, and John H. Sherman, Augusta, one on appendicitis.

ILLINOIS

State Medical Meeting.—The one hundred and first annual meeting of the Illinois State Medical Society will be held at the Palmer House, Chicago, May 20-22, under the presidency of Dr. James S. Templeton, Pinckneyville. Speakers from out of the state include:

Dr. Chester A. Stewart, Minneapolis, Tuberculosis: Its Two Clinically Demonstrable Phases of Development.
Dr. Ray F. Farquharson, Toronto, Canada, Anorexia Nervosa.
Dr. James H. Means, Boston, The Eye Problems in Graves' Disease.
Dr. Isidor S. Ravdin, Philadelphia, Some Problems of the Biliary Tract.
Drs. James B. Costen and William T. K. Bryan, St. Louis, Diagnosis of Cancer of the Esophagus.
Dr. John D. Camp, Rochester, Minn., Osteoporosis and Its Relation to Systemic Disease.
Dr. Frank R. Smith, New York, Early Diagnosis of Malignant Tumors of the Female Genital Organs.
Dr. Frederick A. Collier, Ann Arbor, Mich., Some Problems of Water and Electrolyte Loss in Surgery.
Dr. William Lloyd Aycock, Boston, Susceptibility to Paralysis in Poliomyelitis.
Dr. Oswald P. J. Falk, St. Louis, The Doctor and Coronary Disease.
Dr. John H. Musser, New Orleans, will deliver the annual oration in medicine Tuesday evening on "The Aging Heart" and Dr. Owen H. Wangenstein, Minneapolis, the oration in surgery, entitled "Role of the Surgeon in the Management of the Peptic Ulcer Problem." Tuesday afternoon there will be a symposium on nutrition. At the secretaries' conference, Tuesday evening, the speakers will be Dr. Robert A. Bier, Washington, D. C., on "The Selective Service System as It Affects the Practice of Medicine and the National Defense in Illinois," and Dr. Charles H. Phifer, Chicago, "Social Security Clients." Branch 2 of the American Medical Women's Association will be host to the Medical Women's Association, May 20-21. Among the speakers will be Dr. Esther C. P. Lovejoy, New York, on "American Women's Hospitals in the Defense Program." Other groups meeting at this time will be the Illinois

Society of Pathologists, Physicians' Association of the State Department of Public Welfare of Illinois and the Chicago Society of Industrial Medicine and Surgery. The Veterans' Service Committee dinner will be Tuesday evening with Col. Paul G. Armstrong, director, Illinois Selective Service, discussing "Selective Service, What It Is and What It Means." William F. Waugh, department commander, Department of Illinois, American Legion, will also speak. The fourteenth annual convention of the Woman's Auxiliary to the Illinois State Medical Society will be held May 20-21.

Chicago

The Capps Prize.—The Institute of Medicine of Chicago announces that the Joseph A. Capps Prize of \$400 for 1940 has been awarded to Dr. David N. Danforth, Evanston, for his investigation on "The Anatomy of Labor as Revealed by Frozen Sagittal Sections of the Macacus Rhesus Monkey and of Man." Dr. Danforth graduated at Northwestern University Medical School in 1939.

Course in Anomalies of the Eyes.—Children's Memorial Hospital announces a course in neuromuscular anomalies of the eyes at the hospital, May 18-23, the lectures to be given by Dr. George P. Guibor. The course will include didactic lectures and clinical demonstrations of muscle defects of the eyes. Inquiries regarding the course may be addressed to the Children's Memorial Hospital, 707 Fullerton Avenue.

Memorial to Dr. Fantus.—A bronze plaque was dedicated to the memory of Dr. Bernard Fantus in the new outpatient clinic building at Cook County Hospital in a ceremony on the first anniversary of his death, April 14. The plaque was presented by Dr. David J. Davis, dean and professor of pathology, University of Illinois College of Medicine, and accepted by Dr. Karl A. Meyer, county medical superintendent. Dr. Fantus, for whom the outpatient clinic building is named, founded the blood bank in the county hospital.

IOWA

Personal.—Dr. Norman D. Render, formerly of the staff of the Cherokee State Hospital, Cherokee, has been appointed superintendent of the Clarinda State Hospital, Clarinda, succeeding the late Dr. Roscoe D. Smith.

Recording Room at Annual Session.—During the annual session of the Iowa State Medical Society in Davenport, May 14-16, the speakers bureau will set aside a room where scientific recordings will be run continuously. The bureau has a group of ten recordings which may be heard by any physician during the meeting. The bureau considers this a new kind of postgraduate instruction.

KANSAS

Obstetric Society.—The Kansas State Obstetrical and Gynecological Society was organized in Wichita recently under the auspices of the committee on maternal welfare of the state medical society. The following officers were chosen: Drs. Ray A. West, Wichita, president; Porter D. Brown, Salina, vice president; Lucien R. Pyle, Topeka, secretary. The principal speaker at the meeting was Dr. Leroy A. Calkins, Kansas City, Mo., professor of obstetrics and gynecology, University of Kansas School of Medicine.

State Medical Meeting in Topeka.—The eighty-second annual meeting of the Kansas Medical Society will be held in Topeka, May 13-15, under the presidency of Dr. Forrest L. Loveland, Topeka. Out of state speakers will be:

- Dr. George H. Gardner, Chicago, Gynecologic Management of the "Barren Marriage."
- Dr. Eugene M. Landis, Charlottesville, Va., Diagnosis of Peripheral Vascular Diseases.
- Dr. James Emerson Dailey, Houston, Texas, The Problem of Controlling Tuberculosis.
- Dr. John A. Toomey, Cleveland, The Differential Diagnosis of Meningeal Irritations.
- Dr. Roger L. J. Kennedy, Rochester, Minn., The Significance of Vomiting and Diarrhea in Infants and Children.
- Dr. John R. Nilsson, Omaha, The Open Reduction of Fractures.
- Dr. Sumner L. S. Koch, Chicago, The Repair of Divided Nerves and Tendons.
- Dr. Albert M. Snell, Rochester, Minn., Changing Conceptions of Portal Cirrhosis.
- Dr. Louis J. Hirschman, Detroit, A Simple and Effective Technic of Hemorrhoidectomy.
- Dr. Morris Edward Davis, Chicago, Use and Abuse of Cesarean Section.
- Dr. Arthur L. Smith, Lincoln, Neb., Cardiac Murmurs.
- Dr. Nathan A. Womack, St. Louis, Pathogenesis of Cholecystitis.
- Lieut. Col. Richard H. Eanes, Washington, D. C., The Selective Service Act.
- Dr. Thomas Roy Gittins, Sioux City, Iowa, Laryngotracheobronchitis.
- Dr. Bennett Y. Alvis, St. Louis, Surgical Procedures.

MAINE

Society News.—The Kennebec County Medical Association was addressed, March 20, in Gardiner by Dr. Charles E. Ayers, Worcester, Mass., on "Relation of Trauma to Rupture of Nucleus of Corpus Pulposus."—Dr. Edward T. Whitney of the Boston Dispensary discussed "Rectal Diseases and Their Diagnosis" before the Knox County Medical Society in Rockland, March 11.—Frederick Martin, director of speech clinics, Rhode Island College of Education, Providence, spoke on "Prevention and Correction of Speech Defects" before the Penobscot County Medical Association, March 18.—The Cumberland County Medical Association was addressed in Eugene, March 28, by Dr. Champ Lyons, Boston, on chemotherapy and on April 25 by Dr. Edward B. Benedict, Boston, gastroscopy.

MICHIGAN

Annual Clinic.—The Ingham County Medical Society held its annual clinic in Lansing May 1. A round table discussion on the management of obesity opened the session; the speakers were Drs. Tom D. Spies, Birmingham, Ala., and Louis Harry Newburgh, Ann Arbor. Others on the program were:

- Dr. William A. Scott, Toronto, Ont., Antepartum Hemorrhage.
- Dr. John S. Lundy, Rochester, Minn., The Choice of an Anesthetic.
- Dr. John Scudder, New York, Evaluation of Shock and Its Treatment.
- Dr. Owen H. Wangenstein, Minneapolis, Management of Abdominal Distention.

Dr. Spies will discuss "Avitaminosis and Nutrition" at the dinner session.

New Director of Crippled Children's Commission.—Dr. Carleton Dean has resigned as deputy health commissioner and director of the bureau of local health service, Michigan State Department of Health, Lansing, to become medical director of the Michigan Crippled Children's Commission, Detroit, effective April 1. Dr. Dean was for nine years health officer of the district unit at Charlevoix. He has served as president of the Michigan Public Health Association. Dr. Eldred V. Thiehoff, who has been assistant director in the bureau of local health services, working with county and district health departments, has been made acting deputy health commissioner and director of the bureau. Until his appointment a year ago as assistant director, Dr. Thiehoff had been since 1935 the first director of a district health department composed of Gladwin, Clare and Arenac counties with headquarters in Gladwin. He graduated at the University of Pennsylvania School of Medicine in 1924.

Dr. LeFevre Honored.—Dr. George L. LeFevre was guest of honor at a banquet in Muskegon, March 19, marking completion of fifty years in practice. The banquet was under the combined auspices of the chamber of commerce, the Muskegon County medical and dental societies and other civic groups. Dr. LeFevre, now 75 years of age, began practice in Muskegon in 1891. He was president of the Muskegon County Medical Society in 1905 and in 1922. In 1920 he was elected a member of the council of the Michigan State Medical Society, serving until 1933. He has been chief of staff of Mercy Hospital since 1919. For many years he was a member of the state board of registration in medicine. At the recent banquet Walter B. Steele, D.D.S., was toastmaster and speakers were Drs. Eugene S. Thornton on "Past Associations"; Burton R. Corbus, Grand Rapids, "The Army's Dependence on the Medical Profession," and Mr. O. A. Seyferth, "Civic Activities." A scroll acknowledging his fifty years' service was presented to Dr. LeFevre.

MISSISSIPPI

State Medical Meeting in Biloxi.—The seventy-fourth annual session of the Mississippi State Medical Association will be held in Biloxi, May 13-15, with headquarters at the Buena Vista Hotel and under the presidency of Dr. William H. Anderson, Booneville. The speakers from out of the state will be:

- Dr. William W. Waddell Jr., Charlottesville, Va., Role of Vitamin K in the Etiology, Prevention and Treatment of Hemorrhage in the Newborn Infant.
- Dr. Martha M. Eliot, Washington, D. C. (subject not announced).
- Dr. Oscar Wilkinson, Washington, Reports of the Early Operative Treatment of Squint.
- Dr. Jack S. Guyton, Baltimore, Etiologic Diagnosis of Uveitis.
- Dr. George T. Pack, New York, The Management of Metastatic Cancer in the Groin.
- Dr. Maxwell E. Lapham, New Orleans, The Obligation of a Medical School to the Community.
- Dr. Seale Harris Sr., Birmingham, Ala., Foods and Fads.

A round table discussion will be held Tuesday evening by Dr. Wilkinson on the subject of squint and one by Dr. Guyton on uveitis. The woman's auxiliary to the state medical association will hold its eighteenth annual convention at the Buena Vista

Hotel, May 13-15. The Mississippi State Pediatric Society will devote its session to round table discussions with Dr. George M. Lyon, Huntington, W. Va., addressing the banquet on "Sulfanylguanidine in the Treatment of Bacillary Dysentery." The twelfth annual meeting of the Mississippi State Hospital Association will be held at the Buena Vista Hotel, May 12.

NEW HAMPSHIRE

State Medical Meeting at Manchester.—The one hundred and fiftieth annual meeting of the New Hampshire Medical Society will be held at Manchester, May 13-14, under the presidency of Dr. Ezra A. Jones of that city. There will be round table conferences each morning and a symposium on fractures Tuesday afternoon by Drs. Augustus Thorndike, George W. Van Gorder and Otto J. Hermann, Boston. Other speakers will be:

Dr. Frank H. Lahey, Boston, President-Elect of the American Medical Association, Management of Lesions of the Stomach, Duodenum and Jejunum.

Dr. Paul A. Chandler, Boston, Glaucoma.

Dr. Stanley B. Weld, Hartford, Conn., The National Physicians' Committee.

Dr. Jones, Orthopedics in New Hampshire.

Dr. William J. Brickley, Boston, The Work of the Medical Examiner.

Dr. Lahey will also speak at the anniversary banquet on "Economic Problems of Today." Other banquet speakers will be Dr. Henry H. Amsden, Concord, who will give an address on "The Doctor of One Hundred and Fifty Years Ago," Dr. Marion Fairfield, Nashua, who will read a paper on "Josiah Bartlett" prepared by the late Dr. Thomas W. Luce, Portsmouth, and Gov. Robert O. Blood. Governor Blood is speaker of the society's house of delegates.

NEW JERSEY

Dr. Eagleton's Gift to the Academy.—Dr. and Mrs. Wells P. Eagleton, Newark, have given to the Academy of Medicine of Northern New Jersey in Newark a house adjoining the academy's headquarters. The building, which will be joined to the present one, will be called the Eagleton Civic Medical House. It was said that Dr. and Mrs. Eagleton made the gift "to provide a place where doctors may be free to discuss the medical aspect of any public question." The academy will also be able to enlarge its library facilities. Dr. Eagleton was president of the academy from 1931 to 1933.

Society News.—Dr. William D. Stroud, Philadelphia, addressed the Gloucester County Medical Society, Woodbury, April 17, on "The Clinical Side of the Diagnosis of Heart Disease."—A symposium on "Postpartum Hemorrhage" was presented before the Bergen County Medical Society, Hackensack, April 8, by Drs. Arthur M. Reich, Claude E. Heaton and Irwin Wellen, all of New York.—Dr. Frederick C. Irving, Boston, addressed the Academy of Medicine of Northern New Jersey, Newark, April 17, on "Treatment of Separation of the Placenta with Spanish Windlass and Packing."

NEW YORK

"Doctors for Defense."—The Medical Society of the State of New York began, April 9, a new series of half hour dramatic radio programs entitled "Doctors for Defense." The series will show the physician in every phase of the defense training program: housing, feeding, physical hardening, adaptation to climatic changes, recreation, mental and physical hygiene, sanitation. It will show preparation for treating illnesses and disabilities when they occur, provisions for field hospitals, ship hospitals and air ambulances, then the doctor as a factor in the creation of an efficient air corps, submarine operation and the various other branches of armed defense, his place in industry and in preserving the health of the civilian population. The programs are heard Wednesday evenings on WMCA, 570 kilocycles, from 10 to 10:30 o'clock eastern standard time.

New York City

Twenty-Five Lepers in City.—A homeless man aged 33 was found to have leprosy on examination at Bellevue Hospital recently. It was said that the man had worked in a restaurant in Los Angeles for three years until about a month ago. There are 25 lepers in the city, none of them isolated, according to the *New York Times*, April 10.

Advisory Board for Health Museum.—Seventy authorities in medicine and public health, including fifty physicians, comprise the scientific advisory board of the American Museum of Health, which is to open in the summer in the former Masterpieces of Art Building on the world's fair site. Dr.

Haven Emerson is chairman of the new board, whose duty it will be "to see that vital health knowledge is presented whole and honestly for visitors," according to an announcement.

Personal.—Stefan Ansbacher, D.Sc., associate in charge of vitamin research at the Squibb Institute for Medical Research, New Brunswick, N. J., has been appointed research director in the International Vitamin Corporation.—Dr. Francis J. O'Brien, director of the bureau of child guidance in the city school system, has been appointed an associate superintendent.—Dr. Julius Lewis Amster has been elected president of the medical board of Morrisania Hospital to succeed Dr. Nathan B. Van Etten, President of the American Medical Association, who has served five consecutive terms.—Dr. August W. F. Westhoff, Richmond Hill, was honored at a testimonial dinner by two hundred of his colleagues and other friends recently at Essex House to mark his fiftieth anniversary in the practice of medicine.

NORTH DAKOTA

State Medical Meeting at Grand Forks.—The annual meeting of the North Dakota State Medical Association will be held at Grand Forks, May 19-21, under the presidency of Dr. Cyril J. Gaspel, Grafton. Dr. Morris Fishbein, Chicago, Editor of *THE JOURNAL*, will be the principal speaker at an open evening meeting, May 19, on "Medicine in a Changing World." Guest speakers for the scientific program will include:

Capt. Robert A. Bier, M.R.C., U. S. Army, Washington, D. C., The Physician in the Selective Service Program.

Dr. Edward H. Rynearson, Rochester, Minn., Vitamins.

Dr. Elexious T. Bell, Minneapolis, Pathology of Heart Disease.

Dr. MacNider Wetherby, Minneapolis, Therapeutic Procedures in Chronic Rheumatoid Disease.

Dr. Walter A. Fansler, Minneapolis, Cancer of the Large Bowel.

Dr. Henry E. Michelson, Minneapolis, Diseases of the Skin.

Dr. William A. Coventry, Duluth, Minn., Management of the Breech.

There will be symposiums on heart disease and traumatic injuries, and round table luncheon discussions each day, and an open forum on obstetric problems.

PENNSYLVANIA

Society News.—Dr. Robert S. Hotchkiss, New York, addressed the Northampton County Medical Society at a meeting at the Northampton Country Club near Easton, April 25, on "Factors in Male Sterility."—Speakers at a meeting of the Westmoreland County Medical Society, Greensburg, April 1, were Drs. Michael E. Farah, New Kensington, on "Treatment of Early Syphilis"; Edward J. Moore, Irwin, "Skin Manifestations of Syphilis," and David A. Walker, Torrance, "Cerebrospinal Syphilis."

Education and the Exceptional Child.—The seventh conference on education and the exceptional child under the auspices of the child research clinic of the Woods Schools, Langhorne, will be held on May 13. The speakers will be:

Howard Yale McClusky, Ph.D., Washington, D. C., American Youth and the Present Crisis.

Harry J. Baker, Ph.D., Detroit, Is Our Present Educational Program Adequate for the Exceptional Child?

Dr. Walter F. Dearborn, Cambridge, Mass., Growth and Learning in the Education of Exceptional Children.

T. Ernest Newland, Ph.D., Harrisburg, Can the Present Educational Program for the Exceptional Child Be Improved?

Dr. Leslie B. Hohman, Baltimore, Sex Education for Children and Parents.

Norma E. Cutts, Ph.D., New Haven, Conn., Vocational Guidance as Applied to the Exceptional Child.

Philadelphia

Dr. Krusen Retires as College Head.—Dr. Wilmer Krusen, president of the Philadelphia College of Pharmacy and Science since 1927, retired March 31 with the title of president emeritus and Ivor Griffith, Pharm.D., dean of pharmacy at the college, was elected to succeed him. Dr. Krusen graduated from Jefferson Medical College of Philadelphia in 1893. In 1902 he became professor of gynecology at Temple University School of Medicine; in 1913 he was elected a trustee and in 1914 vice president of the university. Dr. Krusen was director of public health of Philadelphia from 1916 to 1920 and again from 1924 to 1928. Dr. Griffith, a native of Wales, graduated from the Philadelphia College of Pharmacy in 1910. He was appointed instructor at the college in 1916 and has served in various capacities. He was appointed professor of theoretical pharmacy in 1935 and in 1938 succeeded the late Charles H. LaWall, Pharm.D., as dean of pharmacy. Dr. Griffith has resigned as editor of the *American Journal of Pharmacy* after serving since 1921. His successor as editor is Linwood F. Tice, M.S., assistant professor in pharmacy at the college.

Pittsburgh

Health Classes for the Public.—A series of classes in health and hygiene was presented by the Allegheny County Medical Society in conjunction with the Pittsburgh Public Schools beginning March 24 and continuing for six Monday evenings. Those eligible to attend were men employed in service merchandising and in hotels, restaurants and amusements. The speakers were Drs. Oliver E. Turner on public health as it affects the individual; Millard C. Hanson, syphilis; George E. Martin, tuberculosis; George J. Kastlin, pneumonia; Harold P. Hook, general health measures, and Andrew P. D'Zmura, heart disease.

SOUTH DAKOTA

State Medical Meeting at Mitchell.—The sixtieth annual session of the South Dakota State Medical Association will be held in Mitchell, May 18-20, under the presidency of Dr. Oscar J. Mabce, Mitchell. Speakers will be:

- Dr. Vernon L. Hart, Minneapolis, Heredity and Disease of the Skeletal System.
- Dr. Kenneth C. Swan, Iowa City, Insidious Loss of Vision.
- Dr. Joseph C. Ohlmacher, Vermillion, The Medical Profession's Responsibility in the Control of Cancer.
- Dr. Sumner L. S. Koch, Chicago, Some Surgical Principles in the Treatment of Infections of the Hand.
- Dr. Willis H. Thompson, Minneapolis, Bleeding Tendencies in the Newborn and Their Prevention.
- Dr. Henry E. Michelson, Minneapolis, The Relationship of Dermatology to General Medicine.
- Dr. Frederic E. B. Foley, St. Paul, Diagnosis and Treatment of Bladder Neck Obstruction.
- Dr. Robert G. Allison, Minneapolis, Progress of X-Ray Technic.
- Dr. James B. Carey, Minneapolis, Chronic Gastritis.

The guest speakers will conduct clinics in their specialties at morning sessions. At the annual banquet Monday evening Dr. Roy W. Fouts, Omaha, will be the speaker on "The Art of Medicine."

TEXAS

New Health Officers.—Dr. Thomas J. Pennington, Nacogdoches, has been named health officer of Nacogdoches County, it is reported. Dr. William W. Carter, Corsicana, has succeeded Dr. Otho C. Bowmer, Corsicana, as health officer of Navarro County. Dr. Stephen W. Wilson, formerly of Poteet, has been appointed director of the San Augustine-Sabine bi-county health unit, with headquarters in San Augustine. Dr. La Ried S. Oates, Center, has been appointed health officer of Shelby County to succeed Dr. William Spencer Warren, Center. Dr. George A. Gray, Sweetwater, recently director of the Sweetwater-Nolan County health unit, has been appointed director of a new unit for Abilene and Taylor County.

VERMONT

Personal.—Dr. George A. Elliott, assistant superintendent of the Connecticut State Hospital, Middletown, has been appointed superintendent of the Brattleboro Retreat, Brattleboro. He succeeds Dr. Horace G. Ripley, resigned.

Society News.—Dr. Charles K. P. Henry, Montreal, Canada, addressed the Rutland County Medical Society in Rutland April 17 on "Early Diagnosis of Bone Tumors." Dr. Neil Feeney, Montreal, addressed the society March 20 on "Diagnosis and Modern Treatment of Subacute Endocarditis."

WEST VIRGINIA

State Medical Meeting at Charleston.—The seventy-fourth annual session of the West Virginia State Medical Association will be held in Charleston, May 12-14, with headquarters at the Daniel Boone Hotel. Dr. Morris Fishbein, Chicago, Editor of THE JOURNAL, will address a public meeting, Monday evening May 12, on "The Prolongation of Life," and Dr. Robert King Buford, Charleston, will give his presidential address Tuesday evening on "The Physician in the Changing Order." The annual oration on medicine will be given by Dr. Jacob Arnold Bergen, Rochester, Minn., on "Important Newer Concepts Concerning Cancer of the Intestine and Their Bearing on Management" and the oration on surgery by Dr. Hugh A. Bailey, Charleston, on "Operative Wounds, Treatment and Healing." Guest speakers who will address the general scientific assembly and section meetings include:

- Dr. Stanley Gibson, Chicago, Rheumatic Fever.
- Dr. William G. Leaman Jr., Philadelphia, Prognosis in Heart Disease.
- Dr. Henry H. Kessler, Newark, N. J., Amputations of the Upper and Lower Extremities.
- Dr. Charles E. Kinney, Cleveland, Handling of Hearing Problems in General Practice.

- Dr. Edgar van Nuys Allen, Rochester, Minn., Importance of Differentiating Psychoneurotic and Somatic Pain from Visceral Pain.
- Dr. Tiffany J. Williams, Charlottesville, Va., Management of the Toxemias of Late Pregnancy.
- Dr. George J. Thomas, Pittsburgh, Choice of Anesthetics for Emergency Procedures.
- Dr. Isidor S. Ravdin, Philadelphia, Some Problems of Biliary Tract Surgery.

Drs. Roy R. Sayers, U. S. Bureau of Mines, Bethesda, Md.; Paul A. Neal, U. S. Public Health Service, Bethesda, and Dr. Kessler will address the West Virginia Society of Industrial Physicians and Surgeons. Other special societies meeting with the state association include the West Virginia Heart Association with Dr. Leaman as its guest, and the West Virginia Obstetrical and Gynecological Society, with Dr. Williams as guest. The Woman's Auxiliary will hold its meeting during the three days, with Dr. Fishbein as guest speaker at a luncheon Tuesday.

GENERAL

Alumni Meetings at Cleveland.—The Alumni Association of the University of Minnesota Medical School will hold an informal social get-together at the Hotel Cleveland, Cleveland, Wednesday June 4, from 5:30 to 7:30 p. m.—The annual banquet of the St. Louis Medical Alumni Association will be held at the Hotel Statler in Cleveland, June 4, at 7:30 p. m. Three dollars for each person will be charged.

Circulating Library of Music.—Mr. A. L. Rose, vice president of Mead Johnson & Company, Evansville, Ind., has recently organized a free circulating library of music for physicians' orchestras, which physicians throughout the country are invited to use. The music may be kept for six months. In their requests physicians are asked to state the orchestration wanted, name of piece, composer and arranger and name of publisher, and to furnish as much information on their own orchestras as possible.

New President for the Pharmacopeia.—Following the death of Dr. Charles W. Edmunds, Ann Arbor, Mich., president of the United States Pharmacopeia, the board of trustees of the Pharmacopeia at a meeting in New York, April 12, elected Dr. Cary Eggleston, New York, president. Henry A. B. Dunning, Pharm.D., Baltimore, first vice president, was nominated to fill the unexpired term. He, however, declined the succession because of lack of experience and because of his belief that the traditional plan in force for many years, providing that a medical man should be president of the convention and a pharmacist chairman of the board of trustees, is a good plan and should be maintained.

New Director of Committee on Maternal Health.—Name to Be Changed.—The National Committee on Maternal Health recently announced the appointment of Dr. Clair E. Folsome, formerly of Ann Arbor, Mich., as executive director to succeed Dr. Raymond R. Squier, New York, who resigned to devote full time to private practice. The committee also voted to change its name to the Research Council on Human Reproduction, Inc., and legal proceedings are now in progress to effect the change. The organization plans to continue in a research capacity its studies on problems of human fertility and infertility. Dr. Folsome, who graduated from the University of Michigan Medical School, Ann Arbor, in 1933, has recently been field consultant in obstetrics for the Michigan State Department of Health.

American Urological Association.—The annual meeting of the American Urological Association will be held at the Broadmoor Hotel, Colorado Springs, May 19-22, under the presidency of Dr. Thomas Leon Howard, Denver. Among speakers on the program will be:

- Drs. Clarence G. Bandler and Arthur H. Milbert, New York, Urologic Aspects of Military Preparedness and Combat.
- Dr. Elmer Hess, Erie, Pa., Intracystic Reimplantation of the Ureter: A New Operative Technic.
- Drs. Roger C. Graves, Boston, and Lewis W. Guiss, New York, Tumors of the Urethra in the Female.
- Drs. Charles B. Huggins, Clarence V. Hodges and Roland E. Stevens Jr., Chicago, Endocrine Influences on Metastatic Carcinoma of the Prostate.
- Dr. Edwin Davis, Omaha, Antiseptic Aniline Dyes in the Treatment of Submucous Ulcer.
- Drs. Edward W. Beach, Sacramento, Calif., and William G. Shultz, Tucson, Ariz., Spontaneous Healing in Renal Tuberculosis.
- Dr. William F. Braasch, Rochester, Minn., Prognosis in Nonsurgical Bilateral Renal Tuberculosis.
- Drs. Vincil Rogers Deakin and John F. Patton, St. Louis, Sulfathiazole in 200 Cases of Male Gonorrhea.
- Drs. Grayson L. Carroll, Hollis N. Allen and Louis C. Kappel, St. Louis, Sulfathiazole and Its Sodium Salt, Effectiveness and Limitations.

Dr. Irvine H. Page, Indianapolis, will give the Ramon Guiteras Lecture and Dr. Howard his presidential address on Wednesday afternoon, May 21.

Foreign Letters

LONDON

(From Our Regular Correspondent)

March 1, 1941.

The Food Situation

The food situation in this second year of the war can be summed up as being sufficient for nutrition of every one but restricted as to choice. Lord Dawson said in the House of Lords that this was the first totalitarian war, and civilians contributed a larger measure to the fighting than ever. Therefore there should be a nearer equation between their food and that of the forces. The nation had suffered little dislocation of its life by rationing, and there was no evidence of resulting malnutrition, though there was a reduction in weight in some parts of the population. This generation had inherited a strong habit of eating meat. It was a valuable food, but its virtues could be obtained from a smaller quantity. When the minister of food curtailed our meat ration he did us no harm provided we had certain essential foods—wholemeal bread, milk, cheese, potatoes, carrots, green vegetables and fruit.

Lord Woolton, minister of food, said it was impossible to wage war and live to the standard to which we had grown used. We must be ready for greater restrictions and go back to the days of simpler living. The bread supply of the country was ample and cheap. He had been fortified in his bread policy by scientific advice. Our greatest weakness was in the animal protein group. But we previously had been eating more meat than was good for us. The ships required to carry our troops were those which had been used to import meat. But we had potatoes, vegetable oils, fats and milk. Surely we could get all the health and energy we needed. We could not maintain our present supply of food from pigs, poultry, cattle and sheep, which depended on imported foodstuffs. Carrots were so important that he had asked the Ministry of Agriculture to arrange for 30,000 acres to be planted this year. Months ago he arranged for importation of all the powdered and skimmed milk which we could get from overseas. We were holding a reserve of powdered milk, so that in the event of an emergency we could still secure milk, particularly for children and the hospitals. It had been decided to import oranges to the extent of our capacity.

Special Hospitals for Rheumatism

The Empire Rheumatism Council states in its report for the year ended November 1940 that the decision to carry on its work during the war has been justified. Difficulties and dangers have been encountered, but with one exception the research tasks were continued until almost the close of the year. In October one of the laboratories was struck by a bomb. There were no casualties, but the fabric was seriously damaged. Substantial progress has been made with plans for a national scheme of treatment, and this is almost ready for publication. Medical research has a great part to play in bringing under control the causes of disease. It is fitting that researchers should keep to their tasks and follow the high example of doctors and nurses who stand by their patients in the shattered hospitals, which seem to be the favorite objectives of malignant barbarism. The council is endeavoring to establish specialized hospitals for rheumatism. A high incidence of the disease among the soldiers is regarded as probable. Since it is only recently that the medical profession has given special attention to the problem of rheumatism and the number of physicians with wide experience in its diagnosis and treatment is limited, it is held to be wise to concentrate their expert knowledge in specialized hospitals.

More Bombing of London Hospitals

The latest bombing of London hospitals involved two in one night. In one hospital several patients and a nurse were killed when three men's wards were wrecked. Doctors, nurses and rescue squads worked through the night by the light of torches to free those trapped in the wreckage, and before dawn all had been released. The bomb scored a direct hit, bringing part of the building to the ground. While the rescue operations were in progress, surgeons performed operations on the more seriously injured. One rescue worker said that he had never seen such bravery as that shown by the patients. Some of the nurses who helped were wearing dance frocks, as a staff dance was in progress in the nurses' home when the bomb fell, and the nurses and their partners rushed across to the damaged wards. The rescue work was complicated by the discovery of a delayed action bomb near another ward, which made it necessary to remove the patients. A children's hospital was damaged by two bombs the same night. Fortunately the children had been evacuated and there was only a skeleton staff on the premises. Extensive damage was done to both the hospital and the nurses' home, but there were no casualties.

Antigas Mask for Persons with Respiratory Difficulties

Your correspondent is in contact with the civil defense measures and is struck with their efficiency, in which no detail seems to be overlooked. An example is the provision of gas masks for the whole population, including special ones for babies. The most recent development is a mask for those who, on account of respiratory troubles, cannot wear standard gas masks or who, because of tracheotomy, facial deformity, or severe heart trouble cannot wear respirators of ordinary type. The question of suitable respirators for such persons has been the subject of prolonged study and research by the medical and antigas services of the government. Two new types have been devised. One consists of the ordinary civilian respirator with the addition of an outlet valve. The other is a helmet respirator operated by bellows in the same way as the baby's antigas mask. These respirators will be issued to those who establish the need for them by a certificate from a physician. Physicians will receive guidance from health officers and from articles to be published in the medical press.

Prof. William Bulloch

Dr. William Bulloch, F.R.S., emeritus professor of bacteriology in the University of London, has died at the age of 73 years. After a brilliant career he graduated at the University of Aberdeen. He then visited several continental schools and studied tuberculosis under Koch. He was appointed assistant professor of pathology at University College, London, and bacteriologist to the Lister Institute. In 1897 he was offered a chair of bacteriology in London University, which he held at the London Hospital. He was chairman of the governing body of the Lister Institute, an original member of the Medical Research Council and chairman of the committee which prepared its System of Bacteriology. Though not associated with any important advance in bacteriology, he had a great influence as an administrator, teacher, critic, writer and editor. His first notable published work was "Studies in Pathology" for the quarter centenary of the University of Aberdeen, to which he acted as general editor. In 1923, with F. W. Andrews and others, he wrote "Diphtheria: Its Bacteriology, Pathology and Immunology." His best known work was his "History of Bacteriology," published in 1938, which was founded on the Heath Clark Lectures, delivered in 1936 at the London School of Tropical Medicine. He made many contributions to the *Journal of Pathology and Bacteriology*. Toward the end he had the important job of passing all the well known operational catgut prepared at the London Hospital. At no time during his supervision was any infection traced to the stitches for which it was used.

BUENOS AIRES

Jan. 31, 1941.

Cocaine Content of Coca Leaves

Dr. Carlos A. Ricketts recently reported in *La crónica médica*, Lima (57:25 [Feb.], 73 [March] 1940), his investigations of the use of coca leaves. Some eight million persons chew coca leaves in Peru, Bolivia, Ecuador and Colombia. He points out that the Indians did not seem to have used coca in the first historical epoch. This seems to support the view that there is no evidence that the chewing of coca leaves is indispensable for living, traveling and working in the high altitudes of the Andes. Ricketts calls attention to the enormous social and hygienic damage caused by coca chewing, especially if combined with alcoholic excess. The young Peruvian Indian is, physically and mentally, a normal and capable human being until he takes up coca chewing. A few years ago the medical society of Arequipa, Peru, made extensive analytic studies both of coca leaves in their natural state and those which had been chewed for from thirty-five to forty minutes. (Coca leaves are generally chewed in combination with the alkaline ashes of a plant called *llipta*.) The analysis showed that on the basis of the lowest consumption of coca leaves, namely 50 Gm. daily, 42.5 mg. of cocaine is absorbed without *llipta*. This absorption increases to 91 mg. with *llipta*. This is a high dose, far in excess of the pharmacopeial dose. What makes it worse is that this absorption goes on day after day during the person's life.

The president of Peru has promulgated a decree temporarily suspending licenses for operating new establishments for the manufacture of crude cocaine until the department of health, labor and social welfare has been able to issue necessary regulations. The cultivation of the poppy has likewise been prohibited and the poppy fields under cultivation have been ordered to be destroyed. (Peru has a considerable proportion of Chinese among its inhabitants.)

The same picture of social and health deterioration due to the abuse of the coca plant is found in Bolivia. The coca plant is cultivated chiefly in the hot lowlands, in the departments of La Paz, Cochabamba, Potosí and Sucre. The revenues derived amount to three fourths of the total revenues in the first department and to one fifth in the others. Curtailment of coca plant acreage would thus lead to a deficit in the national budget. This deficit could, however, be overcome if other products such as coffee, rice and sugar were cultivated instead of the coca plant.

Diphtheria Control in Argentina

The fight against diphtheria is being waged in Argentina on different fronts. The city of Buenos Aires through the Asistencia pública has been urging antidiphtheria vaccination for months. In the last ten weeks about 36,000 school children have been inoculated. The need of antidiphtheria prophylaxis is emphasized by the reports emanating from Mendoza, capital of a western province, where a number of deaths have occurred. In the last sixteen years 188,000 children have been vaccinated by authority of the National Council of Education and not one serious accident was noted. The annual mortality from diphtheria still amounts to 1,500 deaths.

A measure has been introduced in the legislature making vaccination against diphtheria compulsory. In spite of the opposition, particularly of the socialists, the chamber of deputies finally passed the measure. It affects all children between the ages of 9 and 12 years and will involve no charge. The measure requires the ratification of the senate. The sum of 200,000 pesos (about \$60,000) was voted the Bacteriologic Institute for the preparation of vaccines and an equal sum for the creation of a bureau for specific prophylaxis. Prof. Alfredo Sordelli, director of the institute, went on record as reversing

the objections against antidiphtheria vaccination previously entertained by him. Formerly he had been opposed to compulsory vaccination because of the unreliability of the vaccines and the untoward after-effects which had been observed. Since then the preparation of vaccines had been improved. Sordelli advocated the vaccination especially of children from 1 to 6 years of age and stressed the need of a good organization. Several large provinces of Argentina already enforce antidiphtheria vaccination.

Hospital Service in Buenos Aires

According to an article by Prof. J. W. Tobias, former director of health administration and of public aid, in the *Revista medicina y ciencias afines* (2:461 [July 30] 1940) Buenos Aires has at its disposal 14,553 hospital beds, of which 9,660 are municipal and 2,959 national. Though the city population is 2½ million inhabitants, hospital bed capacity must be figured on the basis of accommodating the environs of the city. This increases the total to about 3,700,000. Of the 90,000 patients admitted to the hospitals of Buenos Aires, 22 per cent live in the interior of the country.

New Health Institute in Costa Rica

In Costa Rica a new health institute has been opened, comprising a bacteriologic laboratory, a chemical laboratory, a division of veterinary medicine and a division for the control of biologic products. It is to supervise all national, municipal and private laboratories and is charged with the control of epidemics and epizootics, with snake extermination and with supervising the use of animal, plant and bacterial poisons.

Brief Mention

Dr. Raúl Cibils Aguirre was elected director of the Public Aid in Buenos Aires. Dr. Tobias, his predecessor, resigned after a change in the city administration. Dr. Federico S. Piombo, a member of the surgico-orthopedic division of the children's clinic of Buenos Aires, has been authorized by the faculty of medicine of Buenos Aires to study the treatment of ankylosis in the United States. Dr. Carlos Fernández Speroni has departed for the United States, commissioned by the faculty of medicine of Buenos Aires to study endocrine diseases at Columbia University and the Mayo Clinic.

Grants from the Rockefeller Foundation have made it possible for four persons appointed by the government of Peru to come to the United States to study industrial hygiene, in preparation for the organization of a division of industrial hygiene in Peru.

In Paraguay the control of trachoma has been intensified. In Asunción, the capital, 224 cases of trachoma were found among four thousand school children. By a governmental decree the investigation of the causes of child mortality has also been started, to continue for two years.

The national service of Brazil for the control of yellow fever maintains at present 917 central centers operating on full time. Centers at which sections are performed number 1,268; most of these are situated in the provinces of Minas Geraes, São Paulo and Rio.

Marriages

GEORGE W. MORSE, Statesville, N. C., to Miss Sybil Annette Newman of Daytona Beach, Fla., January 23.

JOSEPH SPURGEON HIATT JR., Durham, N. C., to Miss Sarah Elizabeth Rankin of Gastonia in January.

AUBREY BIGGS HARWELL, Rochester, N. Y., to Miss Grace Follin at Bell Buckle, Tenn., in January.

WILLIAM CRUSE COLES, Augusta, Ga., to Miss Claire Johnston of St. George, S. C., February 15.

P. DAVID NUTTER, Beckley, W. Va., to Miss Laura Marsh of Oswego, N. Y., at St. Albans, W. Va., January 23.

Deaths

Louis Frank * Louisville, Ky.; Hospital College of Medicine, Louisville, 1888; member of the House of Delegates of the American Medical Association in 1918; professor of bacteriology in 1892 and in 1896, professor of obstetrics from 1896 to 1898, professor of abdominal surgery from 1898 to 1908, professor of surgery from 1908 to 1931 and since 1931 professor emeritus at the University of Louisville School of Medicine; past president of the Kentucky State Medical Association; member and vice president of the Southern Surgical Association; member of the American Urological Association; fellow of the American College of Surgeons; chief of staff and attending surgeon, Norton Memorial Infirmary; consulting surgeon, Jewish Hospital, Children's Hospital and the Kosair Hospital for Crippled Children; aged 73; died, March 22, in Orlando, Fla., of pneumonia.

Edward Kimmel Cravener * Schenectady, N. Y.; Ohio State University College of Medicine, Columbus, 1924; member of the American Academy of Orthopedic Surgeons; fellow of the American College of Surgeons; chairman of the medical advisory board 44, which serves draft boards throughout eastern New York; orthopedic surgeon, Schenectady City Hospital and Schenectady County Home and Hospital; consulting orthopedic surgeon, Benedict Memorial Hospital, Ballston Spa, Moses-Ludington Hospital, Ticonderoga, Saratoga Hospital, Saratoga and the Glenridge Sanatorium, Schenectady; aged 42; died, March 27, at Nassau, B. W. I.

Edward Lamar Clemens, Philadelphia; University of Pennsylvania School of Medicine, Philadelphia, 1915; member of the Medical Society of the State of Pennsylvania; associate in neurology at the University of Pennsylvania Graduate School of Medicine; assistant on the neurologic staffs of the Graduate, Temple and Lankenau hospitals; chief of the neurologic service of the Allentown (Pa.) Hospital; served during the World War; aged 54; died, March 1, of coronary occlusion.

Frederick Clifton Moor * Tallahassee, Fla.; University of Maryland School of Medicine, Baltimore, 1903; in 1934 a member of the House of Delegates of the American Medical Association; fellow of the American College of Physicians; past president of the Florida Medical Association; formerly mayor of Tallahassee; served during the World War; for many years chief physician at the Florida State College for Women; aged 61; died, February 18.

David William Tovey, New York; Bellevue Hospital Medical College, New York, 1898; member of the American Association of Obstetricians, Gynecologists and Abdominal Surgeons; fellow of the American College of Surgeons; clinical professor of gynecology and obstetrics, New York Polyclinic Medical School and Hospital; aged 64; died, February 12, in the Welfare Hospital of carcinoma of the thumb with metastases to the axilla and lungs.

John Stewart Hagen * Cincinnati; Eclectic Medical Institute, Cincinnati, 1898; member of the Ohio State Medical Association; formerly professor of surgical gynecology at his alma mater; served during the World War; member of the Ohio State Medical Board from 1930 to 1933; at one time chief milk inspector; formerly police and fire surgeon; on the staff of the Bethesda Hospital; aged 64; died, March 5.

William Milton Dodson * Woodsboro, Texas; University of Texas School of Medicine, Galveston, 1913; past president of the San Patricio-Aransas-Refugio Counties Medical Society; county health officer; on the staff of the Refugio County Hospital, Refugio; at one time mayor; formerly bank president; past president of the local school board; aged 52; died, February 2, of heart disease.

William John Benner, Anna, Ill.; Washington University School of Medicine, St. Louis, 1903; member of the Illinois State Medical Society; served during the World War; past president and secretary of the Union County Medical Society, and the Southern Illinois Medical Association; formerly member of the school board and city council; aged 64; died, March 3, of brain tumor.

Fleetwood Gruver, Tampa, Fla.; University of Nashville (Tenn.) Medical Department, 1897; formerly associated with the United States Public Health Service as medical officer in charge of the U. S. Quarantine Station; served during the World War; aged 69; died, February 28, in the Veterans Administration Facility, Bay Pines, of chronic gastric ulcer with hemorrhage.

Jesse Lee Weldon, Lanett, Ala.; Birmingham Medical College, 1911; member of the Medical Association of the State of Alabama; past president of the Chambers County Medical Society; formerly member of the board of education; member of the city council; aged 56; died, February 28, in a hospital in Atlanta, Ga., of aortic aneurysm, hypertension and arteriosclerosis.

Albert Summerfield Welch * Kansas City, Mo.; Rush Medical College, Chicago, 1923; associate in medicine at the University of Kansas School of Medicine, Kansas City, Kan.; formerly pathologist at the Kansas City General Hospital; at one time editor of the *Jackson County Medical Bulletin*; author of "Clinical Interpretation of Laboratory Reports"; aged 43; died, February 7, of encephalitis and bilateral pneumonia.

Edwin C. McMillan, Hudson, Iowa; Hahnemann Medical College and Hospital, Chicago, 1903; member of the Iowa State Medical Society; past president of the Black Hawk County Medical Society; formerly county coroner; veteran of the Spanish-American War; at one time member of the board of education; aged 63; died, February 5, of coronary occlusion.

John Calvin Dye * Lieutenant Colonel, U. S. Army, retired, Fayetteville, N. C.; North Carolina Medical College, Davidson, 1905; served during the World War; entered the regular army as a captain in 1920 and was retired in 1937 with rank of lieutenant colonel for disability in line of duty; aged 56; died, March 13, of cirrhosis of the liver.

William George Cassels, Washington, D. C.; Louisville (Ky.) Medical College, 1894; served during the World War; served the Veterans Administration Facility at Oteen, N. C., as chief medical officer and at Hines, Ill.; was chief medical officer of the board of appeals in the Veterans Administration; aged 74; died, March 5, of coronary thrombosis.

George Simeon Brock, London, Ky.; Tennessee Medical College, Knoxville, 1894; University of Louisville Medical Department, 1896; member of the Kentucky State Medical Association; past president of the Laurel County Medical Society; served during the World War; formerly county health officer; aged 67; died, March 6, of coronary occlusion.

Clarence Le Fevre Vreeland, Pompton Lakes, N. J.; Columbia University College of Physicians and Surgeons, New York, 1900; member of the Medical Society of New Jersey; served during the World War; physician of the schools of Pompton Lakes; aged 63; died, February 21, of chronic myocarditis and passive congestion of the lungs.

Alfred Wyckoff Ward, Demarest, N. J.; Long Island College Hospital, Brooklyn, 1901; member of the Medical Society of New Jersey; fellow of the American College of Surgeons; past president of the Bergen County Medical Society; on the staff of the Englewood (N. J.) Hospital; aged 62; died, February 8, of coronary thrombosis.

Frank Newton Loomis, Derby, Conn.; Yale College Medical Department, New Haven, Conn., 1883; member of the Connecticut State Medical Society; past president of the New Haven County Medical Society; on the consulting staff of the Bridgeport (Conn.) Hospital and the Griffin Hospital; aged 82; died, February 3.

Benjamin Pincus Seltzer * Philadelphia; University of Pennsylvania School of Medicine, Philadelphia, 1924; assistant in clinical otolaryngology at the Woman's Medical College of Pennsylvania; member of the bureau of health; on the staff of St. Luke's and Children's Hospital; aged 42; died, February 16, of coronary thrombosis.

Benjamin Lawrence Casey, Toronto, Ohio; Ohio State University College of Medicine, Columbus, 1914; member of the Ohio State Medical Association; president of the Jefferson County Medical Society; served during the World War; aged 49; died, March 8, in the Ohio Valley Hospital, Wheeling, W. Va., of heart disease.

Corydon Mott Ryno, Benton Harbor, Mich.; Yale University School of Medicine, New Haven, Conn., 1901; served during the World War; formerly mayor, member of the board of health and board of education; aged 65; on the staff of the Mercy Hospital, where he died, February 6, of hepatitis and organic heart disease.

John Thomas Gillsen, Paterson, N. J.; Bellevue Hospital Medical College, New York, 1888; member of the Medical Society of New Jersey; past president of the Passaic County Medical Society; on the staff of the Nathan and Miriam Barnert Memorial Hospital; aged 77; died, March 23, of carcinoma of the liver.

Wayne Jason Atwell * Buffalo; University of Buffalo School of Medicine, 1934; professor of anatomy at his alma

mater; member of the American Association of Anatomists; aged 51; died, March 27, in the Buffalo General Hospital of multiple myeloma, metastatic calcification of the kidneys and bronchopneumonia.

Adelbert Bertel Maxwell, Ames, Iowa; Chicago Homeopathic Medical College, 1901; Hahnemann Medical College and Hospital, Chicago, 1905; past president of the Story County Medical Society; served during the World War; formerly member of the school board; aged 78; died, February 15, of cerebral hemorrhage.

Charles Andrew Erdmann, Minneapolis; University of Minnesota College of Medicine and Surgery, Minneapolis, 1893; member of the Minnesota State Medical Association; associate professor emeritus of anatomy at his alma mater; aged 74; died, February 19, in Rochester, Minn., of bronchopneumonia and arteriosclerosis.

Henning Koford * Oakland, Calif.; University of California Medical Department, San Francisco, 1904; fellow of the American College of Surgeons; on the staff of the Samuel Merritt Hospital; aged 60; died, February 15, in St. Patrick Hospital, Lake Charles, La., of cerebral hemorrhage and coronary heart disease.

Henry Edmund Vitou, South Bend, Ind.; American Eclectic Medical College, Cincinnati, 1895; member of the Indiana State Medical Association; formerly county health officer and for many years a member of the city board of health; aged 74; died, February 28, in the Epworth Hospital of pneumonia.

Harry Orville Jones, Berne, Ind.; American College of Medicine and Surgery, Chicago, 1905; member of the Indiana State Medical Association; formerly member of the board of education; served during the World War; aged 59; died, February 22, in the Lutheran Hospital, Fort Wayne, of cerebral hemorrhage.

Samuel L. Caldbick * Everett, Wash.; Saginaw (Mich.) Valley Medical College, 1902; member of the Pacific Coast Surgical Association; fellow of the American College of Surgeons; member of the visiting staff, General and Providence hospitals; aged 63; died, February 9, of coronary occlusion.

Charles Otis Hook, Fort Worth, Texas; Hahnemann Medical College and Hospital, Chicago, 1903; Bennett College of Eclectic Medicine and Surgery, Chicago, 1913; member of the State Medical Association of Texas; aged 64; died, February 15, in the All Saints Hospital of chronic myocarditis.

Albert Faller * Cincinnati; St. Louis University School of Medicine, 1902; professor emeritus of contagious diseases at the University of Cincinnati College of Medicine; served during the World War; aged 66; on the staff of the Jewish Hospital, where he died, March 8, of coronary sclerosis.

George Thayer Cass, Danville, Ill.; Chicago College of Medicine and Surgery, 1907; member of the Illinois State Medical Society; past president and secretary of the Vermilion County Medical Society; formerly health officer; aged 69; died, March 12, in St. Elizabeth Hospital of pneumonia.

Henry H. Brevoort * Lodi, N. J.; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1900; for many years medical inspector and school physician; on the staff of the Hackensack (N. J.) Hospital; aged 67; died, March 18, of cerebral embolism and mitral stenosis.

Herbert Wright Wootton, Old Lyme, Conn.; College of Physicians and Surgeons, medical department of Columbia College, New York, 1888; formerly on the staff of the Manhattan Eye, Ear and Throat Hospital, New York; aged 73; died, February 28, of arteriosclerosis and uremia.

Robert Crawford Brown * Lancaster, S. C.; Medical College of Virginia, Richmond, 1901; president of the Lancaster County Medical Society; served during the World War; on the staff of the Marion Sims Memorial Hospital; aged 62; died, February 24, of coronary thrombosis.

Joseph Schwartz, New York; Long Island College Hospital, Brooklyn, 1919; member of the Medical Society of the State of New York; fellow of the American College of Surgeons; on the staff of the Lebanon Hospital; aged 45; died, February 5, of carcinoma of the stomach.

Alvin De Witt Wadsworth, South Norwalk, Conn.; Hahnemann Medical College and Hospital of Philadelphia, 1900; medical director and superintendent of a sanitarium bearing his name; aged 64; died, February 2, of cerebral hemorrhage, chronic nephritis and hypertension.

William Wallace Wadsworth, Muncie, Ind.; Medical College of Ohio, Cincinnati, 1897; member of the Indiana State Medical Association; past president of the Delaware-Blackford Counties Medical Society; aged 77; died, February 23, of cerebral hemorrhage and arteriosclerosis.

Obie Byron Walker, Bowman, Ga.; Georgia College of Eclectic Medicine and Surgery, Atlanta, 1893; Kansas City (Mo.) College of Medicine and Surgery, 1916; for many years a member of the state board of medical examiners; aged 67; died, February 3, of chronic nephritis.

Morris Sigmund Shuman * Philadelphia; Hahnemann Medical College and Hospital of Philadelphia, 1938; on the staff of St. Luke's and Children's Hospital; aged 30; died, February 12, in the Eagleville (Pa.) Sanatorium for Consumptives of pulmonary tuberculosis.

Edward Field Hamm, Clarendon, Texas; Hospital College of Medicine, Louisville, Ky., 1905; member of the State Medical Association of Texas; past president and secretary of the Limestone County Medical Society; aged 65; died, February 15, of coronary occlusion.

Harry Martyn Voorhees * Los Angeles; University of Southern California College of Medicine, Los Angeles, 1905; on the staffs of the California, Good Samaritan, Cedars of Lebanon and Queen of the Angels hospitals; aged 64; died, February 2, of kidney disease.

Richard Ambrose Outerson, Hartford, Conn.; Jefferson Medical College of Philadelphia, 1902; member of the Connecticut State Medical Society; aged 62; on the staff of St. Francis Hospital, where he died, February 5, of cerebral thrombosis and hypertension.

Robert G. Sharp * San Diego, Calif.; Johns Hopkins University School of Medicine, Baltimore, 1917; member of the American Academy of Pediatrics; on the staffs of the Mercy and San Diego General hospitals; aged 58; died, February 21, of carcinoma.

Paul Henry Hannen * Milwaukee; Rheinische Friedrich-Wilhelms-Universität Medizinische Fakultät, Bonn, Prussia, 1920; served during the World War; on the associate staff of the Evangelical Deaconess Hospital; aged 48; died, March 5, of coronary occlusion.

Charles Augustus Dodson, Palmyra, Wis.; College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1901; aged 64; died, February 24, in the Deaconess Hospital, Milwaukee, of malignant hypertension and lobar pneumonia.

Ollie P. Clark, Winchester, Ky.; Kentucky School of Medicine, Louisville, 1901; member of the Kentucky State Medical Association; past president and secretary of the Clark County Medical Society; aged 66; died, February 23, of cirrhosis of the liver.

Amuel B. Spach, Kenilworth, Ill.; Chicago Homeopathic Medical College, 1886; College of Physicians and Surgeons of Chicago, 1893; member of the Illinois State Medical Society; aged 83; died, February 11, of coronary thrombosis and arteriosclerosis.

George Emmett Martin, Robstown, Texas; University of Texas School of Medicine, Galveston, 1925; member of the State Medical Association of Texas; aged 41; died, February 11, in the Robstown-Clinic Hospital of embolism following an appendectomy.

Morris Mott Sweeney * New York; Columbia University College of Physicians and Surgeons, New York, 1910; on the staffs of the Misericordia Hospital, St. Elizabeth's Hospital and St. Clare's Hospital; aged 60; died, February 23, of coronary occlusion.

James Allen Turner, Nashville, Ind.; Medical College of Indiana, Indianapolis, 1898; past president of the state board of health; served during the World War; aged 65; died, February 19, in the Veterans Administration Facility, Indianapolis, of pneumonia.

George Washington Kimball * La Porte, Ind.; College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1902; served during the World War; aged 68; died, February 23, of heart disease and pernicious anemia.

Edward Eugene Ledbetter * Tioga, Texas; Vanderbilt University School of Medicine, Nashville, Tenn., 1899; veteran of the Spanish-American War; aged 64; died, February 22, in the Methodist Hospital, Dallas, of coronary occlusion.

Charles E. Francis, Bowling Green, Ky.; Kentucky University Medical Department, Louisville, 1906; member of the Kentucky State Medical Association; county coroner; aged 59; died, February 24, of cerebral hemorrhage.

Ross Howard Thompson ☉ Philadelphia; Medico-Chirurgical College of Philadelphia, 1911; member of the American Neurological Association; aged 55; died, February 11, in the Methodist Hospital of bronchopneumonia.

Marian Elizabeth Fischer, Buffalo; Woman's Medical College of Pennsylvania, Philadelphia, 1934; member of the Medical Society of the State of New York; aged 42; died, February 20, of pulmonary tuberculosis.

Harry Feagles, Chehalis, Wash.; Tennessee Medical College, Knoxville, 1909; member of the Washington State Medical Association; at one time mayor of Morton; aged 64; died, March 12, of coronary occlusion.

Joseph F. Crouthamel, Souderton, Pa.; Hahnemann Medical College and Hospital of Philadelphia, 1899; aged 66; died, February 23, in the Grand View Hospital, Sellersville, of carcinoma of the head of the pancreas.

Lewis C. Bean ☉ Gallipolis, Ohio; Starling Medical College, Columbus, 1892; bank president; formerly acting assistant surgeon, United States Public Health Service; aged 74; died, March 19, of cerebral hemorrhage.

Rolland Frederick Hastreiter, Los Angeles; Johns Hopkins University School of Medicine, Baltimore, 1901; member of the American Society of Anesthetists; aged 65; died, February 28, of cerebral hemorrhage.

James Eli Hayes Taylor, Washington, D. C.; Howard University College of Medicine, Washington, 1909; aged 63; died, February 5, in the Freedmen's Hospital of cardiorenal disease with cerebral hemorrhage.

Edwin Bouldin Fenby, Baltimore; University of Maryland School of Medicine, Baltimore, 1878; member of the Medical and Chirurgical Faculty of Maryland; aged 88; died, March 8, of chronic myocarditis.

Thomas Demosthenes Rice, Tigrett, Tenn.; University of Nashville Medical Department, 1894; Vanderbilt University School of Medicine, Nashville, 1894; aged 68; died, February 4, of chronic nephritis and uremia.

Thomas M. Morgan, Childress, Texas; University of Tennessee Medical Department, Nashville, 1900; member of the Tennessee State Medical Association; aged 68; died, February 10, of cerebral hemorrhage.

Percival Lemon Clark, Chicago; Bennett College of Eclectic Medicine and Surgery, Chicago, 1889; aged 74; died, February 2, in Oklahoma City of myocarditis following an operation on the prostate.

Charles Ebenezer Moore, Wilson, N. C.; Bellevue Hospital Medical College, New York, 1875; member of the Medical Society of the State of North Carolina; aged 86; died, February 12, of pneumonia.

Stuart John Fairbank, West Winfield, N. Y.; Hahnemann Medical College and Hospital of Philadelphia, 1898; for many years member of the school board; aged 65; died, March 18, of coronary thrombosis.

James Johnson Haviland ☉ Owosso, Mich.; Detroit College of Medicine, 1894; served during the World War; aged 71; died, March 22, in a hospital at Ann Arbor of cerebral hemorrhage.

Earl Stanley Haas ☉ Marathon, Ohio; Eclectic Medical Institute, Cincinnati, 1909; aged 54; died, February 17, in the Bethesda Hospital, Cincinnati, of coronary artery disease with myocardial failure.

William Thomas Braun ☉ Memphis, Tenn.; Memphis Hospital Medical College, 1898; on the staffs of Methodist, Baptist and St. Joseph's hospitals; aged 64; died, March 7, of coronary occlusion.

William M. Gertman, St. Petersburg, Fla.; Atlanta (Ga.) College of Physicians and Surgeons, 1907; aged 56; died, February 26, in the Veterans Administration Facility, Bay Pines, of bronchopneumonia.

Truman Arthur Penney, Tulsa, Okla.; St. Louis College of Physicians and Surgeons, 1906; also a druggist; formerly mayor; aged 67; died, February 20, of arteriosclerosis and diabetes mellitus.

Ransom Sanford Moscrip, Whitney Point, N. Y.; Albany Medical College, 1899; member of the Medical Society of the State of New York; county coroner; aged 66; died, February 9, of leukemia.

Alvin Thomas Neal, Steffenville, Mo.; Hospital College of Medicine, Louisville, Ky., 1896; aged 72; died, February 25, in the Blessing Hospital, Quincy, of carcinoma of the antrum.

A. B. Campbell, Denver; Louisville (Ky.) Medical College, 1894; formerly member of the state legislature of West Virginia; aged 73; died, March 23, of carcinoma of the prostate.

George Freeman Bush, Ramseur, N. C.; Atlanta (Ga.) College of Physicians and Surgeons, 1900; aged 68; died, February 20, of hypertensive cardiac disease and chronic nephritis.

Edson Almeron Freeman ☉ Akron, Ohio; Rush Medical College, Chicago, 1914; aged 54; on the staff of the City Hospital, where he died, March 13, of carcinoma of the colon.

Charles Mernitz, Tivoli, Texas; University of Louisville (Ky.) Medical Department, 1905; aged 61; died, February 24, in the Refugio County Hospital, Refugio, of carcinomatosis.

John H. Mowers, Rochester, Mich.; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1892; aged 80; died, February 16, of arteriosclerotic myocarditis.

Henry Herbert Darnall, Fulton, Ark. (licensed in Arkansas in 1903); member of the Arkansas Medical Society; aged 61; died, February 11, of a self-inflicted gunshot wound.

Joseph M. Brockerhoff, Bellefonte, Pa.; University of Pennsylvania Department of Medicine, Philadelphia, 1882; aged 82; died, March 5, of arteriosclerosis and myocarditis.

Frank E. Goldstein, Syracuse, N. Y.; Syracuse University College of Medicine, 1912; aged 49; died, February 20, in the Crouse-Irving Hospital of coronary thrombosis.

John Bishop Hazel, Saybrook, Ill.; Hospital College of Medicine, Louisville, Ky., 1906; served during the World War; aged 60; died, March 25, of cerebral hemorrhage.

John Adolphus Blakeney, Smithfield, Va.; Meharry Medical College, Nashville, Tenn., 1923; aged 52; died, February 24, of injuries received in an automobile accident.

Gilbert Hamilton Henry, El Dara, Ill.; College of Physicians and Surgeons, Keokuk, Iowa, 1893; aged 79; died, February 24, of diabetes mellitus and arteriosclerosis.

Hazlett Austin Delcher, Toledo, Ohio; University of Maryland School of Medicine, Baltimore, 1907; aged 56; died, March 3, in the Toledo Hospital of pneumonia.

Peter Brickbauer, St. Louis; Homeopathic Medical College of Missouri, St. Louis, 1895; aged 68; died, February 23, of uremia, chronic nephritis and arteriosclerosis.

Luther A. Chanslor, Killeen, Texas (licensed in Texas under the Act of 1907); aged 62; died, March 19, in a hospital at Temple of pneumonia and chronic nephritis.

Ward Woodbridge, Central City, Iowa; Rush Medical College, Chicago, 1881; member of the Iowa State Medical Society; aged 92; died, February 4, of senility.

Axel Kassemir Hildebrand Sundin, North Providence, R. I.; College of Physicians and Surgeons, Boston, 1906; aged 60; died, January 25, of cerebral hemorrhage.

Alfred Ernest Baxter, Lowell, Mass.; Tufts College Medical School, Boston, 1908; aged 64; died, March 7, in St. John's Hospital of chronic myocarditis.

George Alexander Gordon, Hamilton, Mont.; Detroit College of Medicine, 1901; formerly health officer; aged 64; died, February 24, of cerebral hemorrhage.

William A. Heartsill, Weatherford, Texas; Nashville (Tenn.) Medical College, 1878; aged 88; died, March 5, of senility.

Sheffie R. May ☉ Mount Zion, Ill.; College of Physicians and Surgeons, Keokuk, Iowa, 1880; aged 81; died in February.

Charles M. Hammer, Johnstown, Pa.; Jefferson Medical College of Philadelphia, 1909; aged 66; died, February 21.

William M. O'Brien ☉ Greencastle, Ind.; Kentucky School of Medicine, Louisville, 1892; aged 71; died, February 15.

John Sidney Eason, Verona, Miss.; Memphis (Tenn.) Hospital Medical College, 1908; aged 56; died, March 3.

James Richard English ☉ New York; Long Island College Hospital, Brooklyn, 1892; aged 73; died, March 3.

Francis George Gunn, Kelseyville, Calif.; Cooper Medical College, San Francisco, 1900; aged 69; died, March 1.

Benjamin F. Brayfield, Christopher, Ill.; Kentucky School of Medicine, Louisville, 1892; aged 79; died, March 5.

Lester C. Hanna ☉ Houston, Texas (licensed in Texas under the Act of 1907); aged 61; died, March 14.

Flavian P. Au Buchon, Forest, Ind.; Barnes Medical College, St. Louis, 1898; aged 66; died, March 17.

THIAMINE OVERDOSAGE AND TOXICITY

To the Editor:—The use of thiamine hydrochloride, through both lay and medical channels, has reached large proportions. With inferential evidence only regarding human requirements for the maintenance of good health, and without any published evidence of toxicity, the tendency has been toward an intake well above established deficiency levels. Williams and his associates (Williams, R. D.; Mason, H. L.; Wilder, R. M., and Smith, B. F.: Observations on Induced Thiamine Deficiency in Man, *Arch. Int. Med.* 66:785 [Oct.] 1940) showed that definite deficiency symptoms would develop in otherwise normal adults kept on a daily intake of 0.15 mg. for several months, while it is generally presumed that 2 to 3 mg. daily will cover the normal adult needs in health. Little evidence has been presented, however, to show just how much the daily intake need be increased in patients suffering from long-standing deficiency. Here again the tendency has been toward the use of large doses, with a daily intake many times the normal requirement. Such therapy can reasonably be based only on a clearly established nontoxicity and on evidence that such excessive dosage carries therapeutic benefits not obtained by dosages down nearer the normal requirement. Neither of these bases has yet been satisfactorily established by published data.

In August 1940 I observed an onset of definite toxicity in a Cincinnati woman aged 47 who had been taking 10 Gm. of thiamine hydrochloride daily for two and one-half weeks. The symptoms resembled those of overdosage with thyroid extract—headache, increased irritability, insomnia, rapid pulse, weakness and trembling—and cleared up within two days after administration of thiamine hydrochloride was discontinued. After one week's rest the patient began taking 5 mg. of thiamine hydrochloride daily and after four and one-half weeks at this intake level the same toxic syndrome recurred. Prompt relief again followed cessation of the intake of thiamine hydrochloride.

During a recent visit to Panama, I observed other patients with thiamine toxicity. Liberal doses (20 to 40 mg. of thiamine hydrochloride daily) are often prescribed by physicians in tropical climates in an effort to overcome the physical let-down which so commonly afflicts persons migrating there from cooler regions. One young woman, receiving an average of 17 mg. daily, was excreting 12 mg. daily in her urine and passing stools smelling strongly of thiamine hydrochloride. She was showing symptoms similar to those of thyroid hyperactivity, with fine and coarse muscle tremor, rapid pulse and noticeable nervous hyperirritability. Several other similar cases of toxicity were reported to me after attention had been drawn to the type of toxic symptoms one might expect from overdosage. Cessation of the administration of thiamine hydrochloride was followed in each such case by prompt subsidence of the hyperthyroid-like symptoms. A detailed report of a series of these instances of overdosage will soon be offered for publication by Dr. F. A. Raymond of the Panama Hospital.

Just why no reports of thiamine toxicity have appeared in medical literature is difficult to understand, for the vitamin has been widely used at daily intake levels of 10 to 50 mg. in treatment of deficiency states. Prevalence of toxic reactions in the tropics (or in Cincinnati's August heat) may be related to more widespread multiple deficiencies for the B vitamins at the high environmental temperatures. In cases of multiple deficiency it has been shown that unfavorable results may attend administration of a single one of the lacking elements (Morgan, Agnes Fay: The Effect of Imbalance in the Filtrate Fraction of the Vitamin B Complex in Dogs, *Science* 93:261 [March 14] 1941). Studies on rats in my laboratory (Mills, C. A.: Environmental Temperatures and Thiamine Require-

ments, *Am. J. Physiol.*, to be published) have shown thiamine (and pantothenic acid) requirements per gram of food to be decidedly higher for animals kept at 90 F. than at 65 F. environmental temperature level. It may perhaps be the greater prevalence of multiple deficiency in regions of tropical heat that has led to the unfavorable results of high thiamine dosage in Panama. Lower requirement per gram of food in temperate zone coolness may have prevented similar evidences of unfavorable reactions from appearing at more northern latitudes.

Recognition of symptoms of overdosage at once necessitates more adequate information as to actual thiamine needs under various conditions. Such information can be obtained only by blood level and excretion rate studies. Addition of thiamine hydrochloride to bread and other commonly used foods, without control over the intake level, also carries a potentiality of harm. This is particularly true in those stimulating middle temperate regions where hyperthyroidism and other forms of metabolic disturbance are already prone to occur. The medical profession should recognize the need for greater conservatism in the use of this important vitamin, and its distribution through both nonmedical and medical channels should be placed on a more scientific and controlled basis.

CLARENCE A. MILLS, M.D., Cincinnati.

Professor of Experimental Medicine, University
of Cincinnati College of Medicine.

THE RECORD OF A BLOOD DONOR

To the Editor:—The editorial "The Record of a Blood Donor" that appeared in the February 1 issue of THE JOURNAL concerns a subject of more than passing interest to me. As one of the physicians who attended Rose Marie Ryan (the niece of Mrs. McMullin) I am acquainted with the intimate

* On 8/15 injection of donors with *Staphylococcus aureus* vaccine strain Ryan was started.

details of the early use of Mrs. McMullin as a donor. We have watched the rising tide of publicity about the "golden blood" of Mrs. McMullin with amazement at the credulity of the public and many of our profession. I am sure that you, and the medical profession in general, would be interested in some early details of this affair.

Rose Marie Ryan, aged 3 years, had a superficial infection (pustule) on the right knee which progressed in severity despite conservative local therapy. Five days later, with a high fever (104 F. axillary), localized pain in the back and stiffness of the neck muscles and irritability suggesting meningitis, she was sent to Hahnemann Hospital on Aug. 8, 1935, under the care of her family physician, Dr. Maxwell White. The clinical signs suggesting meningitis were denied by a negative spinal fluid, but a blood culture taken that day contained 364 colonies of *Staphylococcus aureus* per cubic centimeter. The first of a series of somatic abscesses to be drained by Dr. A. B. Webster was located in the muscles of the interscapular region; this was opened on August 12 and from it *Staphylococcus aureus* was also cultured. Positive blood cultures repeatedly confirmed the original diagnosis of staphylococcal septicemia with multiple abscess formation. The patient was critically ill, with signs of an active septicemia, for five weeks. During this time she received many blood transfusions, and numerous somatic abscesses were opened and drained. When the original diagnosis of septicemia was made it was decided that we would give the patient multiple transfusions with epinephrine leukocytosis reinforcement until immune donors could be prepared.

It was definitely at our suggestion and after repeated requests of all members of the patient's family that Mrs. McMullin submitted to injections of a vaccine. This vaccine, prepared from *Staphylococcus aureus* obtained from the blood of Rose Marie Ryan, was heat killed (56 C. for one hour) and proved to be sterile before use. Subcutaneous injections of this vaccine were given to Mrs. McMullin every four days, and she was coincidentally used as a donor for repeated transfusions. In all, nine transfusions of Mrs. McMullin's blood totaling 835 cc. of blood and 225 cc. of serum or plasma were given from August 16 to September 28. When the vaccine injections were started, Mrs. McMullin's blood contained no demonstrable agglutinins against the staphylococcus; on September 5, twenty-one days after the first injection, the agglutinin titer was $\frac{1}{4}$.

Mrs. McMullin was not the only immune donor used in this case; the patient's father was similarly injected with Rose Marie's staphylococcus vaccine. Over the period of August 23 to September 24 he submitted to eleven transfusions, with a total of 755 cc. of blood and 270 cc. of plasma or serum. On September 9 his agglutinin titer was $\frac{1}{4}$. It is of interest to note that on September 11, after the patient's fourteenth transfusion, cyanosis developed from polycythemia, her red cell count being 7,270,000 per cubic millimeter; from this time on all transfusions were of plasma or serum.

It is difficult to assay the value of the immunotransfusions in this case. When the case was reviewed prior to a staff presentation on Nov. 12, 1935 it was our opinion that recovery must be credited to a number of factors, which would include the patient's resistance, immunotransfusions, surgical drainage of the metastatic abscesses and general medical care. A correlation of the critical features is given in the accompanying table.

The patient was taken home on October 11 nearly afebrile. Her recovery was complete and she was known to be alive a short time ago.

Knowing that the increasing publicity about Mrs. McMullin stemmed from the recovery of Rose Marie Ryan, I felt that in some measure it was my responsibility to give publicity to the facts of the case as stated here. Her blood can only partially and jointly (with Mr. Ryan's) share the credit for the recovery of a patient with staphylococcal septicemia in 1935. She was never inoculated with live bacteria and received only a heat-killed vaccine. She was never inoculated with a streptococcus organism by me, and I in no way used her blood for or against any leukemic condition.

On numerous occasions I have been asked for my opinion about the value of Mrs. McMullin's blood. These requests have usually been by telephone from physicians and relatives, not infrequently some distance away, such as South Carolina. A good example is contained in the following telegram, dated January 20, from Alma Hickman, Soaper Hotel, Henderson, Ky.: "Please give me the address of Mrs. Rose McMullin, blood donor, and tell me if she can help leukemia cases; answer collect." In response I wired "Mrs. McMullin's blood of no value in leukemia." A number of inquiries have come to the hospital and have been answered through the medical director; a copy of this correspondence is available and consists of repetitious denials of the value of Mrs. McMullin's blood in leukemia.

H. RUSSELL FISHER, M.D., Philadelphia.

Associate Professor of Pathology, Hahnemann
Medical College and Hospital of Philadelphia.

MEDICAL FAMILIES

To the Editor:—I am enclosing a record of a medical family which I think rather interesting.

Grandfather:	Adam L. Titterington M.D. Born 1789
Great Uncle:	Joseph Titterington M.D. 10-23-1813
Uncles:	Richard Titterington M.D. 11-6-1819
	Cousins: James Titterington M.D.
	James Titterington M.D. 2-19-1824 (1)
	Cousins: Lee Titterington, M.D. D.D.S. (2)
	Clyde Titterington, D.D.S. (3)
	James Titterington, D.D.S.
	John Q. Titterington M.D. 5-3-1826
	Cousins: Jesse Titterington M.D.
	Robert Titterington M.D.
	Daniel Titterington 5-15-1828
	Cousins: James Titterington M.D.
	Jesse M. Titterington M.D.
Father:	Alfred Titterington M.D. 7-7-1834
	Richard M. Titterington D.D.S. (Informant)

I am staying at the home of the last name, Dr. Richard M. Titterington, who supplied me with these facts.

JAMES P. SHARON, M.D., Fort Leonard Wood, Mo.

BOARDS OF MEDICAL EXAMINERS

BOARDS OF EXAMINERS IN THE BASIC SCIENCES

Examinations of boards of medical examiners and boards of examiners in the basic sciences were published in THE JOURNAL, April 26, page 1984.

NATIONAL BOARD OF MEDICAL EXAMINERS

NATIONAL BOARD OF MEDICAL EXAMINERS: Parts I and II. Various centers, June 23-25. Part III. Various centers, June or July. Exec. Sec., Mr. Everett S. Elwood, 225 S. 15th St., Philadelphia.

EXAMINING BOARDS IN SPECIALTIES

AMERICAN BOARD OF DERMATOLOGY AND SYPHILOLOGY: *Written*. Nov. 3. Final date for filing application is Sept. 23. *Oral*. Dec. 12-13. Final date for filing application is Nov. 8. Sec., Dr. C. Guy Lane, 416 Marlboro St., Boston.

AMERICAN BOARD OF INTERNAL MEDICINE: *Oral*. June, in advance of the meeting of the American Medical Association. *Written*. Oct. 20. Final date for filing application is Sept. 1. Sec., Dr. William S. Middleton, 1301 University Ave., Madison, Wis.

AMERICAN BOARD OF NEUROLOGICAL SURGERY: *Oral*. Philadelphia, June 6-7. Sec., Dr. R. Glen Spurling, 404 Brown Bldg., Louisville, Ky.

AMERICAN BOARD OF OPHTHALMOLOGY: *Oral*. New York, June 2; Portland, July 15; Chicago, Oct. 18. *Written*. March 7, 1942. Sec., Dr. John Green, 6830 Waterman Ave., St. Louis.

AMERICAN BOARD OF ORTHOPAEDIC SURGERY: Washington, January. Final date for filing application is Nov. 1. Sec., Dr. Guy A. Caldwell, 1640 State St., New Orleans, La.

AMERICAN BOARD OF PEDIATRICS: *Oral*. Chicago, May 18, following the Region III meeting of the American Academy of Pediatrics. *Written*. Oct. 7-8, immediately following the annual meeting of the American Academy of Pediatrics. *Written*. Locally, Aug. 22. Sec., Dr. C. A. Aldrich, 707 Fullerton Ave., Chicago.

Bureau of Legal Medicine and Legislation

MEDICOLEGAL ABSTRACTS

Medical Practice Acts: Right of Unlicensed Chiropractor to Question Constitutionality of Act.—The healing arts practice act of Virginia (Michie's Code of Virginia, 1936, Chapter 68, Section 1608 et seq.) regulates "the practice of medicine in all of its branches" by creating a board of medical examiners with authority to issue certificates to persons who have met certain prescribed educational requirements and passed the required examination. Section 1612 requires that licensees to practice medicine, homeopathy, osteopathy, chiropractic or chiropody must register their certificates with the clerk of the circuit court of the county or the corporation court of the city in which such practice is to be carried on. The defendant chiropractor was prosecuted for unlawfully practicing "chiropractic and medicine" without a license. The evidence showed not only that the defendant had failed to file a certificate with the clerk of the corporation court of the city of Staunton but that in fact he had never been granted such a certificate by the board of medical examiners. The evidence showed, too, that the defendant had maintained an office in Staunton for almost a year, that he had employed a stenographer in the office, that he had his name on the doors and windows and that people went in and out of the office. The defendant listed his name in the city telephone directory as: "Grosso, Charles S., Chiropractor, Witz Building." The evidence also showed that a few months before the trial the defendant had caused an advertisement to be published in the Staunton papers which lauded chiropractic "as a cure for backaches, constipation, rash and other ills" and offered "free" "spinal analysis and consultation." The advertisement also stated the telephone number, office hours and address of the defendant's place of business. One Whisman, a witness for the commonwealth, testified that he had visited the defendant's office and had received a roentgen examination and a treatment for which he paid the defendant \$16.50. The defendant did not testify in his own behalf. He was found guilty and so he appealed to the Supreme Court of Appeals of Virginia.

Section 1615 of the Virginia healing arts practice act, said the Supreme Court of Appeals, provides that an applicant for a certificate to "practice medicine, homeopathy, osteopathy, and chiropractic" must show that he or she "Has studied medicine not less than four school years, including four satisfactory courses of at least eight months each in four different calendar years in a medical school registered as maintaining a standard, satisfactory to the state board of education. Such standard being based upon the grading of the American Medical Association, of the American Institute of Homeopathy, and of the American Osteopathic Association, respectively." The defendant first contended that this section is unconstitutional because it discriminates against a candidate for a license to practice chiropractic, in violation of the due process and equal protection clauses of the federal constitution and the due process clause of the state constitution. He argued that under the act a candidate for license to practice medicine, homeopathy or osteopathy was required to show graduation from a school conforming to standards prescribed by his particular branch of the healing art but that no like standard was prescribed for chiropractors, and that consequently a chiropractor had to qualify himself by taking a course in a school approved by one of the branches of the healing art other than chiropractic. The court said, however, that even if section 1615 is discriminatory the defendant was in no position to raise that question. He produced no evidence to show that he had been denied the right to take an examination because of the lack of recognition of a chiropractic school. Nor did the defendant show that he had pursued his studies in such a school, or in any other school. In holding that the defendant's rights had been in no way prejudiced, the court said:

It is well settled that one challenging the constitutionality of a provision in a statute has the burden of showing that he himself has been injured

thereby. It avails him nothing to point out that some other person might conceivably be discriminated against.

The defendant also raised objection to certain rulings of the trial court with reference to the admissibility of evidence and the granting or refusing of instructions. He contended that the trial court had erred in refusing to admit the testimony of a practicing chiropractor as to the definition of chiropractic and as to whether or not the defendant's acts constituted the practice of chiropractic. The Supreme Court of Appeals held, in substance, that the question was not whether the defendant was practicing chiropractic but whether he was violating the healing arts practice act. Indeed, said the court, it is conceivable that the acts done by an unlicensed practitioner might constitute the practice of two or more branches of the healing art. In the judgment of the court this testimony was, therefore, properly excluded. The defendant also contended that he should have been allowed to cross examine witness Whisman to show that the witness had visited the defendant at the direction of a local physician who was interested in the prosecution of the defendant. The court held that the defendant should have been given the opportunity requested because the testimony of the witness would have tended to show his credibility or prejudice. The defendant finally contended that he was entitled to an instruction on the presumption of innocence. Such an instruction had been refused by the trial court because of section 1614, which provides that on the trial of any person for practicing without complying with the act "the burden of proof shall be upon him to establish his right to practice." The Supreme Court of Appeals held that the commonwealth was required to prove that the defendant was (1) doing certain specified things and (2) doing them without authority, and section 1614 merely means that on proof of (1) the defendant has the burden of going on and showing that he was licensed to do those things. In the judgment of the court, the section does not deprive the defendant of the benefit of a presumption of innocence. The court concluded that the errors of the trial court were substantial rather than merely "technical" and that the cause should be remanded for a new trial. Judgment for the commonwealth was therefore reversed and a new trial ordered.—*Grosso v. Commonwealth*, 13 S. E. (2d) 285 (Va., 1941).

Malpractice: Hypodermic Needle Broken in Patient's Jaw; Doctrine of Res Ipsa Loquitur Not Applicable.—The plaintiff consulted the defendant dentist about a tooth that had been bothering her and was advised to have it extracted. Preparatory to the extraction the defendant broke off a hypodermic needle in the plaintiff's jaw. After unsuccessfully attempting to remove the needle he took the plaintiff to a dentist and two dental surgical specialists to have it removed, but their attempts even with the aid of roentgenograms were also unsuccessful. Subsequently the plaintiff brought suit against the defendant dentist to recover damages. She alleged that as the result of his negligence she had pains, a nervous condition, spots before her eyes and general poor health including loss of weight. From a judgment of the trial court in favor of the defendant, the plaintiff appealed to the appellate court of Indiana, in Banc.

The appellate court could not agree with the plaintiff's first contention that the defendant had been negligent in allowing the needle to remain in her jaw. The evidence introduced by the plaintiff, said the court, indicated clearly that the defendant's conduct after the needle had broken was exemplary. "He not only advised her as to the true condition but attempted in every way possible to have the needle removed." Likewise, the plaintiff's further contention that the defendant had been negligent in breaking off the needle in her jaw did not meet with the approval of the court. In the judgment of the court the doctrine of *res ipsa loquitur* was not applicable to the present case. In a malpractice case against a dentist or a physician the main issue as to whether or not the defendant used suitable professional skill is a topic calling for expert testimony, and a plaintiff cannot rest his or her case on the mere facts of suffering and rely on the jury's untutored sympathies with-

out attempting specifically to prove by evidence that the defendant's unskilfulness was the cause of that suffering. In the present case there was no evidence, either by lay witness or expert, that the conduct of the defendant, either before or after the needle was broken, was negligent or unskilful. In the absence of such evidence the court held that the plaintiff had not sustained the required burden of proof. Judgment for the defendant was therefore affirmed.—*Robinson v. Ferguson*, 22 N. E. (2d) 901 (Ind., 1939).

Occupational Disease Act (Indiana): Compensability of Bronchitis, Pharyngitis and Sinusitis.—The occupational disease act of Indiana defines an occupational disease as follows:

As used in this act, the term "occupational disease" means a disease arising out of and in the course of the employment. Ordinary diseases of life to which the general public is exposed outside of the employment shall not be compensable, except where such diseases follow as an incident of an occupational disease as defined in this section.

The plaintiff had been employed for three weeks in the defendant's soldering department where he became exposed to dust and the fumes of hydrochloric acid (muriatic acid) used in cleaning the soldering irons. The medical testimony was in agreement that the plaintiff was suffering from bronchitis, pharyngitis and sinusitis and that such diseases were not singular or peculiar to his employment but were common to a person in the ordinary walks of life. The plaintiff's medical witness would not say that these diseases were caused by the plaintiff's employment but he testified that he believed that the acid fumes accelerated them. Two medical witnesses for the defendant testified that they saw no connection between the plaintiff's employment and his condition, but one of the witnesses testified that he thought that the plaintiff's sinusitis might have been accelerated temporarily by the acid fumes. The appellate court of Indiana, in Banc, held that the plaintiff was not suffering from an occupational disease within the meaning of the act, and so it affirmed the order of the industrial board denying compensation.—*Russell v. Auburn Central Mfg. Co.*, 22 N. E. (2d) 889 (Ind., 1939).

Society Proceedings

COMING MEETINGS

American Medical Association, Cleveland, June 2-6. Dr. Olin West, 535 North Dearborn St., Chicago, Secretary.

American Association for the Study of Allergy, Cleveland, June 2-3. Dr. J. Harvey Black, 1405 Medical Arts Bldg., Dallas, Tex., Secretary.

American Association for the Study of Goiter, Boston, May 12-14. Dr. W. Blair Mosser, 133 Biddle St., Kane, Pa., Secretary.

American Association for the Surgery of Trauma, Montreal and Montebello, Canada, May 29-31. Dr. Ralph G. Carothers, 409 Broadway, Cincinnati, Secretary.

American Association for Thoracic Surgery, Toronto, Canada, June 9-11. Dr. Richard H. Meade Jr., 2116 Pine St., Philadelphia, Secretary.

American Association of Genito-Urinary Surgeons, Hot Springs, Va., May 29-31. Dr. Charles C. Higgins, 2020 East 93d St., Cleveland, Secretary.

American Association of Industrial Physicians and Surgeons, Pittsburgh, May 5-9. Dr. Volney S. Cheney, % Armour and Company, Union Stock Yards, Chicago, Secretary.

American Association of Medical Milk Commissions, Cleveland, June 1-2. Dr. Paul B. Cassidy, 2037 Pine St., Philadelphia, Secretary.

American Association of the History of Medicine, Atlantic City, N. J., May 4-6. Dr. Henry E. Sigerist, 1900 East Monument St., Baltimore, Secretary.

American Association on Mental Deficiency, Salt Lake City, June 20-24. Dr. E. Arthur Whitney, Washington Road, Elwyn, Pa., Secretary.

American Broncho-Esophagological Association, Cleveland, June 3. Dr. Paul H. Holinger, 1150 North State St., Chicago, Secretary.

American College of Chest Physicians, Cleveland, May 31-June 2. Dr. Paul H. Holinger, 500 North Dearborn St., Chicago, Secretary.

American Gastro-Enterological Association, Atlantic City, N. J., May 5-6. Dr. Thomas T. Mackie, 16 East 90th St., New York, Secretary.

American Gynecological Society, Colorado Springs, May 26-28. Dr. Richard W. TeLinde, Johns Hopkins Hospital, Baltimore, Secretary.

American Heart Association, Cleveland, May 30-31. Dr. Howard B. Sprague, 50 West 50th Street, New York, Secretary.

American Laryngological Association, Atlantic City, May 28-30. Dr. Charles J. Imperatori, 108 East 38th St., New York, Secretary.

American Laryngological, Rhinological and Otolological Society, Los Angeles, June 16-18. Dr. C. Stewart Nash, 277 Alexander St., Rochester, N. Y., Secretary.

American Medical Women's Association, Cleveland, June 1-2. Dr. Etta Gray, 649 South Olive St., Los Angeles, Secretary.

American Neurological Association, Atlantic City, N. J., June 9-11. Dr. Henry A. Riley, 117 East 72d St., New York, Secretary.

American Ophthalmological Society, Hot Springs, Va., May 29-June 1. Dr. Eugene M. Blake, 303 Whitney Ave., New Haven, Conn., Secretary.

American Orthopedic Association, Toronto, Canada, June 9-12. Dr. Charles W. Peabody, 474 Fisher Bldg., Detroit, Secretary.

American Otolological Society, Atlantic City, N. J., May 26-28. Dr. Isidore Friesner, 36 East 73d St., New York, Secretary.

American Pediatric Society, Hot Springs, Va., May 22-24. Dr. Hugh McCulloch, 325 North Euclid Ave., St. Louis, Secretary.

American Proctologic Society, Cleveland, June 1-3. Dr. William H. Daniel, 1930 Wilshire Blvd., Los Angeles, Secretary.

American Psychiatric Association, Richmond, Va., May 5-9. Dr. Arthur H. Ruggles, 305 Blackstone Blvd., Providence, R. I., Secretary.

American Radium Society, Cleveland, June 2-3. Dr. William E. Costolow, 1407 South Hope St., Los Angeles, Secretary.

American Rheumatism Association, Cleveland, June 2. Dr. A. R. Shands, Dupont Institute, Wilmington, Del., Secretary.

American Society for Clinical Investigation, Atlantic City, N. J., May 5. Dr. Eugene M. Landis, University of Virginia Hospital, Charlottesville, Va., Secretary.

American Society of Clinical Pathologists, Cleveland, May 30-June 1. Dr. A. S. Giordano, 531 North Main St., South Bend, Ind., Secretary.

American Therapeutic Society, Cleveland, May 30-31. Dr. Oscar B. Hunter, 1835 Eye St. N.W., Washington, D. C., Secretary.

American Urological Association, Colorado Springs, Colo., May 19-22. Dr. Clyde L. Deming, 789 Howard Ave., New Haven, Conn., Secretary.

Association for Research in Ophthalmology, Cleveland, June 3. Dr. Conrad Berens, 35 East 70th Street, New York, Secretary.

Association of American Physicians, Atlantic City, N. J., May 6-7. Dr. Hugh J. Morgan, Vanderbilt University Hospital, Nashville, Tenn., Secretary.

California Medical Association, Del Monte, May 5-8. Dr. George H. Kress, 450 Sutter St., San Francisco, Secretary.

Connecticut State Medical Society, Bridgeport, May 21-22. Dr. Creighton Barker, 258 Church St., New Haven, Secretary.

Georgia Medical Association of, Macon, May 13-16. Dr. Edgar D. Shanks, 478 Peachtree St. N.E., Atlanta, Secretary.

Hawaii Territorial Medical Association, Honolulu, May 2-4. Dr. A. L. Craig, Dillingham Bldg., Honolulu, Secretary.

Idaho State Medical Association, Sun Valley, June 18-21. Dr. F. B. Jeppesen, 105 North 8th St., Boise, Secretary.

Illinois State Medical Society, Chicago, May 20-23. Dr. Harold M. Camp, 224 South Main St., Monmouth, Secretary.

Iowa State Medical Society, Davenport, May 14-16. Dr. R. L. Parker, 3510 Sixth Ave., Des Moines, Secretary.

Kansas Medical Society, Topeka, May 13-15. Mr. C. G. Munns, 112 West Sixth St., Topeka, Executive Secretary.

Maine Medical Association, York Harbor, June 22-24. Dr. Frederick R. Carter, 22 Arsenal St., Portland, Secretary.

Massachusetts Medical Society, Boston, May 21-22. Dr. Robert N. Nye, 8 Fenway, Boston, Secretary.

Medical Library Association, Ann Arbor, Mich., May 29-31. Miss Anna C. Holt, 25 Shattuck St., Boston, Secretary.

Minnesota State Medical Association, St. Paul, May 26-28. Dr. B. B. Souster, 493 Lowry Medical Arts Bldg., St. Paul, Secretary.

Mississippi State Medical Association, Biloxi, May 13-15. Dr. T. M. Dye, Box 295, Clarksdale, Secretary.

Montana Medical Association of, Great Falls, June 24-26. Dr. Thomas F. Walker, 206 Medical Arts Bldg., Great Falls, Secretary.

National Gastroenterological Association, New York, May 13-16. Dr. G. Randolph Manning, Room 319, 1819 Broadway, New York, Secretary.

National Tuberculosis Association, San Antonio, Tex., May 5-8. Dr. Charles J. Hatfield, 1790 Broadway, New York, Secretary.

Nebraska State Medical Association, Lincoln, May 5-8. Dr. R. B. Adams, 416 Federal Securities Bldg., Lincoln, Secretary.

New Hampshire Medical Society, Manchester, May 13-14. Dr. Carleton R. Metcalf, 5 South State St., Concord, Secretary.

New Jersey Medical Society of, Atlantic City, May 20-22. Dr. Alfred Stahl, 55 Lincoln Park, Newark, Secretary.

New York State Association of Public Health Laboratories, Syracuse, May 19. Miss Mary B. Kirkbride, New Scotland Ave., Albany, Secretary.

North Carolina Medical Society of the State of, Pinehurst, May 19-21. Dr. I. H. Manning, Chapel Hill, Secretary.

North Dakota State Medical Association, Grand Forks, May 19-21. Dr. L. W. Larson, 221 Fifth St., Bismarck, Secretary.

Ohio State Medical Association, Cleveland, June 3. Mr. C. S. Nelson, 79 East State St., Columbus, Executive Secretary.

Oklahoma State Medical Association, Oklahoma City, May 19-22. Dr. L. S. Willour, 210 Plaza Court Bldg., Oklahoma City, Secretary.

Pacific Coast Oto-Ophthalmological Society, Los Angeles, May 26-29. Dr. C. Allen Dickey, 450 Sutter Street, San Francisco, Secretary.

Pacific Northwest Medical Association, Spokane, Wash., June 25-28. Dr. C. W. Countryman, 407 Riverside Ave., Spokane, Wash., Secretary.

Rhode Island Medical Society, Providence, May 28-29. Dr. Guy W. Wells, 124 Waterman St., Providence, Secretary.

Society of Surgeons of New Jersey, Plainfield, May 28. Dr. Walter B. Mount, 21 Plymouth St., Montclair, Secretary.

South Dakota State Medical Association, Mitchell, May 18-20. Dr. Clarence E. Sherwood, 107½ Egan Ave., Madison, Secretary.

Texas State Medical Association of, Fort Worth, May 12-15. Dr. Holman Taylor, 1404 West El Paso St., Fort Worth, Secretary.

Utah State Medical Association, Salt Lake City, June 12-14. Dr. D. G. Edmunds, 610 McIntyre Bldg., Salt Lake City, Secretary.

West Virginia State Medical Association, Charleston, May 12-14. Mr. Joe W. Savage, Public Library Bldg., Charleston, Executive Secretary.

Current Medical Literature

AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1931 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied by stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (*) are abstracted below.

American Journal of Ophthalmology, St. Louis

Suprachoroidal Iridodetachment for Chronic Glaucoma: Preliminary Report. J. S. Somborg, New York.—p. 516.
Successful Suture of Penetrating Stab Wounds of Heart, with Some Observations on Subject: Two Cases. J. B. Stenbuck, New York.—p. 520.

Chronic Constrictive Pericarditis.—Oppenheimer and his co-workers report 8 cases of constrictive pericarditis treated surgically. Two of the patients have been well eight and a half and four years after pericardiectomy, 2 have had pronounced postoperative improvement for two and one years respectively, and 1 operated on July 19, 1940 was improved four weeks after a partial pericardiectomy; there was an elevated venous pressure with a disappearance of ascites. Three patients have died, 2 respectively three and seven days after operation; 1 after a Brauer and a partial pericardiectomy had transitory relief, a second pericardiectomy was followed by relief after months and ultimate economic restitution, and death was due to adenocarcinoma of the rectum. The cases represent an extrinsic form of heart disease in which a thickened, contracted, at times calcified, pericardium incarcerates and compresses the heart, interfering with its diastolic expansion and less with its systolic contraction, causing thereby extreme venous stasis. The etiology of 5 of the cases was obscure, 1 was tuberculous in origin and in 2 there was a clinical history of rheumatic fever. The symptoms of chronic constrictive

pericarditis are primarily due to constriction and not to the fixation of the heart to surrounding structures. The diagnosis may be made on the history and at times on inspection alone. The direct operative approach has consisted essentially in an extrapleural exposure of the heart, release of the right side with special dissection at the venae cavae after its left side is released and removal of the constricting membranes in a one stage operation. In cases in which doubt exists as to how far to proceed, possible additional decortication in a second stage should be considered. In cases in which typical constrictive pericarditis is not encountered at operation, too extensive decortication seems unwise; the results of a partial operation can be awaited and a second stage performed, if indicated. The authors occasionally practice a two stage operation and advocate it under the foregoing circumstances. Despite considerable experience they remain in doubt as to how much of the diseased pericardium should be excised in some cases. They believe excision should be generous over the right side of the heart, although there is usually no special reason for dissection over the right auricle and venae cavae. Excision over the left side of the heart must be extended to the posterior surface. It is their practice to excise in this region and over the diaphragm until the heart, including the apex, is well released. A constricting membrane will not reform after excision if enough of it is removed to release the heart as the source of the fibrous tissue, the diseased pericardium, is removed. Medical treatment is only palliative. All operations should be performed after careful preparation.

Recovery from Meningococcemia After Anaphylactic Shock.—Baehr suggests that the universal employment of sulfapyridine has served to obscure the equally dramatic crisis which signalizes spontaneous recovery in lobar pneumonia. He reports an instance which illustrates that an insignificant physical or chemical agent is sometimes capable of setting off an immunologic trigger mechanism which suddenly controls a previously overwhelming infection. After an illness of ten weeks from what appeared to be a fatal meningococcal infection and at a time when death appeared imminent, anaphylactic shock followed by a chill and a temperature of 106.4 F. resulted in immediate and complete sterilization of the infection. Although spontaneous recovery from meningococcemia and meningococcal endocarditis is not rare, such an outcome could not have been expected in this instance. Hyperpyrexia may have played a part, as gram-negative cocci are unusually thermolabile. However, the temperature had repeatedly been as high as 105.8 F. without any influence. During the ten weeks of illness the immunologic forces had been unable to overcome the infection. The sudden and almost fatal anaphylactic shock from a drop and a half of serum, and perhaps the severe rigor and pyrexia which followed, had a rapid and profound influence on the balance between the infection and the forces of recovery. Ten days after the incident the patient, a girl of 13, was able to walk out of the hospital.

Cancer of Esophagus.—Garlock believes that the next few years will see the acceptance of surgical treatment for cancer of the esophagus as the only sound therapy. This cancer is usually a slowly growing neoplasm. It remains a local disease for some time before metastasizing. While it may not spread peripherally until late, it may become locally inoperable in the early stages because of fixation to the nearby vital structures, the aorta or bronchus. More rapid progress in the surgical treatment will be made when increasing numbers of early cases (persistent dysphagia) in which esophagoscopy, biopsy and fluoroscopic and roentgen examination have been done are referred to the surgeon. The best results of surgical treatment follow early diagnosis, careful preoperative preparation, sound operative conception, expertly administered anesthesia, meticulous postoperative care and immediate treatment of complications as they arise. The ideal operation is one which removes the tumor-bearing portion of the organ and a wide margin of normal tissue and reestablishes esophagogastric continuity by some type of anastomosis. When the cancer is located in the middle third of the organ, this is not possible and the procedure is to preserve the lower 2 inches of the organ (following resection of the tumor-bearing portion), leaving it attached to the stomach and bringing it out through

a small abdominal incision, where the divided end is sewn to the skin to form an esophagostomy. In this way the sphincteric mechanism of the cardia is preserved, and leakage does not occur. The operation is completed in one stage. This change greatly simplifies the subsequent construction of a skin-lined tube on the anterior wall of the chest to replace the resected esophagus and obviates the use of a rubber tube. In a fairly large group of successful resections of this type there has been little disturbance of esophageal or gastric function. During the last four and a half years the author has operated on 20 patients with squamous cell carcinoma of the esophagus. Among the 14 who presented operable lesions there were 5 deaths. Of the 9 survivors, 5 are alive and well today; 1 for almost four years, 1 for eighteen months, 1 for thirteen months, 1 for seven months and 1 for six weeks. The remaining 4 patients died of local recurrence or other cause twenty-two months, one year, one year, and three and a half months respectively after operation. During the same period he operated on 15 patients with adenocarcinoma of the cardiac end of the stomach with esophageal obstruction. Only 5 had operable lesions, 2 of whom died (1 of cerebral embolus on the third day and 1 from inanition and general debility on the third day with negative necropsy). The surviving patients are alive and well, respectively fourteen, four and three months after operation. The patient with cancer of the esophagus can be assured of a reasonable chance of survival following surgical intervention.

Congenital Hypertrophic Pyloric Stenosis.—According to Haas, the literature of the last ten years shows that treatment of congenital hypertrophic pyloric stenosis is almost equally divided between surgical and medical procedures. The recommended medical procedures are all of value, but the fundamental requirement is the relaxation of the pyloric sphincter. Atropine plus calcium best fulfil this requirement. Other important adjuvants are phenobarbital and thick gruel. The author's procedure is to use breast milk, if available; if not, protein milk or evaporated milk. With artificial feeding some sugar or thick gruel is added in amount suitable to the size of the infant. The feedings are not given more often than every four hours; intervals of six hours are sometimes better. In each feeding there is placed $\frac{1}{4},000$ grain (0.000065 Gm.) of atropine sulfate. If vomiting continues after two feedings the dose of atropine is doubled and increased by $\frac{1}{4},000$ grain every second feeding until vomiting is controlled or signs of atropine intoxication require a temporary reduction in dosage. If it is necessary to use the drug hypodermically, clyses or saline drip with or without dextrose and occasionally a blood transfusion are used. Saline solution (from 750 to 1,500 cc.) by continuous drip is superior to single small injections for combating dehydration, alkalosis and a disordered chloride metabolism. One drachm (4 Gm.) of calcium gluconate is added to the day's formula. When the atropine dosage is raised to the point of tolerance and sufficient relief is not obtained, $\frac{1}{4}$ grain (0.016 Gm.) of phenobarbital is added to each feeding. In some cases the dose of phenobarbital must be increased. The infant should be kept in a semiupright position turned toward the right side. The medication will have to be continued over a variable period, in some cases for months. After the acute phase the medication becomes part of the feeding routine. From time to time an attempt is made to reduce the dose of atropine, and if vomiting does not recur it is discontinued. The tendency to resort to surgery in cases of pyloric stenosis without adequate medical treatment is not in keeping with good medical tradition. Surgical intervention (preferably the Rammstedt operation or some modification of it) is indicated only when an experienced surgeon is available, if proper cooperation in the home is not available and when proper medical treatment fails. The literature of the last ten years shows that the mortality with surgical treatment (2,840 cases) was 6 per cent and with medical treatment (1,218 cases) 7.8 per cent. Of the author's 179 patients 8 were operated on after medical treatment failed; there were 7 recoveries and 1 death. Among the 171 medically treated patients there were 2 deaths, both occurring during the recovery phase when the atropine was being reduced. The cause of death was not explained clinically and necropsies were not permitted.

Oxygen Postoperatively for Hyperthyroidism.—Schnedorf and his collaborators point out that in the toxic thyroid patient (in whom oxygen requirements are greater) it is especially important to remember that anoxemia is present for some time before cyanosis is evident. Arterial blood oxygen saturation may be below normal in patients with hyperthyroidism. The authors determined the blood oxygen saturation of the femoral artery in 12 hyperthyroid patients before and about one hour after thyroidectomy. The normal oxygen

saturation of 6 of the 12 patients was depressed from 2 to 7 per cent under basal conditions before operation. This depression was seen most frequently in toxic patients with high metabolic rates. In spite of using a combination of avertin with amylene hydrate, ethylene and oxygen for the anesthetic a further depression of arterial blood oxygen saturation of 10 patients followed operation. No significant fall in blood pressure was observed. The effect of the basal metabolic rate on oxygen consumption and vital processes of 50 patients was studied. Decided differences in the oxygen consumption and the vital processes were observed under basal conditions. Hypothyroid patients had a lower body temperature, a slower pulse and slower respiration and absorbed less oxygen per minute than the normal patients did. In the patients with appreciably increased basal metabolic rates these processes were considerably increased. The cardiovascular reactions in toxic goiter are increased. In an attempt to transport more oxygen and nourishment to the tissues, and carbon dioxide and metabolic waste products away from them, the heart rate increased from an average basal normal rate of 78 to the average basal hyperthyroid rate of 111 beats per minute. This increase greatly decreases the cardiac reserve. The increased pulse rate interferes with the coronary circulation to the myocardium. Prolonged anoxemia under increased demand may lead to angina pectoris, coronary occlusions, myocardial asthenia and decompensation. The hyperexcitability of the nervous system may lead to arrhythmia and irregularity. Acute and chronic anoxemia causes enlargement, hypertrophy and fatty degeneration of the heart. With an increased basal metabolic rate an increase in the respiratory rate occurs. The tachypnea is a physiologic attempt to increase the absorption of oxygen and to facilitate aeration of the quickened circulation. Dyspnea is a prominent symptom in advanced cases. The patient is conscious of this difficulty and feels that he must voluntarily assist the normal movements. This leads to increased restlessness and nervousness. The vital capacity is decreased below normal. The physiologic processes are less stable than in the normal patient, and therefore the reactions of the toxic thyroid patient should be closely watched because they are violent and superimpose a further strain on the already overburdened vital reserves. Increase in the pulse rate, temperature and respiratory rate are most common following thyroidectomy in the very toxic patient. However, severe reactions and fatal crisis may be precipitated by relatively minor factors. The use of oxygen therapy postoperatively seems apparent. Since the authors' more extensive use of the liquid oxygen tent immediately after operation they have had only 5 thyroid deaths among 202 consecutive operations; 2 of these were due to bronchopneumonia and 3 to acute hyperthyroidism. The cool moist atmosphere in the liquid oxygen tent and the high oxygen concentration exerted a sedative action and decreased restlessness. The high oxygen tension made breathing easier, decreasing its rate, lessening or abolishing dyspnea, decreasing the heart rate and so maintaining the cardiac reserve and frequently correcting arrhythmia and decompensation. The elevated postoperative body temperature was frequently restored early to normal.

Pregnancy and Acute Anterior Poliomyelitis.—Kleinberg and Horwitz determined the effect of acute anterior poliomyelitis on 243 women who had subsequent pregnancies. They examined 44 of the women, and the data on the remaining 199 were obtained through questionnaires filled out by the attending obstetrician and orthopedic surgeon and in some instances by the patient. Among the series there were 13 women whose pregnancy was complicated by an acute attack of anterior poliomyelitis. Asymmetry of the pelvic inlet was found among approximately 80 per cent of the women. The distortion was usually mild and did not produce dystocia. Pelvic asymmetry was absent in those who because of extensive paralysis were completely bedridden, never having attempted to bear weight or to get about with braces and crutches. There were four main types of pelvic deformity: lateral pelvic obliquity, increased anterior pelvic tilt with exaggerated lumbar lordosis, anteroposterior axis deviation or rotation about a longitudinal axis and rotation of one innominate bone on the

other about a transverse axis or torsional deformity. Of 15 cases reported in the literature, 1 case reported to them and the 13 cases collected by them the authors conclude that pregnancy complicated by acute anterior poliomyelitis may be anticipated to progress normally, with a normal termination of labor and with normal offspring. The involuntary contractions of the uterus and the ability of the uterus to expel its contents spontaneously also observed in patients paralyzed by cord tumors, spondylitis and vertebral fracture are due to the fact that the uterus has an independent nerve supply and will contract after the spinal cord is transected and after its sympathetic nerve supply is extirpated. There was no intrauterine poliomyelitis among the 29 cases. The passive immunity of the offspring derived from the mother does not persist for long, as a few cases of acute anterior poliomyelitis in infants less than 1 month of age (earliest, 9 days) have been reported. Analysis of the 243 patients who became pregnant one year or more after an acute attack of anterior poliomyelitis reveals that a normal and uneventful pregnancy and labor with normal offspring may be anticipated. There is no indication for interruption of pregnancy, except those reasons that would also be operative in nonparalytic women. Cesarean section was utilized in a higher percentage (11.5) of the paralytic women than in a comparable nonparalytic series, but it is the authors' belief that in some instances it may not have been warranted and that therefore the percentage probably does not represent the true index of the need of cesarean section for paralytic women.

Liver Cell Fat Necrosis Caused by Pancreatic Reflux.—On the basis of information gained from clinical, pathologic and experimental investigation on liver cell fat necrosis, Schiller believes that evidence of pancreatic reflux into the liver may be expected when the liver in the presence of intrahepatic fat necrosis contains neutral fat as a result of fatty degeneration or infiltration. The degeneration must be severe. When the degeneration is mild, the relatively small droplets are surrounded by a layer of protoplasm sufficiently thick so that the lipase cannot penetrate through this protecting layer. Only when the liver cell is transformed into a fat cell consisting of a large drop of fat surrounded by a thin cell membrane can the lipase penetrate through the membrane and split the fat. The author has examined the livers of 16 patients with pancreatic fat necrosis. All showed fatty degeneration and infiltration. The degeneration was not severe enough. In 6 cases there was a periportal hypertrophic cirrhosis with fatty infiltration. In 5 of these, either the fatty transformation of the liver cells was not severe enough or no reflux had occurred. The sixth case showed the changes expected. In nonspecific necrosis of fat tissue the character of the necrotic areas is different from that seen in specific pancreatic fat necrosis, in which the lipase at once splits large amounts of fat and thus produces masses of fatty acid crystals long before the surrounding tissue can produce a protective granulation tissue. The foci of intrahepatic fat necrosis in the author's case were exactly like those of the pancreatic type. Even though no fat necrosis of the pancreas and the adjacent fat tissue were present, the morphology of the liver foci with the masses of fatty acid needles pointed to the action of pancreatic lipase. Necrosis of liver tissue is a rather frequent pathologic entity in red and yellow atrophy. However, small necrotic areas are also frequently found in cirrhotic livers. Examination of a large number of slides taken from cases of liver atrophy and cirrhosis has convinced the author that in these cases hepatic tissue never contains fatty acids or fat salts. Concerning the route by which the pancreatic lipase reaches the hepatic tissue there are several possibilities. Reflux of pancreatic secretion to the liver by way of the bile duct must be admitted in the presence of pancreatic stones large enough to block the papilla of Vater. The pancreatic and hepatic biliary ducts may be transformed into one communicating system by obstructing the outlet—the papilla of Vater—the most frequent cause of which is stones. Spasm of the sphincter of Oddi and edema of the duodenal mucosa must also be considered. Lipase in the bile is conclusive evidence of pancreatic reflux, as normal bile contains no lipase.

Action of Sulfanilamide on Venereal Lymphogranuloma Virus.—In view of the wide range of chemotherapeutic activity of sulfanilamide, Findlay tried to determine whether the curative activity of sulfanilamide on the virus of venereal lymphogranuloma was also inhibited when *p*-aminobenzoic acid was administered simultaneously with the sulfanilamide. He also examined the effect of *p*-aminobenzoic acid and sulfanilamide on hemolytic streptococci injected intracerebrally in mice. His studies show that *p*-aminobenzoic acid given with sulfanilamide inhibits to a high degree the therapeutic action of sulfanilamide on the venereal virus. If the inhibitory action of *p*-aminobenzoic acid is due to the fact that it competes with sulfanilamide for a particular enzyme, it follows that *p*-aminobenzoic acid or some substance formed from *p*-aminobenzoic acid in the tissues is an essential metabolite of the virus of venereal lymphogranuloma. The question whether this substance can be synthesized by the virus or is an essential growth factor supplied by the tissues in which the virus grows requires further investigation. Since the viruses of venereal lymphogranuloma and trachoma are the only ones known to be acted on by sulfanilamide, it is tempting to regard them as the only two which require *p*-aminobenzoic acid for metabolism. For all other viruses *p*-aminobenzoic acid would thus not be an essential metabolite. An alternative theory, however, of the failure of sulfanilamide to act on all other viruses would be that in the course of their metabolism so much *p*-aminobenzoic acid is formed that the chemotherapeutic action of sulfanilamide is completely inhibited. Experiments are under way to determine whether the alternative theory is valid.

Chronic Benzene Poisoning.—Hamilton-Paterson records a series of clinical and hematologic examinations in women exposed to benzene fumes. These women used a rubber solution of commercial 90 per cent benzene and petroleum spirit. They worked in a large room with natural ventilation assisted by extraction fans. Three cases of chronic benzene poisoning are described in detail and the hematologic pictures of 18 fellow workers are given. Benzene has a destructive action on the bone marrow, and aplasia may ensue; any of the cellular elements may be affected, and a large variety of changes are reported. Leukopenia is the commonest of these, but leukemia may develop either as an acute or as a chronic myelogenous form. Anemia usually occurs later in the disease, and most observers report a mild type with a low color index, but a severe hyperchromic type has been described. The common leukopenia may progress to complete granulocytopenia. In addition to the 21 women who were examined, 14 who were working at the same factory were questioned and 6 had symptoms which might be due to benzene. Unfortunately no blood counts could be made. The chief symptoms were giddiness, menstrual disturbances, epistaxis and watering of the eyes, nausea, morning heaviness, swelling of the legs and lassitude. The author stresses that it must be borne in mind that the initial symptoms in benzene poisoning are slight and easily overlooked, and that the patient may exhibit symptoms and signs pointing to some other diagnosis. Thus the diagnosis of benzene poisoning can be missed if the occupational history is not investigated and if only one type of blood picture is looked for. The blood may show either anemia or polycythemia, leukopenia or leukocytosis, a relative decrease or increase of polymorphonuclears, and eosinophilia. The commonest observations, however, are leukopenia and anemia. Menstrual disturbances are suggestive. The ratio of inorganic to organic urinary sulfates is decreased. Urinary sulfate estimation is valuable during and up to a month after the period of exposure to benzene. Residual changes in the blood picture may persist indefinitely and may be accompanied by disability.

New French Laws Controlling Abortion.—Duvoir and Hausser report the provisions governing criminal and therapeutic abortion, the laboratory determination of pregnancy and the supervision of confinement homes, enacted into law in 1939 with the active cooperation of the French Society of Legal Medicine. The penalties (penitentiary, fines, temporary or permanent cancellation of right to practice) for criminal abortion have been enlarged to include women subsequently proved not to have been pregnant. Physicians are freed from the obligation enjoined by the code of professional secrecy in matters pertaining to criminal abortion. Medical students and midwives make themselves liable to expulsion or exclusion from institutions of higher learning. The provisions against criminal abortion include practically every person who can be proved to have had a connection with the case. Therapeutic abortion is now legalized but surrounded by all possible safeguards against abuse. It must be approved by a conference of three men, the physician in charge and two consultants, one of whom must be a specialist on the list of the civil tribunal. The proceedings are recorded in writing. Therapeutic abortion is permissible only if it can be shown that the mother's life can be saved solely by the abortive act. The laboratory diagnosis for pregnancy must be recommended in writing, authorized by a physician and officially approved. It can be carried out only by laboratories accredited by the public health department. An official record is kept. Confinement homes must have permits to engage in business and are supervised for moral character and hygienic conditions.

- *Vitamin C in Children in Bogotá. C. Torres Umaña.—p. 581.
Technic for Bronchography in Children. A. Castellanos, R. Pereiras and R. Montero.—p. 594.

Vitamin C in Children in Bogota.—According to Torres Umaña, scurvy is rare in Bogota. Elimination of the ascorbic acid in the urine for the first three hours after the injection of 7 mg. is variable in normal children and in those with nutritional or infectious diseases, but without scurvy. The amount of ascorbic acid in 100 cc. of cerebrospinal fluid is about the same as that eliminated in the urine. Children with infections develop insufficiency of vitamin C which can be diagnosed by the diminution of organic ascorbic acid but which does not produce scurvy. The author determined the amount of ascorbic acid in the cerebrospinal fluid of various infants with nutritional diseases or with infections but without scurvy and of the amount of ascorbic acid eliminated in the urine after the administration of 7 mg. of the acid. A vitamin C deficient diet was maintained throughout the experiment. He found that (1) at the beginning of the experiment the amount of ascorbic acid in the cerebrospinal fluid is about the same as that which is eliminated in the urine; (2) after a week in the hospital, without exposure to the sun, the amount of ascorbic acid is lowered in the cerebrospinal fluid and in the urine; (3) after a week of daily administration of ultraviolet radiation for fifteen minutes a day it increased at about the same values as those which existed at the beginning of the experiment. The same results were obtained when the experiment was repeated without previous injection of ascorbic acid. The results suggest that ultraviolet irradiation produces a synthesis of ascorbic acid by the body which varies with the person. He believes that sun irradiation stimulates an organic synthesis of ascorbic acid in man and animals and that the organic production of the substance compensates insufficient supply of vitamin C and prevents scurvy.

Active Immunization Against Tetanus.—Kestermann and Vogt direct attention to the advantages of the active over the passive immunization, pointing out that in active immunization anaphylactic reactions do not have to be feared and that the protection persists for a long time. After the prophylactic administration of serum the antitoxin disappears from the blood stream in from ten to fourteen days. In active immunization, the repetition of injections and the intervals between them are important. The first injection produces comparatively little antitoxin; it makes the organism reactive; only the second injection produces a considerable increase in the antitoxin content. It has been found that the increase in antitoxin after the second injection is the higher, the longer the interval is between first and second vaccination. Intervals of eight or even twelve weeks result in much higher antitoxin titers than intervals of four weeks. However, even after active immunization the quantity of the specific antitoxin in the blood decreases, and French authors have demanded a repetition of the vaccination after one or two years. The authors investigated the antitoxin content of nineteen vaccinated persons at the end of one year. They found that although the antitoxin content of the blood had greatly decreased it was the higher the greater the blood antitoxin had been at the end of the inoculation in the preceding year. A new single "security" vaccination increased the antitoxin content of the blood. The new formation of antitoxin commenced from three to five days after vaccination, and at the end of six weeks it was from ten to three hundred and seventy-five times as high as the initial values (before the "security" vaccination). On account of the great reactive capacity of an organism which previously has undergone active immunization, the "security" vaccination produces such a degree of immunity that the administration of serum seems unnecessary in case of injuries suspected of infection with tetanus.

Night Blindness from Vitamin A Deficiency.—According to Høyaard, Eskimos daily consume approximately 50,000 international units of vitamin A plus some carotene, and their average visual distinction capacity is 1.56 ± 0.023 (for men) and 1.49 ± 0.028 (for women). Seamen (Germans, Norwegians, Swedes), whose daily intake of vitamin A averages between 600 and 1,000 international units, plus carotene, have a visual distinction capacity of 1.2 ± 0.011 . Norwegian students who daily consume an average of 3,600 international units plus carotene have a visual distinction capacity of 1.23 ± 0.016 . Seamen whose distinction capacity in dim light was reduced experienced an improvement following the intramuscular injection of 20,000 international units of vitamin A. The author concludes that the difference between Eskimos and Europeans is due to the lack of vitamin A in the diet of the latter. The vitamin A content of the Eskimo diet is of animal origin. In the diet of Europeans the most important sources of vitamin A are milk, milk products and eggs. It was long believed that vitamin A could be replaced by carotene, which occurs in many vegetables. It has been proved that some persons utilize only about 5 per cent of the carotene taken in with the food. For this reason a purely vegetarian diet without milk and eggs must be regarded as inadequate. Since an increase in the consumption of milk and eggs encounters economic difficulties, the author suggests, as a provisional measure, that certain foods, such as margarine, lard, milk and perhaps bread, be artificially fortified with vitamin A.

 Sacral Teratoma: Two Cases. K. von Pallos.—p. 421.

Arrhenoblastoma.—Kny directs attention to a group of blastomas of the ovary which cause gradual disappearance of female characteristics and the development of virilism. Their varying microscopic aspects have given rise to different theories regarding their genesis and their classification. The author is inclined to accept Robert Meyer's theory. He presents a history of a woman aged 66 who had been troubled with dyspnea, cough, protracted diarrhea, loss of weight, enlargement of the abdomen and swelling of the legs. These symptoms were accompanied by falling out of the hair of the head and by the development of a beard. Necropsy revealed tumors of both ovaries which proved on microscopic studies to be tubular arrhenoblastomas of the atypical solid group of Robert Meyer. The bilaterality and the extensive metastases to the bones and the lungs make this case noteworthy. In view of the fact that the tumors of the two ovaries did not differ much in size and that their structure was identical, the author assumes that the tumors were primary and developed simultaneously. The metastases in the other organs showed an entirely different structure. However, a thorough postmortem examination disclosed no other primary tumor, particularly colloid cancer of the stomach. Changes in the thyroid corresponded to those found in status thyroadenalis. Microscopic examination of the adrenals was neglected, but the clinical signs justify the assumption of such a status. As a sequel to the skeletal metastases the peripheral blood presented the picture of a pronounced secondary anemia, and the liver and spleen exhibited considerable extramedullary erythromyelopoiesis.

Archiv für Japanische Chirurgie, Kyoto**17:1291-1524 (Nov.) 1940. Partial Index**

- *Clinical Experiences in Transfusion of Preserved Blood. A. Takeshita, S. Goya, Y. Ohashi, Y. Ri, A. Suko, T. Murayama, and H. Nagatani.—p. 1416.
 *Studies on the Therapeutic Effects of Vitamin B₁ in Peritonitis and Postoperative Paresis of Gastrointestinal Tract. J. Murakami and H. Utagawa.—p. 1483.

Transfusion of Preserved Blood.—Takeshita and his co-workers made clinical observations in transfusing 33 patients with blood preserved at room temperature for intervals of time varying from one to eighty-four days and 11 patients with blood kept at incubator temperature (35 C.) for one to nine days. In the absence of complications, the transfusion of blood kept at room temperature caused a slight elevation in blood pressure in patients with hypotension, whereas no significant changes were observed in persons with normal blood pressure. The transfusion of incubated blood was accompanied by a greater degree of fluctuation in blood pressure. Pulse rates were but slightly and temporarily accelerated following transfusion of blood kept at room temperature; but after transfusion of blood preserved at 35 C., especially in the presence of hemolysis, the pulse rates remained high for some time afterward. A somewhat similar effect on respiration was noted, in that the respiration remained accelerated after the transfusion of incubated blood. Irrespective of the form of blood used, body temperature became elevated only when complications developed. From these observations the authors conclude that the incidence of complications is practically identical (17.8 per cent) regardless of the nature of blood used in transfusion. The temperature of incubation should never be allowed to exceed 40 C.; but even blood showing a considerable degree of hemolysis as the result of preservation over a long period of time produced no complication other than a transient appearance of hemoglobinuria. Thus these investigators advocate the use of blood preserved at room temperature (10-18 C.) because of its greater convenience in management, since no special precaution for preservation need be taken in this respect.

Therapeutic Effect of Vitamin B₁ in Abdominal Surgery.—Murakami and Utagawa record instances of acute generalized peritonitis in which there was evidence of secondary avitaminosis B₁. The injections of large doses (10-50 mg.) of vitamin B₁ caused the cessation of vomiting and the resumption of normal peristaltic movements of the intestine. In order to study this effect further the authors carried out a series of experimental observations in rabbits, from which the following conclusions were reached: 1. Vitamin B₁ has a markedly beneficial effect in the treatment of intestinal paresis due to peritonitis or following abdominal surgery. 2. This effect, as seen in clinical as well as in experimental subjects, is due to the action of vitamin B₁ in the restoration of normal peristalsis and the alleviation of muscular atony of the intestinal walls. 3. The effective dose of the vitamin in the treatment of intestinal paresis varies, according to the condition of the patient, from 2 to 50 mg. injected intravenously and repeated every four hours. 4. The clinically demonstrable effect appears within thirty minutes after the injection and continues for approximately four hours. 5. There is a synergistic action of vitamin B₁ for a prostigmine preparation, since the combination treatment of these substances prolongs the duration of intestinal peristalsis and of normal tonus for seven hours, instead of but four hours with the use of vitamin B₁ alone.

- Ureter Calculi: Brief Review. H. K. Lassen.—p. 1187.
 *Ureterolithiasis and Its Treatment. K. Østerbye.—p. 1189.
 *Treatment of Ureteral Calculi. S. Moring.—p. 1194.

Ureterolithiasis and Its Treatment.—Østerbye reports ureterolithiasis, all unilateral, in 83 men and 30 women aged mainly between 20 and 45. Ureterolithotomy was done in only 8 cases, electroincision of the orifice in 1, 75 received purely expectant treatment and 20 expectant treatment together with dilation according to Böhlinger. Passage of the stone was observed or roentgenologically established in 53 (70.7 per cent) of the 75 cases and in 15 (75 per cent) of the 20. There was macroscopic hematuria in 30.4 per cent of the cases and microscopic hematuria in 64.6 per cent. The difference between ureteral and renal calculus is stressed. The author says that ureteral calculus occurs most often in men between 25 and 30 and is almost always unilateral, with sterile urine. Spontaneous passage of the calculus occurs in between 75 and 80 per cent of the cases. The concretions are small and mostly composed of calcium oxalate. Recurrence is seen in about 20 per cent of the cases, but between the attacks the patients are perfectly well. Infection and renal injury are rare. In most cases the prognosis is good.

Treatment of Ureteral Calculi.—Moring's material comprises 140 cases of ureteral calculus, only 6 of them bilateral, in 93 men with an average age of 38, 45 women with an average age of 36, and 2 children aged respectively 10 and 4. Twelve patients (9 per cent) had to be treated operatively, 6 primarily, 6 after unsuccessful endovesical manipulations. In 98 cases (70 per cent) endovesical treatment was given, namely attempts at removal of the stone by Böhlinger's forceps or Svend Hansen's instrument, or catheterization with injection of sterile oil or glycerin and dilation or electrocoagulation of the ureteral orifice. The author states that no complications set in which would contraindicate endovesical intervention. There were immediate or almost immediate results in 41 cases, including a number with symptoms of long standing. In 10 cases the stone did not pass until some time after the treatment. Spontaneous passage occurred in 21 cases, practically all with symptoms of only short duration. In some of the cases treated the calculus might have passed spontaneously, but it seemed reasonable to use an apparently safe method in order to shorten what might have become a longer course. As far as possible after-examination after from one half to five years was made of the patients discharged with the expectation that the stone would pass, and in most cases the symptoms had disappeared and the stone previously established could not be found, although few of the patients had noticed its passage. Only 2 cases had become complicated with a graver hydronephrosis.

Undergraduate and Graduate Medical Education for Negroes

EDWARD L. TURNER, M.D.

Dean, Meharry Medical College

NASHVILLE, TENN.

During the year 1930-1931 there were 21,597 medical students enrolled in the seventy-seven class A medical schools in the United States.¹ In twenty-five of these schools, at that time, there were 497 Negro medical students with by far the largest number attending Howard University Medical School and Meharry Medical College.

It is of interest that in the early years of the depression there was an actual increase in the total number of all medical students to a peak enrolment of 22,888 in 1934-1935. This upward trend was not reflected in the number of Negro medical students, as they had decreased to 402 at that time. It would seem that in these early depression years many college students who might normally have gone into selling stocks, bonds, real estate or similar fields of activity saw little or no opportunity there and turned their efforts to premedical and medical training. Negro students, hit more heavily by economic factors, had no funds to seek even this avenue of professional refuge and could not meet the financial demands of premedical and medical training. As a matter of fact, this was the general trend in all Negro professional groups during this period.²

From 1934-1935 there was a gradual decrease in the total number of medical students in this country to 21,291 in 1939-1940 (chart 1). Compared to 1930-1931 this represents a decrease of 3.1 per cent over the entire period. However, the enrolment of Negro medical students continued to fall steadily to a low of 350 in 1938-1939 (chart 2), a decrease of approximately 30 per cent compared to the 1930-1931 level. The greatest single factor in this steady decline has been the slower economic recovery of the Negro group as a whole. Depression hit the

Negro early and severely, and recovery has been proportionately slow. Incidentally, in years past it has been possible for Negro students to obtain remunerative work as Pullman porters, waiters and at similar tasks during the summer vacation months. During these periods many students could accumulate funds to return and assume the obligations of another year of medical training. These formerly lucrative positions became more and more difficult to obtain during depression years and, although the situation has been better during the past year or two, they are still more difficult to obtain than formerly.

As indicated previously, in 1938-1939 there were 350 Negro medical students enrolled in twenty-five class A medical schools in the United States. Forty-five (12.86 per cent) were distributed among twenty-three institutions. The remaining 87.4 per cent were enrolled at Meharry Medical College (183, or 52.29 per cent) and Howard University School of Medicine (122, or 34.85 per cent, chart 3). The latter two schools of medicine engaged in training Negro youth are therefore confronted with the tremendous responsibility and challenge of furnishing adequate opportunities for thoroughly sound undergraduate training for approximately nine tenths of the Negro medical students now studying in our American medical schools. Howard University, though technically a private institution, derives nearly three fourths of its income from the federal government. Probably no other nonmilitary institution of higher education in the nation receives so large a proportion of its income from federal government funds.³ Meharry Medical College is strictly a private institution and derives no support from the federal government. Both institutions have adequate physical plants and teaching hospitals. Both have endeavored to develop good faculties. As a matter of fact the preclinical departments of both institutions are staffed by thoroughly competent Negroes whose

cal College at the present time is a mixed group with a large number of excellent white physicians and surgeons cooperating with the Negro staff in developing a good clinical experience for the medical students. Thus, every effort is being made to offer thoroughly satisfactory

opportunities for carefully selected groups of students in these two institutions.

Until relatively recently the premedical training offered the students in a number of the small Negro colleges was inadequate. Numerous small sectarian institutions were not equipped with the physical facilities to conduct proper scientific courses, and in many instances the faculties were not adequately prepared to teach certain subjects. Undoubtedly, in some cases, college degrees were being bestowed on students for work that could hardly have passed good high school standards. This criticism was equally applicable to a number of small sectarian white schools. The development of accrediting organizations for rating colleges has been one of the greatest forward steps that have ever been taken in stimulating many of these institutions to do more acceptable work. Relatively few Negro colleges have as yet attained class A rating, but those which have succeeded in doing so are conducting work that compares favorably with that of our best institutions. Other schools not so rated are finding it necessary to build stronger faculties so as to improve their teaching programs. The result of these efforts to attain satisfactory rat-

Chart 3.—Distribution of Negro medical students in United States medical schools, 1938-1939.

ings has brought about appreciable improvement in the preparation of Negro premedical students. Although the same problems existed in many of the small sectarian schools for white students, a relatively larger proportion of Negro students had to attend schools of this type to receive an education, and they have consequently played a more vital role with the Negro group. The development of good state institutions for Negroes during the past few years in parts of the South has also made it necessary that the private colleges in these regions either offer something fully as good or better, or else face the possibility of having to close their doors.

In 1927, the first year for which statistics are available regarding internships for Negro physicians, there were more Negro physicians graduating than there were internships available.⁴ One hundred and nineteen Negro phy-

lege of Surgeons⁵ there were twenty-two fully approved Negro hospitals. Five hospitals are listed as provisionally approved. Only thirteen of these twenty-seven hospitals are approved for training interns by the Council on Medical Education and Hospitals of the American Medical Association. There were

ninety-two internships available in nine of the thirteen hospitals in this approved group (table 2). Additional excellent internships for Negro physicians are available in certain hospitals not listed as being specifically for Negroes. These are usually classified as city or county hospitals and include such institutions as Harlem Hospital in New York, Los Angeles County Hospital and Cleveland City Hospital, where Negro physicians either have served or are serving as house officers. The total number of satisfactory internships for Negro physicians in fully accredited hospitals is approximately one hundred and fifty. In the remaining Negro hospitals on the approved list of the American College of Surgeons but not approved for internship by the Council on Medical Education and Hospitals of the American Medical Association there are additional needs for sixteen interns.⁶

But in the meantime, while the total number of the approved internships for Negro physi-

cians has increased, there has been a persistent decline in the number of Negro physicians available. Thus, in 1938-1939 there were only sixty-nine Negro physicians graduated from American medical schools. At the present time it is difficult for hospitals fully approved by the Council on Medical Education and Hospitals of the American Medical Association to obtain a sufficient number of interns and it has become practically impossible for nonapproved hospitals to obtain house officers. At least one very valuable thing has resulted from this need for more Negro graduates, for it has clearly been shown that the nonapproved and non-accredited institution which can offer nothing but room, board and a lot of hard work with no supervision has no attraction for the young physician. Certainly hospitals that cannot offer reasonable educational opportunities for interns should not pretend that they have internships available. Institutions of this type may have some attraction for men who have finished at least a year of internship and possibly a resi-

6. Information obtained directly from hospital administrators, January 1941.

dency, who are willing to serve as well paid house physicians for one or more years before entering practice themselves.

The young Negro physician is more and more desirous of continuing hospital experience beyond the internship. Far more young men and women now apply for residencies than there are residencies available. In his report for the Commission on Medical Education and Hospital of the National Medical Association in 1939, Bousfield⁴ lists thirty-four residencies available for Negro physicians (table 3). With the development of the new tuberculosis unit in connection with the Freedmen's Hospital in Washington, D. C., new residencies in tuberculosis will be opened to Negro physicians. Four residencies are available at Flint Goodridge Hospital in New Orleans, and new residencies are just being developed in connection with the K. B. Reynolds Memorial Hospital in Winston-Salem, N. C. Thus, opportunities for prolonged hospital experiences are increasing for Negro physicians.

One of the institutions offering great potentialities for advanced hospital experience for Negro physicians is the magnificent Homer G. Phillips City Hospital in St. Louis, where a program incorporated with the Washington University School of Medicine is being conducted. Neurology and psychiatry are now being developed in this institution in a way that will offer splendid opportunity in that field. The possibility of special training in ophthalmology, orthopedic surgery and similar special lines is almost nonexistent in the present group of hospitals where Negro physicians are being trained.

With more and more Negro physicians desiring hospital training in the form of residencies, it is obvious that the opportunities now available are inadequate.

In the past the large majority of physicians, once having entered into practice, ended their educational career. A few outstanding, sincere and ambitious individuals managed to obtain some postgraduate experience. In certain areas in the United States there has been no opportunity for the Negro physician to gather with his white colleagues in the city, county or state meetings. The Negro physician was, and still is to a large extent, dependent on himself entirely when he begins his practice.

Fortunately, during the past several years in areas where there have been several Negro physicians within reasonable distance medical organizations have been created. Some of the Negro city and state medical organizations in the South are now developing into thoroughly creditable medical societies. I can speak of at least two of these Negro state medical societies which I had the privilege of attending during the past year. The Mississippi State Medical

Society met in Vicksburg last April. Most of the Negro physicians in the state of Mississippi attended. The material presented was of excellent quality and the discussions which took place were as interesting and profitable as I have heard in many other medical organizations. The Volunteer State Medical Society, which is the Tennessee Negro medical society, met at Meharry Medical College in Nashville last June. This meeting was well attended by the Negro physicians of the state. The papers and discussions during the three day session would have been a credit to any state medical organization in the country. The Mound City Medical Society of St. Louis is also an active organization interested in the educational advancement of Negro physicians, and annual meetings have been well planned and very profitable.

In South Carolina, North Carolina, Georgia, Louisiana, Florida, Texas and Kentucky there are also groups of Negro physicians getting together annually for short medical conferences and clinics. A number of the faculty members from Howard University and Meharry Medical College have taken active part in these clinics and in the presentation of papers.

Where good hospital facilities are available, special courses are now being offered for Negro physicians. These vary from a few days to two weeks or longer. Some of these are simply refresher courses, some are adapted to summarize recent developments in diagnosis and therapy, and some are being directed in certain fields such as tuberculosis, venereal disease, pediatrics and maternal health. The splendid cooperation of white and Negro physicians in many of these centers is bringing excellent opportunities to the Negro physician in general practice. This is especially true at St. Phillips Hospital, sponsored by the Medical College of Virginia, at Flint Goodridge Hospital in New Orleans, where staff members from both Tulane and Louisiana State University School of Medicine give assistance, at Freedmen's Hospital in Washington, D. C., at George W. Hubbard Hospital of Meharry Medical College in Nashville, at Homer G. Phillips Hospital in St. Louis, at Provident Hospital in Baltimore and at Provident Hospital in Chicago.

We as medical educators are fully aware that there are no first, second and third rate ways of teaching medicine. If it is to be taught at all, it must be taught properly. During his course in medical school and his subsequent training in the hospital, the medical student and the young physician must ignite that spark which is going to make him a student the rest of his life. He needs to keep in contact with medical progress as long as he lives. He must take his medical

journals and, above all, he must read them. He should have the opportunity of getting in touch with his fellow colleagues and comparing his experience with theirs. He must learn that he can never let down. He should have affiliation with his city, county and state medical society associations. He should be a Fellow of the American Medical Association and get *THE JOURNAL* weekly. Spare minutes spent with *THE JOURNAL* bring him a wealth of up to the minute information.

These are all factors that help to keep physicians on their toes.

The Negro physician is expected to face the same medical course as any other student, he is required to pass the same state board examinations, he is expected to abide by the same laws, pay his taxes in accordance with his ability, and in general, play the role demanded of any decent citizen and well trained practitioner of medicine. The Negro physician needs every possible opportunity to keep in touch with medical progress. The American Medical Association through its Fellowship and *THE JOURNAL* offers, it seems to me, the best means for the average physician to keep abreast of medical trends. It is my sincere hope that, in those regions of our country where Negro physicians are still denied the right of Fellowship in the American Medical Association, careful study be given to the possibility of developing plans for the recognition of Negro medical organizations so that this opportunity for continuous education through *THE JOURNAL* and the Association may also be extended to them. In the end, it will mean better medicine, better cooperation and a truly worth while improvement in the care of the Negro physician for his patient.

SUMMARY

1. In 1938-1939, 1.64 per cent of the medical students in the United States were Negroes.

2. Eighty-seven per cent of the Negro students enrolled in the United States study at Howard University and Meharry Medical College.

3. The enrolment of Negro medical students had shown a continuous decrease from 1930-1939 with a slight forward trend during the past year.

4. Prior to 1930 the opportunities for internship for Negro physicians in accredited hospitals were not sufficient to care for the annual graduating group.

5. Since 1930 there has been an increase in the number of internships available for graduates in accredited hospitals, so that there are now more good internships available than there are graduates to fill them.

6. The number of residencies for Negro physicians, although increasing, does not begin to meet the demand for continued hospital training.

7. Opportunities for graduate training for Negro physicians are gradually increasing.

8. Negro medical societies are being organized, and carefully planned programs are being developed.

9. Cooperation between white and Negro physicians in many parts of the South is an important factor in the improvement of opportunities for the continuation of study for Negro physicians.

10. It is desirable that affiliations be developed between white and Negro medical societies in certain parts of the South which will permit Negro physicians to become active members of the American Medical Association.

Digests and Reviews

THE ART OF SURGERY

Condensation of address by Dr. Elliott C. Cutler, Moseley professor of surgery, Harvard Medical School, Oct. 3, 1940, before the North Side Branch of the Chicago Medical Society and published in the Aesculapian, November 1940.

I teach pupils that the principles of surgery are simple and few, that they consist in anesthesia, hemostasis and asepsis. The surgeon who practices to the fullest these three principles will have accomplished all the essentials for a perfect surgical undertaking, for if the patient does not bleed or suffer pain or become infected the surgeon may pass from one cavity of the body to another and the patient will recover without untoward event. It is a sad commentary on the ability of the human mind to absorb education that it takes six to eight years to learn even the rudiments of these principles.

Can one have perfect hemostasis in a fifteen minute procedure? Can one be gentle to each little cell in that period of time? Doesn't the surgeon know that a wide-mouthed hemostatic clamp in a piece of tissue will kill a thousand cells and leave a slough in the wound? Can he not envisage the effects of dry gauze on these cells, each one but a tiny drop of water? The choice of a safe anesthetic, suited to the disorder and the physiologic reactions of the individual patient, will obviate speed in operating.

Hemostasis can be accomplished only by the proper use of hemostats. They must be finely pointed so that only a minimum of tissue is crushed. They are better properly placed on a vessel before it is cut in order that tissue juices may not enter the open mouthed vessel and encourage thrombosis. If a large vein is exposed with a tributary in it, the tributary vein must be closed close to the major vessel lest there

be a pool of blood in a vein through which the current does not pass and in which thrombosis again is a peril. And when important vessels are tied in difficult areas it is not sufficient to tie the vessel alone, but the tissue near it must be first transfixated with a needle lest the ligature slip and a catastrophe occur.

Blood must not be lost or else we will hear all this nonsense about giving a patient a transfusion following a surgical operation. Transfusions following surgical procedures are but a commentary on the type of surgery performed, except in those conditions in which the disease itself requires transfusion. And those who have to use transfusions to get through their daily surgical tasks should be honest with themselves and their patients and take up some other line of work.

Asepsis is a knottier problem. The surgeon is late and the scrubbing of his hands is hurried. Or an instrument is dropped on the floor and he berates the nurse until she brings him back his pet instrument improperly sterilized. Or he has a coryza, and rather than put off the procedure he takes a chance.

What surgeon knows fully the working of the steam autoclave? If it breaks down, he tells his head nurse to fix it. She summons the hospital superintendent, who sends a plumber and the matter is patched up. Is the autoclave now competent? Has he inserted cultures to see whether the material is killed within the proper time limits? There must be some one in each hospital who understands these machines. They must be tested from time to time. The steam supply must be adequate. All air must be evacuated if sterilization by steam is to be satisfactory. If the machine functions perfectly there is no safeguard against the busy nurse. There must be strict discipline to ensure that materials remain in the sterilizer a proper length of time.

Spore-forming organisms are not killed in the ordinary autoclave. Contamination is here prevented by making every effort to have materials free of spore bearers when they enter the autoclave. All instruments used in operations on the intestinal tract are potentially infected with sporular organisms. Such instruments immediately after use should be submitted to special sterilization at high pressure. When cleaned, oil must not be used in the joints, for bacteria to be killed by steam or boiling must be wet. A spore suspended in a drop of oil is not damaged by boiling water, since it cannot be wetted. This is an important detail and surgeons should look to their own instruments when gas infection occurs following a surgical ordeal.

BACKGROUND OF THE SURGEON

The surgeon must be a pathologist and preferably a microscopist. Thus, the background of the surgeon must be broad and thorough. This

means graduation from a competent medical school and somewhere between five and eight years' postgraduate training under a competent master, and this time is better spent for the most part under a single master. One of the pathetic observations made by teachers is the wandering from clinic to clinic of a great group of young men. They stay long enough in one place to learn a smattering of what is going on and leave just when their chief is getting to know them and about the time his guidance might be of supreme importance to them. The technics in the different clinics vary. The young surgeon should not try to learn a lot of different technics. Learn one completely and well, and the results will be good. If the education of the surgeon is such that he has been taught to use only his hands, if he has gone steadily from one clinical post to another without a breathing space in which to use his brain, he will become in time an artisan, not an artist.

This is part of the price which all pay who must conduct a technical career. Consider a young surgeon interning. Urgent necessity motivates his every move. He must give an anesthetic, set a fracture, go around with the chief, do a white count, in all of which there is a minimum of intellectual endeavor. He doesn't think what to do; he merely learns how to do it. Instead of synthesizing ideas, he spends his time memorizing. This is a low form of intellectual endeavor and, if continued for a long time, will lead to deterioration of the higher intellectual faculties.

This type of artisan surgery is common among surgeons. Such operators do good by improving technical methods, but on the whole their outlook is narrow. If they find gallstones in a roentgenogram they are prone to think that they should come right out, not realizing that many people live to old age with no symptoms of biliary disease and yet at autopsy the gall-bladder is found choked with stones. The man brought up in this type of surgery rushes from place to place, removing items from the human body when thoughtfulness might obviate much of this. We have to fight against this in the education of the young surgeon. From time to time the young surgeon must be given a problem and work away from the clinic. He must be encouraged to travel to see other surgeons work that he may speculate more, not on how the task is to be done, but on whether it is worth doing. What is important for the young doctor to learn is how to use his mind, how to make observations, and how to add these observations together and synthesize a new idea. That is education, not information.

INTERNSHIP OF HARVEY CUSHING

My former chief, the late Harvey Cushing, often told this story: He began his internship at the Massachusetts General Hospital when

J. C. Warren was chief of the hospital. True to the tradition of that day, Dr. Warren operated with great speed, and young Cushing was greatly impressed. Cushing then went to Baltimore to work under William Halsted. He was not allowed in the operating room his first day there, though a patient from his ward went to be operated on. With misgiving, young Cushing watched three hours go by, while the great master took such exquisite care with each cell that there would be no injury to the patient. Finally, when the patient returned to the ward, Cushing was ready with the customary medication that he had been ordered to give when at the Massachusetts General Hospital. When he was about to administer these medicaments, Dr. Halsted entered the ward. Dr. Cushing said, "I am carrying out the usual procedure." Dr. Halsted said, "Is my patient ill? That is unusual. Let us examine her." Examination revealed normal pulse rate and normal respiration. "What is in the syringe?"

"Strychnine" said Cushing.

"What do you think strychnine will do for the patient?"

Having been educated where memory and orders were the rule, Cushing did not know. He was informed by Dr. Halsted that he should read up on strychnine. "If your reading convinces you that strychnine is good for the patient by all means use it," said Halsted.

Surgery is both an art and a science, and the art can be learned only by the first method of education, that of apprenticeship. When we see the trained surgeon working with perfect regard for anesthesia, hemostasis and asepsis, we really see an artist. He treats his instruments as a painter treats his brushes or a violinist his bow. He uses nicely balanced instruments. He is neat in his technic. His wound is never full of blood. The tissues are treated gently. No cell dies through roughness on his part.

The fullest expression of the use of one's hands may be seen in the ritual of a great surgical procedure. There is strict discipline, precision, gentleness, beauty. The performance of such a task requires more than craftsmanship. It is the use of the hands dictated by a trained intelligence.

Comments

BANTING WAS ORDERED BACK

Frederick G. Banting began his course in medicine at the University of Toronto Medical School in 1912. When a junior in medical school in 1915 he enlisted as a private in the Canadian army. Banting was ordered back to school to finish his university training, graduating in 1916. He at once joined the Canadian Army Medical Corps and was wounded at Cambrai in France in September 1918. He was awarded the Military Cross for valorous conduct during the Cambrai engagement. In 1920 he was resident surgeon in the Hospital for Sick Children in Toronto; then he moved to London, Ontario, as research assistant in the department of physiology of the University of Western Ontario for the session of 1920-1921 and soon thereafter began the research which led to the discovery of insulin, for which he was awarded the Nobel Prize in Medicine, along with Prof. J. J. R. Macleod, in 1923.

According to Dr. Charles H. Best in the *Canadian Medical Association Journal*, April 1941, Banting had a definite philosophy of life, which he once expressed in the following words:

It is not within the power of the properly constructed human mind to be satisfied. Progress would cease if this were the case. The greatest joy in life is to accomplish. It is the getting, not the having. It is the giving, not the keeping. I am a firm believer in the theory that you can do or be anything that you wish in this world, within reason, if you are prepared to make the sacrifices, think and work hard enough and long enough.

TO STUDY EFFECTIVELY

"Against the college of liberal arts must be charged the complaint that too many of its graduates do not know how to read understandingly, to write straightforwardly and to study effectively. Reading has apparently been done largely in a skimming fashion with the sole intent of extracting the gist of thought. Many beginning students find it a wholly new experience to read closely knit text-matter, in which each word and punctuation mark carries definite significance. Within a week or two the medical tyro learns to his dismay that reading and rereading an assignment is not highly profitable unless he has pondered and digested the facts at hand, has arranged these facts in orderly sequence, has fixed their architectural framework in a vivid memory pattern, and has integrated the raw facts and his previous store of basic information into a significant mosaic. Here the instructor must continuously preach the wisdom of imbibing word upon word, line upon line, precept upon precept. . . .

"To study efficiently and to budget time proportionately is the earmark of a superior student. This is admittedly a by-product of previous training, but of greater weight is the fact that proficiency comes only when an individual is innately well endowed. An instructor rarely feels more impotent than when an earnest but dull student confides that all his difficulties trace to not knowing 'how to study' and

innocently requests the magic secret. If we are candid with ourselves we must admit that a certain fraction of our student body is uninspired and lacking in fundamental scholarly instincts.

"These students never can attain a high degree of understanding, let their spark of ambition glow as brightly as it may. To be sure, we can supply some rather obvious practical hints, but we cannot hope to prevail against a defective germinal legacy. Neither can an adequate reply be made to such a common request as 'how to know what is important and what is not.' The mere fact that such a query is made reveals at once the ingenuousness of the inquirer and his lack of understanding of his own incapacities. . . .

"Strong students from small colleges have to learn by test that they need ask no handicap in the race for preferment. Weaker, though eager, students from the same type of school may be shocked into the realization that they cannot hope to ride so high as formerly in the stiffer competition now faced. Conversely, there is often a pleasant surprise in store for the students from the more exacting large universities; they frequently find themselves surpassing their

previous relative standings. Possibly this is due to a more careful appraisal of merit; possibly it is a reaction to more intimate contact with those in charge of courses. Still another experience in revaluation comes to the student of potential ability who squandered much of his energies in campus activities, athletic and otherwise. Freed from these distractions, innate capacities can begin to yield concrete scholastic rewards. So it is that the first quarter in medical school turns into a proving period in which strangers become acquainted with each other, with new working conditions and with new standards. Not until the end of that quarter do they begin to know what order of success they have achieved. Moreover, for many the period of adjustment does not reach a conclusion at this time. Deflation, humiliation and discouragement are the necessary lot of many. For these the winter quarter looms as a probationary period in which the recapture of moderate success or the recouping of personal prestige must be accomplished. The teacher's role during these quarters is a serious and important responsibility."—Arey, L. B.: *Lo, the Poor Freshman!* *Quart. Bull. Northwestern Univ. Med. School*, Spring Quarter, 1941.

DO YOU KNOW WHAT PHYSICIAN—

1. Was a close friend and attendant to Emperor Napoleon?

2. First discovered that the anopheles mosquito is a vector of malaria fever?

3. Founded the U. S. Army Medical Library, which is the largest medical library in the world?

4. Established the U. S. Army Medical Museum?

The answers are on page 2120.

Medical College News

Medical schools, hospitals and individuals will confer a favor by sending to these headquarters original contributions, reviews and news items for consideration for publication in the Student Section.

British Medical Students to Study in the United States

The president of the Rockefeller Foundation, Raymond B. Fosdick, announced, March 17, that the foundation had appropriated \$100,000 to initiate a plan of bringing young British medical students to the United States in order that they may complete their medical education here. Unless unforeseen difficulties arise it is anticipated that some British students will arrive in America this spring and the balance by the fall term of school. The German air raids on London and elsewhere in Great Britain have destroyed teaching hospitals and medical schools to the extent that at this time only one teaching hospital in London has escaped bombing. Twenty-five medical schools in the United States and Canada have indicated their willingness to accept British students and some have offered to remit the tuition. Lord Lothian, British ambassador to the United States, asked the Rockefeller Foundation shortly before he died whether it would consider the possibility of giving a number of British medical students the opportunity to complete their training. The suggestion was warmly supported by leading British medical authorities.

Sigma Xi Alumni Research Fund

With a small gift from the National Research Council and contributions from a few alumni, the Society of the Sigma Xi Alumni Research Fund for Grants-in-Aid was founded in 1920. At the time of its founding the movement was presented to the entire body of alumni and every year since the opportunity to contribute to this fund has been presented. Since 1936 the society has added to the contributions received the income from permanent funds. During the twenty years of operation of the fund, \$36,800 has been distributed to 134 applicants. The grants are distributed in small amounts to as large a number of research workers as possible, and they may be used to cover the purchase of new apparatus, expenses for assistants, publication and the like. The Committee of Award at present comprises Gary N. Calkins of Columbia University; Harlow Shapley of Harvard University, and W. R. Whitney, vice president in charge of research of the General Electric Company, chairman. Last year \$3,350 was distributed in fourteen awards. Contributions to this fund and applications for grants-in-aid should be made to the National Secretary, Society of the Sigma Xi, Yale Station, New Haven, Conn.

Harvard Changes Method of Conducting Examinations

According to the report of the dean, Dr. C. Sidney Burwell, for the year 1939-1940, Harvard Medical School, Boston, has made important changes in the method of conducting the fourth year general examinations. For the next two years, an experimental period established by the faculty, students will be permitted to offer the examinations given by the National Board of Medical Examiners in lieu of the written general examination now set by the Harvard Medical School. The oral examinations, which are given by the examination committee to students who are candidates for honors and those who are possible failures, will be conducted as in the past. This change is one of a series of experiments which have been made with this examination in the past years.

Professor Carlson Addresses Michigan Group

At the initiation of the honorary medical society Alpha Omega Alpha at the University of Michigan, Ann Arbor, Dec. 18, 1940, Dr. Anton J. Carlson, professor emeritus of physiology of the University of Chicago, gave an address on "Science versus Life." The following members of the senior class of the medical school at Michigan were made members of the organization at this time: Harford W. Friedman '41, Herman Harvey Gass '41, Gordon R. Harrod '41, Jack Lapides '41, Charles R. Lowe '41, Philip S. Peven '41, Daniel C. Siegel '41 and Robert F. Ziegler '41.

University of Georgia

A university music association is being organized at the University of Georgia School of Medicine, Augusta, for the purpose of advancing culture in the medical school and to make closer union with a parent school at Athens, Ga. Dr. Irvine Phinizy is chairman of this activity.

Five students were selected in the spring election for membership in Alpha Omega Alpha honorary fraternity: William H. Bonner, William S. Boyd, James M. Combs, William F. McKemie and Herman K. Moore. These men will be inducted May 7, at which time Henrik Dam, associate professor of biochemistry at the University of Copenhagen, will give an address on vitamin K.

Tufts New Chapter of Alpha Omega Alpha

Alpha Omega Alpha honorary medical fraternity, established in 1902 to encourage scholarship, installed its forty-fourth chapter at Tufts College Medical School, Boston, December 2. Dr. Hyman Morrison, clinical professor of medicine, was chairman of the faculty committee on arrangements. The following students, all members of the class of 1941, have been elected to this group: Carroll Bryant Jr., Carl J. Antonellis, George A. Dodge II, Clement S. Dwyer, Herbert F. Hager, Jesse G. Garber, Alfred Kant, Arthur N. Kelly, John L. O'Hara and Raymond Yesner. A dinner followed the installation ceremonies in Curtis Hall on Tufts Campus in Medford.

University of Virginia

Leonard J. Yamshon, junior in the University of Virginia Department of Medicine, Charlottesville, received the annual undergraduate award, a gold medal, by the Phi Lambda Kappa fraternity for a scientific thesis. The second Alpha Omega Alpha lecture of the year at the University of Virginia Department of Medicine was given February 7 by Dr. Isaac A. Bigger, professor of surgery, Medical College of Virginia, Richmond, on the ligation of large arteries.

Louisiana Fellows of Gorgas Society

At a meeting of the Agramonte chapter of the Gorgas Medical Society at Louisiana State University School of Medicine, New Orleans, the following students were approved as new fellows of the society: Hubert Chidester Ashman '43, Charles Richard Bates Jr. '43, Daniel Winston Beacham '43, Howard Albert Buechner '43, Norman Burnstein '43, Philip Louis Cenac '43, Thomas Madison Durham Jr. '43, Philip Borrello Johnson '43, Kay Kohara '43, Louis Levy '43, Douglas Lindsey '43 and George J. Zibilich '43.

This society, named after the late Dr. William Crawford Gorgas, was organized to foster and encourage the highest ideals in medical students. The first chapter was founded at the University of Alabama School of Medicine. In 1932 the Aristides Agramonte chapter was organized at Louisiana State University School of Medicine. Dr. Aristides Agramonte played a great role in the conquest of yellow fever and was the first professor of tropical medicine at Louisiana.

The Gorgas Medical Society is composed of all the members of the second year class in medicine. After the first semester of the second year, the heads of departments select candidates for the fellowships on the basis of scholarship, character and promise of research ability and leadership; the proceedings are secret. A sealed list of nominees is handed to the president of the society in open meeting, the seals are broken and the roster of candidates is disclosed to the society. After discussion in the absence of the candidates, the society votes by secret ballot on each candidate. Thus, each candidate is nominated by the faculty committee and is accepted or rejected by the students themselves. Each fellow is given a key. Fellowship in the Gorgas Society is one of the highest honors available to medical students at Louisiana. The Louisiana chapter and the Alabama chapter, which are affiliated, from time to time confer honorary fellowship on distinguished medical men. Following are some of the honorary fellows of the Gorgas Society: Drs. Rudolf Matas, Arno B. Luckhardt, Morris Fishbein, Carlos Finlay Jr. (Habana, Cuba) and Herbert C. Clark.

Time Off at Long Island

A newly decorated lounge for women students has been provided on the second floor of the Donnellon House at Long Island College of Medicine, Brooklyn. An official housewarming was held December 4, to which also a group of women prominent in hospital affairs in Brooklyn was invited. The guests were received by Mrs. Jean Curran, Mrs. Frederick L. Cranford, Mrs. Tracy Voorhees and Mrs. Raymond P. Sloan, who were assisted by the students who served as escorts to the new lounge. The room invites relaxation with its lounge chairs, two large windows, plenty of good lamps, a maple desk, pictures and other colorful accessories.

Utah

The students at the University of Utah School of Medicine, Salt Lake City, were addressed March 26-28 by Dr. Malcolm T. MacEachern, associate director of the American College of Surgeons, Chicago, on "Preparation for a Professional Career"; by Dr. Edward W. Alton Ochsner, New Orleans, on "Physical Diagnosis," and by Dr. Frank E. Adair, New York, on "The Cancer Problem." About one hundred applications for entrance to the first year class of the University of Utah School of Medicine for the school year 1941-1942 were received, and of these twenty-nine men and two women were accepted. Although applications were

received from all parts of the country, the students from outside Utah came mainly from the six neighboring states which have no medical schools.

Lectures at Minnesota

Dr. Arno B. Luckhardt, professor of physiology, University of Chicago, delivered the William Root Lecture, sponsored annually by the Alpha Omega Alpha medical fraternity, in the University of Minnesota Medical Amphitheater, Minneapolis, April 29, on "Dr. William Beaumont and the Medical Epoch of the Northwest Territory." A lecture was delivered at the medical school April 22 by Prof. Lucien Brouha, formerly of the University of Liège, Belgium, and now physiologist at Harvard University under the Grant Foundation. Professor Brouha discussed functions of the autonomic nervous system.

Texas

The students and faculty of the University of Texas Faculty of Medicine, Galveston, were addressed March 25 by Dr. Ernest von Brueke of Harvard Medical School, Boston, in the morning and evening on "Physiological Tendencies to Stabilize the Appearance of the Environment" and "Fatigue and Recovery in Peripheral Nerves" respectively. Dr. William R. Houston of Austin gave the annual Alpha Omega Alpha address April 8 and at the annual banquet the following junior students were initiated into this honorary fraternity: James Neal Walker, James H. Benton, Roy H. Baskin Jr., Alfred S. Froese and Louis C. Floyd. The medical school has increased its clinical material by arranging to use the charity wards of St. Mary's Hospital for ward rounds.

Lectures at Columbia

Lancelot Hogben, F.R.S., regius professor of natural history at Aberdeen University, addressed the students and faculty at Columbia University College of Physicians and Surgeons, New York, February 18, on "Medical Genetics—Methods and Problems." On Dec. 17, 1940 Henrik Dam, associate professor of biochemistry at the University of Copenhagen, addressed the students and faculty on "Vitamin K—A General Survey of Its Biochemistry and Clinical Application."

West Virginia

The student body at West Virginia University School of Medicine, Morgantown, was addressed, March 14, by Lieut. Comdr. William M. Sheppe of the U. S. Naval Reserve on "The Medical Student and the Naval Reserve." The student body and the faculty were addressed at a special seminar, March 31, by Dr. William T. Lemmon, associate professor of surgery at Jefferson Medical College of Philadelphia, on continuous spinal anesthesia in surgical operations, followed by questions from the audience. In the evening Dr. Lemmon was guest of honor at a dinner given by the Monongalia County Medical Society.

Course in Applied Medicogenetics

The Woman's Medical College of Pennsylvania, Philadelphia, is offering this year a lecture course in "Applied Medicogenetics." The lectures are given on Fridays from 5 to 6 p. m. and are open to physicians and medical students. Clyde E. Keeler, fellow of the Wistar Institute, University of Pennsylvania; Charles B. Davenport, formerly director of the Station for Experimental Evolution and director of the Eugenics Record Office; Dr. Madge T. Macklin, assistant professor

of anatomy, University of Western Ontario Medical School, and Frederick Osborn, president of the American Eugenics Society, are among the lecturers. Although a number of medical schools offer occasional lectures on this subject, this series of lectures, in continuation of a group presented last year, is believed to be the first symposium on this subject sponsored by a medical school in this country. The lectures outlined last year were printed in book form under the title "Medical Genetics and Eugenics."

Professor Hanzlik Addresses Wayne Students

The student body at Wayne University College of Medicine, Detroit, was addressed, February 22, by Dr. Paul J. Hanzlik, professor of pharmacology at Stanford University School of Medicine, San Francisco, on "The Stabilizing Power of Pharmacology." Dr. Hanzlik was introduced by one of his former students, Dr. Arnold J. Lehman, who is associate professor of pharmacology at Wayne University.

Wisconsin

The fourteenth annual William Snow Miller Lecture, sponsored by the University of Wisconsin chapter of Phi Beta Pi, was presented at Madison, March 13, by Dr. John H. Skavlem, assistant professor of medicine, University of Cincinnati College of Medicine. The topic was "Lest We Forget the Importance of William Snow Miller's Anatomical Contributions in Clinical Diseases of the Chest."—The Wisconsin chapter of Alpha Omega Alpha selected in December on the basis of scholarship and character the following new members: seniors—Leland E. Frederick, Ellen M. Sexton, Edward W. Shrigley and Harold C. Younggreen; juniors—Royden F. Collins, George C. Hank and Wallace G. Irwin.

"DO YOU KNOW WHAT PHYSICIAN"

Following are answers to the questions appearing on page 2118:

1. Dr. Jean Nicholas Corvisart, who was a great teacher and founder of modern clinical medicine in France. Corvisart's favorite pupil was Laënnec, and it has been said that his expertness in percussion stimulated Laënnec's invention of the stethoscope at the Hôpital Necker in 1816.

2. Sir Ronald Ross, of England, discovered in 1897 the Laveran plasmodia in the stomach wall of anopheles mosquitoes which had fed on the blood of malaria patients. He also proved that the spores of the parasites are concentrated in the salivary gland of the mosquito.

3. Dr. Joseph Lovell, who was also the first Surgeon General of the U. S. Army, under definitely planned legislative enactment. Dr. Lovell served through the war of 1812 and was Surgeon General of the Army from April 18, 1818 to Oct. 17, 1836, in which year he died. He was born in Massachusetts in 1788.

4. Surg. Gen. William A. Hammond, U. S. Army, established the Army Medical Museum in 1862. After the battle of Antietam, in 1862, the first curator of the museum, Dr. J. H. Brinton, was sent to Frederick, Md., and to other battlefields to collect specimens. During the World War a special unit was organized and sent to France to collect specimens for the museum. The identification of mosquitoes, flies and other insects infesting army camps was made a part of the regular work of the Army Medical Museum in October 1918. The museum is now the largest museum of human pathology in the United States. It is open to the public and is visited every year by thousands of people.

Book Notices

A Textbook of Clinical Neurology. By J. M. Nielsen, B.S., M.D., F.A.C.P., Associate Clinical Professor of Medicine (Neurology), University of Southern California, Los Angeles. Cloth. Price, \$6.50. Pp. 672, with 179 illustrations. New York & London: Paul B. Hoeber, Inc., 1941.

This textbook is written primarily for the medical student so that he can follow daily assignments in class work. The description of the various conditions are clearly and briefly done. The reading of the text is unusually easy. There are twenty-four chapters, starting with diseases of the spinal nerves. Then there follow diseases of the peripheral nerves, spinal cord, cranial nerves, brain stem, cerebellum, thalamus and vegetative nervous system. Inflammations, intoxications, tumors, epilepsy, migraine, multiple sclerosis, trauma, diseases of the muscles follow. Finally there are chapters on mental deficiency, diseases of bone affecting the nervous system, avitaminosis, electroencephalography, psychoneuroses and addiction. Vitamins and avitaminosis are discussed in a sober way. Electroencephalography is likewise properly evaluated. This is a good textbook and is recommended to the medical student.

The 1940 Year Book of Radiology. Diagnosis. Edited by Charles A. Waters, M.D., Associate in Roentgenology, Johns Hopkins University, Baltimore. Associate Editor: Whitmer B. Floror, M.D., Assistant in Roentgenology, Johns Hopkins University. Therapeutics. Edited by Ira I. Kaplan, B.Sc., M.D., Director, Radiation Therapy Department, Bellevue Hospital, New York City. Cloth. Price, \$5. Pp. 496, with 497 illustrations. Chicago: Year Book Publishers, Inc., 1940.

The 1940 Year Book of Radiology is the current issue of a series which has been published for several years. Since its first volume, the Year Book of Radiology has been recognized as a book which radiologists and other members of the medical profession who are anxious to keep abreast of radiologic progress have needed. It is now considered by many radiologists as an encyclopedia of radiologic information, since it presents a correlation of the best and latest achievements in the field of diagnostic roentgenology and radiation therapy. It is almost impossible, in so short a review, to give an adequate idea of its useful contents. Among the many practical new diagnostic procedures mentioned is a pelvic soft tissue study during pregnancy, making it possible, in certain instances, to diagnose cases of placenta praevia. A complete description of the apparatus used in fluorography is also given, with explanation of its use. This method of examination, while it may never replace roentgenograms of regular size, is of interest in mass examinations, such as are being done in the army. The section on the diagnostic use of the roentgen ray in nervous diseases, particularly benign and malignant brain tumors, reveals valuable information, the illustrations are well selected, and the whole is well worth reading.

Equally important is the portion devoted to therapy, which occupies a little more than half of the book. In this section may be found the physical technical factors and the results obtained in the treatment of cancer and other diseases amenable to radiation therapy according to modern methods as employed by leading radiologists of this and other countries. The treatment of gas gangrene, arthritis and para-arthritis, acute subacromial bursitis, the endocrine sympathetic system, amenorrhea and sterility, for example, are presented in a clear, understandable manner. Because of the manner in which the subject is presented, the radiation therapist is afforded the opportunity to obtain easily and quickly certain information regarding this form of therapy which would otherwise require some difficulty and time consuming search in arriving at similar information. It is more than a presentation of illustrated abstracts of the best current radiologic literature: it is a selection of interesting and important medical problems, calculated to have a practical use in the diagnosis and treatment of disease.

The book is replete with clear, interesting and important illustrations, printed on excellent paper. The type is clear and easy on the eye.

The editorial comments following many of the subjects constitute a valuable contribution to the book, and for all these reasons it should be in the library of every progressive radiologist.

Handbuch der Erbkrankheiten. Herausgegeben von Dr. Arthur Gütt, Staatssekretär a. D., SS-Brigadeführer. Band VI: Die erbliche Taubheit und ihre Diagnostik. Von Dr. M. Schwarz, o. Professor und Vorstand der Universitäts-Ohren- und Hals-, Nasenkl. Frankfurt a. M. Körperliche Missbildungen. Von Dr. Hellmut Eckhardt, Facharzt für Orthopädie, Geschäftsführer der Hauptabteilung II—Volksgesundheitspflege—des Reichsausschusses für Volksgesundheitsdienst und der Reichsarbeitsgemeinschaft zur Bekämpfung des Krüppeltums. Paper. Price, 24 marks. Pp. 373, with 222 illustrations. Leipzig: Georg Thieme, 1940.

This is the sixth volume of a handbook of hereditary diseases edited by Arthur Gütt, former state secretary of Germany in charge of institutions and measures for improvement of the German race and "SS-Brigadeführer." For those who have not a more intimate knowledge of present Germany it may sound somewhat strange to read in the first sentences of Gütt's preface "Life is fight. . . . Germany has been forced to fight against her will by the British and French warmongers in 1939 as well as in 1914. . . . The German people is about to build up a new Europe and to start a new world order." Those statements of the editor in the preface to a scientific book may be surprising, all the more as war is the most antieugenic event which can be thought of. The book complies with the scientific standard indicated by the preface. It represents a compilation of arbitrarily selected literature without original ideas or contributions. But worse than that, the compilation particularly of Schwarz contains many mistakes, incorrect quotations and contradictions and suppresses essential publications which are not in accordance with his theory, so that the reading of such a book is misleading rather than enlightening. Ten years ago a publication of such a book would have been severely criticized in Germany; today it seems to represent the highlights of German science. In the first part the normal and comparative anatomy, the embryology of the ear and the functional tests applied to the ear are described on the first forty-five pages. Then the hereditary deafness and deaf-mutism, the hereditary hardness of hearing by impairment of the inner ear, the hereditary atresia of the meatus, otosclerosis, the acquired varieties of deafness and, as a matter of fact, their judicial consideration from the point of view of the German sterilization law is discussed. The second part deals with bodily malformations, their nature and causes, and then the different systemic and localized malformations are discussed. The illustrations are good, as well as the printing and the paper.

Modern Drug Encyclopedia and Therapeutic Guide Presenting Descriptions of 11,114 Modern, Nonpharmacoepial, Ethical Medicinal Preparations in 15,629 Forms, Comprising: 3,421 Drugs and Chemicals, 663 Biologicals, 691 Endocrines, 2,270 Ampoule Medicaments, 3,190 Individual and Group Allergens and 879 Miscellaneous Products. By Jacob Gutman, M.D., Ph.D., F.A.C.P., Director, Brooklyn Diagnostic Institute, Brooklyn. For the Use of Physicians, Dentists, Pharmacists and Medical Students. Second edition. Fabrikoid. Price, \$7. Pp. 1,614. New York: New Modern Drugs, 1941.

This work represents an attempt to present for the physician, pharmacist or student an index of the nonpharmacoepial medicinal and other preparations which have found more or less favor in the practice of therapeutics. The therapeutic agents described therein are presented with varying details as to their composition, action and uses, how supplied and administration.

The first edition appeared in 1934 and contained descriptions of eight thousand, one hundred and sixty agents. In the foreword appeared the statements "This treatise is designed to meet the demand of the progressive physician for information concerning the most modern therapeutic agencies placed at his command by research laboratories" and "It presents without bias or comment all the popular nonpharmacoepial preparations and other remedies found useful in the treatment of disease." More than one preparation which the book described has been the subject of unfavorable reports by the Council on Pharmacy and Chemistry and the Bureau of Investigation. Some preparations have at one time or another been the subject of governmental action for being misbranded. It is doubted that the truly "progressive physician" might concede that all the described articles were modern or popular.

In 1938 a supplement to the 1934 edition was published. Now there has appeared a second edition, containing descriptions of eleven thousand, one hundred and fourteen nonpharmacoepial preparations with an increase of two hundred and fifty-one pages over the first edition. Like its predecessor, this edition is intended "for the use of physicians, dentists, pharmacists and

medical students," but, like its predecessor, the volume may be of more value as an encyclopedia than as a therapeutic guide. Because of the many proprietary preparations on the market such a book will be of value to the medical librarian, pharmacist, curious student and harassed and busy physician. But its limitations must be kept in mind by those who have occasion to scan its pages. Indications for the use of certain drugs often embrace a wider field than may be found in *New and Non-official Remedies*, *Useful Drugs* or the like. For example, the use of cinchophen is recognized in *New and Nonofficial Remedies* for acute gout, occasionally for other joint disorders and sometimes for the relief of pain in sciatica, but in Gutman's volume the indications include "gout, acute and chronic arthritis, rheumatic fever, neuralgia, neuritis, lumbosacral disease, sciatica, in iritis, episcleritis." Again, the dosage is often expressed in an unsatisfactory manner, the terms "tablets" or "teaspoonful" being used instead of grains, grams or units. Nor is the limit of the dose always in accord with the limits expressed in *New and Nonofficial Remedies*. No doubt part of these discrepancies can be explained by the statement in the foreword, "Descriptions, statements, analysis and all other data are offered without change or comment, but as found available in the numerous standard works and references consulted, or as obtained from the producers and distributors of the respective products." Some discrepancy has been found between the description of a product as presented in advertising of the producer and that contained in this book.

Regardless of its deficiencies, this work may be considered by some to have a place as a source of information on the non-pharmacoepial drugs found on the market. It is divided into parts and chapters which permit easy reference to the drug, the disease or the manufacturer. Some improvements have been made in the second edition, but it still remains more of an "encyclopedia" than a "therapeutic guide."

Bird Malaria. By Edginald Hewitt, Sc.D., Department of Protozoology, School of Hygiene and Public Health, The Johns Hopkins University, Baltimore. *The American Journal of Hygiene Monographic Series*, No. 15, July 1940. Supported by the De Lamar Fund of The Johns Hopkins University. Cloth. Price, \$1.10. Pp. 228, with 46 illustrations. Baltimore: Johns Hopkins Press, 1940.

Malarial parasites were discovered in birds only a few years after the description of malarial parasites in man by Laveran. Not only has work on them been closely related with the work on the parasites of man but they have played an amazing part in the development of knowledge regarding the transmission, pathology, immunology and therapy of the human infections. The present volume should therefore have a wide appeal to students of malaria. It is admirably conceived and excellently outlined. Following an introductory statement there are eleven chapters considering the discovery and early history of bird malaria, geographic distribution and incidence, experimental hosts and methods, species of parasites, characteristics of laboratory infections, symptomatology and pathology, immune reactions, chemotherapy, sexual cycle and mosquito transmission, the exoerythrocytic stages and suggested problems for investigation.

The exact material that should be contained in such a work is a matter of opinion, but it would seem that certain important subjects, such as immunity and exoerythrocytic stages, are superficially treated and that there should be more of a balance between the amount of published work on a given subject and the treatment by the author. Sporadic references are made to investigations on simian and human malaria. It would have been much more helpful if such references had been made more consistently and with a more critical selection of the work to be included. In the present state of confusion over exoerythrocytic schizogony the author can be pardoned for failing to evaluate some of the literature in this field, but it seems unfortunate that the discussion on *Toxoplasma* and *Toxoplasma*-like bodies should not have included a clear statement of the differences between these structures and the essentially dissimilar exoerythrocytic stages of malarial parasites. The author adopts certain usages that will probably not be generally accepted. For example, he attempts to follow Wolfson in restricting the term "periodicity" to "the degree of similarity in the length of the different asexual generations." This definition would eliminate the essential synchronism that is implied in general usage and would include a large range of vital phenomena which are not ordinarily con-

sidered periodic. The list of eighty-five questions included under chapter 11 as suggestions of problems to be solved exhibit an unusual variation in importance. Although many are thought provoking, it is unfortunate that some emphasize superficial aspects of the subject and others have been essentially answered before.

Besides matters of opinion there are a considerable number of errors. Some of these, such as the statement in table 21 that *Reichenow* showed that *Culex pipiens* is susceptible to *P. circumflexum*, will be misleading to readers using the book for reference. Throughout the discussion of immunity "humoral" is misspelled. A number of the illustrations copied from other authors are inadequately portrayed; as, for example, the halftone reproductions of certain colored plates. In spite of these shortcomings, the volume is thought provoking and will be of great value to beginning students as well as research workers in malaria. The bibliography is unusually complete.

Behandlung Innerer Krankheiten: Richtlinien und Ratschläge für Studierende und Ärzte. Von Prof. Dr. Ferdinand Hoff, Vorstand der medizinischen Poliklinik der Universität Würzburg. Paper. Price, 14 marks. Pp. 397, with one illustration. Leipzig: Georg Thieme, 1940.

This book on therapy of internal diseases is a concise discussion of the methods now practiced commonly in Germany. The author was wise to restrict himself to a description of those therapeutic agents with which he himself is familiar. He makes no claim that his survey is all inclusive. The introductory chapter contains a discussion of the general principles involved in treatment. This is followed by a description of the treatment of the more important diseases of the cardiovascular system, lungs, blood, glands of internal secretion, metabolism, digestive organs, genitourinary organs, muscles, nervous system and diseases of an infectious nature. For example, only fourteen of the common diseases of the nervous system are selected for discussion. The clinical remarks on the general characteristics of the diseases are sound and indicate that the author has had wide experience. Although it is true that many useless therapeutic measures are described, on the whole the book is more critical and contains more rational therapeutic information than do most books on treatment published in Germany. The style is clear and the arrangement logical. It can be recommended to physicians who wish to compare modern therapy in America with that in Germany.

Emotional Hygiene: The Art of Understanding. By Camilla M. Anderson, A.B., M.D., Assistant Psychiatrist, Philadelphia General Hospital, Philadelphia. Second edition. Cloth. Price, \$2. Pp. 253, with illustrations by Dorothy G. Stevenson. Philadelphia, New York, Chicago, Montreal & London: J. B. Lippincott Company, 1940.

This is a somewhat unusual book on mental hygiene. Intended primarily for nurses, it is simply written and suitable for the general reader. The writer assumes the attitude of a kindly and understanding adviser who attempts to explain the biologic bases of behavior and the nature of emotional disturbances; she offers "a guide for the perplexed." The latter part of the book is addressed specifically to nurses and reveals the author's particularly intimate knowledge of the problems of the student nurse in training. A spiritual quality based on religious feeling, a desire to offer a "philosophy of life" and a woman's outlook determine the peculiar character and atmosphere of the book. It is a good and readable general book on mental hygiene.

I. V. Stalin: Akademiya Nauk USSR sbornik trudov. [Collected Works of Ukrainian Academy of Science (Dedicated to Stalin on His Sixtieth Birthday)]. Cloth. Pp. 711, with illustrations. Kiev: Izdatelstvo Akademi Nauk USSR, 1940.

This large volume is dedicated by the Ukrainian Academy of Science to Joseph Stalin on the occasion of his sixtieth birthday. About one third of the articles are devoted to extolling the role of Stalin in continuing the work of Lenin and in encouraging the growth of sciences in Russia. The volume contains several articles dealing with the original contributions emanating from the Ukrainian Academy of Science, such as the mechanism of blood transfusion by Bogomolets, corneal transplants of Filatov and the "corticalin" discovered by Nina Medvedeva. The bulk of the articles deal with scientific investigations in fields not related to medicine or biology. The text is in the Ukrainian, the official language of the Ukrainian Socialist Soviet Republic. It would be difficult to appraise the scientific value of contributions on so wide a variety of subjects.

Queries and Minor Notes

THE ANSWERS HERE PUBLISHED HAVE BEEN PREPARED BY COMPETENT AUTHORITIES. THEY DO NOT, HOWEVER, REPRESENT THE OPINIONS OF ANY OFFICIAL BODIES UNLESS SPECIFICALLY STATED IN THE REPLY. ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT BE NOTICED. EVERY LETTER MUST CONTAIN THE WRITER'S NAME AND ADDRESS, BUT THESE WILL BE OMITTED ON REQUEST.

PREVENTIVE INOCULATIONS FOR TROPICAL RESIDENCE

To the Editor:—A former patient of mine is planning to take up a contract work at the island of Trinidad in connection with the national defense bases at that point. He has asked me to advise him in the matter of the necessary types of vaccinations, inoculations and other preventive measures that might fortify him against certain tropical ailments. Would you please discuss this problem in *The Journal*?

A. G. Augustine, M.D., Napanoch, N. Y.

ANSWER.—There are no tropical disorders peculiar to Trinidad that are not encountered in other tropical areas, and the specific preventives or vaccines needed for Trinidad are those necessary for any other similar community.

A person going from a temperate climate to Trinidad should be vaccinated against typhoid, paratyphoid, smallpox and diphtheria. There are no other specific measures that have been proved valuable or necessary. Malaria is the chief disease problem of the island, but there is no vaccine for this infection. There are no prophylactic drugs which will prevent an attack of malaria following the bite of an infected mosquito. Quinine and atabrine (chinacrin) will minimize the intensity of an infection or keep it at a subclinical level, but these drugs should be taken only according to the directions of the local physician or health officer. Individuals should be advised to sleep in screened quarters or under bed nets and should avoid unnecessary exposure after dusk. There is no active yellow fever in Trinidad.

Other general measures such as the use of light clothing, boiling of water, avoiding fresh fruits and vegetables are necessary as in any tropical area and are covered completely in the chapter on tropical hygiene in the sixth edition of E. R. Stitt's *Diagnosis and Treatment of Tropical Diseases* (Philadelphia, Blakiston Company).

PROGNOSIS AFTER REMOVAL OF HYPERNEPHROID CARCINOMA

To the Editor:—A woman aged 38 had a nephrectomy about ten months ago for a hypernephroma involving the lower pole of the left kidney. At that time there was a mass about the size of an orange in the left lumbar region and there were stringy blood clots in her urine. Intravenous pyelography showed a deformed kidney pelvis and a mass attached to the lower pole of the left kidney while the right kidney was normal in all respects. At operation, under spinal anesthesia, a well encapsulated tumor was found growing from the lower pole of the left kidney. It was noted at the time that there were no evidences of metastasis in the abdomen. The pathologic diagnosis of hypernephroma was made, of the clear celled type. Since operation she has had occasional pain at the incision site but no apparent abnormality. Since operation she has been having a twice monthly urinalysis which has been persistently normal, with specific gravities ranging from 1.016 to as high as 1.028 but usually about 1.022. She has no nocturia and has never bled again since. The blood pressure has been consistently about 120 systolic and 82 diastolic, as it was before her operation. Chest roentgenograms have been repeatedly negative for any form of disease. The problems which now enter are the following: Should the patient be placed on any special diet, considering the fact that she has such good concentrating power in her residual kidney? Her ideal weight is about 135 pounds (61 Kg.). About how much should she be allowed to deviate from this? In view of the age and history of the patient would there be any great danger in her carrying a pregnancy through to term? What precautions would be necessary to make sure that she would have the best possible chance with the fewest complications? How often should there be a complete checkup, and what tests would be adequate to detect possible spread of the tumor as well as existing kidney function? Should her activities be curtailed in any way? Are there any special drugs that should be avoided in treatment?

M.D., Pennsylvania.

ANSWER.—The clinical observations as given indicate a normal remaining kidney. Such a solitary kidney carries with it an adequate reserve and is capable of carrying out all the renal excretory needs of the body. Dietary or medicinal restrictions are therefore not necessary. Likewise the body weight need not necessarily be kept within any special limits. The patient should be encouraged to lead a normal life.

Special functional tests of the remaining kidney are not urgently indicated, because the potential danger in a case like this lies not so much in a failure of the renal function as in the consequences of the malignant condition.

Following a nephrectomy for hypernephroid carcinoma, the chances for a five year cure are between 25 and 30 per cent. The fatal outcome in the remaining cases is due to metastases in the long bones, in the skull and in the lungs and occasionally to a recurrence at the original site of the neoplasm. The local recurrences are best demonstrated by palpation, and the metastases by roentgen examination. Since these tumors are notably radioresistant, the surgeon has accomplished all that is within his power when he has performed the nephrectomy.

If the patient is already pregnant there is no reason why she could not carry her pregnancy through to term. Special diet or medication is not necessary during such a pregnancy. The complication which is most to be feared in the presence of a previously healthy solitary kidney is pyelitis. The urine should therefore be examined at frequent intervals for the presence of pus cells (every two weeks at first and every week in the latter half of the pregnancy).

But further pregnancies should be discouraged because of the high ultimate mortality of patients who have been operated on for hypernephroid carcinoma.

POSITIVE SEROLOGIC TEST IN GIRL WITHOUT SYMPTOMS

To the Editor:—Two years ago a girl then 12 years old, in the course of a general physical examination, was found to have a 4 plus Wassermann reaction. In another laboratory the Meinicke, Kahn and Jacobsthal reactions were also found positive. The bloods of her twin sister, her mother, her father and four brothers were repeatedly found negative. She was nursed, the same as her twin sister, by her mother and five different wet nurses whose bloods were not tested. Therefore the possibility of contagion exists, but on the other hand both the mother and the family physician are positive that this girl at no time had any sore in the mouth, sore throat, cutaneous eruption or moist patches near the anus or genitalia that might be taken for manifestations of early syphilis. The only cutaneous diseases that she ever had, according to the mother's statement, was a mild case of measles in infancy, two or three outbreaks of urticaria of short duration and an attack of furunculosis two years ago with typical boils that have left white scars. A physical examination made today shows a girl of 14, well developed, 63 inches (160 cm.) tall, weight 110 pounds (50 Kg.), with nearly perfect teeth, not a single cavity or filling, normal shape and fairly good alignment, tonsils present but small and healthy, no adenoids, tongue, gums and mucous membranes normal, eyes, eyelids, corners of the mouth, ears, scalp and hair normal. The lymph nodes and spleen are not palpable. The tendon reflexes are normal. The skin shows only scars of boils on the neck, forearms and back, no acne nor any other abnormality present. The urine is normal. The blood is normal, except for a positive Meinicke reaction. The menstruation has been normal since the age of 12. No Wassermann test has ever been made on the spinal fluid. For the last two years she has been submitted by other physicians to intermittent treatment with arsenicals and bismuth preparations in series of about ten doses of an arsenic compound followed by ten doses of a bismuth compound and a period of rest, having had five treatments in all. On the first examination I could not ascertain the size of the doses administered. Now the question arises whether this girl should be submitted to intensive antisyphilitic treatment until the serologic reaction is reversed or not treated at all. I have been consulted by the attending physician to advise him on this point, but I am at a loss to decide. Of course my first impulse is to advise intensive treatment, but in view of the facts aforementioned are we justified in submitting a young girl to the inconvenience, dangers and expense involved by this course on the rather scanty foundation of an isolated serologic abnormality?

Julio Bianchi, M.D., Guatemala.

ANSWER.—For a patient living in the tropics, of course there is the possibility of her having had yaws, malaria, pinta or leprosy. Certainly with the first disease there would have been plenty of cutaneous evidence of it in the past. It is stated that the spleen is not palpable and that the blood is normal except for the serologic reaction. Nevertheless, it might be well to conduct a careful investigation to rule out malaria, since it is well known that there is a positive serologic reaction in a large proportion of such patients. The fact that she has had no cutaneous disease would rule out pinta. It appears that there is no evidence of leprosy.

Occasionally "false positive" serologic reactions are seen in infectious mononucleosis, in malaria and rarely in cancer and tuberculosis. In leprosy and pinta the percentage of positive reactions is high—around 80. Even with these diseases ruled out there is an occasional false positive reaction. Kahn would call them biologic reactions.

Since this young girl's physical examination is entirely negative, she should have a lumbar puncture. If it is found to be negative, one would not be greatly concerned over the situation, particularly in view of plenty of treatment in the past. The girl should be regularly checked and carefully examined every six months to one year. A conservative attitude is indicated.

A recent report by J. E. and C. F. Moore, and Harry Eagle (*Biologic False Positive Serologic Tests for Syphilis*, *THE JOURNAL*, Nov. 9, 1940, p. 1602) may be consulted.

"MINERAL SPIRIT" AND JAUNDICE

To the Editor:—Recently a white man aged 30, in previous excellent health all his life, suffered from malaise for a period of four months. No other symptom was present. Examination throughout was negative. The patient stated that he just did not feel well. A short time after his physical examination he developed a sudden acute generalized jaundice with no other symptoms. In fact he began to feel better. The patient is a cleaner, using a commercial preparation known as Kyso Mineral Spirits, manufactured by the Standard Oil Company of Kentucky. Will you inform me as to the ingredients of this preparation, especially as to liver toxicity that might occur from contact, and whether there is any record of such toxicity in others who are in contact with this material.

Benjamin L. Camp, M.D., Ellijay, Ga.

ANSWER.—Mineral spirit or white spirit is a petroleum distillate chiefly used as a turpentine substitute. It is not a precise chemical entity, and the manufacturing specifications for various companies may vary slightly as to boiling point range, flash point, color, specific gravity and the like. It is used principally as a solvent for paint and as a dry cleaning agent. Thousands of workers in this country daily are exposed to mineral spirit in scores of industries and industrial operations. From its use, industrial dermatitis is comparatively common. Acute mental states resembling alcoholic intoxication, called by workmen "naphtha jags," sometimes arise. Long continued exposure to petroleum distillates akin to mineral spirit has led to an occasional severe and intractable injury chiefly centering about damage to the central nervous system, the medullary sheaths of peripheral nerves, the heart muscles and the liver. In the chronic form of the disease, as described by Hayhurst, the principal manifestations are loss of weight, anxiety, mental depression, a tendency to stupor and disorientation, tremors, ataxia, moderately severe anemia, increased pulse rate, and diarrhea with alternate constipation. Here and there, in publications dealing with this form of intoxication, mention is made of jaundice, hepatitis and tenderness over the liver. However, jaundice as an extensive manifestation of injury has not been encountered. Extended discussions of poisoning by petroleum distillates may be found in *Industrial Medicine* 5:53 (Feb.) 1936 and in the book *Toxicity of Industrial Organic Solvents*, published by the Chemical Publishing Company of New York, page 109. According to this book two cases of intoxication, one accompanied by unconsciousness, have been attributed by the British Home Office to the use of white spirit since 1929. First was a workman painting in a confined space and the second in a dry cleaning works. The probabilities of mineral spirit causing the type of jaundice described in the query is, therefore, slight. Since this workman is a cleaner (presumably a dry cleaner), inquiry should be made as to exposure to carbon tetrachloride. Finally, consideration should be given also to the possible toxic effects of impurities, such as thioalcohol and thioether.

TRAUMA TO BACK AND POLIOMYELITIS

To the Editor:—I am interested in a case in which a laborer jumped off a wagon and claimed to have hurt his back. Two days later his attending physician noted paralysis of the left leg and urinary retention. Two days after that the patient was dead. Autopsy by competent pathologists revealed (1) that the cause of death was acute anterior poliomyelitis and (2) that there was no evidence of injury from the fall to the spinal column or the spinal cord. Can you give me any references in regard to the possible contributory factor of the trauma to the man's death?

M.D., Colorado.

ANSWER.—Stern cited 3 cases from the literature prior to 1913 in which physicians have considered trauma a possible factor in a case such as this on the theory that the injury produced a "locus minoris resistentiae" in the spinal cord.

Parker reported several cases in which he considered the possibility of trauma localizing the lesion in the particular part affected.

In this case the data are not complete. As they are given, the probability is that the pain in the back was a manifestation of the invasive stage of poliomyelitis. In this premonitory stage the muscles of the back may be spastic and motion painful. The course was no different from that in other cases of fulminating poliomyelitis. Even if one accepts the pain in the back as a symptom of injury there is no basis from the data given for assuming that the injury had any effect.

INJURIES TO FEMALE GENITALIA FROM INTERCOURSE

To the Editor:—Is it possible for abrasions of the vagina and introitus to result from a vigorous, voluntary sexual intercourse with a woman who has been married over five years and who is normally built? Under what circumstances? Kindly list the injuries that may result from forced intercourse with married women.

M.D., Fairfield, Conn.

ANSWER.—Yes. Abrasions may result from hasty and traumatic entrance, from disproportion in the size of the genitalia, from violence of relationship even though not objectionable at the time of contact, or from an unusually prolonged (or repeated) sexual act. Unusually deep insertion may reactivate pelvic cellulitis as the result of cervical traumatism. Other causes to be considered are the employment of a concentrated postcoital vaginal douche as prophylaxis against conception or infection, and the introduction or activation of trichomonads or monilia.

A listing of all injuries which may result from forced intercourse is scarcely possible. Most important are (1) bruising and tearing of the external genitalia, also cutting from entrapped hairs, and (2) injury of the urethra, producing a "urethral hang" (the urethra is subject to distressing honey-moon trauma perhaps more than any other genital tissue). Serious injuries to the bladder, rectum and upper part of the genital tract are possible but unlikely.

SODIUM CITRATE AND BLOOD COAGULATION

To the Editor:—Sodium citrate solution is mixed with blood in the indirect method of blood transfusion to prevent the coagulation of blood. The statement is made on page 942 of the third edition of Sollmann's *Manual of Pharmacology* that when sodium citrate solution is injected intravenously "the coagulation time of the circulating blood is definitely shortened." I have seen similar discrepant statements in a textbook on pharmacology for nurses. If these statements are true, what is the explanation?

L. A. Crowell Jr., M.D., Lincolnton, N. C.

ANSWER.—In order to prevent coagulation of blood, about 0.25 per cent of sodium citrate must be added so as to bind the calcium; 0.1 per cent and less do not hinder coagulation. Intravenous injection of 10 to 50 cc. of 10 per cent sodium citrate, which would bring the blood concentration of patients to less than 0.01 per cent, shortens the coagulation time for several hours, probably by liberating thromboplastin from the platelets. The pertinent literature is cited in Sollmann's *Manual of Pharmacology*, fifth edition, page 919.

POLARIZED AND FLOURESCENT LIGHTING FOR LIBRARY

To the Editor:—I have been asked regarding the value of polarized light as compared to fluorescent light for reading in public libraries. Will you kindly advise regarding the availability, practicability and utility as far as the effect on the vision is concerned?

Edwin C. Braynard, M.D., Glen Cove, N. Y.

ANSWER.—Polarized light is not to be recommended for public libraries. There are better ways of avoiding poor lighting, and it is not an economical method. Fluorescent light is economical and if skillfully arranged is highly satisfactory. I suspect that the idea is to have lamps on a table or desk, with the reader facing the lamp. This is a poor arrangement. If one must have this arrangement, polarized light is probably the best for reducing specular glare. Abundant diffuse general illumination is the best.

INSULIN ADMINISTRATION AND HEPATOMEGALY

To the Editor:—In a discussion of the causes for abdominal distention in a girl with diabetes the statement appears in *The Journal* (Feb. 8, 1941, p. 550) that "in juvenile patients with severe diabetes who are maintained entirely on regular insulin (without protamine zinc insulin) it is not uncommon to have marked enlargement of the liver with abdominal distention." It seems unfortunate that the implication is made that hepatomegaly can be properly attributed to the use of unmodified insulin or that the condition may be avoided through the use of the protamine product. It would be correct to state that, in the child in whom diabetes mellitus is inadequately controlled for a long period, hepatomegaly may result. Many children with severe diabetes have been under close observation here with the use of weighed diets and unmodified insulin for many years, and not those remaining free from significant glycosuria hepatomegaly has not been encountered. Such excellence of control can be maintained through the use of unmodified insulin, if the dose and the frequency of administration are sufficient and other factors in control are observed. We have not been able to accomplish this through the use of protamine zinc insulin and feel that poor control is favored through its use. The substitution of protamine zinc insulin for the unmodified product may make the regimen simpler for the patient and for the physician, but when the resultant level of control of diabetes is lowered the substitution seems unwarranted.

THE PROBLEM OF GASTRIC CANCER

WILLIAM A. COOPER, M.D.

Research Fellow, National Cancer Institute, National Institute
of Health, U. S. Public Health Service

NEW YORK

The prodigious effort expended by the medical profession in the study of malignant diseases probably has had less effect on mortality from gastric cancer than on that from any other of the common types of carcinoma. While gratifying progress has been made in the treatment of cancer of the skin, nasopharynx, larynx, cervix uteri and the breast, cancer of the gastrointestinal tract, and most particularly of the stomach, remains a highly lethal disease. A favorable outcome in gastric cancer is so unusual that most practicing physicians have never witnessed a cure. Indeed, only those privileged to observe, over a long period of time, large numbers of patients with cancer of the stomach are in a position to know of the occasional cures. In a disease with such a dismal outlook it seems prudent to review its salient features to determine (1) whether this outlook is justified and (2) what is to be done to correct the situation.

To illustrate the problems, the experience of the New York Hospital in cancer of the stomach since September 1932 is analyzed. It is recognized that the number of patients who have passed the five year period is small, a factor which may somewhat distort the end results. It is hoped that there may be occasion to present this same material from time to time, modified by further experience with the same cases and augmented by new cases studied in the interim.

CLINICAL MATERIAL

During the seven and a third year period from September 1932 to 1940, 264 patients with proved cancer of the stomach were admitted to the medical and surgical pavilions of the New York Hospital. It is felt important to include both the medical and the surgical cases to portray a well rounded picture of the disease as it is encountered in a large general hospital. In 88 of the cases (33½ per cent) the disease was sufficiently advanced to be considered inoperable clinically. In 91 cases (34.5 per cent) an exploratory laparotomy was done, with 7 deaths occurring in the hospital after exploration, an operative mortality of 7.7 per cent. In 21 cases (7.9 per cent) a palliative gastroenterostomy was done, with 5 operative deaths, a mortality of 23.8 per cent. In 7 cases (2.7 per cent) miscellaneous procedures such as colostomy, gastrostomy or total gastrectomy were done, with 6 operative deaths (85.5 per cent). In 16 cases (6.1 per cent) a palliative

gastric resection was done in the presence of metastasis which could not be removed, with 2 operative deaths (12.5 per cent). Only 41 out of the total of 264 cases (15.5 per cent) were sufficiently early to be considered curable by surgical methods. In these a partial gastrectomy was done, with 4 operative deaths, an operative mortality of 9.8 per cent. The combined mortality for both the palliative and the curative resections was 10.5 per cent. These data are shown graphically in the accompanying chart.

RESULTS

All of the 223 patients (84.5 per cent) with cancer too advanced for hope of surgical cure were doomed to die. The average duration of life after admission to the hospital in this group is given in table 1.

The variation in the duration of life in these groups is largely explained by the extent of the gastric lesions when the patients were admitted to the hospital. Obviously, those patients with cancer sufficiently advanced to be clinically inoperable should live a shorter time than those found inoperable only by exploration. Though the duration of life after palliative resection or palliative gastroenterostomy is not strikingly prolonged, there is no question concerning the value of these procedures. Most of the palliative gastroenterostomies were performed for pyloric obstruction, and there is no doubt that some months were added to the duration of life in this group. Vastly more important than the few months of life, however, is the fact that in general this group was clinically improved by gastroenterostomy. In most instances there was a cessation of vomiting, an increase in appetite and some gain in weight. Two patients of this group enjoyed two years of practically normal life.

Clinical improvement in the group of palliative gastric resections was even more striking, though the average duration of life was not quite as great as that in the palliative gastroenterostomies. Many of these patients were able to lead essentially normal lives until a few months before death. The usual prolonged period of disability was greatly shortened, and the final period of decline was relatively rapid. So general was the improvement in the palliative resection group that this procedure usually is felt to be indicated when it is mechanically possible to remove all of the gastric tumor.

Of the 41 patients on whom curative gastric resections were performed, 15 are now dead, the average duration of life after operation being sixteen months. Only 9 patients had curative resections done five or more years ago. Of these, 4 are living and free from disease, a five year survival rate of 44.4 per cent. Of the 17 patients on whom curative resections were done three or more years ago, 10 are living and free from disease, a three year survival rate of 58.8 per cent.

These figures are sufficiently striking to warrant scrutiny. They are open to question in two ways: 1.

From the Department of Surgery of the New York Hospital and Cornell University Medical College.

Carried out under a grant from the National Cancer Institute of the U. S. Public Health Service, Washington, D. C.

In separating the curative and palliative resections there has been some selection of cases. If the end results are calculated for all resections, the three year survival rate is 52.6 per cent and the five year survival rate 40 per cent—figures which are still unusual for cancer of the stomach. It is scarcely justifiable, however, to compromise gastric resection as a method of treatment by including in the curable group those cases of metastasis which obviously could not be removed at operation. 2. A second, more valid criticism is that the series is small. The three year survival rate, however, indicates that the five year survival rate in this series will probably remain elevated for at least two years to come.¹

The experience of the New York Hospital, therefore, indicates that operable cancer of the stomach is cured in 44.4 per cent of cases for a period of five years by gastric resection, a result comparable to that in cancer of the breast, a disease generally regarded as curable. Surely, then, the despondent outlook on gastric cancer

of treatment is so poor that cures for the group as a whole are distinctly rare. It is not to be assumed that surgery has made no progress in its attack on the disease. During the sixty years since Billroth performed the first successful partial gastrectomy, the mortality of the operation has been reduced from a formidable figure to about 10 per cent or less in the hands of competent surgeons. It is clear that this figure will be further reduced by continued concentrated effort. But this progress has been largely confined to making gastric resection a safer operation. The physician cannot rely on the surgeon to improve the outlook on gastric cancer by further refinements in surgical technic. Not until more resectable cases are seen by the surgeon will cures of this dread disease become common. It is clear, therefore, that the essence of the problem of gastric cancer is that of early diagnosis.

One should therefore examine the available methods that make diagnosis possible to determine wherein these methods contribute to the timely discovery of cancer of the stomach.

1. *The History and Physical Examination.*—The histories and physical findings presented by this group of patients were in 84.5 per cent of the cases those of inoperable gastric cancer. The typical picture with upper abdominal pain or discomfort, progressive anorexia and loss of weight, vomiting, anemia and weakness was sufficiently striking in most of the cases

Observations in 264 cases of gastric cancer.

is not justified. But this optimistic side of the picture is seen only by the surgeon who follows operable cases. The physician in general practice is likely to be more impressed by a broader picture, that these four cures represent only 5.4 per cent of the 72 patients admitted to the hospital five or more years ago, a picture that emphasizes the rarity of the cures of gastric cancer.

TREATMENT

No treatment other than the surgical treatment of gastric cancer is worthy of mention. In view of the basic pathologic condition (neoplastic infiltration of a hollow viscus) it seems likely that roentgen therapy will never furnish a rational attack on the disease. Still the record of surgical intervention as a method

1. This is not the only series in which the end results have been unusual. Pack and Livingston (End Results in the Treatment of Gastric Cancer, New York, Paul B. Hoeber, Inc., 1939, p. 127) collected about four thousand gastric resections done for cancer in which the three year survivals averaged 34.6 per cent, the five year survivals 26.8 per cent and the ten year cures, when reported, 19.66 per cent, i. e. roughly one third living at three years, one fourth living at five years and one fifth living at ten years. These averages include five year survivals of 39.5 per cent reported by Gatewood, 33.3 per cent reported by Harms and 28 per cent reported by Balfour.

to be recognized by the uninitiated. If the patient seeks medical advice only after this stage has been reached, in the majority of cases he is merely delegating to his physician the unpleasant task of terminal care, a task for which the philosopher or the minister of God may be as well suited as the student of medicine. The tragic drama of inoperable gastric cancer confirms in the minds of the patient, his friends and his relatives a horror of cancer in general and further frustrates his physician. It is relatively unimportant to the patient that the clinical picture of inoperable gastric cancer be recognized. In fact, most of the clinical experience with gastric cancer is futile unless it teaches doctors how to diagnose the disease earlier.

There seems little hope that the casual, superficial history will discover gastric cancer in the operable stages. Mullen² has aptly stated that "physicians might be divided into two classes: (1) those who are eternally suspicious of gastric cancer and never find it; (2) those who are never suspicious of it and eternally miss it. The first are apt to complain of the futility of their efforts, and the second to comment on the hopelessness of the disease." Certainly care, healthy optimism and suspicion are as essential to the gastric diagnostician as are hands to the surgeon.

The early symptoms of gastric cancer can be summarized in the two indefinite terms frequently used by the layman—"dyspepsia" and "indigestion." Reduced to medical terminology these symptoms are as follows:

(a) Loss of appetite is one of the earliest and commonest symptoms. At first the patient notes that heavy

2. Mullen, T. F.: Some Factors Influencing the Curability of Cancer of the Stomach, Surg., Gynec. & Obst. 72: 298 (Feb., no. 2A) 1941.

foods he has previously eaten and enjoyed cause some upper abdominal discomfort, fullness or gas. He soon loses desire for these foods and eliminates them from his diet. In time he finds that other foods disagree with him, and he suffers from true anorexia. This frequently progresses to an abhorrence of all food—at which time the growth has usually gone too far for surgical removal.

(b) Fulness after meals often precedes by weeks or months the development of upper abdominal discomfort or pain. The appetite is satisfied more easily than usual, and the patient does not enjoy his favorite dish, which is often an indigestible concoction.

(c) The fulness disappears when less is eaten and the old favorites are eliminated from the diet but in time progresses into upper abdominal discomfort after meals, which in turn may develop into pain.

(d) Epigastric pain is not always present and in itself is more typical of ulcer than of cancer; this is particularly true if it is intermittent and responds to food and alkalis. In carcinomatous ulcers, however, pain may be present from the outset and may exactly simulate ulcer pain. Mild pain without periodicity may occur both early and late in the disease.

(e) Gas and belching are frequently associated with the symptoms listed or they may occur alone as the first symptoms of gastric cancer. If the gas tastes foul to the patient an advanced necrotic tumor is usually present.

(f) Nausea, particularly after eating, is often present early, though advanced cases have been observed in which this sensation has never been experienced. The nausea may occur alone or may be associated with vomiting.

(g) Vomiting, if persistent and severe, is more often a late than an early symptom. Occasional unexplained attacks of nausea and vomiting followed by complete relief are frequently the first symptoms of gastric cancer. The patient invariably refers such an attack to a dietary indiscretion. If the emesis contains changed blood, the disease is likely to be advanced.

The symptoms enumerated attract the attention of both the patient and the physician to a gastric disorder. However, all these symptoms may be entirely absent and the physician may have some difficulty in knowing to which system he should attribute the nonspecific symptoms that follow.

(h) Weakness, lack of vigor and strength, or of the usual sense of well-being, may be the first manifestations of gastric cancer. Though usually related to either loss of weight or anemia, they may occur alone as the earliest symptoms.

(i) Anemia, often associated with weakness and pallor, is sometimes the first sign of the disease but is more characteristic of advanced gastric cancer. The typical picture of pernicious anemia is unusual but is

seen often enough to warrant a complete investigation of the stomach before liver therapy is started. In view of the disproportionately high incidence of gastric cancer in patients with proved pernicious anemia, and of the possible relation of atrophic gastritis to cancer of the stomach, it is imperative that patients known to have either pernicious anemia or atrophy of the gastric mucosa be thoroughly reinvestigated every six months as long as they live, regardless of their response to liver or other therapy.

(j) Loss of weight, while characteristic of advanced disease, may occur alone or associated with the other nonspecific symptoms, as the first sign of the disorder. This is particularly true of patients lacking sensitivity to symptoms in general.

Abnormal physical findings are usually entirely absent in early gastric cancer. Slight epigastric tenderness or resistance may be elicited on examination; this is especially common in cancer that simulates ulcer.

Cancer of the stomach.

A fixed epigastric mass is usually advanced and inoperable, but a movable mass may be a bulky adenocarcinoma which can be resected with a fairly favorable prognosis in spite of the terminal signs of disease. Because of this type of cancer, a movable lesion should be explored before it is declared to be inoperable, regardless of its size.

Though a careful physical examination is essential, it is the history which is of greater importance in the discovery of early cancer. Only by carefully planned questioning regarding former dietary habits to contrast with the present reactions to food can the physician form a picture on which to base his diagnosis.

It is often stated that cancer does not develop in a normal stomach. This is most apparent in the 25 per cent of patients who for many years have suffered from mild gastric symptoms some or all of which simulate the early symptoms of gastric cancer. Clinical diagnosis is particularly difficult in this group, for the changes in the reactions of these patients to food may be extremely subtle.

The average duration of symptoms before the patients entered the hospital in this series was twelve and one-half months. Strangely, the duration of symptoms of the 41 patients with resectable cancer was sixteen months, three and one-half months above the average. Difficulty was encountered in attempting to place the responsibility for the delay of more than one year between the onset of symptoms and the establishment of a positive diagnosis, for the hospital records frequently omit detailed accounts of the medical experiences of patients before entering the hospital. In 88 case histories these data were recorded. As one might anticipate, analysis shows that both the patient and the private physician contributed to the delay. The average delay on the part of the patient in seeking medical aid was eight months, while the average delay on the part of the private practitioner in establishing the diagnosis was four and a half months.

A more accurate and dramatic study of the responsibility for delay in the diagnosis can be made by examining the records of the outpatient department. In spite of readily available diagnostic aids, in a number of instances there was a delay of six months or more in establishing the diagnosis. Responsibility for this delay

TABLE 2.—Reports of Roentgen Examinations

	Examination					Final Diagnosis
	1st	2d	3d	4th	5th	
Positive reading of cancer of stomach.....	70.7%	83.0%	84.7%	86.0%	86.0%	86.0%
Questionable, suspicious of cancer or repeat examination requested.....	11.8%					3.1%
Diagnosed as other pathologic condition, i. e. ulcer, gastritis, spasm, or benign lesion.....	13.1%					8.7%
Normal stomach.....	4.4%					2.2%
Total cases examined 220						

* In the group of 33 cases in which repeated roentgen examinations failed to clarify the final diagnosis, 29 patients had gastric acid studies, the results of which are shown in table 3.

is squarely on the shoulders of the outpatient department and emphasizes the inadequacies of the present attack on the disease.

It is apparent, therefore, that the history and physical examination, though primarily essential, fail to establish the diagnosis in many instances and, as applied by both the general practitioners and the physicians of the clinic, allow for a delay of one to six months in bringing the patient to surgical treatment.

Unfortunately the vagueness of the early complaints and the obscurity of the physical findings more often than not render early clinical diagnosis difficult, if not impossible. The profession, therefore, has come to rely on various special examinations to compensate for the inaccuracies of the usual clinical methods. Procrastination on the part of the physician in delaying further investigation until the symptoms become well established accounts for a good portion of the inoperable gastric cancer seen at the New York Hospital.

2. *The Roentgenographic Examination.*—Certainly the most useful of the diagnostic aids in cancer of the stomach is the roentgenographic examination. Without fluoroscopic and roentgen studies it is impossible to advise patients properly regarding their gastric complaints. But just how accurate is this examination in the diagnosis of gastric cancer, and is it to be relied on to diagnose cancer of the stomach early? The

existent impression is that the roentgenologist is extremely accurate in both the discovery and the differential diagnosis of gastric lesions. Comfort and Butsch³ found the roentgen diagnosis to be correct in 78 per cent of gastric lesions of less than 4.4 cm. in diameter, while 12 per cent of the diagnoses were equivocal and 10 per cent were wrong. In diagnosing benign gastric ulcers they were 93 per cent correct; in diagnosing malignant gastric ulcers they were 70 per cent correct. The general impression is that the roentgenologist is about 90 per cent accurate in the diagnosis of cancer of the stomach.

In critically analyzing the roentgenographic reports on my group of cases it is found that the accuracy approaches the commonly accepted 90 per cent when repeated examinations are possible. The reports of these examinations which were returned to the clinicians are shown in table 2.

It is apparent from table 2 that the roentgenologist is certain of only 70.7 per cent of the cases on the first examination but that with repeated examinations the accuracy goes up to 86 per cent. If one adds the 3.1 per cent still suggestive of cancer with repeated examinations, the accuracy is 89.1 per cent. In the last analysis only 2.2 per cent of this entire group were said to have normal stomachs; i. e., 97.8 per cent were said to have some type of pathologic lesion.

Since it is most important for the clinician to be acutely aware of the diagnostic limitations of gastric roentgenograms it is essential that he bear in mind the 30 per cent suggestive, benign or negative diagnoses returned after the first examination rather than the remarkable 97.8 per cent final accuracy in detecting disease. It is also important for the clinician to remember that this accuracy in roentgenologic diagnosis was obtained in a group of cases in which 84.5 per cent were inoperable. It is likely that the roentgen examination would be much less accurate in a group of cases with higher operability. In this series the roentgenologist diagnosed cancer in 80 per cent of the 41 resectable cases. Intelligent correlation of the clinical history with the roentgenologic report is of paramount importance in establishing a diagnosis of gastric cancer. A carefully taken history compatible with cancer of the stomach should probably never be overruled by a single negative roentgen report. Further study is usually indicated.

3. *The Gastric Analysis.*—Considerable confusion exists regarding the value of the gastric acidity as a diagnostic aid in cancer of the stomach. There is little question that much of this confusion has arisen through the use of a variety of technics and the inaccurate performance of the test. In measuring the gastric acidity it is important to remember that one wishes to know how much acid the stomach is capable of producing. To obtain a maximum response it is necessary to use histamine as a secretagogue; to measure this response it is necessary continuously to aspirate the gastric juice (and gastric juice only). Errors in the test creep in through the aspiration of bile, the swallowing of saliva and failure to aspirate continuously. Using the technic described by Bloomfield and Pollard,⁴ Holman⁵ has carefully studied the gastric acidity in

the New York Hospital series. He found the acid below normal or absent in 85 per cent of the cases of gastric cancer and to date has found no example of hypoacidity in gastric ulcer. In this clinic, therefore, the gastric analysis has been found a useful aid in the diagnosis of cancer of the stomach. Its chief value lies in differentiating benign and malignant lesions. Though fallible in 15 per cent of the cases, it adds confirmatory evidence in 85 per cent of cases of gastric cancer. In the absence of a gastric lesion, the diagnostic value of the gastric analysis has not yet been determined. An effort is being made to determine its value by doing the test on all patients with gastric symptoms. Diagnostic aids are so urgently needed in cancer of the stomach that a complete study should be employed in all patients suspected of having the disease.

The reduced or absent free hydrochloric acid in 19 of the 29 cases supported the diagnosis of gastric cancer, leaving but 10 cases (3.7 per cent) out of the entire series in which neither roentgen examination nor determination of the gastric acidity tended to confirm the clinical picture which made these studies necessary. On scrutiny it is found that 9 of these 10 cases were diagnosed by the roentgenologist as gastric ulcer. This simply confirms the experience of most observers that it is difficult to differentiate with certainty the benign from the malignant ulcer.

The questionable lesions that the gastric analysis fails to place in the malignant group present a real diagnostic problem. Yet this problem is simplified if one considers surgery as indicated in any gastric ulcer that fails to heal under conservative treatment. If the ulcer is chronic and has recurred repeatedly under adequate treatment over a period of years, gastric resection usually is indicated whether the lesion is benign or malignant. The recent gastric ulcer with a short history may be given a two week period of conservative care in the hospital. If the roentgenograms fail to show a marked diminution in size or if the clinical symptoms are not alleviated, resection again should be considered. It is not safe, however, to regard reduction in size or the disappearance of symptoms as proof of the benignity of a gastric lesion, for malignant ulcers have been known to disappear on the roentgenogram and the patients commonly improve clinically on bland diets. Such cases deserve continued observation until the physician is satisfied that the healing is complete and permanent. Among all others, ulcers of the prepyloric area should be regarded with the greatest suspicion.

4. *Gastroscopy*.—The most recent addition to the diagnostic armamentarium of gastric disease is the flexible gastroscope designed by Wolfe and Schindler in 1932. While statistical data regarding its value in the diagnosis of gastric cancer are lacking, there can be no question that certain tumors missed on roentgen examination are visible through the gastroscope. If this occurs with sufficient frequency, the operability of cancer of the stomach will certainly be increased. An increase will be observed, however, only if the examination is applied to a large group of patients suspected of having gastric cancer. In the diagnostic problem of gastric cancer the real need for gastroscopic examination is in those cases in which the roentgenogram fails to establish the diagnosis. Since it is apparent that roentgen examination has limitations which increase the earlier the disease is seen, gastroscopic examination will in all probability become increasingly necessary as a diagnostic aid.

5. *The Stool Examination*.—A less specific but nonetheless useful diagnostic aid is the examination of the stools for occult blood. Any oozing or ulcerating lesion of the gastrointestinal tract will, of course, give a positive reaction. Occult blood in the stools necessitates further study to determine its origin and cause and therefore can be added to the group of symptoms considered under the history and physical examination which demand a clear explanation. Though occult blood is usually present in the stools of patients with gastric cancer, unfortunately its absence does not exclude the disease, for scirrhus carcinoma may not ooze or ulcerate.

6. *The Importance of Complete and Repeated Examinations*.—Most of the delay in diagnosis in the New York Hospital outpatient department was due to a false security derived from negative reports on one or more of the diagnostic aids. In several instances, after a negative roentgenologic examination the patient was reassured and lost contact with the clinic until some months later when the symptoms were well advanced. It is of paramount importance to carry out a complete gastric investigation on every patient over 35 years of age who has symptoms compatible with early gastric cancer. Nor is it sufficient for one to complete the investigation and, finding it negative, discharge the patient as well. The proper management of such a case

TABLE 3.—Results of Studies on Gastric Acidity in Cases Not Diagnosed by Roentgen Examination

Free acid below 50°.....	6 cases	
Free acid above 50°.....	10 cases	34.5%

demands continuous observation until all the early symptoms have disappeared. If they do not disappear, a complete reinvestigation should be done at frequent intervals until the diagnosis, whatever it may be, is established. In this method of management lies a fertile field of endeavor against cancer of the stomach. Not until these concepts are accepted and practiced by every physician who sees patients with gastric complaints will the profession be performing its function against this dread disease.

SUMMARY

The despondent outlook generally held by physicians toward cancer of the stomach is justified only by the high proportion of failures (95 per cent) experienced in the past. Analysis clearly shows that the failure is largely due to late diagnosis. It also shows that the responsibility for the delay in diagnosis is divided among the patient (eight months), the patient's physician (four and a half months) and the general hospital (one to six months). But the profession in its fatalistic outlook based on past experience should not accept these figures as irreducible. With highly dependable diagnostic aids available there is every reason to believe that their vigorous and repeated application would reduce the professional delay to the vanishing point. With proper educational steps the patient's delay could be reduced materially. The common expression of the profession "They all die anyway" reflects an unhealthy attitude of despair which must give way to an enthusiastic and vigorous attack on the disease before real progress is possible. It is firmly believed that a complete reversal of attitude toward cancer of the stomach on the part of the medical profession is long overdue.

THE ETIOLOGIC ROLE OF CHEWING TOBACCO IN CANCER OF THE MOUTH

REPORT OF EIGHT CASES TREATED WITH RADIATION

H. L. FRIEDEL, M.D.

AND

L. M. ROSENTHAL, M.D.

CHICAGO

It is our purpose in this paper to discuss the etiologic relationship between tobacco chewing and cancer of the mouth and to report 8 cases in which irradiation was employed. The chewing of tobacco is by no means infrequent and the paucity of reports in the literature does not reflect the incidence or importance of this practice in cancer of the mouth. The eight cases included in this communication serve to illustrate the prominent features of what appears to be a clearly defined clinical entity.¹

The observation that cancer of the oral cavity is considerably higher in males than in females has aroused much speculation and has stimulated investigation of the irritating effects of tobacco, to which men are exposed in a greater degree.² A comprehensive survey of the literature led Lickint³ to conclude without reservation that the use of tobacco is a definite carcinogenic factor. Hoffman⁴ has accumulated extensive statistical data showing a causative relationship between cancer and tobacco. The role of chewing tobacco in cancer of the mouth has received some attention in various publications and in practically all of the standard textbooks. A careful survey, however, failed to disclose clearly recorded clinical data on cases in which the chewing of tobacco has been either definitely proved or strongly suspected as the etiologic factor. Abbe,⁵ who wrote an indictment of tobacco in cancer, describes his experience with 100 patients who had cancer of the mouth, all of whom were habitual users of tobacco in one form or another. In this group there were 13 tobacco chewers in whom cancer of the mouth developed at the point at which the tobacco was held. There are no clinical data. Ewing⁶ states that tobacco has a predominant influence on cancer of the buccal mucosa and that cancer often develops in the mouth of a tobacco chewer at the point at which the quid has been held. Martin and Pflueger,⁷ in a review of cancer of the cheek, included chewing tobacco in a list of chronic irritants which are considered by them to be etiologic factors. There was, however, no elaboration on this observation.

Although careful clinical studies are lacking, there have been a long series of experimental investigations on animals in which tobacco and its derivatives have been applied in an attempt to evaluate the carcinogenic properties. Brosch⁸ in 1900 was the first to produce

an atypical epithelial proliferation in guinea pigs by the application of tobacco juice. Wacker and Schmincke⁹ in 1911 produced proliferations of the epithelium of rabbit ears by the application of tobacco tar which had been obtained from pipes. The material was mixed with crude paraffin oil before application. Hoffman, Schreus and Zurhelle¹⁰ in 1923 succeeded in producing only hyperkeratosis on the skin of fowls with tobacco tar. Helwig¹¹ in 1928 found that the ethereal extracts of tobacco tar and combustion products of tobacco distilled over a temperature of 400 to 500 C. did not contain carcinogenic substances for mice. However, tobacco tar when mixed with olive oil and applied to the epithelium of rabbit ears apparently produced an atypical proliferation. No actual malignant transformation seemed to occur. Chikamatsu¹² in 1931 painted the skin of mice and the ears of rabbits with tobacco tar and found it to be inactive in mice but observed that it caused the development of "canceroid ulceration" on rabbit ears approximately two hundred and twenty-five days after treatment was instituted. Bogen and Loomis¹³ in 1932, in two series of 12 mice treated respectively with tobacco tar and gas house tar, found no epithelial proliferation with tobacco tar. In every animal treated with the mineral tar, however, definite epithelial proliferation was present. Lu¹⁴ in 1934 applied the distillate of tobacco combination to rabbit skin and was able to produce carcinoma in 3 of 4 animals. He stated that the appearance of the lesion was hastened when large amounts of cholesterol were introduced. Schürch and Winterstein¹⁵ in 1935 reported that they were able to produce carcinoma by applying tobacco tar to rabbit skin after the animals had received a cholesterol-rich diet. They were unable to evoke malignant epithelial proliferation in mice or rabbits which had received no excessive cholesterol. They postulated constitutional damage with the cholesterol-rich diet.

Roffo,¹⁶ who has carried out extensive experiments on rabbits, used several distillation products of tobacco, a watery distillate (100 to 120 C.), a thick liquid (120 to 350 C.) and the residue. The products were applied daily to the ears of three series of 20 rabbits for a period of ten months. In no animal treated with the watery distillate did a tumor develop but in 95 per cent of the rabbits treated with the thick liquid and in 70 per cent of those treated with the residue a squamous carcinoma developed. These figures would indicate that the tobacco tar contained a powerful carcinogenic substance. Roffo has stated that the carcinogenic agent present in tar is spectroscopically identical with cancer-

producing hydrocarbons related to the benzantracene group. This is somewhat difficult to reconcile with the observations of Kennaway,¹⁷ who has shown that the carcinogenic substances of coal tar are not found in appreciable quantities below 500 C. Recently Sugiura¹⁸ presented evidence to show that tobacco tar was only weakly carcinogenic and, in contradistinction to Roffo's claim, could produce only 1 squamous carcinoma in 168 mice and no squamous proliferation in 22 rabbits. The manner of the distillation and the manner of application were approximately the same. It is possible, however, that the divergent results may be due to the use of different strains of animals by the investigators.

The exact nature of the carcinogenic substance contained in tobacco tar is not clear, and wide discrepancies exist in the observations of various workers. It cannot be denied, however, that tobacco tar may be considered at least weakly carcinogenic.

With respect to the clinical features of the constant use of an irritant in the oral cavity, a similar picture presents itself in the case of betel or buyo¹⁹ chewing. Betel chewing is a common practice among the natives of the Orient, and a review of the recent literature discloses an unusually high incidence of cancer of the mouth where the practice is prevalent. The ingredients of the betel chew, as described by various authors, consist essentially of the betel leaf, the areca nut, lime (shell or stone) and tobacco. It became increasingly evident as more reports were surveyed that tobacco is frequently used as an ingredient in the several varieties of the betel chew and, as will be shown later, may possibly represent the most important carcinogenic factor.

Ellis,²⁰ reporting on betel chewing in Siam, quotes the results of a questionnaire which was sent to physicians scattered throughout Siam. To the query "Have your observations led you to believe that betel-nut chewing is irritating and tends toward the production of cancer of the mouth?" thirteen of the sixteen answered in the negative. However, the opinion of one of the three constituting the minority reflected a survey of the Chulalongkorn Hospital statistics, which were the most detailed and significant of all. Fells,²¹ in a two year survey of experiences in southern India, reported 377 cases of epithelial cancer, 91.5 per cent of which were in the mouth. Bentall²² reported 1,700 cases in southern India, of which 71 per cent were in the mouth. Both authors pointed out the frequency of betel chewing in India and suggested this as a possible etiologic factor. It appears to be the opinion of those who have access to reasonably accurate statistics that the practice of betel chewing is closely associated with the development of cancer of the mouth. No real attempt, however, has been made to isolate the important carcinogenic agent or agents in the betel chew.

A review by Orr²³ on the carcinogenic effect of the betel chew presents presumptive evidence that the agent

is contained in the tobacco and in its combination with lime. He points out, in a wide geographic survey, that although betel chewing is common throughout India the incidence of cancer of the mouth is much more prevalent in southern India and is common only on the southwest coast. In analyzing the important difference in the geographic distribution of oral cancer, he concluded that the difference in the carcinogenic effect of the chew was due to the use, in southern India, of cheap, irritating tobacco with shell lime (a stronger alkali than stone lime) and a prolonged retention of the quid. Difference in the vitamin content of the diets in the various regions was suggested as another possible contributing factor. On reports from the Bihar district, Orr found that the Hindus, who chew betel continuously, have a low incidence of carcinoma, but the Santals, an aboriginal tribe, who are heavy tobacco and lime chewers, using no betel or areca nut, have a high incidence of oral cancer. Maxwell,²⁴ describing his experience in

Fig. 1.—Typical microscopic structure of tobacco cancer.

Formosa, stated that he rarely saw cancer of the mouth in the locality in which he was stationed, although betel chewing was extremely prevalent. It is interesting to note, however, that in his description of the chew he significantly failed to mention the use of tobacco. Spittel²⁵ and Davidson²⁶ also pointed out the possible significance of tobacco in the betel chew. Wells,²⁷ in a report on betel chewing and its effect on the teeth, stated that in the many patients he examined he saw not a single instance of carcinoma of the mouth. In describing the betel chew he failed to mention the use of tobacco.

Since statistical data in countries in which betel chewing is common are very meager or lacking entirely, it is difficult to ascertain the exact incidence of betel cancer or to single out the ingredients in the chew which have the most important carcinogenic effects.

19. Buyo chewing in the Philippines has been described by Davis (Buyo Cheek Cancer, *J. A. M. A.* 64: 711-718 [Feb. 27] 1915) as an etiologic factor in cancer of the mouth. On careful review of this communication it is evident that the buyo chew and the betel chew are identical. Apparently the betel leaf is sometimes called the buyo leaf in the Philippine Islands.

The available evidence, however, points to the tobacco as being an important carcinogenic factor. This conception would fit the available data and serves to eradicate apparent discrepancies.

Eight cases of carcinoma of the mouth are presented in which a definite history of tobacco chewing has been

Fig. 2 (case 4).—Carcinoma of the inner surface of the right cheek before therapy.

elicited. This series was collected over a two year period, during which time 85 cases of various types of carcinoma of the mouth and tongue were observed. The average age of the 8 patients was 69 years—all were over 60. The practice of chewing tobacco extended over a period of fifty years on the average and the quid was chewed daily for lengths of time varying from two to ten hours. The first symptom referable to the lesion was usually soreness, and as the lesion progressed it became more painful and interfered with mastication. In these cases the points of origin correspond exactly to the areas in which the quid was held. The sites of development of the lesions were the mucous membrane of the cheek (6 cases) and the mucous membrane of the alveolar ridge (2 cases). In addition to the actual neoplasm there were widespread areas of leukoplakia surrounding the tumor and partially covering its surface; the leukoplakia was, in all probability, a precursor of the actual new growth. In this respect it is interesting to note that in two cases the usual position of the quid was changed because of developing irritation and soreness, and areas of leukoplakia subsequently appeared at the new site.

The appearance of the tumors on the inner surface of the cheek is distinctive and almost pathognomonic. All presented sharply circumscribed margins, raised several millimeters to a centimeter above the normal mucosa. The surface had a papillary verrucoid character and was covered and surrounded by patchy areas of leukoplakia. The lesions may be extensive, occupying the whole of the inner surface of the cheek from the lower to the upper alveolar margin (fig. 2). The tumors which began on the mucous membrane of the alveolar ridges had fewer distinguishing features and represented the ordinary type of ulcerating carcinoma. They were long narrow lesions extending along the alveolar margins and were associated with extensive leukoplakia (fig. 3). In most of the cases there was a moderate degree of induration along the margins of the tumors, but extensive infiltration into the submu-

cosal tissues was not present. The lesions developed slowly, 1 patient having had symptoms for eleven years and 2 others for more than three years. They were slow to invade the neighboring lymphatics, and only 1 of the 8 patients had definite metastasis to the cervical nodes. Patient 7 had an enlargement of a node in the upper portion of the anterior cervical lymph chain which was considered not to be involved by carcinoma clinically. All tumors from which a biopsy was made disclosed epidermoid carcinoma. They were well differentiated and in none of them could a considerable degree of anaplasia be demonstrated. The lesions responded well to radiation therapy and showed prompt regression. It is noted, however, that large doses were required for complete disappearance. The type of radiation therapy will be outlined with the description of the cases:

REPORT OF CASES

CASE 1.—A white man aged 64, admitted July 18, 1938, had chewed tobacco daily for twelve years. He held the quid in his mouth for periods of two to three hours at a time. The quid had always been held on the left side at a point corresponding to the site of the lesion. He had always been a heavy smoker, using cigars and a pipe for the past twenty-five years. Upper and lower plates have been worn for twenty-five years, but these did not appear to have caused him any trouble. The first symptom was soreness, which appeared one year prior to admission. The soreness became progressive and he could feel a roughened area on the inner surface of the left cheek shortly before admission. The Wassermann reaction was negative.

On the inner surface of the cheek, adjacent to the lower alveolar ridge, there was present a small oval papillary tumor which did not appear to infiltrate the submucosal tissues. The surface of the tumor was the seat of multiple projections, and areas of leukoplakia surrounded and covered portions of the lesion. Adenopathy was not noted. Histologic section disclosed papillary epidermoid carcinoma with pearl formation. Roentgen therapy was administered, the patient receiving 6,250 roentgens measured on the skin to one field. The surface area

Fig. 3 (case 4).—Appearance of inner surface of the right cheek, after therapy.

averaged about 30 sq. cm. The dose was administered in twenty-three days. The technical factors consisted of 220 kilovolt peak, 5 mm. of copper plus 1 mm. of aluminum filtration, focal skin distance 60 cm. Epithelitis and moist epidermitis was produced which healed in the usual manner. The patient is living and well with no evidence of disease.

CASE 2.—A white man aged 69, admitted Dec. 18, 1939, had been an inveterate tobacco chewer for the past fifty years

and had chewed daily for hours at a time. He used no cigarets and smoked cigars only occasionally. He had no dentures or bridgework although he was completely edentulous. It is difficult to ascertain whether he continuously held the quid on the left side of the mouth, corresponding to the site of the lesion. However, the quid was held on this side of the mouth most of the time. The first symptom was "sore mouth"

Fig. 4 (case 5).—Carcinoma of the mucous membrane of the right alveolar ridge before therapy. Note tobacco quid in apposition with the ulcerated portion of the lesion.

three years prior to admission, and at that time a physician prescribed local applications. About five months prior to admission he consulted another physician because of the progressive soreness and pain, and radium and roentgen therapy were administered. The pertinent complaints when he was first seen were referable to the masses in the neck which had developed three months previously.

Extensive leukoplakia on the mucous membrane of the left cheek with superimposed superficial ulceration was present. There was no evidence of carcinoma of the mouth but histologic sections made before treatment with radium and roentgen rays revealed definite squamous cell carcinoma. He had extensive bilateral cervical adenopathy, the largest node measuring 5 cm. in diameter on the left side and 3.5 cm. in diameter on the right side. No further therapy was deemed advisable because of the extent of the disease, and he was referred back to his physician. He died several months later with metastatic carcinoma.

CASE 3.—A white man aged 65, admitted Dec. 20, 1939, had symptoms referable to the lesion in his mouth about nine months prior to admission. The first symptom was pain, which became progressively worse. He consulted a physician several months after the onset and was treated with local applications. The lesion failed to improve and a biopsy was done. The patient had chewed tobacco daily for approximately thirty-five years. The quid had rested almost always on the side of the mouth corresponding to the site of the lesion. He had had dentures for the lower jaw for the past five or six years. He lost about 40 pounds (18 Kg.) in one year.

There was an ulcerated lesion on the left lower alveolar ridge. The ulceration was 1 cm. wide and about 4 to 5 cm. in length, extended to the anterior pillar and involved the mucous membrane of the left cheek. Patchy areas of leukoplakia were present at the edges of the lesion. Cervical adenopathy was not noted. Histologic sections demonstrated epidermoid carcinoma.

The patient received teleradium therapy with the 10 Gm. pack. He was given 156,000 milligram hours in a period of thirty-six days through an 8 cm. portal at a distance of 12.5 cm. The radium was filtered with the equivalent of 2 mm. of platinum. The lesion at first responded poorly, and imme-

diately after the teleradiation a local applicator in the form of a vulcanite mold was inserted. Three thousand milligram hours was given in five days. The radiation surface of the mold was about 14 sq. cm. The mold contained 160 mg. of radium with a filtration of 1 mm. of platinum. Following therapy extensive epithelitis developed involving the entire lesion and the surrounding mucous membrane. The skin showed only a small area of moist epidermitis. The skin and mucous membrane healed in normal fashion. One month after completion of therapy the patient was free from disease. He died three months later of coronary thrombosis with no evidence of carcinoma.

CASE 4.—A white man aged 72, admitted Jan. 12, 1940, had been chewing tobacco daily for the past sixty years. He stated that he had chewed constantly throughout the day. Until several years ago he always held the quid on the right side at the point at which the lesion developed. Recently, however, because of pain and irritation, he shifted the quid to the left side. About eleven years previously he had consulted a physician because of soreness and roughness of the buccal mucosa on the right side. At that time his teeth were removed and a small nodule of the cheek was cauterized. This never healed completely, but the lesion did not increase in size until six months prior to admission.

There was an obvious tumefaction in the right cheek and a heaped-up papillary verrucoid tumor mass occupying almost the entire mucosa of the cheek and extending anteriorly to within 1 cm. of the labial commissure was present. The lesion measured approximately 3 cm. vertically, 4 cm. in the antero-posterior direction and about 1 cm. in thickness. The lesion was covered and surrounded by patchy areas of leukoplakia. Adenopathy could not be demonstrated. Roentgenograms of the mandible and maxilla revealed no evidence of bone invasion. On the mucous membrane of the left cheek, corresponding to the new site at which the quid was held, a small patch of leukoplakia 1.5 cm. in diameter had developed. Histologic section of the tumor on the right cheek revealed epidermoid carcinoma.

The patient was treated with the 10 Gm. radium pack. He received 152,000 milligram hours through a 6 by 6 cm. portal at a distance of 12.5 cm. in a period of eighteen days. The radium was filtered with the equivalent of 2 mm. of platinum.

Fig. 5 (case 5).—Appearance after therapy.

The lesion did not completely disappear, and a nodule measuring about 1 cm. in diameter remained. Interstitial application of radium was used about three months after the teleradium therapy. He was given 1,200 milligram hours in a period of one hundred and twenty hours. Five 2 mg. needles filtered with 1 mm. of platinum were inserted underneath the remnant. The needles were arranged parallel to one another in a flat radiating surface, measuring approximately 3 by 4 cm. At the present time the patient is free of disease.

CASE 5.—A white man aged 70, admitted April 15, 1940, had chewed tobacco daily for almost sixty years. The quid had been held almost entirely on the left side for about two hours each day. The first symptom, observed three months prior to his admission, was pain, intensified by mastication. The Wassermann reaction was negative.

Fig. 6 (case 6).—Carcinoma of the inner surface of the right cheek before therapy.

There was present an extensive lesion between the alveolar ridge and the mucous membrane of the cheek on the right side, measuring approximately 7 cm. in length. The lesion was surrounded by an extensive area of leukoplakia. There was ulceration in the center and considerable induration at the edges. Involvement of the mandible was not present on roentgen examination. A specimen for biopsy was not taken. There was no cervical adenopathy.

The patient was treated with telerradium therapy. He was given 156,000 milligram hours with the 10 Gm. radium pack in eighteen days through an 8 cm. round portal at a distance of 12.5 cm. The radium was filtered with the equivalent of 2 mm. of platinum. Additional therapy was administered two weeks after completion of telerradium therapy in the form of a mold. The radiation surface of the mold was approximately 5.5 sq. cm. He received a total of 1,370 milligram hours in seven days of treatment extending over a period of nine days. The mold contained 50 mg. of radium. The radiation surface was 7 mm. from the lesion. The radium was filtered with 1 mm. of platinum. Intense epithelitis was produced, which healed normally. There is now no evidence of cancer.

CASE 6.—A white man aged 70, admitted July 2, 1940, stated that he had had an elevated area on the mucous membrane of the right cheek for the past six months. The first symptom that he observed was soreness. He consulted a physician because the lesion was becoming larger and more painful and interfered with mastication. At first the patient stated that he did not chew tobacco but on close questioning he admitted that he had chewed it for a period of thirty years, during which time he chewed daily for from five to six hours. The quid was held on the right side almost entirely. In later years, however, the quid was shifted to the left because of soreness at the original site. He stopped the practice of chewing tobacco approximately at the age of 50, but since then he has been smoking, using both a pipe and cigars. The Wassermann reaction was negative.

There was a rounded raised papillary lesion of the mucous membrane of the right cheek measuring approximately 2.5 cm. in diameter. The mucous membrane of the right cheek was covered with thin patchy areas of leukoplakia. On the inner surface of the left cheek, opposite the second molars, a round patch of leukoplakia with a slight central depression was present. (This corresponds to the new site at which the quid

was held.) There was no evidence of cervical adenopathy. Histologic section showed papillary epidermoid carcinoma.

The patient was given roentgen therapy and received 5,000 roentgens measured on the skin in a period of eleven days. Technical factors were 220 kilovolts, 60 cm. distance, portal 4 by 4 cm., filtration 2 mm. of copper plus 1 mm. of aluminum. Following radiation therapy, epithelitis of the surface of the lesion and surrounding mucous membrane developed. The skin showed only a small area of moist epidermitis which was situated approximately in the center of the treated cutaneous surface. These radiation reactions healed normally and two months after therapy was administered the lesion had completely disappeared.

CASE 7.—A white man aged 75, admitted July 30, 1940, stated that he had used chewing tobacco for the past sixty-five years almost continuously. He chewed practically all day and held the quid at a point on the left side corresponding to the site of the lesion. The first symptom developed about a year prior to admission, at which time he observed an irritation on the inner surface of the left cheek. Since then he had also had burning pain in the left side of the mouth associated with excess salivation. The Wassermann reaction was negative.

There was an irregular, ulcerated area involving the buccal mucosa anterior to the body of the mandible. The lesion measured approximately 2 by 3 cm. It was craterlike, and the edges consisted of papillary masses. The margins were firm but the lesion did not infiltrate deeply into the submucosal tissues. There was a small soft node in the upper portion of the anterior cervical lymph chain which was considered not to be involved by carcinoma. Histologic section revealed epidermoid carcinoma. The patient is under treatment with telerradium therapy at the time of this report.

CASE 8.—A white man aged 72, admitted Aug. 9, 1940, stated that he had chewed daily for periods of from four to five hours and had continued this practice for the past sixty-five years. He smoked a pipe occasionally and had worn an upper plate for about two months. Oral hygiene had been poor. The first symptoms appeared three years prior to admission, and at that time swelling of the cheek, irritation of the buccal mucosa on the right side and difficulty in mastication were present. The symptoms subsided for a time, but after this the lesion gradually became more painful. The Wassermann reaction was negative.

Fig. 7 (case 6).—Appearance of the inner surface of the right cheek after therapy.

There was a verrucoid lesion, approximately 4 by 5 cm. in diameter, occupying the greater portion of the mucosa of the cheek on the right side. The anterior portion was papillary and covered with patchy areas of leukoplakia, which also involved the mucous membrane surrounding the lesion. The leukoplakic areas extended to the alveolar margins above and below. There was no evidence of cervical adenopathy. The

Wassermann reaction was negative. Histologic section showed epidermoid carcinoma. The patient is receiving telerradium therapy at the present time.

SUMMARY

The data presented here, although subject to certain limitations because of their clinical character, support the concept that chewing tobacco is an etiologic factor in the development of cancer of the mouth. A study of tobacco chewing, a practice whereby the causative factor is applied to the mucous membrane, is perhaps the most direct method of demonstrating its etiologic relation to cancer. It is agreed by practically all observers that carcinoma of the mouth develops at the point at which the quid is held, and an analysis of the history and observations made in the 8 cases presented here amply corroborates such a view.

The literature on betel chewing reveals further evidence that the practice of chewing tobacco may be the dominant factor in the development of this type of cancer. Tobacco as a common ingredient in the betel chew has received some attention in this regard from others. It is to be noted that reports which fail to show a greater incidence of cancer of the mouth in betel chewers also fail to mention the use of tobacco in describing the preparation of the betel chew. It is unfortunate that details and statistical information on betel chewing and cancer are lacking in regions in which this is a common practice.

The lesions on the inner surface of the cheek associated with the use of chewing tobacco have a distinctive appearance. They are of a papillary verrucoid character, covered and surrounded by patchy areas of leukoplakia. Only moderate induration is present, and deep infiltration into the submucosal tissues is lacking. The leukoplakic changes are probably precursors of the actual neoplasm and represent the earliest changes. This is well illustrated in 2 subjects who transferred the quid from one side of the mouth to the other after the developing lesions became too painful. In both instances, small circumscribed patches of leukoplakia appeared at the new sites. The lesions are slow in growing and metastasize only late in the course of the disease. Histologically the tumors reveal no unusual features. They are all examples of differentiated epidermoid carcinoma.

The therapy which these patients have received has been radiation. Immediate response has been excellent, although large doses were required for complete regression. It is impossible to state the effectiveness of radiation with respect to cure, since these cases have been collected in the past two years. It is important to note, however, that all patients who completed treatment were freed of the primary lesion.

21 West Elm Street.

A Great Thrill.—To the student of medical history there is a great thrill in finding instances in which a supposedly modern invention had its origin far back in the ages. Such was the case with bimanual turning, credited to Braxton Hicks in the middle of the nineteenth century. In reality the procedure was described in detail three hundred years before by Scipio Mercurio, the Dominican monk of Padua and Venice. Mercurio quit the cloister to practice medicine in Venice in 1571, and there he published his midwife's book, in which he described his technic of version and the cesarean operation. As far as is known, he was the first to advise cesarean section on the living mother with a contracted pelvis. His writings were the outstanding contributions to obstetrics in the sixteenth and seventeenth centuries.—Findley, Palmer: *A Historical Sketch of Obstetrics*, *J. Internat. Coll. Surgeons*, April 1941.

AMINO ACIDS AS A SOURCE OF NITROGEN FOR ALLERGIC INFANTS

LEWIS WEBB HILL, M.D.

BOSTON

It is sometimes necessary to feed infants who are allergic to milk a food containing no milk. The soy bean foods have been and will continue to be of value. Their chief disadvantage is that in some infants they cause large, loose bowel movements and irritated buttocks. While such trouble is not common if the food is cooked in a double boiler for three quarters of an hour, it would be of advantage to have an alternate food for use when necessary.

Shohl, Butler, Blackfan and MacLachlan,¹ using a synthetic protein-free food² in which amino acids prepared from hydrolyzed casein were the chief source of nitrogen, showed that for short periods nitrogen equilibrium and good gains in weight could be maintained. This is of great theoretical interest but of less practical importance unless it can be shown that such a food is adequate for nutrition over relatively long periods.

The preparation used by me was the same as that used by the authors cited. It has the following composition: amino acids 20 per cent, dextrimaltose 42.3 per cent, virgin olive oil 18 per cent, arrowroot starch 10 per cent, brewers' yeast powder 3 per cent and mineral salts 6.7 per cent.³

One level tablespoon contains 38 calories. When four level tablespoons are mixed with 6 ounces (180 cc.) of water, the mixture contains amino acids 2.8 per cent, fat 2.8 per cent, carbohydrates 8.5 per cent and minerals 0.8 per cent. The food contains no vitamin A, C or D, but adequate amounts of these were given in added quantities. The earlier lots contained none of the vitamins B, so that one-half teaspoon of brewers' yeast twice a day was given to each infant receiving the food. Later 3 per cent of yeast was incorporated directly into the food during the process of manufacture, and no additional vitamin B was given.⁴

The nitrogenous compounds contained in the preparation are not allergenic, since it was found by making intracutaneous tests that a solution of the amino acid preparation containing the same amount of nitrogen as the casein solution ordinarily used for making cutaneous tests would not give positive cutaneous reactions in infants who did react positively to casein.

In this investigation it was my chief purpose to determine whether infants would take such a food over relatively long periods and, if they did take it, whether or not it would produce adequate gains in weight. The value of a milk-free diet for certain eczematous infants has been discussed by us.⁵

2. Laboratory product 113 (now called Amigen Compound) was supplied by Mead Johnson & Co. Their Dr. Warren M. Cox stated that approximately 60 per cent of the nitrogen of the hydrolyzed casein used in this product is amino nitrogen and 12 per cent ring nitrogen, and the remainder probably presents higher molecular aggregates, such as polypeptides. In using the term "amino acids," I refer to the enzymic casein hydrolysate.

3. Including 3.5 per cent calcium gluconate.

4. The amount of yeast added by the manufacturer supplies approximately 12 international units of thiamine hydrochloride per level tablespoon of the powder.

5. Hill, L. W., and Stuart, H. C.: Soy Bean Food Preparation for Feeding Infants with Milk Intolerance, *J. A. M. A.* 93: 985-987 (Sept. 28) 1929.

Thirty-six eczematous infants, all under 1 year of age, most of whom gave positive cutaneous reactions to one or more of the proteins of cow's milk, were fed on the food for periods varying from two weeks to three months. The food is taken well by most infants under 1 year of age and does not often cause vomiting or diarrhea. The stools are usually two to four a day and are of thin consistency but do not cause irritated buttocks. The results on the eczema are the same as with any other milk-free food—if the eczema is caused by milk it will be greatly relieved or cured with a milk-free diet. In about one half of the patients treated in this series the eczema was apparently definitely due to milk.

In several such cases the eczema immediately recurred when milk was resumed and disappeared again when a return was made to the milk-free food. In some cases, in spite of positive intracutaneous reactions to milk, there was no improvement whatever on withdrawal of milk. This observation is not new and simply means that not all positive intracutaneous test reactions to milk are of etiologic significance. There can be no doubt, however, that many times the withdrawal of milk and the substitution of the amino acid food causes great improvement or cure of the dermatitis.

Gain in weight is irregular in many eczematous infants irrespective of what they eat, so that it is not possible to apply exact statistical methods to the recorded data. With the amino acid food there were some large gains over short periods but no large gains over long periods. However, in many cases, although the gain in weight over a period of two or three months may not have been large, it was adequate, and babies experiencing the gain were in excellent nutritional condition. As a matter of fact, it is better for eczematous babies not to gain weight rapidly during the acute stage of the eczema, and I should consider a gain which is somewhat below the average normal as satisfactory. Any estimate of the proper gain in weight is difficult as regards eczematous infants, and many of them cannot be compared to the normal, because the infants are not well. Some infants, especially those with erythroderma, will not gain well no matter what they are fed or how much of it they eat until the acute stage of the dermatitis is over, which may take several months. Furthermore, eczematous infants are subject to infections of the skin and respiratory tract which interfere with nutrition, and some wriggle and rub so actively that they use more calories than the normal baby. In several instances I discontinued the amino acid food because the gain in weight did not seem sufficient and found that there was no better gain with milk. I found that often the usual 45 or 50 calories per pound was not enough and that I have had better results with 60. Most patients took adequate amounts of the food and gained well. It has a strong taste, somewhat like strong beef tea, and some infants, although they may take it well for a few weeks, tire of it and thereafter will not take enough to gain. This is perhaps the only real disadvantage of the food.

I know of no milk-free food that has no disadvantages, and for that reason it is desirable to have more than one. The soy bean foods are not well adapted for very young babies (under 4 months) or for those with a tendency to loose stools. I fed one infant aged 7 weeks the amino acid food, and it was well tolerated. I have the impression that it is the milk-free food of choice for very young infants.

I have known of infants who have taken a soy bean food for as long as two years. I doubt that the amino

acid food would be taken for as long a period but consider it a valuable adjunct in the dietetic treatment of milk-sensitive infants.

SUMMARY

Thirty-six infants were treated; satisfactory results were obtained in 19 and unsatisfactory results in 9. The results were inconclusive in the treatment of 8 infants.

By satisfactory results, I mean that the food was taken well by the baby, improved the eczema and caused satisfactory gains in weight. By unsatisfactory results is meant that it caused either diarrhea or vomiting, was taken either poorly or not at all or caused unsatisfactory gains in weight.

CONCLUSIONS

1. It is possible to feed infants satisfactorily for periods of at least three months on a synthetic food which contains no protein except that contained in a small amount of added brewers' yeast and in which more than 60 per cent of the nitrogen is in the form of amino acids. This food has some advantages over other milk-free foods.

2. No milk-free food for infants at present available is entirely without disadvantages. It is desirable to have more than one type of food, in order to meet the individual needs of different babies.

TRANSMISSION OF A MURINE STRAIN OF POLIOMYELITIS VIRUS TO GUINEA PIGS AND RHESUS MONKEYS

CLAUS W. JUNGBLUT, M.D.

AND

MURRAY SANDERS, M.D.

NEW YORK

In 1910, while studying experimental poliomyelitis in monkeys, Roemer and Joseph¹ first called attention to a presumably spontaneous flaccid paralysis which occurred among approximately 5 per cent of their normal guinea pig stock. In the following year Roemer² succeeded in transmitting this disease to normal guinea pigs by intracerebral injection of emulsions of the brains and spinal cords of spontaneously paralyzed guinea pigs. The causative agent was identified as a hitherto unknown filter-passing virus which proved glycerin resistant and could not be grown on artificial mediums. The pathologic condition in the central nervous system was described as meningomyeloencephalitis of lymphocytic nature, involving the pia mater and also the substance of the spinal cord, particularly in the lumbar levels. While stressing the dissimilar pathologic features, Roemer did not fail to emphasize the striking analogy between this paralysis of guinea pigs and Heine-Medin disease. Identification of the etiologic agent was not carried further, probably because the virus was lost in its fifth passage in guinea pigs. Since the time of Roemer's observation laboratory workers have almost universally held that guinea pigs are

This work was supported by a grant from the Philip Hanson Hiss Jr. Memorial Fund.

refractory to experimental inoculation with poliomyelitis virus. However, Neustaedter³ in 1913 and Picard⁴ in 1925 reported what they interpreted as spontaneous induction of poliomyelitis in certain guinea pigs in which flaccid paralysis of the extremities developed after close contact with poliomyelitis-infected monkeys. Neither investigator was able to extend his studies further, since the infectious agent proved nontransmissible in guinea pigs beyond one or two passages. To our knowledge no further records have been published of "spontaneous" flaccid paralysis in guinea pigs. It would therefore seem that the observations of Roemer, Neustaedter and Picard are unique in that all three referred to the occurrence of flaccid paralysis in guinea pigs under conditions in which the possibility of a transfer of poliomyelitis virus by natural routes of infection cannot be excluded with certainty.

In an earlier communication dealing with the adaptation of the SK strain of poliomyelitis virus from the monkey to rodents we⁵ reported the fact that the murine virus, while highly pathogenic for cotton rats and white mice, possessed no demonstrable paralyzing power in rhesus monkeys or guinea pigs; however, active virus could be recovered from such symptomless infected animals for at least ninety-six hours after intracerebral injection. These observations were based on properties of the murine virus manifested in its earlier transfers (tenth to thirtieth passage). With continued passages in mice evidence began to accumulate of a considerable increase in virulence, intracerebral potency of the murine virus for mice gradually rising from an original titer of approximately 1:1 million to activity on dilution of 1:1 billion. This phenomenon served as a stimulus to reexamination of the pathogenicity of the murine virus, beginning with the seventieth passage in mice, for rhesus monkeys and guinea pigs.

As far as its pathogenicity for rhesus monkeys is concerned, it was found that the murine virus had undergone a minor though distinct change. Whereas formerly only slight nervous disturbances of transitory character had been observed, the virus now evoked much more definite signs of activity when introduced directly into the central nervous system. Thus, of a group of 7 monkeys inoculated intracerebrally with suspensions of the brains or cords of paralyzed mice, 3 monkeys passed through a well defined encephalitic syndrome consisting of high fever, coarse tremor and tonic-clonic convulsions, followed by extreme prostration which proved fatal in 1 instance. The described symptoms, as well as the histologic examination of the monkey which died, left no doubt that the infectious agent was capable of localizing in the brain of the monkey, with the production of acute polioencephalitis. Yet in none of these animals can classic poliomyelitis be said to have developed; if this diagnosis is to be limited to a disease process that is characterized by spinal localization of the virus, with subsequent production of flaccid paralysis. Again, the essential difference in the character of the observed process was revealed by the fact that all surviving monkeys, when reinjected four weeks later with SK monkey poliomyelitis virus, were found unprotected.

With reference to its pathogenicity for guinea pigs, the murine virus presented a new and entirely different picture. Thus, beginning with the seventieth passage in mice; transfer of the virus from mouse to guinea pig could be obtained with a high percentage of takes. Of a total of 26 guinea pigs inoculated intracerebrally on different occasions with 0.1 cc. of unfiltered suspensions of the brains or cords of paralyzed mice, flaccid paralysis developed in 24, or approximately 92 per cent; of 6 guinea pigs inoculated similarly with filtered material (Berkefeld N or W candles being used as filters), 3 became paralyzed. Control injections of material from the brains of normal mice did not cause any paralytic symptoms in guinea pigs.

The following will briefly describe the symptoms and the pathologic changes caused by the disease in guinea pigs, as well as the distribution of the virus and the routes of infection. During a variable period of incubation there develops in a majority of the infected guinea pigs a preparalytic fever which drops with the onset of symptoms. When paralysis sets in it is usually complete, involving the hind legs more often than the front legs. The condition, as a rule, terminates in death, although partially paralyzed animals may go on to recovery (fig. 1). The pathologic changes in the cen-

Fig. 1.—Flaccid paralysis in guinea pig four days after intracerebral injection of murine poliomyelitis virus.

tral nervous systems of paralyzed guinea pigs reveal a typical poliomyelitic process in the anterior horn of the spinal cord associated with a mild encephalitic process. Perivascular infiltration is commonly observed, as well as complete or partial necrosis of ganglion cells with advanced neuronophagia. Lesions in the white matter are rare; the meninges have a normal appearance (fig. 2). The infectious agent can be recovered from the brains or cords of paralyzed guinea pigs; it has not been found in blood or in extraneural sites. Curiously enough, it is either the brain or the cord of a paralyzed guinea pig which contains the virus in a form pathogenic for guinea pigs, but rarely can the disease be further transmitted with both tissues of the same animal. A titer of 1:20 of suspensions of the brain or the cord represents the average potency of the guinea pig virus. Initial transfer of the virus from mouse to guinea pig may be accomplished by intracerebral inoculation or by subcutaneous, intraperitoneal and intravenous injections; feeding as well as nasal instillation have produced negative or questionable results. Once the virus has been established in the guinea pig, further propagation of the disease in that animal has succeeded only by intracerebral transfer.

Neutralization tests in guinea pigs have shown that virus which has passed through guinea pigs is com-

pletely inactivated by guinea pig convalescent serum, antimurine virus¹ rabbit serum and SK monkey convalescent serum; conversely, guinea pig convalescent serum has inactivated SK poliomyelitis virus in the monkey. Normal serum from monkeys or guinea pigs has uniformly failed to inactivate guinea pig virus. The serologic evidence, therefore, suggests the identity of the virus in its three hosts, i. e. monkey, mouse and guinea pig.

When passed serially through guinea pigs the virus shows a definite tendency toward deterioration. This is indicated not only by a progressive decrease in the percentage of infected animals in which manifest paralysis develops but also by a gradual lengthening of the period of incubation. Thus, in the late passages, incubation periods of from seven to twenty-one days were commonly observed, as compared with an average period of two to four days for the first transfers. This phenomenon appears to be characteristic for the virus in guinea pigs, since two attempts to maintain continuous serial passages in guinea pigs came to an abrupt

Fig. 2.—Section of cord from paralyzed guinea pig showing diffuse loss of anterior horn ganglion cells and degeneration of some of remaining nerve cells; also diffuse and perivascular infiltration by lymphocytes and increase in glial elements.

end with the sixth and seventh passages respectively. A third tree, at present, has been carried as far as the tenth generation.

Passage through guinea pigs brought about another significant modification of the virus. While active in guinea pigs, the infectious agent could be easily returned to mice and cotton rats but not to rhesus monkeys. However, when its virulence diminished for guinea pigs and mice, intracerebral inoculation of a rhesus monkey with material from the cord of a paralyzed guinea pig resulted, eight days later, in classic poliomyelitis, i. e. complete flaccid paralysis of the left leg with typical lesions on one side of the cord in the lumbar region. It would therefore seem as if some cyclic change in pathogenicity of the virus had taken place in the course of its passage from the monkey to rodents and back to the monkey.

Description of the fluctuating pathogenicity of the virus in various hosts brings us to a discussion of another property of the virus in guinea pigs, namely its power of inducing what would seem to be latent immunity. This was first noticed when guinea pigs,

which had exhibited no demonstrable paralysis after intracerebral inoculation with virus subjected to passage in guinea pigs, failed to contract the disease on reinfection with highly potent mouse virus. Thus, of a group of 29 previously infected but symptomless guinea pigs, only 13 showed paralysis on intracerebral reinoculation. A similar protection was observed in 18 out of 21 guinea pigs which had escaped paralysis following injection of mouse virus by ineffective routes when these animals were reinfected intracerebrally with mouse virus. The incidence of paralysis in these two series should be contrasted with the infectivity of the mouse virus in normal control guinea pigs, which reaches as high as 92 per cent. Attempts to recover virus from the brain and cord of guinea pigs forty-eight hours after reinfection failed to demonstrate the presence of virus in the central nervous system of "latently immune" or convalescent animals, while active virus was readily recovered from infected normal guinea pigs. In three feeding experiments, "latently immune" as well as normal guinea pigs continued to discharge active virus in their feces for a period of forty-eight hours after the oral administration of murine virus. Virus has never been recovered from the feces of intracerebrally infected guinea pigs or from the feces of normal guinea pigs. Essentially analogous observations were made with rhesus monkeys. Thus, among a group of 19 monkeys which had failed to respond with paralysis to intracerebral inoculation with virus passed through guinea pigs, 5 escaped the disease when reinfected intracerebrally with SK poliomyelitis virus; on the other hand, paralysis developed in all of 12 accompanying control monkeys.

It becomes evident, from what has been said, that there are certain similarities and dissimilarities of the SK strain of poliomyelitis virus in monkeys and rodents which presumably develop during the transition of the infectious agent from one host to another. In the first place, one is impressed by the decided neurotropism of the virus in rhesus monkeys and in guinea pigs when contrasted with its wide distribution in mice. Second, as the range of hosts widens, a gradual expansion in the avenues of infection may be observed which seems to parallel the apparent diminution of affinity to specialized tissue. To wit, rhesus monkeys are constantly susceptible only to intracerebral injection of the virus, guinea pigs may acquire the disease by intracerebral, intravenous, intraperitoneal and subcutaneous injection, whereas mice succumb to intracerebral infection as well as to infection by all peripheral routes, including feeding and nasal instillation. Since the virus in mice has possibly a broader basis of cellular attack, it is not surprising that *in vitro* cultivation succeeds with mouse virus while similar attempts with monkey or guinea pig virus have produced negative results. However, these discrepancies may be more quantitative than qualitative because the virus reaches much higher levels of potency in mice than in either monkeys or guinea pigs. It would therefore seem that, in its basic properties and manifestations, the guinea pig virus approaches the monkey and human virus more closely than does the murine virus. Indeed, the similarity of guinea pig and human virus may well be said to be even more striking than that of monkey and human virus. For while SK virus in paralyzed monkeys is restricted to the central nervous system, occurring only in the spinal cord and not in the brain, and is transmissible at will from monkey to monkey in unbroken series, guinea pig virus gives evi-

dence of definite instability which recalls the behavior of the infectious agent in man. Thus not only is the virus distributed haphazardly between the brain and the cord of paralyzed guinea pigs but transfer of nervous tissue, despite the presence of obvious lesions, often fails to induce paralysis in guinea pigs. In other words, the extent of experimental transmissibility of the virus in guinea pigs bears some resemblance to the characteristic limitations of natural chains of infection observed in the picture of human epidemics of poliomyelitis. This superficial resemblance is further accentuated by the fact that guinea pig virus, in both guinea pigs and monkeys, seems capable of reproducing a state of latent immunity which has been suspected to operate in the disease in man but heretofore has not been clearly recognized in experimental poliomyelitis in monkeys. Experience must show whether these observations will ultimately lead to a fuller appreciation of the complex biologic properties of the virus of poliomyelitis and, furthermore, to what extent such observations can be made the starting point for a better understanding of the epidemiologic problems of the disease in man.

PSYCHIATRIC GERIATRICS

THE POSSIBILITIES IN THE TREATMENT OF MENTAL STATES OF OLD AGE

G. WILSE ROBINSON JR., M.D.
KANSAS CITY, MO.

Geriatrics is the science of the treatment of diseases of old age. In the days of straight pathologic interpretation, this branch of medicine was neglected almost entirely because of the belief that arteriosclerosis and/or senile atrophy were the sole and only causes of the presented symptoms.

Senile organic changes are both progressive and irreversible. If the changes were causing the symptoms, the only thing for the physician to do would be to control the symptoms, and the only objective of society would be to provide care and custody for those whose mental faculties have been disturbed or destroyed by these pathologic developments. These concepts have led to a pessimistic outlook, by both physicians and laymen, and to a disinterest in geriatrics as a constructive branch of therapeutics.

The most distressing developments of old age are the mental symptoms. If the mental symptoms are interpreted as straight pathologic developments they are all hopeless, and every person over 60 who acquires mental symptoms should be confined immediately to an institution and considered to be in need of custody and protection the rest of his life.

In recent years study and observation of these conditions have shown that a straight pathologic interpretation in these cases should not be made. The classic statement "A man is as old as his arteries" is, of course, still true, but "old age" and "senile dementia" are not synonymous.

For years it has been customary to divide all the psychoses roughly into "functional" and "organic." This division puts almost the entire burden of the senile psychoses on structural changes, ignoring or minimizing any other possible factor. Rhein, Winkel-

man and Patten¹ worked out a classification of the mental manifestations of old age based on a correlation of clinical symptoms and postmortem observations. However, more than 30 per cent of their cases did not fit exactly into their classification, even with their advantage of complete pathologic study. Gellerstedt² and Rothschild³ pointed out that there is no correlation between the intensity of mental symptoms and the severity of the pathologic changes. They found many severe pathologic changes in brains of patients with no history of mental symptoms. Riggs⁴ also has found this to be true.

Wartman⁵ found in 500 consecutive autopsies that 90 per cent of the men and 85 per cent of the women over 60 years of age had cerebral arteriosclerosis. These statistics confirm the concept that pathologic conditions are not the only factor. It is known that 90 per cent of the men and 85 per cent of the women over 60 are not afflicted with mental symptoms.

Rothschild⁶ pointed out the difficulty of exact diagnosis and differentiation of senile dementia and arteriosclerotic psychosis, using pathologically proved cases for his material. He pointed out also the high incidence of other types of psychotic reactions which develop in the later years of life and which do not result from irreversible pathologic changes.

Clow⁷ analyzed 100 cases of psychosis accompanying cerebral arteriosclerosis. It was pointed out that the past reactive history seemed to be important in that 61 of the patients were, in their adult years, more than ordinarily tense. Fifty of them were described as having an unusually narrow range of interest. A large proportion of them had made notably poor sexual adjustments. Thirty-three showed maladjustments ranging from frigidity to promiscuity and psychopathic behavior.

Toxic factors, such as a definitely excessive use of sedative medication, contributed to the development of the psychosis. Operations, trauma, infections and other activating incidents were noted in a number of the histories. Notwithstanding the large number of cases in which toxic and physical factors appeared to play the chief role, emotional disturbances apparently were by far the most frequent factors to upset the limited adjustment of the person with cerebral arteriosclerosis and to precipitate a psychosis.

A diagnostic breakdown showed that 34 patients had delirium as the presenting clinical picture, 19 agitated depression, 18 mental confusion, 5 depression, 5 manic-like states and 4 paranoid states. Only 14 patients presented deterioration as the most prominent feature.

Of these 100 patients 11 recovered, 12 were much improved, 31 improved, 30 did not improve and 16 died. Forty-nine patients were able to return home. Treatment consisted of psychotherapy and the applica-

Secondary toxic delirious reaction.....	10

* This series includes only 1 psychoneurotic patient. I have studied several other patients but refused to treat them for several reasons. This patient came to me recently, and the good result makes me hopeful that some help can also be given those with this type of reaction. Patients with similar conditions will receive treatment in the future.

infusions of dextrose, 66 per cent were able to return home. Palmer, Braceland and Hastings⁸ reported on a series of 123 cases of senile and arteriosclerotic psychosis. These are true mental states of old age considered by all to result from pathologic changes, yet in their series 30, or 24.4 per cent, made a social recovery, i. e. became well enough to go home.

The physician who studies this material with an open mind cannot help but conclude that the pathologic conditions alone do not cause all the symptoms. There must be some other factors. The mental states of persons over 60 who present symptoms of an abnormal mental state must be analyzed in terms of total psychiatry rather than of pathology alone.

A series of cases at the Neurological Hospital confirms this concept. Three years ago my associates and I began to study this problem constructively and treat patients with these disorders intensively by every known means. We decided that every patient was entitled to a chance and that a hopeless prognosis would not be given until every possible therapeutic aid and measure had been exhausted. Since then we have studied and treated 50 patients over 60 years of age. There are a few other patients in this age class who, for various reasons, were not treated. Furthermore, there have been a number of patients under 60 admitted to the hospital who had demonstrable arteriosclerosis and a psychosis. Only those patients over 60 who received a full course of treatment are included in this series.

Table 1 gives the clinical diagnosis of this series. The term "primary toxic delirious reaction" indicates those cases in which a delirium-like reaction developed during the course of some major or minor illness or operative procedure. "Secondary toxic delirious reaction" indicates that the delirium which resulted from malnutrition, treatment measures and similar factors developed during the course of some other type of psychotic reaction. The cases of secondary delirium are not included in the totals, as they appear under the heading of the primary type of reaction. These secondary delirious reactions all cleared under proper

treatment. "Psychotic reactions to visceral disease" has been set up as a separate entity. However, the use of this term may not be exact. The exact nature of some of the psychotic reactions to heart disease and other visceral diseases has not yet been determined.

While there is a definite pattern of the mental symptoms found in cases of cardiac disorders, no consistent etiologic factor other than the cardiac decompensation could be shown in Drewry and Wall's⁹ series of 10 carefully studied cases. They reported that of 50 consecutive patients with heart disease, 4 (8 per cent) showed the clinical picture of "cardiac delirium." Gibson¹⁰ reported an incidence of 10 per cent, while Coombs¹¹ and Romberg¹² considered the condition rare.

Michael¹³ pointed out that arteriosclerosis may be one of the causes that modify the course of a mind disordered during cardiac decompensation to the extent that prompt recovery, the rule in patients who have recovered from signs of heart failure, is delayed. Ziegler¹⁴ in his discussion of Michael's paper commented that psychoses arising from cardiac decompensation are delirious reactions or toxic psychoses.

Because of the difficulties of classification this group has been set up separately. It probably belongs in one of the classes of toxic delirium but was set apart because the primary physical disease still existed at the time of admission and was present when the patient left the hospital or died. These are cases of true organic heart disease. The tachycardias and arrhythmias of a functional or malnutritional type seen so frequently in psychotic patients are not con-

group. It will be seen in table 2 that the reactions to visceral disease have the poorest prognosis.

The most striking fact in this diagnostic breakdown is the small number of cases (6 per cent) of arteriosclerotic psychosis. Muncie¹⁵ pointed out that the clinical picture of this condition is distinguished by the uneven deteriorative changes, the presence of focal signs, general and retinal arteriosclerosis and the exclusion of other factors. Only 3 of my patients had focal signs indicating an area of cerebral destruction. I feel that a severe abnormal mental reaction resulting from a single vascular occlusion is rare, because large areas of the brain must be destroyed before permanent mental symptoms develop. Surgeons now remove a whole frontal lobe of the brain without producing any demonstrable change in the personality. Both frontal lobes or large areas of the brain must be removed to produce mental symptoms. Our 3 patients had had multiple attacks of apoplexy, indicating that there had probably been widespread destruction. The term, as used here, indicates that the psychosis results directly and exclusively from the arteriosclerosis and its effects, not as Clow used the term, indicating that arteriosclerosis was definite in his 100 patients with abnormal mental reactions. The pathologic references given previously indicate that extreme arteriosclerosis alone will not cause mental symptoms. I feel that many, if not most, of the conditions diagnosed as arteriosclerotic insanity are really toxic delirious reactions.

Arteriosclerosis is a factor in the total etiology in that it affects or lowers the adjustability of the whole organism and its physiologic processes, thereby making it easier for the various types of psychosis to develop. Only rarely, and then late in its course, does it cause a psychosis by itself alone. Senile dementia, on the other hand, results from "the exaggerated or premature appearance of rather specific parenchymatous changes, but these changes are seen frequently in individuals not suffering from senile dementia, although this finding is more or less a curiosity."¹⁶ This condition was more common (22 per cent) in our cases. Senile dementia and arteriosclerotic psychosis were the only two types of reaction found in our series that resulted from changes in the brain alone and were, therefore, irreversible. Only 14, or 28 per cent, of the total series were in these groups. Theoretically then, 36, or 72 per cent, of our series fall into clinical classifications which might respond to modern psychiatric therapy.

Table 2 bears out this concept.

Thirty-five patients, or 70 per cent, of our total series recovered sufficiently to return home. These included 2 patients with an arteriosclerotic psychosis. Of the 36 patients who had conditions that should be expected to respond to active psychiatric therapy 25, or 69.4 per cent, recovered completely while 8, or 22.3 per cent, had a remission of sufficient quality to enable them to go home. This gives a percentage of 91.6 of the group with a reversible type of psychosis who were able to return home and take care of themselves rather than be confined in an "institution" for the rest of their lives. These figures certainly do not bear out the usual hopeless prognosis held for patients with mental disorders over 60.

In this series the delirious patients received daily infusions of 10 per cent dextrose as outlined by me in a previous publication.¹⁷ The patients with agitative depressive psychosis received metrazol to induce convulsive shock. One of these was 84 when treatment was given, and she remains well today, more than two years after treatment was given. None of these patients received any sedatives, nor were they given any hydro-

TABLE 3.—Six Months Follow-Up*

* Includes only those with whom I have been able to make contact.

therapy. The average length of time under treatment was about six weeks for those who recovered.

Table 3 shows the state six months after discharge of those patients who returned home. It is interesting to note the high percentage of sustained recoveries.

Twenty-four patients of the 33 with syndromes having a good prognosis who made a social remission or better have been home six months or more. I was able to establish contact with 20 of these patients six months after discharge. Seventeen of them, or 85 per cent, had maintained their good condition, showing that the therapeutic measures applied corrected or "cured" the psychosis and did not just give a "boost" or temporary mobilization of faculties. These sustained recoveries could not be expected if pathologic changes were responsible for the symptoms presented at the time of original contact.

CONCLUSIONS

1. Pathologic changes of a destructive or deteriorative type were solely responsible for the symptoms in only 14, or 28 per cent, of this series of 50 patients over 60 years of age with abnormal mental reactions. Thirty-six patients, or 72 per cent, had types of mental illness that respond to modern therapy.

2. Of the 36 patients with a good prognosis, 33, or 91.6 per cent, recovered sufficiently to go home in an average length of time under treatment of six weeks.

3. Of the 33 patients who recovered, 24 have been discharged six months or more and only 2 have had a relapse; 1 died. Seventeen, or 85 per cent, of the 20 with whom I was able to maintain contact remained well at the end of six months.

4. Senile dementia and arteriosclerotic psychosis, the usual diagnosis for abnormal mental states in persons over 60, are not the common mental disorders of older people. The common disorders, such as toxic delirious reactions and affective reactions, usually an agitative depressive psychosis, may be corrected readily.

5. Psychiatric geriatrics is a fertile field for investigation and study from a constructive standpoint, and the results to be expected are as good as in the treatment of younger patients with mental disorders.

CONTROL OF TUBERCULOSIS IN WISCONSIN

THE RESULTS OF FOUR YEARS OF MASS STUDY
IN SANITARY DISTRICT NO. 5, 1936 TO 1939

L. M. MORSE, M.D.

District Health Officer, Wisconsin State Board of Health
NEILLSVILLE, WIS.

The Wisconsin State Board of Health has sponsored programs of testing with tuberculin and roentgen examination in the school population as a case finding study and also as an educational program in an effort to make the public tuberculosis conscious. Although the programs were centered about the school population, the adults and children of preschool age also participated. The physicians and public health nurses in the various counties encouraged the "contacts" and suspected families to take the Mantoux test. This paper presents only the work carried out over a four year period, 1936 to 1939 inclusive, in Sanitary District no. 5 (fig. 1); the other districts carried on the same type of program.

The total area of the district is 7,054 square miles and is located in west central Wisconsin. The area is primarily devoted to dairying and farming, although the eastern part of the district has some of the largest paper mills in the state. The total population of the area is 240,000, of which there is an urban population (cities over 2,500) of only 55,000. The district is inhabited predominantly by German, Norwegian and Polish people, and less than 1 per cent of the population is Indian. The Indian population was not included in this four year study. There are approximately one hundred and eighty physicians in the district and twenty-two public health nurses. Two sanatoriums are located in the eastern part of the district.

A general plan was followed in which programs of mass testing with tuberculin and roentgen examinations were carried out. Usually the county boards appropriated the funds for tuberculin tests and roentgen examinations of the positive reactors, although in some counties local townships, the persons themselves or organizations supplied the funds. During the four year study, the various county boards in the district appropriated \$23,916 for case finding in the control of tuberculosis. The county health committee, through the district health officer and county nurse, handled the publicity and obtained the signed request cards which authorize the physician to give the test. Radio talks were given, newspaper articles written, posters displayed and various groups addressed on the subject of tuberculin testing. The plans and policies were determined by the public relations committee of the individual county medical society or a special tuberculin testing committee appointed by the society. It was significant that the longer the publicity was maintained, the higher was the number of request cards returned by the parents or guardians giving the physician permission to test with tuberculin. No program was instituted in any county unless at least 75 per cent of the school population had signed to take the test. Practically all the physicians in the district participated in the testing program, and those who had adequate roentgen ray facilities took roentgenograms of the chests

of the positive reactors. All the roentgenograms were examined by members of the Wisconsin Anti-Tuberculosis Association or by other qualified roentgenologists. Roentgenograms with poor contrast were retaken. Old tuberculin in the dilution of 1 to 1,000, prepared by the state laboratory of hygiene, was used exclusively.

The accompanying table summarizes the results of the program carried out in Sanitary District no. 5. The persons who were given the tuberculin tests and roentgen examinations were divided into five groups according to age. The table shows that of the 36,022 persons who received the Mantoux test 3,991 reacted

Totals and Results of Testing with Tuberculin and Roentgen Examination in Sanitary District No. 5, 1936 to 1939

	Preschool Children (1 Through 5 Years)	Grade School Children (6 Through 14 Years)	High School Students	Normal School Students	Adults	Totals
Number of Mantoux tests given from 1936 to 1939, inclusive	505	23,418	10,049	144	1,906	36,022
Number of positive reactors to Mantoux test, 1936-1939, inclusive	56	1,611	1,538	24	762	3,991
Total number of roentgenograms taken	80	1,645	1,072	19	1,001	4,074
Number having more than one roentgenogram, as a result of the rotating program, or as a result of suspicion of tuberculosis	15	108	120	2	79	414
Number of cases of active tuberculosis	0	8	6	0	54	68
Number of cases of suspected active tuberculosis	6	47	25	1	85	164
Number of roentgenograms showing primary tuberculous infection	12	559	264	4	353	1,222
Number of roentgenograms showing probable or possible tuberculous infection or negative.....	32	950	568	0	458	2,297
Number of roentgenograms showing pathologic lesions other than tuberculosis	3	139	49	0	274	465

The number 4,074 refers to the total number of roentgenograms taken. Some of these patients (414) required one, two or even three roentgenograms over a period of six months to a year before a diagnosis of active tuberculosis was made. The figures 80, 1,645, 1,072, 19 and 1,001 reading across refer only to individual patients.

positively and 32,031 negatively. There were 4,074 roentgenograms taken of the chests of the positive reactors; 414 persons had one or more roentgenograms taken because of suggestive conditions in the chest. It was found that 68 persons had active tuberculosis, and 164 were considered as having evidence suggesting active tuberculosis; consequently there were 232 cases of active or of suspected active tuberculosis discovered which had previously been unknown in the community. There were 1,222 persons who showed roentgen evidence of a healed primary complex. There were 2,297 persons who were considered as having a probable or a possible tuberculous infection and were classified as having negative roentgenograms of the chest.

It is interesting to note that through the 4,074 roentgenograms which were taken because the person examined was a positive reactor there were 465 persons found to have other pathologic abnormalities of which

Dr. R. S. Baldwin, of the Marshfield Clinic, gave suggestions and criticism, and Mr. Harold Holand and the staff of the Wisconsin Anti-Tuberculosis Association prepared the charts and other material.

they, at the time, were not cognizant, for instance: One hundred and eighty-four patients had evidence of pleurisy; 150 had evidence of cardiac disorders; 75 had either acute or chronic bronchitis; 24 had suggestive bronchiectasis; 8 had evidence of pneumonia; 5 had tuberculous cervical glands; 3 had carcinoma of

Fig. 1.—Location of district health units.

the lung; 1 had a pulmonic abscess, and 1 had Hodgkin's disease. Some of these patients have since died. It is evident that to take roentgenograms of the chest annually is good preventive medicine, from the amount of nontuberculous, thoracic disorders that was discovered.

Figure 2 presents graphically the number of persons tested in each age group. The grade school and high school students received the majority of tuberculin tests. This, of course, is to be expected, since the program was originally outlined with special emphasis on the school population. The grade school group received more than twice the number of tuberculin tests as compared to the high school group of students.

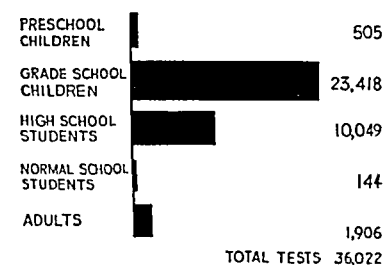

Fig. 2.—Tuberculin tests given, 1936-1939 inclusive.

adult and preschool groups represent only 7 per cent of the 36,022 who received tuberculin tests.

Figure 3 shows the percentage of positive reactors in the district and among each age group. For the entire district, only 11 per cent of those tested were positive reactors whereas in the state at large they average from 14 to 16 per cent. There were twice as many positive reactors discovered among the high

school students as among the grade school students. The higher incidence of positive reactors in the preschool and adult groups is explained by the fact that the public health nurses and physicians exerted special efforts to bring in contacts and groups in which tuberculosis was known to have occurred at some time in the past or to exist at present. Although the adult and preschool groups represent only 7 per cent of those receiving tuberculin tests, they revealed the highest percentage of positive reactors.

Figure 4 shows graphically the incidence of cases of active tuberculosis in the district for each of the age groups tested and compares this with the normal expectancy for the state. This "normal expectancy" is based on the Framingham ratio for estimating cases (nine times the annual number of deaths from tuberculosis). A normal expectancy of 1 case of active tuberculosis is derived for every 336 persons in the general population. Thus, with an average estimate of 9,033 cases of active tuberculosis in Wisconsin during the period 1936-1939 and an estimated state population of 3,032,174, there would be 1 case of active disease

Fig. 3.—Percentage of positive reactors to tuberculin tests (Mantoux), 1936-1939 inclusive.

for every 336 persons in the state ($\frac{3,032,174}{9,033} = 336$). Statistically, persons given a tuberculin test in the district are compared with this normal expectancy, giving the "case finding productivity" for each group tested. Thus, among adults tested with tuberculin, twenty-four and a half times as many cases of active and suspectedly active tuberculosis were found as would be expected in an unselected population. With adults tested, there was some selection of persons for the tuberculin test on the basis of contact or symptoms. Less than 1 case per 336 persons tested was found among grade school children, which is less than the normal expectancy for the general population. Only among high school students were as many cases found as one would expect to find in an unselected population in Wisconsin. The high total of four times the normal expectancy for preschool children is partly explained by a selection of children for the tuberculin test who were known to have been in contact with infectious tuberculosis.

These statistics on cases found show that it is among the contacts that the largest number of cases of active tuberculosis are to be discovered. Every case comes from another; every case may lead to another.

COMMENT

A great deal has been written about the tuberculin test, its value, its limitations,¹ its potential dangers² and its use in case finding.³ This study definitely demonstrates that mass testing with tuberculin as a screening measure and case finding procedure is of economic and of educational value but requires modification in rotating programs, limiting it to selected groups, as in younger children and in adults, and to places in which the incidence of infectious tuberculosis is highest. It is also a valuable procedure in determining the incidence of tuberculosis in the community.

Although there were 32,031 negative reactors discovered, it is known that many of these may react negatively today and positively tomorrow.⁴ The negative reactors cannot be forgotten, and all the attention should not be focused on the positive reactors. Occasionally cases are encountered in which the

Compare the **BLACK** figures with the normal **OUTLINE** figure.

The black figures show how effective the case-finding program in District 5 was for each group tested.

Fig. 4.—Cases found for groups tested with tuberculin, 1936-1939 inclusive.

evidence of tuberculosis exists but the reaction to tuberculin is negative.¹ I found a number of such cases. One cannot prove that all persons who react negatively to the tuberculin test have escaped earlier infection, since there is evidence that cutaneous hypersensitiveness may wane or disappear.⁵ Howe⁶ has shown that there may be considerable daily fluctuations in cutaneous sensitiveness to tuberculin. Many studies indicate that more tuberculosis develops among those who react negatively to tuberculin on exposure than those who react positively.

More than 90 per cent of all the positive reactors have had one or more roentgenograms made. Those

whose roentgenograms had a suggestive appearance may have had new ones every month or every three to six months. It is important to remember that one of the most difficult parts of the program was to get roentgenograms of the positive reactors. What about the group of patients who had a positive reaction to tuberculin with a normal roentgenogram of the chest? The tendency is to say that they are healthy and that no special care is needed, but there are patients of this type on record who died of tuberculosis within two and one-half years. Ch'iu, Myers and Stewart⁸ in a ten year follow-up examination of children, of whom 446 were positive reactors and 772 were negative reactors, found that 15.02 per cent of the positive reactors were sick with a reinfection type of tuberculosis as compared to 1.68 of the negative reactors. Thus there were 9 cases of tuberculosis among the positive reactors to 1 among the negative reactors. The ratio between the mortality for the positive reactors and that for the negative reactors is 38 to 1. Pope and his associates⁹ found that the morbidity from adult type tuberculosis was four times as great among the positive reactors as among the negative reactors. If nothing is done about these positive reactors possibly 15 per cent of them will eventually incur active tuberculosis for which institutional care is needed.

It is noteworthy that the majority of the persons who had definite roentgen evidence of primary tuberculous infection exhibited no external sign of tuberculosis and, as a matter of fact, would not have known that they had the primary complex had they not taken the tuberculin test. The course of the disease in adults is apparently the same as in infants and children—active treatment is not necessary, but all must be looked on as potential cases of reinfection type of tuberculosis at some future date.¹⁰ It is significant that in those areas in which infection in childhood is most common the highest mortality is found in adult life; in areas such as Cattaraugus County, N. Y., in which a majority of the adolescents are demonstrably tuberculin negative, the mortality in adult life is low.¹¹

It has been estimated¹² that there are more than 500 patients with active tuberculosis in the district, of whom less than 50 per cent have been hospitalized. This presents a specific problem in the district. As a direct result of this program, 232 cases of active or suspectedly active tuberculosis were discovered which had previously been unknown in the community. No incorrigible person with infectious tuberculosis should be permitted to be at large. The patient with infectious tuberculosis must be segregated, and the education of the population in the prevention, early discovery, communicability and prevalence of tuberculosis must continue. More widespread emphasis should be placed on the prevention of the transmission of infection, and more general use of roentgenograms, especially in cases of suspected and doubtful tuberculosis, is necessary if more minimal tuberculosis is to be discovered. The preclinical case must be detected. It is essential to

check the discharged sanatorium patients periodically. Respectfully scrutinize the very aged for active tuberculosis. Concentrations of sputum and gastric lavage should be done more frequently as a routine procedure in searching for the tubercle bacillus.

Since the inception of the program, the various counties in the district have had rotating programs; selected age groups and contacts have been retested, and most of the positive reactors are given a roentgen examination annually. The campaign against tuberculosis has been successful, probably as a result of three factors: first, education; second, improved medical and public health facilities, and third, improvement in general living conditions. In the epidemiology of tuberculosis, the public health nurse plays an important role along with the physician; the follow-up of contacts and of families is of extreme importance in control and in discovering the source of infection. The control of tuberculosis presents a more complex problem than almost any other of the communicable diseases for which the cause is known.¹³ Environmental factors seem to have a more common influence on the development of the disease than do the constitutional factors.

SUMMARY

Four years of intensive mass tuberculin tests and roentgen examinations engaged in by the general practitioner in cooperation with the state board of health in Sanitary District no. 5 of Wisconsin have revealed the following:

1. There were 36,022 tuberculin tests to which 3,991 persons reacted positively and 32,031 negatively. There were 4,074 roentgenograms taken and 232 cases of active or suspectedly active tuberculosis discovered. There were 1,222 roentgenograms which showed definite evidence of primary tuberculous infection. There were 465 roentgenograms revealing other pathologic lesions, exclusive of tuberculosis, of which the patients were not cognizant at the time. It is apparent that the use of roentgenograms is good preventive medicine for the early diagnosis and discovery of other conditions of the chest.

2. The negative reactors should not be dismissed and all the attention focused on the positive reactors.

3. The case finding productivity was highest in the adult and preschool groups, which represented only 7 per cent of the total number tested. This shows that it is among "contacts" that the largest number of cases of active tuberculosis is to be discovered.

4. This program was successful because the various methods of publicity that were employed made the communities tuberculosis conscious.

5. The cost of this program was only \$23,916, which represents a small investment of money in comparison to the dividends returned to the taxpayers by discovering early tuberculosis and thereby decreasing sanatorium costs.

6. Tuberculosis is a communicable disease, and the spread of it tends to concentrate around the infectious case; consequently the control of tuberculosis still rests with the family physician and a heavy responsibility with the medical profession and health officials. It is evident that tuberculosis still presents a fertile field for the early application of the newer developments of medical science; much work remains to be done.

Clinical Notes, Suggestions and New Instruments

MULTIPLE HEMANGIOMAS OF BONE, PROBABLY CONGENITAL

JOHN W. PIERSON, M.D.; GEORGE FARBER, M.D., AND
JOHN EAGER HOWARD, M.D., BALTIMORE

Diffuse osteolytic lesions of the skeletal system are often among the clinician's most difficult diagnostic problems. Even microscopic examination of biopsy material may be inconclusive for exact diagnosis. We have recently seen a patient whose widespread lesions confused several physicians in other localities as well as ourselves. The correct diagnosis was established only by skeletal biopsy. Because we have found in the literature no clinical description of a similar case, we feel justified in calling the entity to the attention of the profession in order that it may be considered in the differential diagnosis of patients who suffer with multiple skeletal lesions, osteolytic in character.

REPORT OF CASE

History.—R. P., a white man aged 21, was referred to us by Dr. Warfield M. Firor for diagnostic study. The patient's medical history was free of all but minor illnesses until his skeletal difficulty was accidentally brought to light. Birth and development had been normal. At the age of 3 years the tonsils and adenoids had been removed. He suffered annually from mild attacks of hay fever in the latter part of the summer.

In September 1934, at the age of 16 years, after wrestling with his brother, the patient noticed slight swelling and tenderness over the left clavicle. Two days later, when tackled in a football game, he experienced a sudden sharp pain in this clavicle. Roentgenograms were taken at once and disclosed that the clavicle had been fractured through a cystic area. On the same film were noted several cystic areas in the scapula. Roentgenograms were then taken of many other bones, revealing widespread skeletal lesions of cystic type.

A diagnosis of hyperparathyroidism was made (metabolic status or electrolyte status of the serum at this time is not known) and twelve roentgen treatments were given to the anterior cervical region over a period of six months. Coincidentally he was given a calcium preparation intravenously twice each week and drank 3 quarts of milk daily. The patient states that his physicians were unable to detect any change in the skeletal lesions at the end of six months. Thereafter, for three and a half years, the patient received no therapy whatever (he continued to drink 1 quart of milk daily) and felt in the best of health. In the spring of 1939 a specimen was taken for biopsy from one of his ribs and was diagnosed osteitis fibrosa cystica.

Physical Examination.—The patient's weight was 162 pounds (73.6 Kg.) and his height 70 inches (178 cm.). The pulse was 80, the respiratory rate 18 a minute; blood pressure was

Fig. 1.—Distribution of the lesions.

125 systolic and 80 diastolic. He was well developed and healthy looking and stated that he had no symptoms of any kind. There were a few tiny pigmented moles scattered over the skin of the torso, but otherwise the skin was clear and

Fig. 2.—Multiple cystic areas in the pelvis with trabeculae through some of the lesions. Lesions overlap but apparently they are not confluent.

of normal texture. The scalp was searched for pigmented areas without success. No palpable or visible abnormalities could be detected in the skeleton. General physical examination by several observers resulted in perfectly normal findings.

Laboratory studies showed the hemoglobin content 16.3 Gm. (112 per cent), red blood cell count 4.91 millions, hematocrit reading 47 mm., white blood cell count 4,550. A smear and differential count were done and were normal, with 5 per cent eosinophils.

Fasting serum calcium determinations were made on four occasions and ranged from 10.4 to 10.7 mg. per hundred cubic centimeters of serum. Fasting serum phosphorus was determined coincidentally and ranged from 4 to 5.5 mg. per hundred cubic centimeters of serum. Total serum protein ranged from 6.34 to 6.5 Gm. per hundred cubic centimeters of serum.

Fig. 3.—Skull showing multiple punched out areas without surrounding reaction. Diploic involvement best seen just anterior to coronal suture.

Nonprotein nitrogen was 30 mg., cholesterol 231 mg. and sugar 100 mg. per hundred cubic centimeters. Carbon dioxide combining power was 52 volumes per cent. Serum chloride was 100.6 milliequivalents. Serum phosphatase activity on two occasions was 2.5 Bodansky units.

Examination of several specimens of urine revealed no abnormal constituents.

The entire skeleton was examined roentgenologically; the distribution of the lesions is shown in figure 1.

Roentgen Examination.—Lesions were widely distributed over the osseous system; they represented cystic changes in the spongiosa which were outlined by condensed bone. These cysts were traversed by irregular coarse trabeculae, and many of them were expansive (figs. 2, 3, 4 and 5).

The skull showed numerous such lesions in the vault, where they caused localized expansion of the diploe with thinning and bulging of the tables. Large vascular channels appeared to enter some of the cysts. The left posterior clinoid process was deformed. No change was demonstrated in the base of the skull.

The vertebral bodies contained large cysts, some of which extended into the pedicles and transverse processes. The right pedicles and transverse processes of the second and third lumbar vertebrae were greatly expanded and a number of spinous processes of the other vertebrae were involved. Similar lesions were seen in the ribs and shoulder girdles. The fifth and eighth ribs on the right and the seventh rib on the left side showed pathologic fractures through the cysts. The pelvic bones were filled with irregular cysts.

Fig. 4.—Ribs showing multiple cystlike areas with expansion.

The femoral heads were the sites of large cysts, which were found subjacent to the faintly outlined epiphyseal lines. Small cystic changes were visualized along the inner surface of the cortex of the left humerus. A large solitary cyst was demonstrated in the upper end of the right humerus and another the size of an almond was located in the lower portion of the left femur. The cortex surrounding the latter cyst appeared to be expanded, and a radiolucent channel in the cortex communicated with the cyst. This radiolucent channel represented a large blood vessel. Small, less sharply outlined lesions were seen in the upper portions of the femurs. The bones of the left forearm, lower legs, hands and feet were normal in appearance.

For ten days the patient was on a low calcium diet (estimated but not analyzed). At the end of this period a metabolic study of his urinary calcium was begun, on a diet containing 0.116 Gm. of calcium and 0.8 Gm. of phosphorus a day for two consecutive three day periods. Urinary calcium excretion during the first of these periods was 0.396 Gm. of calcium (0.132 Gm. a day) and for the second period 0.420 Gm. of calcium (0.140 Gm. a day). These amounts are well within the range of normal.

A 4 cm. portion of the sixth rib was removed for pathologic study¹ by Dr. Warfield M. Firor.

According to Dr. S. S. Blackman's report on the pathologic sections, the microscopic specimen consisted of four cross sec-

1. The microscopic sections were made for us by Dr. Stacy R. Guild of the Department of Otolaryngology.

tions of a rib (figs. 6, 7 and 8). They did not appear to form a continuous series, but in three of the sections a multilocular cavernous hemangioma could be traced. It extended from near the center of the marrow cavity outward and into the cortex of the external surface of the rib. Where the angioma occupied the more central part of the marrow cavity, at the point of greatest dimensions, it formed a single large space measuring 8 by 5 mm. Scattered irregularly in the normal myeloid and adipose tissue of the marrow, about the margins of the larger cavities of the angioma, there were a good many smaller angiomatic channels which varied from about 80 to 300 microns in greatest diameter.

The channels in the angioma were more or less completely filled with blood. At some levels they contained only serum. They were lined by a layer of endothelium superimposed on an exceedingly thin basement membrane which was only a little thicker than the walls of normal venules in the marrow.

In places the walls of the angioma lay directly over bony spicules of the shaft of the rib. In other areas the cells of the marrow lay immediately beneath the angioma, and at one point the angioma was in contact for a short distance with the inner surface of the cortex of the rib.

The bone trabeculae near the margins of the largest of the angiomatic cavities in the shaft of the rib were concentrated closer together than normal and tended to lie parallel to one another. They were narrower than the normal trabeculae lying at a distance from the angioma, and some of them were composed of partly calcified osteoid tissue. Where the angioma extended into the cortex of the bone the latter was extremely thin, measuring in places not more than 40 microns. The normal cortex of this bone, on the contrary, varied from about 0.5 to 2.5 mm. in thickness.

COMMENT

In the literature there are many reports of hemangiomas involving the skeleton. In 1930 Bucy and Capp² reviewed the literature up to that date and reported cases of their own. Pich³ described a case of hemangioma of the calvarium which was thought to be a sarcoma

Fig. 5.—Cystic appearing area in lower end of femur with thinning and expansion of cortex.

and, therefore, resected. But these reports are of isolated skeletal lesions. Saltykow⁴ reported a case in which, at autopsy, hemangiomas were found to involve three vertebrae.

The records of the department of pathology of the Johns Hopkins Hospital were searched to see whether a similar condition had been observed. Many cases in which hemangiomas involved isolated bones were found. In three cases hemangiomas were found to have involved more than one bone: In one case several vertebrae were involved, in another case three ribs were found to be the seat of hemangiomatic lesions, and in the third the skull and one vertebra were involved. In no case, however, were there anything like the widespread lesions occurring in our case.

The clinical data on our patient and roentgenograms taken of him were presented to several of our associates here and elsewhere prior to the establishment of the diagnosis, and the correct diagnosis was never once even suggested as a

diagnostic possibility. For these reasons we believe the condition to be quite rare.

Furthermore, the roentgenographic characteristics of the disease, at least as exemplified in our case, are quite decisive and

Fig. 6.—Angiomatic area in cortex of rib.

Fig. 7.—Angiomatic cavity in rib marrow. Under the microscope this cavity is seen to be filled with serum.

clear cut. The lesions appear as extremely sharply demarcated, vacuolated areas in bones which seem otherwise entirely undisturbed by their presence. No evidence of fibrous, osteogenic or other irritative response appeared either roentgenographically or microscopically. The thin areas immediately surrounding the

cysts we regarded as areas of condensation and not true reactions of the bone to the tumor. The individual or clustered cystic areas varied in size from that of a large olive to that of a millet seed. Their distribution was equally remarkable and unusual. After roentgenography of the entire skeleton only one lesion was apparent below the elbows or knees. This

Fig. 8.—Small angiomatous channels in marrow.

single exception occurred in the upper portion of the right radius. The distribution of the lesions, as disclosed by roentgen rays, is seen in figure 1.

Another striking feature is the excellence of the patient's general health. Even after we had seen the roentgenograms and knew of his skeletal abnormalities, nothing abnormal could be made out on physical examination, nor were we able to elicit any symptoms of disability whatever. It is interesting to speculate as to how long the patient's disease might have continued unrecognized had not his fracture necessitated roentgen examination.

But of more importance to the patient is the (as yet) unanswerable speculation "Is the condition progressive or not?" We have assumed that the condition is of congenital origin. Will the lesions gradually develop, with pressure atrophy of more and more bone, until too little skeletal structure will remain for supportive purposes? Two reasons have led us to believe that this would not be so: 1. We have been unable to detect any progress of the lesions over a five year period when we compared the roentgenograms of the skull, long bones and thorax taken in 1935 with our own made in November 1939. 2. Nowhere either in the roentgenograms or in the specimen taken for biopsy have we been able to find any evidence of osseous destruction, irritation or effort at repair. We have given this patient a sanguine prognosis and urged him to carry out his planned matrimonial venture.

In differential diagnosis the most likely confusion will arise from xanthomatosis. The latter disease commonly causes multiple, clear-cut, irregular cystic areas in the skeleton without evidence of any response on the part of the affected bone. Furthermore, the patient may be in apparently the best of health until the terminal phase of his disease. Distribution of the lesions should, however, if our case is characteristic, give a clue, and biopsy should be conclusive.

Osteitis fibrosa cystica (hyperparathyroidism) should be readily distinguished by (1) its characteristic metabolic disturbances and (2) the generalized rarefaction if the skeleton is involved at all.

Osteitis fibrosa disseminata may be differentiated by (1) the completely different distribution of the skeletal lesions, (2) their different appearance on roentgen examination (areas of rarefaction beside contiguous areas of new osseous formation), (3) the pigmented areas on the skin and (4) the precocious sex development in females of this group.

These three are by far the most likely skeletal diseases to be confused with the condition under discussion. But when one considers the matter closely it may be seen that, clinically, this differential diagnosis is really not difficult for any one of them, except the first, provided one knows of and thinks of the possibility of disseminated hemangiomas of bone. Our worst confusion was not that we thought our patient suffered with any one of the three diseases just mentioned but that at that time we did not know of any other condition he might have. It seems useful, therefore, to record this case, which should be kept in mind when cystic or vacuolated multiple skeletal lesions are encountered which do not fit in with any of the other more common disease entities.

proved of real and lasting value there is not the slightest doubt; the alleviation of symptoms and cure of long-known disease processes which heretofore have been therapeutically unapproachable unequivocally attests to this fact. The heroic relief obtained in patients with severe deficiency states, especially prevalent in the South, and those less obvious but more widespread alterations of the human economy which one now recognizes as "subclinical" or "hypovitaminotic" states are

being increasingly brought under control. However, the enthusiasm and eagerness of clinicians to use vitamin therapy in nondeficiency and other conditions have expanded the clinical application of these substances far beyond their proper confines. This wave of enthusiasm must, therefore, be guided by true observation and tempered by sound clinical judgment.

The present study was instigated after the appearance of several reports by Jolliffe and others¹ which dramatized immediate and amazing beneficial effects in postencephalitic and arteriosclerotic parkinsonism by the intravenous administration of one or more doses of 50 to 100 mg. of pyridoxine hydrochloride (vitamin B₆). Dr. Jolliffe reported this work in April 1939 at a symposium on vitamins at Mount Sinai Hospital, New York, and again before the American Neurological Association in June 1940.² He stated that "within a few minutes there was much improvement, rigidity was decreased significantly and the patients were able to walk without the usual stiffness." Spies later reported before the Illinois State Medical Society the results of studies concerning the use of pyridoxine in 11 selected cases of parkinsonism of at least four years' duration, 8 of which were arteriosclerotic and 3 postencephalitic. He stated that "within a few minutes there was much improvement in the latter 3."

In view of the gratifying results obtained by these reliable workers, I felt moved to try this same type of therapy. Accordingly, a group of 15 patients with parkinsonism were selected from private practice, 10 of whom had the postencephalitic and 5 the arteriosclerotic type. Daily doses of 50 to 100 mg. (repeated one to three times) were administered intravenously to this group. I might add that this series of patients constituted an especially fitting one for such a study, since all of them had previously been under my observation for a period of six to eighteen months. Real improvement could therefore be accurately evaluated by comparison with the carefully recorded previous condition of the entire group. Moreover, particular care was taken to avoid any suggestive comment at the time of injection or thereafter, so that the psychologic effects of a "new" medicine would not be a factor in the therapeutic result. This is particularly important, I believe, since the threshold of suggestibility in patients suffering from parkinsonism is universally low and any therapeutic result can be easily misconstrued in such patients. This high degree of suggestibility which characterizes the parkinsonian state must be constantly kept in mind when making observations on such patients.

The results of this study, as shown in the accompanying table, revealed no beneficial effects whatever in any of the patients in this group. Two patients stated that they "thought they felt a little better," although careful neurologic examination at the time and several days later revealed no change in the degree of muscular rigidity or tremor. No toxic or untoward effects were noted at any time after the administration of doses as high as 100 mg. given intravenously.

COMMENT

It is my opinion as well as the opinion of many other workers that in order to consider a special form of vitamin therapy truly efficacious in altering the course of a known disease process the following two criteria should be fulfilled: (a) A deficiency should exist in the bodily economy of the particular vitamin substance which is being supplanted artificially, and (b) any degenerative process which has developed as a result of an existing deficiency must necessarily still be "reversible" in order for the specific therapy to be of value.

The rationale which initially prompted workers to administer pyridoxine hydrochloride to patients with parkinsonism fulfils neither of these two essential criteria. It has never been shown, either experimentally or clinically, that parkinsonism can result from deficiency of vitamin B₆. Secondly, the neuro-pathologic changes localized in the globus pallidus and substantia nigra, which are known to be the underlying lesions

of parkinsonism, represent a degeneration which has occurred and existed for years in these areas of the central nervous system. It is a profound type of structural damage, characterized pathologically by the replacement of nerve cells by glial tissue and one which can hardly be considered "reversible."

SUMMARY AND CONCLUSIONS

1. Repeated intravenous doses of 50 to 100 mg. of pyridoxine hydrochloride were administered to a selected group of 15 patients with parkinsonism.

2. No beneficial effects whatever were noted after this treatment.

3. No untoward effects were noted as a result of this treatment.

4. On the basis of the foregoing study it is my opinion that pyridoxine is of no value in the treatment of parkinsonism.

LEGAL RESPONSIBILITY FOR MEDICAL MALPRACTICE

II. MALPRACTICE: SOMETHING OF THE ANATOMY OF THE LAW

HUBERT WINSTON SMITH, A.B., M.B.A., LL.B.

Member of the Bar of the United States Supreme Court
BOSTON

When a physician seeks to make contact with legal thought, he may feel as forlorn and lost as a curious traveler among users of an unknown tongue. This is not so much because the law is filled with words of art or because lawyers desire to keep the subject out of reach of the layman. Courts now regard it as a vain display to use Latin maxims, and much of the old technicality has been swept away. The real difficulty arises because the layman is unfamiliar with a limited number of combinations of vowels and consonants which lawyers take for granted.

He who acts as interpreter should proffer enough comment to make the landmarks vivid and the journey pleasant, while sparing his charge the ennui of the encyclopedic. It is in the role of such a guide that I have essayed this abbreviated account of the modern law and the materials with which it works.

On July 5, 1939 the Supreme Court of Pennsylvania handed down its important opinion in *Hodgson et al. v. Bigelow*, 335 Pa. 497, 7 Atlantic (2d) 338. The plaintiff, a boy of 8 years, fell on a stick while at play and received a dirty, penetrating wound of the thigh, 5 inches (13 cm.) long. The defendant, a practicing physician of Philadelphia, relying on his judgment, made no incision or débridement, did no test to determine hypersensitivity to serum and gave no tetanus antitoxin. Finding the mouth of the wound was half an inch (1.3 cm.) wide, he swabbed to the bottom with alcohol and iodine, inserted a loose gauze drain and applied a sterile dressing. He repeated the same treatment on three successive days, the wound appearing "very satisfactory." He did not see the boy on the fifth day, but on the sixth, the stepfather told the physician the child had complained about his jaws hurting and being stiff. Thereupon, the physician made an examination and pronounced the jaws and mouth "perfectly normal." On the seventh day the boy was rushed to a hospital, suffering from tetanus and a staphylococcal infection of the leg. He had a stiff neck, his

2. Jolliffe, Norman: Treatment of Paralysis Agitans by Vitamin B₆, read before the meeting of the American Neurological Association, Rye, N. Y., June 6-8, 1940.

mouth opened only half an inch (1.3 cm.), his abdominal muscles were rigid and he suffered from generalized rigidity of all the voluntary muscles. He spent four weeks in the hospital; he underwent débridement of the wound immediately and a closure operation twenty-three days later and received a total of 750,000 units of antitetanus serum. By the time he was discharged he had incurred medical bills of more than \$1,500. He sued the defendant for alleged negligence in failing to administer tetanus antitoxin.

At the trial, five reputable physicians and surgeons (among them X) in testifying for the plaintiff asserted that the injury was a "puncture wound," which prevailing medical standards in the community demanded should be incised to its depths, cleaned and drained and which necessitated giving the patient a subcutaneous injection of 1,500 units of tetanus antitoxin immedi-

Furthermore, in submitting the case to the jury, the trial court did not make clear the important questions, or "issues," they were to decide. The jury returned a verdict for the defendant. The trial court granted a motion for new trial filed by the plaintiff. It did so because the court was of the opinion that perhaps some of its rulings and remarks may have been prejudicial to the plaintiff. From the order granting a new trial, the defendant appealed. The Pennsylvania Supreme Court held that the new trial was properly granted, saying:

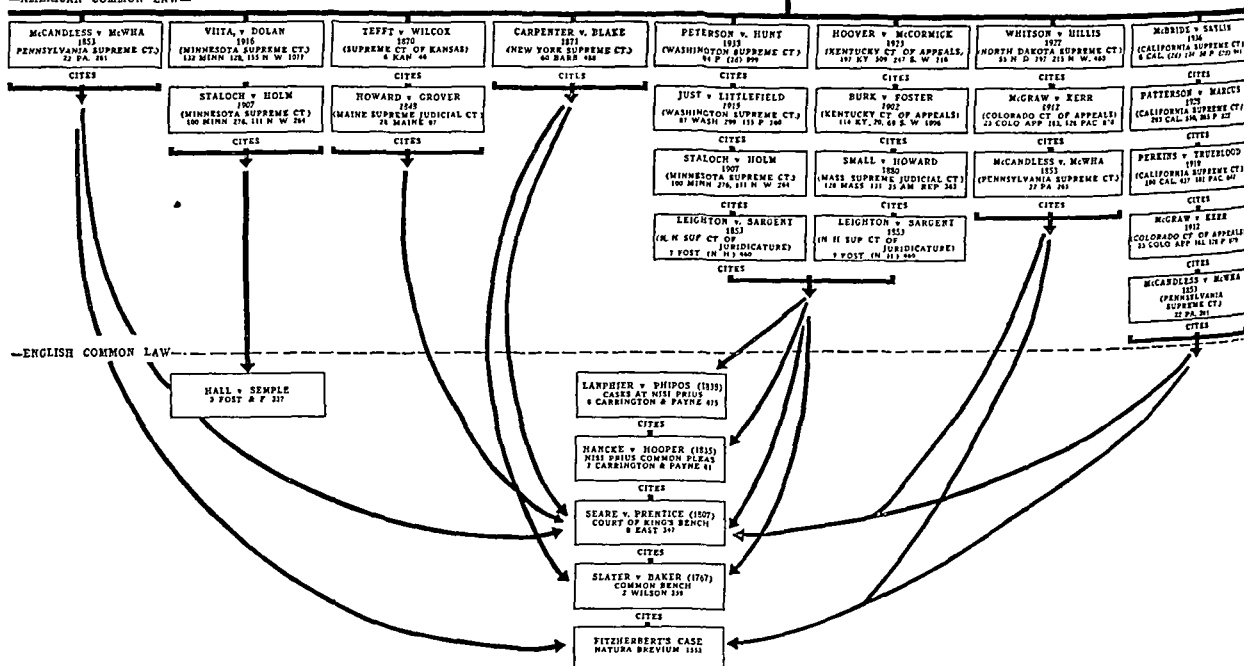

The first question for us to decide is whether or not the plaintiff made out a prima facie case of malpractice against the defendant; if this question is answered in the negative, the verdict in favor of the defendant should stand and no new trial should be had. If the question is answered in the affirmative, we are then faced with the second question: Did the court err in granting a new trial?

HODGSON v. BIGELOW (SUP. COURT, PENNSYLVANIA) JULY 5, 1939, 7 ATL. (24) 338

(FAILURE TO GIVE TETANUS ANTITOXIN FOR A "PUNCTURE" WOUND MAY CONSTITUTE CIVIL MALPRACTICE)

CITES AS AUTHORITY THESE CASES

—AMERICAN COMMON LAW—

Genealogy of a common law decision, showing derivation of the American law of malpractice from English precursors.

ately, with a repetition in ten days. The defendant on cross examination was asked this question: "So the wound when you finished treating it was still a puncture wound rather than an incised wound?" He answered: "Yes."

The defendant called nine physicians of good professional repute (among them Y), and they testified, in effect, that a substantial group of physicians in good standing in Philadelphia in May 1936 would have rendered the same treatment which Dr. Bigelow did in this case. On cross examination they admitted that the administration of antitoxin would be indicated for a "puncture" wound, but though they had not seen it, they refused to consider this a "puncture" wound because instead of a narrow mouth it had an orifice which would admit air, a swab and a drain.

The trial judge said, in the jury's hearing, of one item of testimony given by Y, a witness for the defendant: "The effect of that is, of course, to destroy X's testimony."

By a 4 to 3 decision, the court held that the plaintiff's evidence, including testimony that the injury was a "puncture" wound, made out a prima facie case of negligence against the defendant for failure to administer antitoxin. But the defendant's witnesses denied it was a "puncture" wound. This conflict in the expert testimony raised a disputed question of fact, which must be submitted to the jury. If the injury was found not to be a "puncture" wound, the defendant's omission to give antitoxin would not constitute negligence. In that event, the way he treated the injury represented a legitimate choice between two alternative approved methods. The trial court committed prejudicial error in failing to clarify the issue so as to make it clear to the jury that the crucial question was "puncture" wound or not" and in transgressing the province of a trial judge by declaring that the testimony of Y destroyed that of X. This comment on the evidence was an improper and prejudicial invasion of the jury's function, since the credibility and weight of all testimony

is for the jury to decide. Therefore, the order granting a new trial had to be affirmed.

This case was chosen not only for its intrinsic interest but to test the assertion sometimes made that the American common law of malpractice has no kinship with the law of England. Of course it is only the preserved, published opinions of courts of appeal that collectively make up the large body of "judge-made" or so-called "common law."¹ On questions not covered by constitution or statutes this "common law" is the law of the land. Appellate judges shy away from deciding cases without precedent, and so they refer to earlier opinions of their own and of sister states in support of the immediate action taken. If an opinion is carefully analyzed, it will be found to turn on one or more crucial principles. These constitute the "ratio decidendi," while the composite of loose, unnecessary language indulged in in reaching the decision is called "dicta." A dictum has no binding force as precedent but only such persuasive influence regarding a later case as its logic and vigor may win for it. One may ask: In America, where the forty-eight states are autonomous and each has its judicial system, what influence do the appellate decisions of one state have on the courts of a sister state? The answer is that all the states but Louisiana² at an early date adopted the then existing English common law as a basis of decision or as an analogous reference. They then began a process of changing and developing it to suit the needs of the new world. In this evolution, a given state court is bound only by the precedents of its own appellate courts or, on federal questions, by the precedents of the United States Supreme Court. Nevertheless, on novel questions, it is customary for lawyers to argue and courts to consider, as persuasive authority only, the opinions of the highest courts of other states and, indeed, sometimes of the modern English courts. Thus, in respect to many legal questions of common concern, a symmetric development and growth have been preserved throughout the nation through this process of habitual reference to decisions of other jurisdictions. On more disputable questions, appellate courts of different states may subscribe to different views and thus give rise to so-called "splits of authority."

One may begin with the most recent opinion of a court and by tracing back the precedents on which it relies to still earlier precedents come, at last, to the common source of them all. Such endeavor is reminiscent of the labor of a grubbing geologist, who uncovers a late stratum and then earlier ones, until at last he proves that the bird of the later stratum sprang from some ancient reptile of an earlier layer. I have traced in the chart the genealogy of the main authorities cited in *Hodgson v. Bigelow*, skipping some of the intermediate stratums, to show that legal tradition is continuous and that conceptions of medical responsibility, in fact, trace back to original English progenitors.

In connection with legal sources, what are the types of "judge-made" precedents which collectively form the common law applied by the courts? For convenience, some of the more significant features of the three essential types have been tabulated in comparative form.

1. Recently, the occasional written opinions of federal district courts and the trial courts of one or two states have been published and thus preserved as precedents of a lower rank.

2. This state has a unique local law derived from the civil doctrine of the Napoleonic Code, a heritage of its days as a French possession. Several of the Western states have community property laws (controlling property rights between husband and wife), which are a heritage of the Spanish law.

TYPES OF "JUDGE-MADE" LAW ORIGIN

CIVIL COMMON LAW:

Civil common law is a composite of (1) ancient customs of the realm; (2) contributions of old Germanic law; (3) conceptions of land tenures and other legal ideas brought to England by the Normans in 1066; (4) rights and duties created by the royal prerogative; (5) special concessions exacted from the crown in way of guaranties of basic rights and human liberties, as the "Magna Charta"; (6) old acts of parliament; (7) occasional, unacknowledged references to Roman law in deciding novel controversies; (8) accumulated precedents of prior cases; (9) actual extensions of existing doctrine (true lawmaking), under the guise of interpreting old principles; (10) interpretations of statutes and constitutions in case of ambiguous language or of doubt as to the scope of their application; (11) enforcements of new policies of law arising from the legislative function in the form of constitutional provisions, municipal ordinances, statutory enactments or proper administrative rulings, and (12) "Americanizations" of the English common law as taken over shortly after the American Revolution. Modern common law has parted company with the old system of "writs" and the scholastic approach to liberalize its entire perspective and bring its doctrines as to procedural and substantive law into keeping with the changing social order.

CRIMINAL COMMON LAW:

In general, the origin of criminal common law is the same as that of civil common law except that in modern times "penal codes" have been enacted in most jurisdictions, which define what conduct shall be deemed criminal, fix the magnitude of the offense and prescribe appropriate penalties and punishment. Thus, what is a misdemeanor in one state may today, by virtue of positive enactments, constitute a felony in another. Building on these points of departure, a large body of "judge-made law" has sprung up for construing and applying the penal codes to the diverse problems presented to the courts for solution. These precedents of appeal courts are preserved and again form reference material for subsequent proceedings.

EQUITY:

Equity began as an exercise of royal prerogative on petition of persons to the crown in peculiar cases for which rigid common law did not provide substantial justice. As these appeals grew, the king delegated such matters to one person, who finally grew to the stature of chancellor, administering justice on the individual merits of the case according to the respective "equities" of the parties.

Thus, after the Norman Conquest in 1066, the office of chancellor was usually occupied by an ecclesiastic who, as a member of the king's select council, helped determine causes which the ordinary judges were incapable of determining. This was in fact an exercise of the king's royal prerogative in his place and stead. By the reign of Edward I, the chancellor had gained some independent judicial stature and was hearing cases referred by the king or council. The new tribunal advanced rapidly in power and came to sit as a regular court at Westminster during the reign of Edward III (1327 to 1377). The establishment of the Court of Chancery as a regular tribunal for administering equitable relief and extraordinary remedies is usually referred to the twenty-second year of the reign of Edward III, when he ordered by general writ that all such matters as were of Grace should be referred to the chancellor, but this probably merely confirmed an existing practice of many years' duration. The practice of appointing as chancellor jurists versed in common law, instead of ecclesiastics, arose during this time, and by the end of the reign of Henry V (1413 to 1422) the strictly formative period was over, and Chancery was one of the strongly entrenched courts of the realm. Its prestige and power were greatly enhanced through the fact that the statute of 13 Edw. I, Ch. 1, § 24, which had been intended to enable the invention of new writs in law actions to cover novel situations, was aborted by the strict and narrow construction put on its language by the common law judges; this tended to freeze the whole common law system of writs in its existing pattern.

and drove the litigant (plaintiff or defendant) with a novel contention back into equity.

At first, precedents were not saved, but later they were preserved and resorted to as authorities and constituted a separate system of equity jurisprudence supplementary to the law.

Reasons for the development of equity lay in certain deficiencies of the common law:

1. There was a scholastic rigidity of certain doctrines of the old common law.

Example.—Suppose X sued Y on a sealed instrument. At law, Y could not plead a release and discharge unless it, too, was under seal. In equity, such a defense could be asserted.

2. In early common law there developed a system of "writs," or so-called "forms of action," under which a plaintiff must be able to fit his case to recover.

Examples.—"Replevin" was the proper action to recover personal property wrongfully taken; "detinue" to recover property rightfully taken but wrongfully detained; "trespass vi et armis" for direct injury by the intended act of another; "trespass on the case" for consequential or unintended injury by another (as by negligence), and "trespass quare clausum fregit" for trespass on real property.

Unfortunately, the invention of new standardized writs was not continued by the common law; and the principle of growth being arrested, litigants with novel claims which no existing writ would fit were without remedy in a court of law and so resorted to the king and later to the chancellor.

3. Law courts generally could not command a defendant to do a given thing.

Exception.—There was the writ of mandamus at law to require a public official to perform a legal duty.

The chancellor in equity could order such acts on pain of punishment for disobedience ("contempt").

4. The old common law dealt only with two-sided disputes, while equity would adjust the competing interests of several parties in a common subject matter.

5. The old common law would not consider events transpiring after the writ was filed, while equity would take into account all that occurred until the end of the suit and decree accordingly.

6. The law presupposed an existing controversy or alleged injury as the basis of action, while equity would render advisory opinions in respect to such subjects as a proper distribution of trust funds.

To avoid unseemly conflicts with courts of law, equity early adopted the rule that it would assume jurisdiction only when the remedy at law was inadequate and the burden rested on the petitioner to show this inadequacy.

PROCEDURE³

CIVIL COMMON LAW:

The plaintiff proceeds by action at law, pleading his cause of action in a petition or declaration served on the defendant. In this pleading he sets forth the essential facts of the defendant's alleged wrongful conduct, details the injury caused thereby and prays judgment for a specified sum in money damages by way of compensation.

CRIMINAL COMMON LAW:

The state is plaintiff and proceeds by complaint or indictment against the defendant, who is arrested but may remain at large until trial by posting bail (usually a bond providing for forfeiture of the principal amount in event the defendant defaults by failing to appear for trial).

EQUITY:

The petitioner (plaintiff) brings a suit in equity against the respondent (defendant) on a pleading known as a bill, the respective allegations of which the respondent in his answer must specifically admit, deny or qualify.

3. In no court can a plaintiff prove what he has not pleaded, and the same rule applies to defendants in respect to affirmative defenses.

COURT IN WHICH ADMINISTERED

CIVIL COMMON LAW:

Cases in civil common law are tried in civil courts, the proper court of original jurisdiction being determined by such considerations as the nature and the size of the demand, as set forth in local statutes conferring the jurisdiction.

CRIMINAL COMMON LAW:

Cases in criminal common law are tried in criminal courts or, in smaller localities, by the judge of the civil court sitting as a court of criminal law.

EQUITY:

Under old English practice, law and equity were administered by separate courts. Now, in a single proceeding, a litigant may have both the legal and the equitable remedies to which his case might entitle him. The old procedural distinction has been abolished in modern times in most states by "merger clauses" of state constitutions or statutes. These confer on one judge the full powers formerly wielded by the separate courts of law and equity. They do not affect the substantive distinctions between the two systems of jurisprudence. Hence, though equitable remedies may be had in the same action, they will be granted, as before, only on a showing that available legal remedies are inadequate.

In a few states (Delaware, Maryland, Mississippi, New Jersey, Tennessee and Vermont), separate equity courts are still maintained. In these states, one cannot get an equitable remedy in a law court. In the federal practice, the traditional distinction between the courts of law and of equity is preserved in a somewhat different way. Federal district courts maintain separate dockets for law and for equity cases. At law term, the court tries law cases; at equity term, it sits as a court of equity. Differences in the mode of pleading law and equity cases are not abolished as in state practice under "merger" provisions. Both parties are required to plead according to the federal equity rules promulgated by the United States Supreme Court.

MEASURE OF PROOF REQUIRED

CIVIL COMMON LAW:

The plaintiff must establish the essential elements of his case by a preponderance of the (credible) evidence. Both parties have a constitutional right to trial by jury of any question of fact.

CRIMINAL COMMON LAW:

The state must prove its case beyond a reasonable doubt. A constitutional right of trial by jury may be asserted by the defendant.

EQUITY:

Equity may vary the degree of proof required according to whether the circumstances are "suspicious" and demand "clear and convincing proof." Generally speaking, it requires only a preponderance of the evidence. At common law, no right to trial by jury existed in equity. Accordingly, it is held in the federal courts that no right to trial by jury exists today in a federal suit in equity, the constitutional guaranty preserving only such right as existed at common law.

MODE OF TRIAL

CIVIL COMMON LAW:

If the plaintiff and the defendant join in "waiving" jury trial, questions both of law and of fact are tried by the court. If a jury is demanded, the trial functions are divided. The court is to decide questions of law, rule on adequacy of pleadings and on admissibility of evidence, enforce rules of court and "instruct" a verdict for the appropriate party when the person carrying the burden of proof fails to offer enough evidence to warrant reasonable men founding a verdict on it. If, however, an issue of fact is raised by conflicting testimony, the court must prepare a proper "charge," submitting the pertinent questions of fact to the jury under such appropriate legal definitions as may be

required. In general, in state courts, the judge is forbidden to comment to the jury on the weight or credibility of the evidence. Under the practice of the federal courts, the judges possess such power of comment.

It is the province of the jury to decide the questions of fact according to the weight of the credible evidence before them, giving such weight and credence to testimony as they see fit. Thus a party with one witness may prevail over his opponent who offers six. Material facts not offered in evidence cannot be considered by the jury, and they are not to concern themselves with the legal effect of their answers.

CRIMINAL COMMON LAW:

In general, there is the same division of functions when judge and jury are used: The court determines the law, and the jury determines the facts.

EQUITY:

The chancellor in equity determines questions both of law and of fact (except in those states whose constitutions broadly guarantee a right to trial by jury of every issue of fact, without distinction between law and equity).

He may make use of a jury in an advisory capacity to help determine facts or appoint a referee or auditor to go over a series of complicated transactions, as in alleged corporate swindles, financial frauds, accountings and trust transactions.

TYPE OF REMEDY GRANTED

CIVIL COMMON LAW:

The court grants substitutional redress in the form of money damages. The court enters judgment on the verdict for the damages established but does not collect them. In seeking payment, the plaintiff must put his judgment in the hands of the sheriff; the latter levies execution on any discoverable "non-exempt" assets of the defendant and sells them at public sale. Today, courts of law also foreclose mortgages and fix liens, and by statute a plaintiff may "sequester," "attach" or "garnishee" various types of property pending trial in certain specified cases covered by statute.

As contrasted with equitable remedies, law remedies usually give redress which is substitutional and not "in personam"; the defendant is not ordered to do a specific thing.

CRIMINAL COMMON LAW:

The sentence of the court is penal: fine, imprisonment or execution, each being a price exacted by society as expiation for the crime. One should not overlook the fact that in appropriate cases the severity of the penalty may be reduced by probation or suspended sentence or by the intervention of executive clemency in the form of pardon.

The penalty is characterized by some jurists as "retributive," by others as deterrent and by those who are still more inclined to hold society partially at fault as both "deterrent and reformatory."

There can be no doubt that modern law has supplemented the primitive concept of pure retribution with a humane interest in rehabilitation. This has gone forward with a more honest recognition of the limitations of "free will" and of the role of social factors in the causation of some types of criminality. The final warrant for the more enlightened approach to the problems of criminality, in the eyes of many, is still the protection of society, but protection achieved by a species of intelligent prophylaxis directed against future criminality.

EQUITY:

The court acts directly on the person of the defendant, requiring him by its decree to perform or desist from certain conduct. It can also assess money damages as supplemental relief.

Among its important special remedies are: (1) granting of injunctions; (2) granting specific performance of unique contracts (as for sale and purchase of land), when the law would give only money damages for the breach; (3) decreeing rescission and cancellation of contracts obtained by fraud; (4) quieting of title by removing "clouds from title;" (5) granting accounting in termination of partnership relationships and so forth; (6) appointing receivers, as for insolvent corporations, and (7) creditors' bills and bills of discovery.

RIGHT OF APPEAL

CIVIL COMMON LAW:

Provided the sum involved is above a certain minimum amount and provided there is conformance with jurisdiction statutes, either party within a specified time after trial may perfect an appeal. Usually the case may be carried to an intermediate court of appeal as a matter of right but to the state supreme court only in the latter's discretion. If, as in some states, there are no intermediate courts, the disappointed litigant may usually take his appeal to the state supreme court as a matter of right.

Appeal to the United States Supreme Court is granted only in that court's discretion, only on certain questions and only when appeals to the highest state courts are first exhausted. The Supreme Court is increasingly confining its grant of appeals (that is, grant of writ of certiorari) to questions involving important federal legislation, constitutional guaranties or matters of national public importance.

CRIMINAL COMMON LAW:

The defendant has a right of appeal, but the state has none.

EQUITY:

Either litigant may appeal.

SCOPE OF APPEAL

CIVIL COMMON LAW:

No new testimony can be offered on the questions under litigation. For the facts, the court looks to the jury's verdict (containing fact findings) or, in the absence of a jury, to the findings of fact entered by the trial judge. As to the sufficiency of evidence to support such fact findings, the court looks only to the sworn testimony and exhibits contained in the "statement of facts" prepared by the court reporter, approved by counsel and verified by the trial judge. Pleadings, rulings of the court and judgment are included in a separate "transcript" similarly prepared and verified. The "statement of facts," "transcript" and "appeal bond" constitute the record which comes before the appellate court. Counsel are confined to arguments of law, namely, (1) that as a matter of law no evidence was offered warranting submission of fact issues to the jury and (2) that errors of law were committed by the trial court in its rulings, in its judgment or in the conduct of the trial; that prejudicial conduct was indulged in by opposing counsel (such as improper argument) or that misconduct occurred in the jury room (such as consideration of matters not in evidence).

An appellate court can enter one of three decisions in a case properly before it: (1) affirm the judgment of the trial court; (2) reverse the judgment entered below and remand the cause for a new trial, or (3) when the case has been fully developed on the merits and it appears that a judgment awarded a party in the trial court is based on evidence too flimsy to support the verdict of a reasonable man, reverse and render the judgment of the trial court. This involves taking the judgment from the party to whom it was awarded below and making it final in favor of the opposite party. This drastic power is exercised only in the most clearcut cases and usually in cases in which the trial court erroneously refused a motion for an instructed verdict based on the same want of evidence.

CRIMINAL COMMON LAW:

The scope of review is similar to that of civil common law.

EQUITY:

The scope of review is similar to that of civil common law.

APPLICATION TO QUESTIONS OF MEDICAL RESPONSIBILITY

CIVIL COMMON LAW:

Civil common law is the law which is most important and most frequently applied. The doctrines of civil law which are most pertinent are:

1. The law of contracts: It affects the creation of the physician-patient relationship and modifies the scope of duty which automatically arises under the law of torts.

2. The law of torts: It is made up of doctrines which permit a person to recover compensatory damages for injuries due to invasion of his rights of property or personality by another and are not dependent on contractual or consensual relationship.

(1) Battery: Any touching of another for which consent has not been obtained.

Example.—The action of a surgeon who with permission to remove the appendix alone removes the patient's tonsils as well.

Under old common law, proper action was by writ of trespass for a direct, intended contact.

(2) Fraud on the rights of health of the patient:

Example.—The action of a physician who, knowing that his treatment can be of no benefit, induces a patient to continue it and thus to incur a large bill by assurances that it is well suited to effecting a cure.

Even though the wrong is intentional, the injury is usually consequential. Hence, under the old common law, the writ would be "action on the case."

(3) Negligence: A negligent affirmative act or an omission to act in respect to one to whom a duty of care is owed.

Example.—The action of a physician who causes serious injury by negligently inserting acid instead of oil into the ears of a patient. Or again, the action of the physician who abandons the care of a sick patient without his consent or without due notice of his intention to withdraw.

Negligence is redressible as consequential, unintended injury at common law by action of trespass on the case, or "case."

(4) False imprisonment: Holding of another prisoner against his free will.

Example.—The action of a physician who by force requires a patient of sound mind to come with him against his will to some place for supposedly urgent treatment.

The remedies are purely substitutional, money damages being given by way of compensation.

The only element of punishment in any of these civil actions is rare assessment of "punitive damages" for extreme or gross malpractice.

CRIMINAL COMMON LAW:

1. Penal sanctions are contained in medical practice acts, which are directed against practice without a license.

2. Penal sanctions are directed against those acts which constitute violations of criminal law whether committed by a physician or by a layman, such as (1) murder, (2) criminal abortion, (3) dispensing of narcotics and (4) assault and battery.

Note: These are so-called international crimes, which are recognized without reference to whether they are perpetrated in the course of medical practice. If they are committed in the care of a patient, they may also constitute malpractice, and the act which injures the state and is thus a crime may also afford basis to the injured person for a civil malpractice suit to recover compensatory damages.

3. In regard to the crimes which might be committed by a physician in the course of an honest effort to cure a patient and which, therefore, represent the most likely instances of criminal malpractice, three crimes should be considered:

(1) Murder. At the common law and under many modern statutes, there may be a murder conviction based on death caused by an extreme kind of recklessness, although there may have been no intent to cause the death of the victim. As applied to a physician, it would need to be proved that he used a form of medical treatment which was so imminently dangerous to the patient as to show a "depraved mind regardless of human life." Needless to say, prosecutions of this kind against physicians are rare.

(2) Manslaughter. The penalty for this crime is less than that for murder, and a correspondingly lower degree of recklessness is required, although even for liability for this crime the death must have been caused by conduct showing a greater degree of negligence than is necessary for civil liability.

(3) Assault and Battery. If injury to a patient short of death is caused by a course of treatment sufficiently reckless to warrant a conviction of murder or manslaughter if the patient had died from it, there may be a conviction for assault and battery.

It should be remembered that in all criminal proceedings the offense charged must be proved beyond a reasonable doubt.

Remedies are penal, with a view to punishing and deterring such conduct. In every instance, the state occupies the role of plaintiff, for the injury is to society.

The leading American case is that of *Commonwealth v. Pierce* (Supreme Judicial Court of Mass., 1884) 138 Mass. 165. Pierce, a practicing physician, was indicted for manslaughter for allegedly causing the death of his patient, Mary Bemis. Pierce had been in attendance as her physician since Dec. 29, 1882. On Jan. 7, 1883, she became very sick and was confined to her bed. Pierce prescribed the application to a large part of her body of kerosene-soaked flannels, which were to be renewed every three hours. He never applied them himself, leaving this to her husband and attendants. The patient consented to the treatment, which was continued until January 14, when the defendant was discharged and other physicians called. On January 16 she died of burns, blisters and suppurating sores extending over two thirds of her body. Neither the averments of the state's indictment or the proof offered showed that the defendant knew of the dangers of kerosene so applied or that he acted with evil intent. The trial court refused to give rulings, requiring these for conviction, as well as a requested charge that "the defendant cannot be convicted under this indictment, if the death resulted from any degree of ignorance on his part, if he was acting with the purpose to cure or benefit the patient." Instead, the trial judge instructed the jury as follows: "Injurious acts resulting from gross carelessness or foolhardy presumption, without intent to injure, may constitute an assault. If persons who are engaged in operating steam engines are guilty of gross carelessness or foolhardy presumption, and injuries result, they are criminally liable. So, with apothecaries, if a person without knowledge and skill deals with deadly drugs, he may be guilty of gross carelessness amounting to presumption, and be criminally liable. Whenever men are called upon to act with dangerous agencies, the law holds them to some degree of criminal responsibility. If they are grossly careless, or reckless and presumptuous, they are guilty. The same general principle applies to medical treatment. The government must show, not merely the absence of ordinary care, but gross carelessness amounting to recklessness. A man is not to be convicted of manslaughter merely because of his ignorance. His ignorance is only important as bearing upon the question whether his conduct in the care and treatment of the patient was marked by foolhardy presumption or gross and reckless carelessness. The defendant in this case is to be tried by no other or higher standard of skill or learning than that which he necessarily assumed in treating her; that is, that he was able to do so, without gross recklessness or foolhardy presumption in undertaking it. It is not necessary to show an evil intent; if, by gross and reckless negligence, he caused the death, he is guilty of culpable homicide. The question is whether the kerosene (if it was the cause of death), either in its original application, renewal, or continuance, was applied as the result of foolhardy presumption or gross negligence on the part of the defendant."⁴

4. From a conviction, the defendant appealed, complaining that the indictment and charge were deficient in the respects previously mentioned.

Mr. Justice Holmes, in a learned opinion affirming the conviction, approved the foregoing charge of the trial court. He said, among other things:

"More specifically, the questions raised by the foregoing request and rulings are whether an actual good intent and the expectation of good results are an absolute justification of acts, however foolhardy they may be if judged by the external standard supposed, and whether the defendant's ignorance of the tendencies of kerosene administered as it was will excuse the administration of it.

"So far as civil liability is concerned, at least, it is very clear that what we have called the external standard would be applied, and that, if a man's conduct is such as would be reckless in a man of ordinary prudence, it is reckless in him. Unless he can bring himself within some broadly defined exception to general rules, the law deliberately leaves his idiosyncrasies out of account, and peremptorily assumes that he has as much capacity to judge and to foresee consequences as a man of ordinary prudence would have in the same situation. In the language of Tindal, C. J., 'Instead, therefore, of saying that the liability for negligence should be coextensive with the judgment of each individual, which would be as variable as the length of the foot of each individual, we ought rather to adhere to the rule which requires in all cases a regard to caution such as a man of ordinary prudence should observe.' *Paughan v. Menlove*, 3 Bing. N. C. 468, 475; S. C. 4 Scott, 244 (English).

"If a physician is not less liable for reckless conduct than other people, it is clear, in the light of admitted principle and the later Massachusetts cases, that the recklessness of the criminal no less than that of the civil law must be tested by what we have called an external standard.

"We admit that, if the thing is generally supposed to be universally harmless, and only a specialist would foresee that in a given case

(Continued on next page)

EQUITY:

The enormously important contact of equity with medical practice lies in the possibility of using the injunction to stop improper practice. Exactly what circumstances warrant the grant of this drastic remedy is important enough to merit detailed consideration in an independent paper. Here, consideration must be confined to some of the more salient principles.

In each new controversy, one will do well to answer the following questions in attempting to decide whether an injunction will be granted.

A. What is the exact nature of the controversy in terms of the parties involved and the objectives sought to be gained?

1. If the aggrieved person is a patient already injured by the defendant's malpractice, the proper remedy is a civil action at law for compensatory damages. The injunction is peculiarly useful and finds its fit application in preventing future wrongs or breaking up some repeated chain of wrongful acts. Accordingly, in case of the typical malpractice claim, the remedy at law is adequate, and equity will decline jurisdiction; the dereliction is past rather than prospective, and the injunction is wholly inapt.

2. If the moving complainant is a physician who seeks by injunction to restrain what he considers improper medical practice by the defendant, one meets at once the question of what basis of equitable jurisdiction can be made out.

The early and rather misleading case of *Merz v. Murchison* (6th Circuit Court, Ohio, 1908), 30 Circuit Court Reports, 646, in some quarters has created unfortunate confusion and doubt as to the power of equity to intervene by injunction. In that case the facts were as follows: the plaintiff, X, a licensed physician and surgeon, sought to enjoin alleged unlawful and unfair competition by the defendant, Y, a chiropractor who had no license under the medical practice act of Ohio. The evidence showed that Y was under indictment in a proceeding by the state for alleged violation of the statute.

The court held that the plaintiff's bill for an injunction must be dismissed because he could not show a property right invaded or any intent under the medical practice act to vest rights of action in private physicians. The court said:

"There appears to be no serious contention by counsel for plaintiff but that his claim to the equitable interposition of this court is based mainly, if not wholly, upon this statute. Without legal provisions for the examination and licensing of physicians and surgeons, one person would be as free as another to practice these professions without interference from the courts.

(Footnote 4 continued)

it would do damage, a person who did not foresee it, and who had no warning, would not be held liable for the harm. If men were held answerable for everything they did which was dangerous in fact, they would be held for all their acts from which harm in fact ensued. The use of the thing must be dangerous according to common experience, at least to the extent that there is a manifest and appreciable chance of harm from what is done, in view either of the actor's knowledge or of his conscious ignorance. And therefore, again, if the danger is due to the specific tendencies of the individual thing, and is not characteristic of the class to which it belongs, which seems to have been the view of the common law in regard to bulls, for instance, a person to be made liable must have notice of some past experience, or, as is commonly said, 'of the quality of his beast.' 1 Hale P. C. 430. But if the dangers are characteristic of the class according to common experience, then he who uses an article of the class upon another cannot escape on the ground that he had less than the common experience. Common experience is necessary to the man of ordinary prudence, and a man who assumes to act as the defendant did must have it at his peril. When the jury are asked whether a stick of a certain size was a deadly weapon, they are not asked further whether the defendant knew that it was so. It is enough that he used and saw it such as it was. . . . So here. The defendant knew that he was using kerosene. The jury have found that it was applied as the result of foolhardy presumption or gross negligence and that is enough.

The remaining questions may be disposed of more shortly. When the defendant applied kerosene to the person of the deceased in a way which they have found to have been reckless, or in other words, seriously and unreasonably endangering life according to common experience, he did an act which his patient could not justify by her consent, and which therefore was an assault notwithstanding that consent. *Commonwealth v. Collberg*, 119 Mass. 350. See *Commonwealth v. Mink*, 123 Mass. 422, 425. It is unnecessary to rely on the principle of *Commonwealth v. Stratton*, 114 Mass. 303, that fraud may destroy the effect of consent, although evidently the consent in this case was based on the express or implied representations of the defendant concerning his experience.

As we have intimated above, an allegation that the defendant knew of the deadly tendency of the kerosene was not only unnecessary, but improper. *Regina v. Packard*, C&M 236. An allegation that the kerosene was of a dangerous tendency is superfluous, although similar allegations are often inserted in indictments, it being enough to allege the assault, and that death did in fact result from it. Exceptions overruled."

"A court will not interfere with the practice of medicine or surgery by one person on the petition of another, merely because such practice is unskilful and patients may be injured rather than benefited thereby, nor because the patients are deceived by false claims of skill.

"The plaintiff relies on what he earnestly urges is a property right to practice medicine and surgery conferred on him by his statutory license, and an interference with that property right by the unlawful competition of a person unlicensed.

"Probably the statute rather qualifies rights heretofore existing than confers new ones. . . . The circle of competition may be narrowed by excluding unlicensed competitors, but that is not the purpose of the law.

"The statute, which is designed to protect the public, contains certain penal provisions in behalf of the public. Can a private individual invoke it in his own behalf and in a civil proceeding prevent the very acts which the statute makes criminal?

"We quote this language from an opinion by Lord Mansfield, 2 Burr. 803: 'The rule is certain that where a statute creates a new offense, by prohibiting and making unlawful anything that was lawful before; and appoints a specific remedy against such new offense (not antecedently unlawful) by a particular method of proceeding, this must be pursued and no other.' . . . It is the judgment of the court that plaintiff's petition be dismissed."

But note: this decision does not preclude the right of one practitioner to enjoin acts of another which constitute torts under the established principles of unfair competition, without necessary reliance on infringement of a medical practice act—such, for instance, as when Y initiates a campaign to wean away X's patients by fraudulent statements or devices or by certain types of simulation endeavors to confuse the public into believing he is X and thus to exploit X's good will by diverting patients from their intended destination. Such "simulation" cases are not so apt to arise in respect to professional practice as in commercial activities in which complaints have given rise to lively litigation of large volume.

The fact is that the individual practitioner's right to injunctive relief depends on the necessary proof of some economic interest in the nature of a property right which has been infringed by conduct amounting to unfair competition.

To redress unfair competition, equity traditionally has been prone to require proof of such a property right, and the question at once presented is whether the license of a physician fills such requirements. In the *Merz* case, and indeed in a minority of more recent decisions from a small number of states (for example, *Drummond v. Rowe*, Supreme Court of Appeals of Virginia, 1931, 156 S. E. 442), the view is taken that licensing statutes are for the exclusive benefit of the public and confer no vested interest on the licensee sufficient to give him standing in equity. In this initial problem of arriving at the "statutory intent," the majority view and more acceptable construction is that licensure statutes have a dual purpose: to protect the public against incompetent practitioners and to protect qualified practitioners from the economic inroads of unlicensed competitors. According to the majority view, then, the license confers on the holder a franchise in the nature of a property right which equity has jurisdiction to protect.

Indeed, the authority of the *Merz* case has been impaired, if not altogether destroyed, by the recent case of *Dworken v. Apartment House Owner's Ass'n of Cleveland* (Court of Appeals of Ohio) 1931, 176 N. E. 577. In this case it was held that a license to practice law is an exclusive, valuable privilege sufficient to enable an attorney, proceeding by a "class bill" for himself and all other attorneys, to secure the equitable relief of injunction to protect his quasiproperty right from encroachment by the unlicensed practice of the corporate defendant.

In the *Merz* case, which the court distinguishes, the plaintiff sued for himself alone and did not prove that the unlicensed defendant attracted clients which otherwise would have resorted to him.

The difficulty of showing that the improper practice has prevented a patient from resorting to the particular plaintiff is met by bringing a "class bill" in equity in which the plaintiff seeks the injunction for himself and for other physicians similarly situated.

As the Supreme Court of Appeals of West Virginia said in *Sloan v. Mitchell*, 1933, 168 S. E. 800:

"The right of a licensed physician and surgeon to practice his profession is a valuable franchise in the nature of a property right to protect which he may sue in equity in the interest of himself and other physicians similarly situated, to enjoin a person from encroaching upon said right by engaging in the practice of medicine and surgery without a state license.

"A court is not powerless to prevent the doing of an act involving encroachment upon valuable franchise rights of others merely because such conduct is denounced as a public offense."

This right of the licensed practitioner, springing from concepts of unfair competition, to be protected in equity logically is limited to such conduct as represents an improper or unlawful diversion of patronage, as when the defendant unlawfully because unlicensed, takes economic benefits from the pool of medical practice (*Sloan v. Mitchell*, supra) or advertises, contrary to law, as in *Eisensmith v. Buhl Optical Company* (Supreme Court of Appeals, W. Va.) 1934, 178 S. E. 695 or permits himself to be used to put corporations or other unqualified persons directly or indirectly in competition with individual practitioners, as in *Ezell v. Ritholz* (Supreme Court of South Carolina) 1938, 198 S. E. 419.

When patronage has been rightfully procured and the defendant inflicts injury by negligent diagnosis or treatment, the patient has his proper remedy by a civil action for damages resulting from the malpractice; fellow physicians have no standing to secure an injunction because no unfair competition is involved.

When, however, a licensed physician uses an unlawful mode of practice to divert patronage from his competitors, a very different case may arise. Thus, when pregnant women are induced by known practices of a licensed physician to resort to him for abortions without therapeutic cause, the economic interest of respectable obstetricians in the same community in procuring normal deliveries at term is infringed, unfair competition exists and the affected physicians are entitled to proceed in equity by a class bill for injunctive relief.

By the sounder view, now entertained by a majority of courts, in all the situations discussed in this section the existence of penal statutes carrying penalties which might be invoked by criminal prosecutions will not defeat the equitable jurisdiction provided the plaintiffs show in their bill that the legal remedies so provided are inadequate to protect their interests and break up the wrongful conduct (*Ezell v. Ritholz*, supra). In this respect, there is a growing tendency to depart from the holding of the *Merz* case that the creation of a specific criminal law remedy against unlicensed practice by implication excludes resort to any other remedies.

To summarize:

(1) Suits in equity by individual practitioners for injunctions against improper practice depend essentially on a showing of unfair competition. They should therefore be brought by active practitioners in the same community engaged in such field of practice or specialty as makes it clear that the improper practice of defendant impinges on their economic interests.

(2) Such a suit should be in the form of a "class bill" for the benefit of the plaintiff himself and of all physicians similarly situated. Such suits in some states may properly be brought by medical societies or state medical boards when a valid authorization by individual practitioners or by statute constitutes them the "class" representative.

(3) When unfair competition can be shown, it is no necessary part of the plaintiff's proof that the defendant's conduct constitutes malpractice in respect to the patients treated. He need not show that the treatment was ignorant, unskilful or negligent, for in this type of case he does not derive his rights of action through the patient.

(4) Lacking the essential elements of unfair competition necessary to show unfair or unlawful diversion of patronage, the mere fact that the defendant's conduct was ignorant, unskilful or negligent so as to confer rights of action on his patients for injuries received in the course of treatment will not create equitable rights in fellow physicians.

3. If the moving complainant is the state, which seeks by a bill in equity to enjoin improper or unlawful practice by defendant, the basis of jurisdiction is different.

Logically, unless authorized to do so by express statute, the attorney general is not the proper plaintiff to protect the private property rights of individual practitioners against unfair competition. But he is usually the proper person to bring a bill on behalf of the state.

The state makes out its title to equitable relief by virtue of its sovereign interest in protecting the health and welfare of its citizens. Historically, equity has always exercised jurisdiction in proper cases to abate a public nuisance by issuing prohibitory injunctions. The more alert courts have hastened to press this doctrine into service in the present connection. Since equity abated nuisances at common law and since in equity there was no right to jury trial, this adequately meets the protest that the defendant is entitled to have the state restricted to a criminal prosecution under the penal provisions of licensure statutes in order to preserve his right to trial by jury.

Without completely exhausting the subject, the salient principles which should control the position of the state may be summarized as follows:

(1) The title of the state to injunctive relief against improper or unlawful practice rests on its right to protect public health, morals, safety and the collective welfare, rather than on the necessary showing of an invaded property right.

As Chief Justice Crane, of the New York Court of Appeals, said in *People v. Laman* (Court of Appeals, N. Y.) 1938, 14 N. E. (2d) 439, a suit by the attorney general to enjoin Laman from practicing medicine unlawfully, without a license:

"Although invasion of property rights or pecuniary interests is emphasized in some of the earlier cases as a basis for equitable interference, there appeared later a recognition that public health, morals, safety, and welfare of the community equally required protection from irreparable injury."

(2) Of the several theories advanced to sustain the state's title to equitable relief, the most satisfactory is that which proceeds on the theory that a continuing unlawful practice by the defendant may constitute a public nuisance which the state may abate by injunction in equity.

A few courts have gone so far as to hold that mere practice without a license is a nuisance in itself, without necessity of showing that the unqualified practitioner is so incompetent that his practice imperils the health of those he treats (*Kentucky State Board of Dental Examiners v. Payne* [Court of Appeals of Kentucky, 1926] 281 S. W. 188; *State v. Anderson*, 6 Tenn. Civ. App. 1). This view is unsound, for at common law, before the passage of licensure statutes, such practice was no nuisance; and in proceeding on the common law theory of public nuisance rather than by criminal law indictment under the licensure statute the state must show actual or imminent danger to the public. It is so held by the majority view.

As Chief Justice Ross said in *State ex rel. La Prade, Atty. General v. Smith* (Arizona Supreme Court) 1934, 29 Pacific (2d) 718:

"The practice of medicine and surgery is not per se a nuisance. A license does not add to one's qualifications. It only shows that the holder thereof has complied with the law. His skill and ability as a practitioner would be the same before as after he secured the license. Of course, one having a license from the proper authorities would be presumed to be qualified to practice, and, in a criminal prosecution for violating the law requiring a license before practicing, the absence of such a license would give rise to an unrebuttable presumption of disqualification. But in a proceeding of this kind, based upon acts alleged to be injurious to health by reason of unskilfulness, ignorance, and incompetency, it is incumbent upon the state to make out its case." (Accord: *People v. Laman* (Court of Appeals, N. Y.) 1938, 14 N. E. (2d) 439.

Thus, the right of the state to enjoin unlawful practice derives from a necessary showing of actual or prospective injury to patients from the ministrations of an incompetent defendant. The burden of proof is both greater and different than that which rests on the individual practitioner. The right of the latter to an injunction depends on the protection of his quasi-property right against the wrongful invasion of unfair competition, a tort in which injury to the patient is no necessary ingredient.

(3) In a majority of jurisdictions where the question has arisen, the state has been permitted to restrain unlicensed practice through the exercise of ordinary equity jurisdiction over public nuisances, without specific statutory authority so to proceed (*People v. Laman*, supra, and cases cited). In a limited number of jurisdictions, courts have been inclined to restrict the state exclusively to proceeding criminally against the unlicensed physician, on the ground that the penal provisions of the licensure acts impliedly negative the right to use any other sanction (*Dean v. State* [Supreme Court of Georgia], 1921, 106 S. E. 792). Most of these decisions can be explained on other grounds, as for instance, the failure of plaintiff in the *Dean* case to prove the harmful character of the defendant's practice.

The better view holds that the existence of penal sanctions against unlicensed practice does not oust the jurisdiction of equity to grant an injunction provided it is shown that the legal remedy is actually inadequate. This has been well expressed by Chief Justice Crane in *People v. Laman* (Court of Appeals, N. Y.), supra, as follows:

"We have pointed out that the fact a criminal penalty has been imposed for the performance of such acts will not deprive equity of its jurisdiction. In equity the court will consider the criminality of the act only to determine whether, under the particular circumstances, equitable intervention is necessary to give adequate protection to the interest invaded, or whether justice will be best served by relegating the parties to the criminal court. It is not every violation of a statute, even of the statute under consideration, that calls for equitable interference. But where, as here, it is made to appear as a fact that real danger is threatened to the public health by the conduct of the defendant, that irreparable damage to the health of individuals is likely to result, and that criminal prosecution, even if successful, will not give adequate protection to those in danger, a proper case for injunction has been made out.

"As heretofore pointed out, equity interferes, in a proper case, not to punish the individual for his past acts, but to afford more complete protection to the complaining party by enjoining unlawful acts in the future."

B. Has the state legislature, by positive enactment, increased or diminished the inherent equitable jurisdiction of the courts or specified who shall have standing as a party plaintiff to protect private or public medical interests?

The state legislature has the power to alter the scope of equitable remedies in the directions mentioned. Even in jurisdictions where the state is now denied injunctive relief against unlicensed practice, the remedy could be conferred at once by a proper legislative act.

Similarly, many suits for injunction have failed because under proper interpretation of state statutes the bill for injunction was filed by a plaintiff without the right to sue. (See *Bentley v. State Board of Medical Examiners* [Supreme Court of Georgia, 1922], 111 S. E. 379, in which it was held that the statute creating the State Board of Medical Examiners did not expressly or impliedly confer authority on it to proceed in equity for cancellation of a forged license or for an injunction to restrain unauthorized practice.)

In conclusion, equitable remedies have little scope in redressing rights of a patient who has been injured by medical malpractice; to protect the private economic interests of one practitioner against the unfair competition of another, however, equity will grant the powerful remedy of injunction in appropriate cases; and to protect the public as a group from the irreparable injury of incompetent practice by an unlicensed person, equity will likewise grant injunctive relief on the entirely different principle of abating a public nuisance.

It is important to realize that only a small fraction of the complex relations of man to man and of man to property is dealt with by the constitutions, state and federal, and by statutory enactments. The large residue falls within the sphere of "judge-made" law, which is civil, criminal or equitable according to the nature of the transaction. Preserved, published decisions of appeal courts handed down in the same jurisdictions, in absence of positive enactments, control the litigated question

with practically "imperative" authority; such decisions from other jurisdictions are looked to for their advisory value when the question is a novel one. If a trial judge goes against the express precedents laid down by the highest appeal court of his jurisdiction, he may be bold, but he is courting reversal of his judgment and blemish of his judicial record for correct rulings. This fact tends to make of trial judges discreet administrators of settled law. They have the intrinsic power wielded by their brethren of the highest court of appeal, to break with precedent, establish a new principle or declare a statute invalid because unconstitutional. They may openly forsake an old rule in favor of a new one more agreeable to their sense of reason. Yet, as a practical matter, trial judges prefer the security of "settled law," buttressed by precedent, to the risk of reversal. By tacit consent, the delightful exercise of the judicial process to make new law by extending existing doctrines or by departing old dogma is left to the learned court "upstairs," which molds with impunity. Even these highest tribunals, the supreme courts of the several states and of the United States, do not often or readily depart suddenly from the precedent—supported, fundamental trends which protect values congenial to the existing social order.

It is true that the "common law" of which I speak is a system largely self contained and with certain limitations. If it were the only source of law, some of these limitations would make the whole legal system inadequate. More than once a distinguished jurist has given an anemic principle a transfusion of the rich blood of his own genius and enabled it to outlast its natural life. Like a patient with long-standing leukemia, but less justifiably, an ailing legal principle may thus live many years beyond the day of its expected doom.

In large measure, the common law is an introvert despite its occasional effort to appear an extrovert. Judges are house bound. The court, by tradition, is a passive hearer of disputes rather than an investigator of reality. It bids the litigants to bring their irreconcilable disputes to the court house, and by a device of allocating the burden of proof and imposing rules of diligence, it gets the conflicting versions of the parties before it. This practice of making a litigant father his own case may work fairly well so far as an individual dispute goes. But it does not always provide impartial scientific information for proper construction of those legal principles brought into being to enforce or advance a public policy. This is particularly true when the policy itself is not a self-evident interest open to intuitive ascertainment by the quick witted but depends on complicated economic or social facts which need scientific inquiry for their proper exploration. Such formulations are more apt to satisfy when they depend on moral or equitable considerations, for then they may have a surer point of reference. When the rule regulates morally neutral economic or social transactions according to some supposed "public policy," intuition is a less satisfactory point of reference, and the likelihood of error increases. A misconception as to what is sound "policy" may arise, or in advancing a correctly ascertained policy the common law may err in supposing that a certain doctrine will achieve that goal. A judge has no satisfactory official means of discovering the scientific workings of a given rule of law on the body social, particularly in advance of making his rule or extending an old one. He has nothing similar to the medical five or ten year follow-up to see whether a new treatment has the beneficial operation that was hoped for. This

lack of equipment is in part due to the fact that under the philosophy of "division of powers" into judicial, executive and legislative the courts are not intended to function as lawmakers and their actual activity in this sphere is a sub rosa exercise of legislative powers. Secondly, jurisprudence in the United States depends mostly on uniform rules, abstractions one might say, applicable to large series of transactions and large groups of people, rather than on "individualized justice;" only in equity does this latter approach find much scope. Thirdly, the very rationale of "judge-made law" developed at an age when intuitive thinking and exploration of the subjective was an accepted approach and the objective scientific method was but slightly developed.

Thus, the common law has large motor powers, moves with confidence in the external world and yet is singularly lacking in afferent neurones of its own. Perhaps these very self limitations of the judicial system afford some warrant for the extreme reluctance of courts to forsake the ruts of a well traveled road for the smoothness of dimly lighted byways.

Yet, in fairness, one must not judge the common law too quickly or draw inapt comparisons with science. The bric-a-brac or external indicia of "civilization" change more than do the fundamental relationships of man to man, which the law primarily regulates. Today a pedestrian may be run down by a negligent bus driver, while in the days of the Romans he was injured by a negligent archer shooting arrows in a public place. Both wrongs are torts. Today one buys and sells automobiles, while the Romans trafficked in chariots, but both sets of transactions involve the concepts of bargain and sale. Thus, legal concepts are more fundamental and permanent than the objects which they control. The law has been canny enough to keep many of its formulas broad and automatically responsive to changes in social standards. For instance, in the law of negligence, the required "due care" exacted from the actor bespeaks no rigid definition but calls for that degree of care which an average prudent man would have exercised in similar circumstances, taking into account the time and the place.

The very inversion of the common law has helped it achieve a considerable symmetry and harmony among those parts which in logic should have similar treatment. It is not static; over long periods it exhibits conservative but substantial growth. This forward look is helped by the constant ascent of new jurists to the bench, especially those men of large caliber who bring to it a keen knowledge of practical affairs. That the trial judges are conformists and that even the supreme court judges are timid innovators is not wholly to be regretted. A definite and certain rule which is only moderately good but is uniformly applied is generally preferable to a constantly changing, unpredictable rule which professes to be superior. The transactions of society are so complex that predictability has a high value, and the great bulk of law practiced outside the courthouse would lose its prophylactic usages if this certainty were destroyed. Stability of law, security of transactions and the knowledge beforehand of the legal effect of long term undertakings are valued interests of the average citizen.

Therefore, one should not compare the common law to a sulky horse unwilling to pace but should liken it to a watchdog set to guard the gate. It is not so much an initiator of new modes of thought as a powerful preserver of the established order.

It is more the proper sphere of the courts to act as custodians of the law, evolve it gradually with smooth transitions and settle disputes by reasonably certain standards, than to invade too boldly the realm of social reform under the guise of the judicial process.

More efficient means exist for breaking an outworn tradition than reliance on appeal courts. At common law, an injured man could not recover against his employer if he was hurt through the negligence of a fellow employee. No judge would have departed from this principle which such massive precedent had enshrined. Yet the whole creed, with its related doctrines, was swept away by statutory enactment of the workmen's compensation acts. Thus, in legislation one finds the instrument to break bonds with the outworn, to fill defects and to set up a new good. This new value the common law courts will then as doggedly preserve as they did the old doctrine. Constitutional prohibitions serve as a brake on too enthusiastic and radical statutory change which might ill advisedly sweep away important individual liberties. This legislative function belongs to all but is exercised by those who show initiative. In this fact lies a chance for physicians, by vigorously supporting new constructive legislation, to bring science to the aid of law and also to affect the social implications attaching to their profession.

One might say that common law, based on past experience guided by reason, makes society conform to its tenets. By legislation, a dissatisfied society makes law conform to it. When this antithesis is properly maintained, the good in law is preserved and the bad extirpated by planned legislation at one major operation, much as a surgeon amputates a gangrenous leg.

In administrative agencies (such as the Interstate Commerce Commission, which regulates public carriers; the Board of Tax Appeals; the Patent Office; the Labor Relations Board and the Securities Exchange Commission) expert boards are used to surmount the jury "blindspot" for technical evidence. These administrative bodies wield quasijudicial powers and take over the jury role of fact finding. Great speed is introduced, and legal formalities are reduced to a minimum. Yet there is some slight loss of the impressive certainty and predictability of the common law so far as the quasijudicial rulings are concerned.

Correctly viewed, law must be taken as the summation of those integrated mechanisms by which lives are regulated and disputes settled.

Whether he is a lawyer or a layman, any one who has a question of law before him should ask:

1. Is it affected by the constitution (state or federal), that is, the supreme law?

2. Is it dealt with by statute, and if so, what are the provisions of the act? Are these constitutional? How have the common law courts interpreted the language used?

3. If there is no statute, the question must be subject to common law. Is it a civil common law action for compensation, a criminal common law action by the state or a proceeding in equity? What is the current law in the particular jurisdiction as established by the preserved decisions and supporting opinions of the appeal courts?

Again, one must not confuse substantive law with adjective law. The latter deals with matters of procedure, mode of trial and rules of evidence directed to carrying the former into effect. Existing defects in respect to the law of medical malpractice lie more in

these mechanisms of proof making and fact ascertainment in scientific disputes. Part of the trouble lies in the existing rules of evidence and part in the broad constitutional guaranties of the right to trial by jury. These uniformly apply, without differentiation, to all disputed questions of fact, even when they arise on scientific evidence too technical for a lay jury to appraise. One should remain aware that the body of law under consideration is almost wholly common law in origin, that it can be effectually changed only by intelligent legislation directed toward mode of trial and that constitutional guaranties touching on evidence and right to jury trial must be reckoned with in proposed modifications.

With this brief, but necessary, excursion finished, it is possible to turn again to the main theme of this study.

[ED. NOTE.—This is the second of a series of six articles on "Legal Responsibility for Medical Malpractice." The remaining articles in the series will be published in early issues of THE JOURNAL.]

Council on Physical Therapy

THE COUNCIL ON PHYSICAL THERAPY HAS AUTHORIZED PUBLICATION OF THE FOLLOWING CHAPTER, WHICH IS THE SEVENTH OF A SERIES ON AMPUTATIONS AND ARTIFICIAL LIMBS TO APPEAR IN THIS COLUMN. WHEN COMPLETED, THE SERIES WILL BE PUBLISHED IN THE FORM OF A HANDBOOK ON AMPUTATIONS. THE COUNCIL WISHES TO EXPRESS ITS APPRECIATION FOR THE COOPERATION OF ITS GROUP OF CONSULTANTS ON ARTIFICIAL LIMBS. THE COUNCIL IS REPRESENTED BY DRS. FRANK D. DICKSON, HARRY E. MOCK, FRANK R. OBER, S. PERRY ROGERS, PAUL STEELE AND PHILIP WILSON, AND THE ASSOCIATION OF LIMB MANUFACTURERS OF AMERICA IS REPRESENTED BY MESSRS. MCCARTHY HANGER SR., W. E. ISLE, JOSEPH A. SPIEVAK, DAVID E. STOLPE AND J. B. KORRADY.

HOWARD A. CARTER, Secretary.

CHAPTER V.

AMPUTATION IN CONGENITAL AND CHRONIC DISABILITIES

Almost every community contains one or more persons severely crippled by chronic disability, either congenital or acquired, who would be happier, healthier, more useful citizens if relieved of parts of one or more extremities by judicious amputation. A few of these individuals will be found to have refused amputation because of religious or superstitious prejudice against giving up any part of their natural bodies. Others have requested amputation and been refused. In many instances amputation has never been seriously considered as a method of reconstruction and rehabilitation by either patient or surgeon.

The following general factors are to be considered in determining the advisability of amputation for the relief of chronic disability:

1. *Function.*—If one extremity is totally devoid of useful function, and if reconstructive surgery offers no hope of restoration of function, amputation of the entire extremity is usually indicated. A useless arm, if not painful, might be kept for its cosmetic value; but the function of artificial legs is so good that amputation, even by ablation of the entire extremity, should be urged.

2. *Pain.*—Severe pain, if otherwise incurable and if caused within the extremity, is a positive indication for amputation.

3. *Infection.*—Progressive or intractable infection affecting the health or threatening the life of the patient may demand amputation.

4. *Prognosis Following Other Treatment.*—A program of reconstruction involving multiple operations, braces and appliances should not be undertaken without a careful estimation of the result likely to be achieved. Will simple amputation of all or part of such an extremity offer a better prognosis in terms of appearance, comfort and function?

5. *Sites Available.*—Does a sufficient part of the extremity possess useful function to allow amputation at a site of election, with assurance that the remaining stump will function well in a prosthesis? Most chronic deformities are only partially disabling; their amputation is surgery of election. Advice to these patients requires a nice judgment and an awareness of the physiologic requirements described in chapter I. Will even an amputation of the entire extremity, fitted with a "tilting table" leg, provide better function than the disabled member?

6. *Braces.*—Does the patient now require an appliance more unwieldy, unsightly or uncomfortable than an artificial limb? After a proposed program of reconstructive surgery will he still require an appliance?

7. *Age.*—In the choice of procedures for the relief of disability from chronic disease or deformity of an extremity, the age of the patient may be a most important consideration. Children have time to spare. Intelligent reconstructive surgery counts on the assistance of the growth process in many instances. Conversely, the permanent health and function of a stump are better assured if amputation is performed after the growing period has ended.

8. *Economic Status.*—This consideration may be related to the previous one. An adult may choose amputation because he feels he cannot afford the time required for an alternate procedure. Furthermore, free hospital beds for crippled children are plentiful, while free orthopedic beds for adults are extremely scarce.

9. *Consultation.*—Do one or more competent consultants agree that amputation is the procedure of choice?

10. *Wishes of the Patient.*—In an astonishing number of instances the patient affected by a disabling, painful, chronic deformity goes from surgeon to surgeon begging for an amputation. Objection frequently comes from family and parents, who bear neither the pain nor the disability and who may enjoy their martyrdom in caring for the cripple. The wishes of the parents must be considered in the disposition of a minor child. With an adult, the surgeon need concern himself only that the patient understands what he may reasonably expect as a result and that he positively wants the amputation. The indications for amputation for the relief of chronic disability vary with the cause of the deformity. Similarly, limitations are sometimes imposed by the nature of the underlying pathologic condition. Etiologically, most cases will fall into one of four groups:

1. *Congenital Deformities.*—Supernumerary parts, digits or major portions of an extremity should be amputated, the earlier in life the better. Congenital amputations may be fitted with suitable prostheses in early childhood. Reamputation or reshaping of the stump may allow more satisfactory fitting and better function but should be delayed until the end of the growth period if possible. Congenital absence of long bones is a fairly common anomaly. Absence of the tibia results in a short fibula, which usually dislocates at its upper end. The bone becomes bowed and the foot falls into marked varus. The whole lower leg is unfit for weight bearing. If the parents refuse amputation until they are convinced that the outlook is hopeless, an adjustable walking Thomas splint may be worn until amputation is agreed on. Absence of the femur, partial or complete, presents a similar problem. Some modification of the ischial-bearing Thomas splint should be worn well into adolescence. If amputation then appears to be the best solution, a suitable length of bone and soft tissue will be available. Absences of either the radius or the ulna are susceptible to reconstructive surgery and bone grafts and seldom require amputation.

2. *Post-Traumatic Deformities.*—Angulation and overriding of long bones, malalignment of joint surfaces and ankylosis of joints are correctable by reconstructive surgery. Paralysis of part of the musculature and extensive loss of bone are not in themselves indications for amputation. Such conditions as inoperable anesthesia, chronic infection, massive loss of soft tissues and impairment of circulation tend to throw the balance in favor of amputation. Age is a factor here; reconstruction which could not succeed in an adult may be attempted in a child.

3. *Paralysis.*—Amputation is seldom indicated in cerebral palsy. In an exceptional case of monoplegia or hemiplegia the gait may be improved by amputation of an extremely spastic

and deformed lower extremity. The procedure is limited by the fact that such an extremity is affected in its entirety and must be removed in its entirety. In an occasional case of paralysis and deformity from anterior poliomyelitis, benefit may be derived from amputation. The ideal patient is the adult with extensive paralysis of one lower extremity, with severe deformity and shortening, yet with sufficient muscular control of the hip to motivate a good thigh stump. The number of these patients is limited by the rarity of a strong and stable hip in an extremity otherwise so deformed.

4. *Infection*.—Chronic pyogenic osteomyelitis or arthritis is an indication for amputation only when competent treatment over a long period has failed to effect, or to promise, a cure. Such cases are, unfortunately, common enough. An infection which impairs the health or threatens the life of its host is an absolute indication. The elective cases are limited by the availability of a favorable site for amputation through uninfected bone and soft tissues. The use of drugs of the sulfanilamide series before and after amputations should reduce the operative risk in these cases.

Council on Pharmacy and Chemistry

BACTERIOPHAGE THERAPY: II.

IN 1934 THERE WAS PUBLISHED IN THE JOURNAL UNDER THE AUSPICES OF THE COUNCIL A SERIES OF ARTICLES ON THE STATUS OF BACTERIOPHAGE THERAPY, BY DRs. EATON AND BAYNE-JONES. RECENTLY THE COUNCIL FELT THAT SUBSEQUENT DEVELOPMENTS IN THIS FIELD MIGHT WARRANT A RE-STUDY OF THIS SUBJECT. DR. A. P. KRUEGER, PROFESSOR OF BACTERIOLOGY AT THE UNIVERSITY OF CALIFORNIA AND HIS COLLEAGUE, DR. E. JANE SCRIBNER, KINDLY AGREED TO MAKE THE NECESSARY STUDY AND TO WRITE A REPORT. THEIR REPORT, WHICH FOLLOWS, HAS BEEN ADOPTED BY THE COUNCIL AND AUTHORIZED FOR PUBLICATION. IN AUTHORIZING THE PUBLICATION, THE COUNCIL EXPRESSES ITS GRATITUDE TO DRs. KRUEGER AND SCRIBNER FOR THEIR EXCELLENT STATUS REPORT.

OFFICE OF THE COUNCIL.

THE BACTERIOPHAGE

ITS NATURE AND ITS THERAPEUTIC USE

ALBERT PAUL KRUEGER, M.D.

AND

E. JANE SCRIBNER, Ph.D.

BERKELEY, CALIF.

There appeared in THE JOURNAL during December 1934 a series of articles on bacteriophage therapy by Drs. M. D. Eaton and Stanhope Bayne-Jones.¹ The phases of the subject covered included the experimentally determined facts relating to the bacteriophage phenomenon, the laboratory and clinical evidence for and against the therapeutic usefulness of bacteriophage and the role of so-called antiviral in crude lysates containing bacteriophage. The survey served most effectively as a timely basis for determining the status of commercial phage preparations. In the six years since the report of Eaton and Bayne-Jones was published, much more information about both phage itself and its clinical utility has accumulated; it has been thought advisable therefore to supplement their paper with an analysis of the recent literature, using as a background certain of their summarized material. We propose to consider the following subjects:

1. The nature of bacteriophage and its mode of action on bacteria.
2. The laboratory evidence regarding the therapeutic value of phage in experimental infections.
3. The clinical evidence for and against the usefulness of phage in treating infectious diseases.

From the Department of Bacteriology, University of California Medical School.

1. Eaton, M. D., and Bayne-Jones, Stanhope: Bacteriophage Therapy. J. A. M. A. 103: 1769-1776 (Dec. 8), 1847-1853 (Dec. 15), 1934-1939 (Dec. 22) 1934.

It is not possible to abstract or discuss in this article all the papers that have been published on the subject, and we have selected only those that have seemed to us most significant.

1. THE NATURE OF BACTERIOPHAGE AND THE PHAGE-BACTERIUM REACTION

The phenomenon of bacteriophagy, as carried out under optimal conditions in vitro, is spectacular. One sees a turbid culture representing the accumulated product of several hours of bacterial growth suddenly clear and become sterile. A minute amount of the cleared culture added to a fresh inoculum of organisms in broth induces the same train of events. To early investigators this regeneration of the lytic principle signified at once that the latter was an animate material of some sort and d'Herelle built his entire theory of bacteriophage around the concept that it is a living ultramicrobe, parasitic on bacteria. Other workers developed their own extremely divergent theories, and claims to practically every likely possibility were made long before there existed sufficient factual evidence to arrive at a considered conclusion.

The past eight years has witnessed the gradual accumulation of enough fundamental data to answer with some finality a good many of the most important questions about phage and phage action. Such of this information as we feel has a bearing on the general problem of therapeutic application is summarized here-with:

1. Phage is a protein of high molecular weight.²
2. Under optimal conditions of temperature, pH and so on in the test tube the reaction between phage and the bacterial substrate displays the following characteristics (fig. 1):

(a) Bacterial reproduction follows the normal growth curve just as though no phage were present up to the time lysis (massive dissolution) of bacteria begins.³

(b) Phage production proceeds at a rate considerably faster than bacterial growth;⁴ therefore the ratio of phage to bacteria in a given mixture is constantly rising, the great percentage of phage being attached to the cells.⁵

(c) When approximately 100 phage units per bacterium has accumulated (lytic threshold) lysis of bacteria occurs very rapidly.⁶ For example, a densely turbid suspension containing 100 million cells per cubic centimeter will become crystal clear within one half hour. Lysis consists of actual cellular disruption⁷ accompanied by hydrolytic cleavage of bacterial proteins in some instances.⁸ Granular cellular debris may or may not remain after lysis has gone to completion depending on the nature of the organism lysed.⁹

Med. 47: 279-303 (Feb.) 1933.

Substances present in solution during growth of the bacteria may alter the lytic threshold materially. Thus 0.00016 molar manganous chloride reduces the phage-bacteria ratio requisite for lysis to 12 as compared with the normal figure of 100;¹⁰ 0.125 molar sodium sulfate and 0.25 molar sodium chloride have just the opposite effect; they raise the ratio to 320 and 1,000 respectively.¹¹

3. Phage is readily inactivated by a variety of chemical and physical agents.¹² Of particular significance in evaluating clinical usage is the inactivating effect of those products which occur in tissues as a constant part of the phenomenon of inflammation. It is known that blood serum, white cells, bacterial polysaccharides, whole dead bacteria, tissue debris and in fact colloidal suspensions of many sorts exert either a direct destructive action on phage or an indirect inhibitory effect on the interaction of phage and bacteria.

When injected into the body of man or animals, phage serves as an antigen, stimulating the tissues to produce antiphage.¹³ This antibody, as its name implies, also neutralizes phage activity. Likewise, certain normal secretions such as the gastric juice or bile may serve as phage inactivators.

4. Phages exhibit decided limitations in the range of their activity; that is, no single phage is capable of lysing all organisms. Usually it is found that a particular phage will act on one group of bacteria but not on others; e. g., a coli phage will not lyse staphylococci. Even within the group for which it displays activity there occur resistant strains able to grow freely in concentrated phage solution. Apparently phage specificity is linked with the antigenic structure of the bacterial substrate; certain definite chemical components must be present on the cell surface for phage fixation to occur and if these materials are lacking this highly essential initial step in the phage-bacterium reaction cannot be consummated.

Besides having a wide distribution in nature, resistant micro-organisms may develop spontaneously from phage-susceptible forms in the course of the reaction between the latter and phage.¹⁴ In this sense phage is a potent dissociating agent; it can readily split off from a parent bacterial strain daughter cells possessing entirely different structural, biochemical, pathogenic and immunologic characteristics, these alterations being reflected in such diverse and biologically important matters as colonial structure, fermentative capabilities and host invasiveness. Naturally it is to the host's advantage if phage-induced dissociation should result in the production of less pathogenic forms. This interesting possibility will be considered at some length later on.

5. The mechanism of phage formation during the reaction between phage and susceptible cells has been the subject of long controversy. d'Herelle and his followers¹⁴ have held to the theory that phage is a living ultramicrobe parasitic on bacteria and as such develops by means of an independent metabolism at the expense of the host cell. The major opposition to this tenet

has come from Bordet and his school,¹⁵ who advanced the concept that phage is simply a unique by-product of bacterial metabolism possessing the curious property of destroying the cell which formed it. The accumulation of data with the passage of time has strengthened Bordet's stand.

The first accurate quantitative study of the kinetics of bacteriophagy³ clearly implicated bacterial growth as an essential factor in phage production. If susceptible bacteria grew in the presence of phage, more phage was formed; when they ceased reproducing, phage formation came to a halt. This relationship was found to be so reliable that it could be stated in mathematical form, and equations were derived which accurately forecast all the major events of bacteriophagy. Nevertheless, more recent work¹⁶ has proved that bacterial reproduction and phage formation are distinct reactions presenting the deceptive appearance of cause and effect only because they have nearly identical optimums. The rates of the two processes have been shown to have different p_H and temperature maximums; by careful adjustment of these factors, conditions were obtained which inhibited cell division while permitting phage production. Similarly certain concentrations of sodium chloride or sodium sulfate,¹¹ in the medium induced

THE NORMAL PROCESS OF BACTERIOPHAGY IN VITRO

Fig. 1.—Phenomena that comprise bacteriophagy.

the cessation of bacterial reproduction without slowing down phage formation. These observations have been confirmed by Northrop¹⁷ in the course of work on an entirely different phage and bacterium.

The fact is, then, that bacterial growth is not essential for the elaboration of phage, the two phenomena having an apparently intimate connection only because they require much the same milieu. Once established, this conclusion led away from attempts to involve some previously unsuspected aspect of bacterial growth as the prime conditioning factor for phage formation. It seemed reasonable to assume as a working hypothesis¹⁸ that phage, itself a protein with many of the properties of an enzyme, is fabricated in much the same way that other enzymes are; namely, by the cellular synthesis of an inactive precursor which is later changed into the active form. A classic example among the enzymes is trypsinogen, developed by the pancreas in the inactive state and subsequently converted to the enzyme trypsin in the small bowel. Trypsinogen in solution can be

autocatalytically transformed into trypsin by the addition of a small amount of trypsin to it.¹⁹

Experimental search has brought to light satisfactory evidence that an analogous relationship exists in the production of phage. Traces of a substance which reacts with phage to form more phage have been detected in ultrafiltrates of bacterial cultures,²⁰ but the yields were so irregular that a totally different approach had to be evolved. This has taken the form of demonstrating phage precursor in "activated" bacteria;²¹ i. e., cells which have completed a phase of rapid growth and subsequently have been brought to a resting state by storage in salt solution at low temperature. Such cells added to phage react with it extremely rapidly and within two minutes cause the phage titer to rise to levels as high as ten times the original value. The cellular component responsible for this increase in phage content²² is very labile and can be inactivated by several chemicals such as iodoacetic acid and methylene blue in concentrations that are not lethal for the cells themselves.²³ The same thing holds for the heat inactivation of precursor; it proceeds at temperatures too low to injure the bacteria, and the rate of inactivation rises abruptly with small temperature increments. The latter fact is of considerable interest, for in general it is peculiarly characteristic of protein denaturation that small differences in temperature have such an enormous influence on the rate of reaction. The probability follows that phage precursor either contains a protein constituent or, as seems more likely, consists entirely of a protein.²⁴

2. LABORATORY EVIDENCE REGARDING THERAPEUTIC VALUE OF PHAGE IN EXPERIMENTAL INFECTIONS

Phage preparations employed in the treatment of disease are far from being simple solutions of the lytic principle in water. As a matter of fact they contain varying proportions of all sorts of materials too complex to analyze accurately, such as constituents of mediums, the accumulated by-products of bacterial metabolism, substances released by lysis of the microbial substrate, and finally a small amount of phage (at the most 1 or 2 mg. per liter). Certainly the effects observed in

infected animals and human beings following the injection of a crude lysate cannot be attributed to the phage content alone, for all the substances just noted are biologically active and are present in sufficient concentrations to be therapeutically significant. For convenience they may be classified in two groups:

A. Bacterial derivatives serving as antigens and stimulating the production of specific antibacterial immunity.

B. Medium proteins and peptones capable of initiating the common nonspecific protein shock reaction.

There are thus three major possibilities to be considered in analyzing the mechanism of such recoveries as may follow the injection of phage into infected hosts. The results conceivably may be due to cellular lysis *in vivo*, to specific immune phenomena, to nonspecific protein shock or to some combination of these three factors.

Because of the technical difficulties involved but few attempts have been made to treat infected animals or patients with purified phage, and the meager experimental data obtained have led to the conclusion that phage lysis of bacteria in tissues is on a very low level indeed, if it occurs at all. This is in accord with a

Fig. 2.—Reasons for failure of lytic destruction of bacteria in tissues.

prediction now some ten years old based on observations of the phage-bacterium reaction *in vitro*.²⁵ Briefly the facts are these: For susceptible cells to undergo lytic destruction there must be available in the immediate environment sufficient phage to raise the phage-bacterium ratio above the critical lytic threshold. This relatively high concentration of phage can be attained theoretically by introducing enough phage directly into the infected area, e. g. a wound, or by injecting a few cubic centimeters into the body, depending on the circulation to convey the phage to the infected site, where, through contact with a susceptible bacterial population, it may develop into the amount required for lysis. There are, however, very real difficulties which stand in the way of realizing either desideratum. In the first place a good lysate contains a mere 1×10^{10} or 1×10^{11} phage units per cubic centimeter (0.001 mg. of phage protein), and even when large amounts are used topically in diseased areas its active strength is seriously reduced by the inactivating influence of nearly every element participating in the phenomenon of inflammation. Dead susceptible bacteria bind considerable quantities of phage and the adsorptive process is irreversible.²⁶ Similarly leukocytes and leukocytic

25. Manwaring, W. H., and Krueger, A. P.: Laboratory-Endorsed Therapeutic Agents, *J. A. M. A.* **93**: 95-96 (July 13) 1929; Limitation of Bacteriophage Therapy, editorial, *ibid.* **96**: 693 (Feb. 28) 1931.

extracts²⁶ are potent phage-inactivating agents. Blood serum,²⁷ the carbohydrate fractions of dead bacteria²⁸ and nonbacterial polysaccharides²⁹ all exert a pronounced inhibitory effect on bacteriophage. It was thought for a time that only the carbohydrates from susceptible bacteria could interfere with phage action, but recent work²⁹ has proved that the polysaccharides of resistant strains may act just as powerfully.

The functional efficiency of phage, therefore, depends on the exact local situation obtaining in the infected tissue and, judging from quantitative experimental evidence, it would be remarkable if under average conditions more than 1×10^7 phage units in each cubic centimeter of the original lysate remained available for action on living organisms. Since the average lytic threshold appears to be in the neighborhood of 100 phage units/bacterium, the maximal number of bacteria which could be lysed by each cubic centimeter of phage preparation would be 100,000, a relatively small portion of the massive bacterial population involved in a serious wound infection. Should the bacterial content of the exudate be moderately greater than this, the nature of phage distribution among the organisms would operate to reduce to a negligible percentage the number of cells receiving enough phage for initiation of lysis. The practical functioning of these influences which keep the concentration of phage in an infected site at a very low level is reflected in the data of Jern, Howes and Meleney,³⁰ who followed the fate of phage introduced directly into localized staphylococcal infections in man. There was no evidence that phage multiplied in the infected areas; on the contrary, substances not specified by the authors inhibited phage action and greatly diminished the amount available in the lesions.

The possibility must be considered that the loss of phage incurred by the factors enumerated might be compensated for through local production of phage by the infecting organisms. It has been stressed already that the optimums for bacterial growth and phage formation are approximately the same,³¹ and that the latter process can be dissociated from the former only by very careful

regulation of experimental conditions. Ordinarily the effective elaboration of phage requires an environment that favors free bacterial growth. In tissues all the humoral and cellular elements of the host oppose the reproduction of the invader and it is difficult to see how any significant regeneration of phage could be expected to occur under these generally adverse circumstances. As a further detriment to the lytic destruction of bacteria even when phage is repeatedly applied there ensues a continuous dilution of phage by plasma diffusing through the walls of small vessels in the inflamed area. This phenomenon involves more than physical dilution, for along with the fluid come new stores of the substances which inhibit bacteriophage.

If topical treatment of infected tissues with phage is to follow established precepts, we may suppose that care will be exercised to preserve the infection-limiting reaction which normally develops at the periphery of the diseased site and that the use of excessive pressure will be avoided when the lysate is instilled. Certainly this is to the host's advantage; but if this condition is met there is no reason to assume extraordinary penetration of phage into the deeper tissues and it becomes unlikely that bacterial lysis is more than a remote possibility in anything except the very superficial areas.

The second means of utilizing phage presupposes that a small amount injected hypodermically anywhere in the body will eventually localize in the center of infection.³² Such a concept completely disregards the known facts and implies a chemotactic affinity of fantastic proportions between phage and pathogen. To begin with, the dilution factor is huge; in an average individual receiving a dose of 2.0 cc. of phage, granted that the entire quantity reaches the blood stream, the actual concentration in the circulation could not be more than 4×10^6 phage units per cubic centimeter. This amount would be subject to two additional depleting influences, namely, the phage inactivating substances of the blood stream and the phagocytic capacity of the reticulo-endothelial system. The extent of the depletion is clearly shown in the experimental data of several workers, as for example those of Nungester and Watrous.³² These investigators injected 2.0 cc. of staphylococcal phage intravenously into each of fifteen albino rats (a large dose corresponding approximately to 150 cc. for a human being). The initial phage titer was 5×10^8 phage units per cubic centimeter; in five minutes the blood titer was 2×10^5 phage units/cc. and in two hours only 40 phage units/cc. This means that immediately after the injection of phage the effective blood level is reduced to 0.04 per cent of the original concentration of the lysate. In two hours only one phage particle in ten million of the lysate injected remains in the blood stream. The reticulo-endothelial cells of the spleen and liver appear to function actively in the removal of phage from the circulation and thus prevent it from acting on blood-borne organisms. This clearing effect provides an explanation for the generally negative attempts to treat streptococcal and staphylococcal septicemias in experimental animals with phage.³³

There is no doubt that these depleting factors operate under practical conditions and in our opinion help to

explain the failure of certain types of phage therapy. For example, Bronfenbrenner and Sulkin³⁴ in a well controlled study found that the intravenous injection of homologous phage into rabbits suffering from staphylococcal cutaneous infections was of no value. Also Jern and her co-workers³⁰ have made some very pertinent observations on patients suffering from furuncles and carbuncles. After large amounts of phage were injected at a distance from the lesions, only one case in four showed the presence of phage in the exudate. In a separate group of eight patients, satellite furuncles developed around the original lesion being treated with phage. Despite the admittedly close relationship between the primary and secondary sites of infection, no phage could be recovered from the latter.

To recapitulate, the cumulative experimental evidence indicates that lysis of invading organisms by phage within the body of the infected host is entirely dependent on local circumstances in the diseased tissue. These are practically without exception inimical to the process of bacteriophagy, largely because the body fluids and the cells participating in the defense reaction ex-

itself was responsible. However, it is conceivable that the period of heating not only destroyed the phage but also inactivated some other biologically active component, e. g. something analogous to the Vi fraction of the typhoid organism. A more conclusive control using an unaltered crude lysate from which the phage had been removed by differential adsorption would be of aid in settling this point.

It is possible to visualize very special conditions under which the lytic effect of phage might be exercised to good advantage. This would be the case in the superficial layers of a wound and in the outer portion of the mucous lining of a cavity such as the bladder where continued application of strong lysates eventually could bring into the area enough phage to cause lysis. The same would be true of localized infectious processes of the bowel (e. g. dysentery) as distinct from generalized systemic infections of gastrointestinal origin (e. g. typhoid). Conditions in the lumen of the bowel can at times and at certain levels favor the rapid growth of enteric pathogens while presenting little in the way of phage inhibitory agents. If phage introduced by mouth

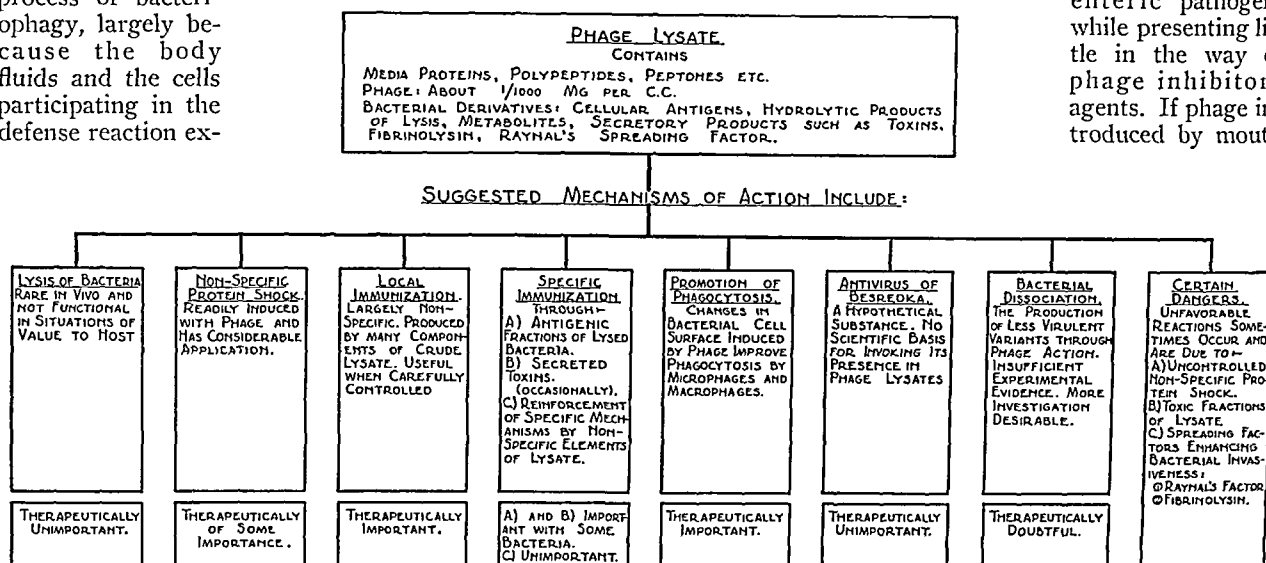

Fig. 3.—Possible mechanisms that have been advanced as a basis for phage action in vivo. The evaluation of the importance of each mechanism represents the opinion of the authors.

ert either a direct inactivating effect on phage or inhibit the interaction of bacteria and phage.

Nevertheless there have been reported a few experimental studies which suggest that actual bacterial lysis may play a role in the therapeutic and prophylactic action of phage. For example, Fisk³⁵ observed that antityphoid phage injected into mice immediately before the administration of typhoid bacilli conferred a very satisfactory protection. Further, phage-inoculated mice remained resistant to infection for as long as twenty-four hours; even when a period of four hours was allowed to elapse following the injection of organisms before beginning treatment with phage, the results were fully as successful. The fact that heating the phage to 70 C. for fifty minutes eliminated the protective action of the lysate would also suggest that the lytic principle

successfully escaped the inactivating effect of the gastric juice it might develop at a considerable rate while in contact with a free-growing substrate and could very well regenerate sufficiently to destroy the bacteria.

Nevertheless it is problematic how much good to the host accrues from bacteriophagy in such zones. The striking forces of the invaders are in the depths of the tissues and hence are not to be thought of as participating in what is undoubtedly a very localized superficial reaction. This contention is supported by the data of Jern, Howes and Meleney.³⁰ In no instance among 110 patients suffering from furuncles and carbuncles did the repeated local use of phage accomplish complete destruction of bacteria in the lesion. Staphylococci persisted even after the slough and exudate had disappeared.

Looking at the phenomenon as a whole, one is forced to conclude that bacteriophagy in vivo is of rare occurrence and that when it does take place bacterial destruction is limited, by virtue of the special environment required, to such locales as preclude phage-engendered lysis of bacteria from playing a major part in recovery. Therefore, with the few exceptions already noted, it is not logical to rely on the lytic power of phage in the treatment of disease. From this point of view the

emphasis in the literature on phage therapy has been misplaced. As a rule the feature most heavily stressed has been the necessity for employing a specific phage, i. e. one active for the causal agent involved, while little has been said about the need for bringing into play a sufficient quantity of phage. Yet it is clear that not only must the qualitative criterion of specificity be met, but in order to manifest activity the phage has to be present in adequate quantity.

The exclusion of direct lytic action of invading organisms as a significant mechanism in the therapeutic action of crude lysates leaves four further possibilities to be considered:

A. *The Development of Less Virulent Variants from Pathogenic Organisms Through Phage-Induced Dissociation.*—The great majority of disease-producing bacteria normally tend to form smooth-surface (S) colonies when grown on solid mediums, but through exposure to an unfavorable environment rough (R) colonies may appear. These are split off from the parent strain in response to the stimulus provided by a great variety of injurious agents, e. g. numerous chemicals, immune serum and bacteriophage. The constituent organisms are apt to be altogether different from the original ones in size, shape, motility, surface structure, antigenic composition, biochemical activities and virulence. Since the R variants are usually less virulent than S strains and are more readily destroyed by the body's defense systems, the dissociation might be very much to the infected host's advantage if it could be made to operate at will. While R forms emerge at times during normal recovery from infection, they are not a universal accompaniment of healing and, as yet, many of the factors which lead to their dissociation from the invading strain in vivo are unknown.

It is not especially difficult to produce less virulent variants from S strains in vitro by means of phage action, but no satisfactory statistical survey has been conducted to determine the effectiveness of phage treatment in initiating the phenomenon in the patient. Some indication of such action was found by Gowen³⁰ and Jern, Howes and Meleney³⁰ during the studies already referred to. They noted that repeated applications of phage to boils or carbuncles altered the cultural characteristics of the bacteria and caused them to form moth-eaten, degenerative and roughened colonies, sometimes with changes in chromogenic and hemolytic properties. Here again the quantitative aspects of phage therapy are seen to be important, for the dissociative effect tended to disappear within forty-eight hours unless topical treatments were repeated. This coincides with Jern's report that, "while the bacteriophage persisted in the lesion and still had some destructive action after twenty-four hours, it did not increase in potency as it did in the test tube. Instead, it grew progressively weaker."

To keep sufficient phage in the area so that bacterial dissociation can be continuously maintained, the phage supply must be renewed from time to time. Even then it is difficult to find any correlation between the successful induction of dissociation and a favorable host response. In Jern's series, 82 per cent of the patients showing no detectable variants in wound cultures were improved by phage treatments, while only 33 per cent of the patients whose cultures revealed staphylococcus dissociation were clinically benefited.

One must admit that this phase of phage therapy offers theoretical possibilities worthy of further investigation. While it may well prove to constitute a very limited approach, it is more conducive to a healthy state of mind in evaluating the results which follow the use of phage than is the overstressed dependence on lytic destruction of bacteria *in situ*. At the same time it should be pointed out that dissociation can take the opposite direction and sometimes may lead to the formation of more virulent bacterial strains. Madison³⁷ has found this to be true of variants arising through phage action on the hemolytic streptococci. The tissue invasiveness of the original organism was shown to parallel its capacity to secrete the fibrin-dissolving principle, fibrinolysin. Phage induced variants formed ten times the concentration of fibrinolysin produced by the parent strain and consequently were potentially more dangerous to the host.³⁸

B. The Augmentation of Phagocytic Efficiency Through the Stimulus Supplied by Phage.—The intravenous injection of a great array of entirely nonspecific materials present in culture mediums, bacterial filtrates and the like is known to produce leukocytosis (see section D), so it is not surprising that phage lysates can accomplish the same end. However, phage itself as distinct from the various complexes of the crude lysate, appears to exert a very interesting and highly specific effect in enhancing both the mobilization of leukocytes and their phagocytic capacity. To summarize the essential facts:

1. The intravenous injection of phage and susceptible staphylococci into rabbits causes a more pronounced leukocytosis than the injection of either susceptible organisms alone or phage mixed with resistant staphylococci (Nelson³⁹).

Phagocytosis of susceptible bacteria in vitro is promoted by the presence of phage, while phage has no effect on the phagocytosis of resistant strains (Smith⁴⁰ and Nelson³⁹). More recently MacNeal, McRae and Colmers⁴¹ have shown that this stimulation occurs not only in aqueous mediums but in blood serum as well and that, during the first hour after the intravenous injection of phage, phagocytosis of susceptible organisms in vivo is increased. Hoder⁴² reports that phage-resistant strains of the staphylococcus, typhoid bacillus, dysentery bacillus and colon bacillus which arise during the course of the phage-bacterium reaction usually are more readily phagocytized than the normal phage-susceptible strains.

3. The phagocytic efficiency of the reticuloendothelial system is raised when rabbits suffering from staphylococcal septicemia are given intravenous injections of homologous phage (MacNeal, Frisbee and Slavkin).⁴³

It would seem that the attachment of phage to an organism so alters the surface composition that phagocytosis by macrophages and microphages takes place more readily.

C. *The Stimulation of Specific Antibacterial Immunity in the Host by Antigenic Fractions of Lysed Organisms.*—In the preparation of a lysate, susceptible bacteria are grown in broth to which the appropriate phage has been added. As a terminal event, in the reaction from 10 million to 2 billion bacteria per cubic centimeter are disrupted, a portion of the released bacterial substance consisting of specific antigens. Unfortunately a certain percentage of protein, varying with the nature of the bacterium, is hydrolyzed during lysis and consequently loses its immunity-provoking capacity. Northrop⁴⁴ has found that lytic disruption of *Staphylococcus aureus* is attended by loss of all the native protein, while intact protein appears in solution during the lysis of *Bacillus coli* or *B. megatherium*. When the residual intact fraction is injected hypodermically it functions actively as a vaccine and evokes formation of characteristic humoral antibodies. Unquestionably many bacteriophage preparations are potent immunizing solutions (Arnold and Weiss,⁴⁵ Maslakowetz and Kasarnowsky,⁴⁶ Compton,⁴⁷ Flu⁴⁸ and others) but active immunity produced in this way takes considerable time to develop and is not detectable ordinarily until four or five days have elapsed. Consequently, specific immunization with such cellular antigens as are not destroyed during lysis is not a weapon for immediate use in an acute infection. Additional studies of the type undertaken by Hetler and Bronfenbrenner⁴⁹ and Northrop⁴⁴ are needed to measure the extent of protein hydrolysis occurring when lysates are made from a wide range of pathogenic forms.

There are some data to indicate that phage lysates make particularly good immunizing agents and that their protective effect is exerted more rapidly than that of an orthodox vaccine (Larkum⁵⁰). This is not unreasonable, for the antigenic materials of a lysate are already in solution and need not be broken down by preliminary cellular digestion to become available for immunization. Furthermore, toxin-producing organisms, e. g. the staphylococcus, can secrete into the medium a significant quantity of toxin during preparation of a lysate (King, Boyd and Conlin,⁵¹ Holm, Anderson and Leonard⁵²). When injected, the toxin stimulates the formation of antitoxin and the latter may furnish signal aid to the infected patient, provided of course the situation is not too acute and there is enough time for the specific immune mechanism to be brought into play (Larkum⁵³). Occasionally the toxin fraction is large enough to produce severe reactions in the host.⁵¹

A well recognized phenomenon in experimental bacteriology is the induction of immunity confined to a limited tissue area and not shared by the body as a whole. This local immunity appears subsequent to the topical application of various culture filtrates and whole cell suspensions but the best of the available evidence suggests that the immunity is not specific and that non-specific factors are of primary importance in its production; consequently it will be discussed in the next section.

D. *The Stimulation of Specific or Nonspecific Immune Mechanisms of the Host by Proteins, Peptones and So On of the Crude Lysate.*—It is a curious fact, but a satisfactorily verified one, that the injection of a great variety of nonrelated substances can occasion at times a rise in titer of narrowly specific humoral antibodies. Among the provocative agents are included such materials as proteins, polypeptides, metallic salts and all sorts of colloids, which not only are mutually unrelated but bear no antigenic relationship whatever to the antibody whose titer increases. This seems at first hand contradictory to the tenets of the modern school of immunology, for one of its major accomplishments has been the exhaustive elucidation of chemical specificity as originally envisioned by Ehrlich. The accumulated data have proved that the specific reactive groups of an antibody are a direct reflection of the structural configuration of the antigen used to produce it. Nonetheless it is true that completely nonspecific agents may elicit the following types of response:

1. Enhancement of specific antibody production when administered early in the immunizing program.
2. Increase in the normal antibody content of the blood stream (normal antibodies are those present in a nonimmunized and previously uninfected individual and cannot be related definitely to any previous contact of the host with the corresponding antigen).
3. Secondary stimulation of antibody production when the nonspecific agent is used after the primary specific immunization has attained a maximum.

These host reactions are not qualitatively or quantitatively comparable to the intensive or lasting antibody response which takes place after the injection of specific antigen, nor can they be relied on to follow with regularity the use of any particular nonspecific material. They fit into the general theory of serologic specificity as minor and undependable reinforcements of the basic specific reactions.

Unpurified phage lysates carry with them a notable amount of complex medium constituents, cellular derivatives, metabolites and the like, all of which may function as augmenters of immunity in the sense just defined. It is unlikely that they account for any considerable degree of therapeutic efficiency on the part of the lysate.

Besides supplying a negligible stimulus to the body's specific immune system, the agents enumerated are responsible for an altogether different type of bodily reaction known as nonspecific protein shock.⁵⁴ Within a few minutes after the intravenous injection of serum globulin, albumin, milk, typhoid vaccine and the like, the patient experiences a chill followed by a sharp rise in temperature. The fever breaks in from one to three hours and sometimes remains at a normal level even when the patient's illness previously has run a prolonged febrile course. The subsequent symptomatic relief may be striking. It appears to depend on profound changes

in the fundamental biochemical process of the body, and Petersen⁵⁵ has collected an impressive array of data exemplifying the manifold expressions these changes may take. Certain of them represent direct augmentation of the bodily defenses against infection. This would be true of the following, to make only a partial list:

1. Leukocytosis preceded by primary leukopenia.
2. Mobilization of serum enzymes.
3. Stimulation of the sympathetic nervous system.
4. Increased lymph flow and lymph volume.

Properly employed, nonspecific protein shock may be a most useful weapon in treating infectious diseases, and phage lysates are well suited to its induction. However, whether elicited by phage or some other nonspecific preparation, it is a modality which must be cautiously and critically applied because of its potentialities for harm to patients whose systems already carry the heavy burdens of illness.

A more limited form of defensive reaction may be involved when lysates are used for topical treatments. The application of killed bacterial cultures, culture filtrates, autolyzed cultures and so on to given tissue areas can confer a material increase in immunity confined to the treated zones without in any way elevating the resistance of the body as a whole. This local immunity is evidently nonspecific, both in origin and in action, for it can be evoked by the application of bacteria-free meat extract broth⁵⁶ and is effective against many different organisms. Fundamentally it seems to depend on the production of a localized inflammatory reaction and concomitant macrophage infiltration.⁵⁷ The latter persists after the inflammation has subsided and its extent is in effect a measure of the tissue's capacity to resist infection, although there is good evidence not only that it is the quantity of cells which is concerned but that in addition there are local factors tending to increase the phagocytic efficiency of the mobilized macrophages.

No single component of the preparations used to bring about local immunity is common to them all, so it follows that the property of raising a tissue's defense barriers is characteristic of entirely distinct chemical entities. Phage lysates in general should be agents *par excellence* for topical use in developing local immunity, since they contain several of the individual materials known to be active in this direction; it is our opinion that much of their therapeutic efficiency can be ascribed to this mechanism.

The results following the instillation of phage or the use of dressings wet with phage are not uniformly favorable. In recently reported experiments Bronfenbrenner and Sulkin⁵¹ applied wet dressings and instillations of phage to staphylococcal skin and eye lesions in rabbits with no result beyond temporary intensification of the inflammatory reaction. They feel that lysates made from invasive strains of staphylococcus are apt to contain the thermostable Reynal's spreading factor and can be dangerous to the host by promoting the influx of bacteria into the tissues. They recommend that noninvasive strains be selected for the preparation of therapeutic lysates.

As a final consideration, there remains the possibility that the antiviral of Besredka⁵⁸ may be implicated in local treatments with lysates. This hypothetical substance is said to be present in the cell-free filtrates of old broth cultures of bacteria and according to Besredka consists of a nonantigenic but toxic bacterial derivative which possesses the admirable property of specifically desensitizing such host cells as are susceptible to the invading bacterium. The induced resistance appears within twenty-four hours after treatment; that is, very much earlier than is the case with classic immune responses. The French medical literature contains voluminous reports on the successful use of Besredka's preparations, and Eaton and Bayne-Jones¹ have summarized some of the typical data. They feel, as we do, that a large amount of the clinical and experimental evidence regarding antiviral is inconclusive and that Besredka's interpretations of his own and others' observations are as yet unproved. Even if we grant that a measure of success has attended the clinical application of antiviral therapy there is no reason to jump to the conclusion that the results depend on a purely theoretical antiviral. They could just as well be due to the presence of the entirely nonspecific agents responsible for production of local immunity.

(The remainder of this article will be published in the next issue of THE JOURNAL)

NEW AND NONOFFICIAL REMEDIES

THE FOLLOWING ADDITIONAL ARTICLES HAVE BEEN ACCEPTED AS CONFORMING TO THE RULES OF THE COUNCIL ON PHARMACY AND CHEMISTRY OF THE AMERICAN MEDICAL ASSOCIATION FOR ADMISSION TO NEW AND NONOFFICIAL REMEDIES. A COPY OF THE RULES ON WHICH THE COUNCIL BASES ITS ACTION WILL BE SENT ON APPLICATION.

OFFICE OF THE COUNCIL.

ASCORBIC ACID (See New and Nonofficial Remedies, 1940, p. 530).

The following dosage form has been accepted:

Mead's Ascorbic Acid Tablets, 100 mg.: Each tablet contains 100 mg. of ascorbic acid-N. N. R. equivalent to 2,000 international units of vitamin C.

Prepared by Mead Johnson & Co., Evansville, Ind.

ANTIMENINGOCOCCIC SERUM (See New and Nonofficial Remedies, 1940, p. 427).

The following product has been accepted:

Sharp & Dohme, Inc., Philadelphia.

"Lyovac" Antimeningococcic Serum Natural Polyvalent.—A dried form of antimeningococcal immune natural serum, prepared from the blood of horses immunized with new or recently isolated strains representing four main types of meningococci. It is packaged by the "Lyovac" process, which consists essentially of rapid freezing at a temperature far below the freezing point, together with rapid dehydration under high vacuum without melting or fusing of the original frozen substance. The finished product is sealed under vacuum in the "Vacule" flame-sealed ampoule. Marketed in packages including one double-end "Vacule" ampoule to yield 15 cc. of restored serum, one needle-ampoule containing 15 cc. of distilled water (with preservative: Phenol, 0.35%), one complete intraspinal outfit and one 1 cc. ampoule-vial of Normal Horse Serum (diluted 1:10) as test and desensitizing material.

PENTOBARBITAL SODIUM (See New and Nonofficial Remedies, 1940, p. 128).

The following dosage forms have been accepted:

Capsules Pentobarbital Sodium-Endo, 34 grains.

Prepared by Endo Products, Inc., Richmond Hill, N. Y.

Capsules Pentobarbital Sodium-Endo, 1½ grains.

Prepared by Endo Products, Inc., Richmond Hill, N. Y.

SULFAPYRIDINE (See New and Nonofficial Remedies, 1940, p. 495).

The following product has been accepted:

Sulfapyridine-Abbott.—A brand of sulfapyridine-N. N. R.

Manufactured by Abbott Laboratories, North Chicago, Ill. No U. S. patent or trademark.

Capsules Sulfapyridine-Abbott, 0.25 Gm. (3.85 grains).

Tablets Sulfapyridine-Abbott, 0.5 Gm. (7.7 grains).

Tablets Sulfapyridine-Abbott, 0.5 Gm. (7.7 grains) (bisected).

FEDERAL DRUG REGULATIONS AMENDED

The Acting Administrator of the Federal Security Agency on April 10 announced¹ amendments to the original regulations promulgated in December 1938² under sections 502(f), 505(b) and 505(i) of the Food, Drug and Cosmetic Act. The amended regulation under section 502(f) becomes effective on October 7; the other amended regulations take effect May 10.

The amendment of special interest to the medical profession relates to the regulation previously promulgated under section 502(f), which declares a drug or device misbranded unless its label bears (1) adequate directions for use and (2) adequate warnings against misuse. The application of section 502(f) and the original regulation promulgated under this section to drugs dispensed by physicians or on physicians' prescriptions was discussed in a previous issue of THE JOURNAL by Dr. Theodore G. Klumpp,³ Chief of the Drug Division of the Food and Drug Administration. The amended regulation exempts from compliance with the requirements of clause (1) of section 502(f) a shipment or other delivery of a drug or device (a) if such shipment or delivery is made for use exclusively by or on the prescription of physicians, dentists or veterinarians licensed by law to use such drug or device, (b) if the label of the drug or device bears the statement "Caution: To be used only by or on the prescription of a ——" or "Caution: To be used only by a ——" ["physician," "dentist" or "veterinarian" or any combination of two or all of such words to be inserted], (c) if no representation appears in the labeling of such drug or device with respect to the conditions for which it is to be used, (d) if adequate directions for the use of such drug or device are available in scientific publications or otherwise and (e) in case the drug is not designated solely by a name recognized in an official compendium and is fabricated from two or more ingredients, if its label also bears the quantity or proportion

of each active ingredient. The amended regulation provides that the exemption shall remain valid until all of such shipment or delivery is dispensed on and under labels bearing the directions for use specified in prescriptions of physicians, dentists or veterinarians. The amended regulation, as does the original regulation, also exempts from compliance with the requirements of clause (1) of section 502(f) any shipment or other delivery of a drug or device (1) with respect to directions for common uses if adequate directions for such uses are known by the ordinary individual or (2) if such drug is made for use exclusively in the manufacture of another drug or device and its labeling bears the statement "For manufacturing use only" and contains no representation relative to the effect of such drug or device. Both the amended regulation and the original regulation declare that the exemptions relative to drugs or devices for use only by or on the prescription of a physician, dentist or veterinarian, or for manufacturing use only, shall expire if any part of the shipment or delivery is disposed of for any use other than by or on the prescription of a physician, dentist or veterinarian or for manufacturing use, as the case may be. Any person causing any such exemption so to expire shall be considered as having committed an act of misbranding unless, prior to such disposition, such drug or device is relabeled to comply with clause (1) of section 502(f).

The amendment to the regulation heretofore promulgated under section 505(b) is of no special interest to physicians and so will not be discussed.

The amended regulation under section 505(i) does affect physicians and others engaged in research. It provides that "new drugs" intended solely for investigational use, which under section 505(i) are exempt from the provisions of the act relating to "new drugs," be labeled "Caution: New drug—Limited by Federal law to investigational use" instead of the labeling required under the original regulation "For investigational use only." It requires (a) that the shipment or delivery of such a drug be made only to, and solely for investigational use by or under the direction of, an expert qualified by scientific training and experience to investigate the safety of such drug, (b) that the person introducing such a shipment or delivery into interstate commerce obtain a signed statement from the expert investigator that he has adequate facilities for the investigation and that the drug will be used solely by him or under his direction for purposes of investigation, unless or until an application becomes effective with respect to such drug under section 505 of the act and (c) that the shipper preserve such statement together with complete records showing the date and quantity of each shipment or delivery and make them available for inspection on the request of a representative of the Federal Security Agency until three years after the introduction of such shipment or delivery into interstate commerce. It is provided that the exemption from the provisions of the act relating to new drugs shall

1. Federal Register 6:1920 (April 15) 1941.

2. Federal Register 3:3167 (Dec. 28) 1938.

3. Klumpp, Theodore G.: The Federal Food, Drug and Cosmetic Act as It Applies to Drugs Dispensed by Physicians or on Physicians' Prescriptions, J. A. M. A. 116:830 (March 1) 1941.

become void if the shipper fails to preserve or make available for inspection the investigator's signed statement and the other records required or if any part of such shipment or delivery is used other than in accordance with the investigator's statement.

These regulations result from experience and are planned in the interest of protection of the public health. They do not place any added burden on the medical profession. They provide opportunity for research with new preparations and at the same time protect the public against precipitous exploitation of new drugs.

AVITAMINOTIC DYSENTERY

The Shiga bacillus can function as a harmless saprophyte in the intestine of normal monkeys, according to Day¹ and his co-workers of the University of Arkansas, but it assumes lethal pathogenicity if the animals are placed on a "vitamin M" deficiency diet.

Avitaminotic dysentery was first described by Verder and Petran,² who found that the withdrawal of vitamin A from the diet of monkeys is almost invariably followed by the development of gastrointestinal disturbances. They noted further that the serum of avitaminotic diarrheal monkeys usually agglutinated the dysentery bacillus, though the organism itself could not be detected in the stools till after death. They concluded that, while the dysentery bacillus was directly responsible for the diarrhea, the essential etiologic factor was the vitamin A deficiency.

Langston and his colleagues³ afterward found that monkeys given a diet fractionally deficient in parts of the vitamin B complex usually develop anemia, leukopenia, gingivitis and diarrhea, from which death usually occurs between the twenty-sixth and the one hundredth day. Since the lethal effects were not prevented by riboflavin, thiamine hydrochloride or nicotinic acid given alone or in combination, they concluded that the essential etiologic factor is not identical with any part of the vitamin B complex thus far identified. The essential therapeutic factor, however, is present in dried yeast and in crude liver extract but is absent in most samples of commercially purified liver extract. For the unknown factor that prevents this deficiency which results in diarrhea they suggested the term vitamin M.

Detailed bacteriologic studies of M-avitaminotic dysentery were afterward made by Janota and Dack⁴ of the University of Chicago. Large doses of living dysentery bacilli administered to normal monkeys would not produce dysentery. Confirming this negative result they found that many of their captive monkeys maintained on an adequate stock diet were healthy

carriers of *B. dysenteriae* (Flexner). As soon as these healthy carriers were placed on a vitamin M deficiency diet they developed Flexner type bacillary dysentery. Monkeys on diets deficient in vitamins A, C and D in addition to the M factor did not show severer symptoms, from which they concluded that M is the essential antidysentery vitamin in this animal species.

In their latest studies of nutritional cytopenia, Day and his colleagues¹ have confirmed these bacteriologic results, recovering *Shigella paradysenteriae* from the stools of M-deficiency monkeys. In one of their series 3 out of 16 monkeys with this deficiency failed to develop diarrhea, although each exhibited severe leukopenia before death. They conclude that the diarrhea is not the essential cause of the lethal blood dyscrasia. They interpret their results as proof that vitamin M deficiency causes a lowered microbic resistance in the gastrointestinal mucosa, and that gingivitis and ulcerative colitis result from the action of pathogenic saprophytes already present in these locations.

The probability that their conclusions are applicable also to man is strengthened by recent studies of human dysentery carriers. In an examination of six hundred and eighty-eight apparently well persons in Henrico County, Va., for example, McGinnes and his colleagues⁵ found one hundred and ten (17.6 per cent) whose intestine harbored the dysentery bacillus. Whether or not the few associated cases of clinical dysentery were correlated with nutritional deficiencies, however, was not determined by the Virginia epidemiologists. If nutritional deficiency is the essential etiologic factor in human dysentery, the path to epidemiologic control of this disease becomes apparent.

MAGAZINES FOR THE WAITING ROOM

Patients and office attendants in physicians' waiting and reception rooms throughout the country report increasingly that *Hygeia*, the Health Magazine, when available, is most frequently read. One attendant reports that thirteen copies of news stand favorites were available in the office under her observation. With six copies of popular 5 cent weeklies at hand, one was in use. From two copies of a well known magazine that specializes in cartoons, one was chosen for reading. Of three copies of a popular picture magazine, one was being read. But with two copies of *Hygeia* present, both were in use!

Hygeia's appeal accords with the tremendous increase in interest in well presented health material. The great attendance at health exhibits in the Chicago Century of Progress Exposition, at the New York World's Fair or at the more localized expositions in such cities as Milwaukee, San Francisco, Cleveland and Pittsburgh exemplify this interest. The informative, well illus-

1. Day, P. L.; Lanston, W. C.; Darby, W. J.; Wohlin, J. G., and Nims, Virginia: *J. Exper. Med.* 72: 463 (Oct.) 1940.

2. Verder, Elizabeth, and Petran, Elizabeth: *J. Infect. Dis.* 60: 193 (March-April) 1937.

3. Langston, W. C.; Darby, W. J.; Shukers, C. F., and Day, P. L.: *J. Exper. Med.* 68: 923 (Dec.) 1938.

4. Janota, Martha, and Dack, G. M.: *J. Infect. Dis.* 65: 217 (Sept.-Oct.) 1939.

5. McGinnes, G. F.; McLean, A. L.; Spindle, Forrest, and Maxcy, K. F.: *Am. J. Hyg.* 24: 552 (Nov.) 1936.

trated, authoritative articles found in *Hygeia* meet this thirst for knowledge about health.

Since the physician's reception room is a health center, it is the logical place for dissemination of facts about health. The patient comes there because of a definite interest in health and appreciates the opportunity to increase his knowledge by reading *Hygeia's* articles rather than fiction or entertainment. A patient waiting to see a doctor is not interested in entertainment; he wants information and help.

A careful survey of one hundred offices in eighteen representative cities was recently made to observe reading preferences of waiting patients throughout the entire "office day." From the figures obtained, it is apparent that nearly two million waiting patients now read *Hygeia* every month in doctors' offices. Subsequently a test was made to determine "reader response" by inserting special coupons in doctors' copies of *Hygeia*. Waiting patients signed and returned about one third of the coupons—demonstrating that they are definitely motivated by what they find in the magazine.

Physicians who are subscribers frequently write that *Hygeia* disappears from their reception rooms, being frequently carried away by patients who find articles of special interest to them. In such instances, on receipt of postal card notice, an additional copy will be mailed without charge to the physician.

The physician who does not keep recent copies of *Hygeia* available in his reception room for waiting patients to read is overlooking an opportunity to benefit himself and his patients. Patients will appreciate the thoughtfulness of the doctor in providing the magazine. They will profit from its authentic articles and gain an increasing respect for scientific medicine. The physician will find such patients more cooperative and more appreciative of his services.

Current Comment

OSTEOPATHY IN NEBRASKA

Osteopaths may not practice operative surgery in Nebraska, according to an opinion handed down May 2 by the supreme court of that state. The supreme court based its opinion, it is reported, on the fact that the legislature had recognized a difference between the practice of medicine and surgery on the one hand and the practice of osteopathy on the other by providing for the issuance of different types of licenses to the two classes of practitioners. The osteopaths in Nebraska have sought to take a short cut to the field of medicine by having enacted a law authorizing them to practice as taught in osteopathic schools. This type of statute was resorted to in the belief that, by the simple expedient of adding additional courses in osteopathic schools, osteopaths could ease over into the practice of medicine without having to obtain specific legislative authority. Formerly they tried the same procedure in Kansas,

where the supreme court said in effect that if osteopaths desire to practice medicine they should qualify in the same manner in which doctors of medicine have to qualify. Now another state supreme court has halted the attempt by osteopaths to obtain the right to practice in a field in which by training and experience they are not qualified. To the argument that the principles of osteopathy have changed, Justice Carter in the Nebraska case replied that the scope of osteopathy cannot be changed merely by a self-serving attempt to broaden its extent by invading fields requiring a different license. "If the changes are the result of advancements in the profession," continued Justice Carter, "they still constitute the practice of osteopathy. But the practice of operative surgery by an osteopath is an invasion of the field of the physician and surgeon as it is generally known and is not an evolutionary advancement of the profession." Assistant Attorney General Clarke in prosecuting this case to a conclusion has earned distinction not only for himself but for the state of Nebraska.

LEISHMANIASIS IN CRETE

On the island of Crete Dr. Basileus Malamos of Athens conducted studies on leishmaniasis. Crete is said to be the only place in the world where the three types of *Leishmania* are found simultaneously. Kala-azar, oriental boil (also called Aleppo boil, Delhi sore, Pendjelah sore and Biskra button) and canine kala-azar occur. Transmission takes place through gnats (*Phlebotomus*) and is specific. Oriental boil is encountered more frequently in the interior of cities, in narrow, dark streets and in certain dwellings. Kala-azar is found chiefly at the edge of towns or in houses in a rural environment. The explanation by Malamos is that the vector of kala-azar can move only within a short radius, whereas that of oriental boil can fly some distance. This explains why the two diseases are rarely found in the same person and why kala-azar is met frequently in children whose contact with the ground is closer. The clinical manifestations of kala-azar include pronounced leukopenia, enlargement of the spleen, meteorism, discoloration of the skin, anemia, progressive emaciation, cachexia and prolonged fever with remissions. The differential diagnosis must consider malaria, erythroblastosis and anemias due to other causes. Thorough diagnosis requires sternal puncture. Spleen puncture, formerly employed, has been found to be dangerous and has been discontinued. Antimony is the substance used chiefly in combating the disease. Military physicians must consider kala-azar. Cases of kala-azar were observed in the recent Spanish civil war among nazi troops fighting for Franco, and the condition was first mistaken for malaria. The oriental boil may occur more than once in the same person from repeated bites by infected gnats, each sting leading to a boil. Here differential diagnosis must consider lupus, lipoma and syphilis. Cauterization is the therapy recommended. Canine kala-azar occurs in dogs that have access to city areas in which human kala-azar is encountered. The manifestations in canine kala-azar are about the same as in the human type. However, ulcers, loss of hair and a rapidly induced cachexia can also be observed.

MEDICAL PREPAREDNESS

In this section of The Journal each week will appear official notices by the Committee on Medical Preparedness of the American Medical Association, announcements by the Surgeon Generals of the Army, Navy and Public Health Service, and other governmental agencies dealing with medical preparedness, and such other information and announcements as will be useful to the medical profession.

SELECTIVE SERVICE SYSTEM ACTS TO DEFER MEDICAL STUDENTS AND INTERNS

To meet a "growing national shortage of physicians and surgeons," reported by the Office of Production Management, a policy of deferment from military training of individual medical students "who give reasonable promise of becoming acceptable medical doctors" was proclaimed, March 4, by Brig. Gen. Lewis B. Hershey, deputy director of Selective Service. These deferments should be continued in each case as long as the student is progressing satisfactorily, he said.

General Hershey's memorandum, which summarizes the report of the OPM, was sent to all state Selective Service directors for communication to their local boards. It stresses the OPM statement that the shortage of physicians and surgeons affects both the nation's armed forces and the civilian population and that the utmost care must be exercised to meet both needs.

Local boards are urged to see that, while no practicing physician whose services are necessary to his community is called for military service, the requirements of the armed forces for physicians and surgeons also are filled. It also is stressed that where physicians, including interns, are eligible for military service they should be encouraged to apply for Medical Reserve Corps commissions, but that they will be inducted if they are placed in class I-A and fail to take advantage of the opportunity to be commissioned. In the case of interns it was pointed out that, if commissioned, they will be deferred from active duty by the War Department to complete one year's internship.

Summarizing the OPM report on its study of the situation, General Hershey pointed out that it indicates a present need of around 9,000 medical officers for the Army, Navy, Public Health Service and Veterans Administration in addition to present staffs. This approximates a reduction of about 5 per cent in the number of physicians now available for service in civilian life, and it is estimated that the further demand caused by health problems in communities expanded by new defense industries will increase this civilian need to about 10 per cent.

In addition to the 9,000 additional medical officers required by the Army, Navy and other defense agencies, General Hershey said the OPM report showed a probable annual turnover of around 3,500 because of retirement of regular medical officers and the expiration of tours of duty of reserve medical officers.

The OPM report estimates that there are 155,000 practicing physicians in the United States, of whom about 27,000 are

65 years of age or older, and the mortality is around 3,800 a year. Their places can be filled only by medical graduates who enter the profession each year and their number is estimated at approximately 5,000, of whom only 60 to 65 per cent probably would be qualified physically or otherwise for military service.

Commenting on this situation in announcing the Selective Service policy of deferring medical students who are making satisfactory progress in their professional training, General Hershey's memorandum to state directors stated:

There are no replacements for medical students who are withdrawn from school. Consequently if the supply of medical students who are to be graduated into the medical profession is reduced through their induction to serve in a nonprofessional capacity, an increasing reduction of physicians available for military service as well as an aggravation of the increasing overall national shortage will result.

As an outline of policy and procedure for the Selective Service System concerning medical students, General Hershey quoted the OPM report:

It is of paramount importance that the supply be not only maintained but encouraged to grow, and that no student or intern who gives reasonable promise of becoming an acceptable medical doctor be called to military service before attaining that status.

Local boards were cautioned, however, that deferment is not an exemption and that the obligation and liability for military service remain on its expiration.

General Hershey's memorandum also called attention to a previous one, issued on April 22, prescribing procedure for deferment of individual students in a number of specialized professional fields which were suggested by the Office of Production Management. This memorandum suggested procedure for presenting local boards with detailed facts concerning individual students, which was prepared by the American Council of Education and concurred in by National Headquarters of the Selective Service System. As set forth in a bulletin (number 10) issued by the council, this provides for getting into the hands of the local board of a "student statement of information" concerning his status and plans, and an affidavit by his college or university in which the college officials testify as to his standing, courses and occupational objectives, together with a general evaluation of the student as a "necessary man" for occupational deferment.

ARMY RESERVE OFFICERS ORDERED TO ACTIVE DUTY WAR DEPARTMENT

The following additional medical reserve corps officers have been ordered to extended active duty by the War Department, Washington, D. C.:

DAVIS, John Evan, Jr., 1st Lieut., Trenton, N. J.
DOEHRING, Paul Christoph, Jr., 1st Lieut., Rochester, Minn.
FLANDERS, Merton Newcomb, 1st Lieut., Waterville, Me.
FUIKS, Dellivan Meldrim, Captain, Sacramento, Calif.
GAJAN, Isidore Wilmot, Jr., 1st Lieut., New Iberia, La.
GOEN, Rayburne Wyndham, 1st Lieut., Denver.
HANLEY, James Leo, 1st Lieut., Rochester, Minn.
HELBLING, Franklin Kirkland, 1st Lieut., South Pasadena, Calif.
HINES, Leonard Wayne, 1st Lieut., Santa Rosa, Calif.
HOFFMAN, Richards Holmes, 1st Lieut., Bellefonte, Pa.
KAISER, William Frederick, Jr., 1st Lieut., Portland, Ore.
KASLOW, Arthur Louis, 1st Lieut., Palo Alto, Calif.
KEARNEY, Sanborn Gale, 1st Lieut., Bakersfield, Calif.

LECLERCQ, George Theodore, Captain, Boston.
LONG, Arthur Paige, Captain, Needham, Mass.
LYON, Thomas Pinkney, 1st Lieut., Gilroy, Calif.
MULLER, Harold Powers, Captain, Oakland, Calif.
OETJEN, Leroy H., 1st Lieut., Leesburgh, Fla.
OWSLEY, Guy Argyle, Captain, Hartford City, Ind.
PETERMAN, James E., 1st Lieut., Indiana, Pa.
RYAN, Bernard Francis, 1st Lieut., Ahwahnee, Calif.
SAKKISIAN, Milton Vahan, 1st Lieut., Sacramento, Calif.
SPECKER, Lewis, Captain, Sacramento, Calif.
STRUBLE, Gilbert Carl, Captain, Ottumwa, Iowa.
UPSHUR, Alfred Parker, Lieut. Col., New York.
WARRINGTON, William Rich, 1st Lieut., Portland, Ore.

Orders Revoked

McANALLY, William Jefferson, Jr., 1st Lieut., New Orleans.
WILSON, Galo Edward, Captain, Seattle.

FIRST CORPS AREA

The following additional medical reserve corps officers have been ordered to extended active duty by the Commanding General, First Corps Area, which comprises the states of Maine, Vermont, New Hampshire, Rhode Island, Massachusetts and Connecticut:

AXELROD, George, Captain, Clinton, Mass., Fort Devens, Mass.
CASHMAN, Justin L., 1st Lieut., North Haven, Conn., Fort Devens, Mass.
COTTER, Joseph R., 1st Lieut., Charleston, Mass., Fort Devens, Mass.
DeMINICO, Luigi B., 1st Lieut., Brighton, Mass., Fort Devens, Mass.
DOOLEY, Francis M., Captain, Portland, Maine, Fort Devens, Mass.
DUNKLE, Philip L., 1st Lieut., Wallum Lake, R. I., Fort Devens, Mass.
ELIAS, Anthony N., 1st Lieut., Taunton, Mass., Fort Devens, Mass.
FINEBERG, Meyer H., Major, Boston, Fort Devens, Mass.
FLANAGAN, Donald J., 1st Lieut., Somersworth, N. H., Camp Edwards, Mass.
GRABFIELD, Gustave P., Colonel, Boston, Memphis, Tenn.

THIRD CORPS AREA

The following additional medical reserve corps officers have been ordered to extended active duty by the Commanding General, Third Corps Area, which comprises the states of Pennsylvania, Virginia, District of Columbia and Maryland:

ALBRIGHT, Chester Harrison, Jr., 1st Lieut., Harleysville, Pa., Fort George G. Meade, Md.
BARNES, Russell Henry, 1st Lieut., Tyrone, Pa., Indiantown Gap Military Reservation, Indiantown Gap, Pa.
BENSY, Oliver Robert, Captain, Pittsburgh, Camp Lee, Va.
BERNSTEIN, Albert Alexander, 1st Lieut., Scranton, Pa., Fort Belvoir, Va.
BITMAN, Joseph, 1st Lieut., Abington, Pa., Camp Davis, N. C.
BOSS, Myron Theodore, 1st Lieut., Baltimore, Camp Davis, N. C.
CAMBEST, Michael Albert, Jr., 1st Lieut., Pittsburgh, Fort Belvoir, Va.
CANUSO, Nicholas Andrew, 1st Lieut., Philadelphia, Fort Bragg, N. C.
CAWLEY, Frank Thomas, 1st Lieut., Washington, D. C., Fort Belvoir, Va.
CRIGLER, Fielding Jason, Captain, Charlottesville, Va., Fort Belvoir, Va.
CROCKETT, Edward David, 1st Lieut., Washington, D. C., Fort Bragg, N. C.
GATES, John Stoeve, 1st Lieut., Mount Joy, Pa., General Dispensary, U. S. Army, Baltimore.
GIORDANO, Anthony Mariano, 1st Lieut., Reading, Pa., Camp Davis, N. C.
GOLDMAN, Louis H., 1st Lieut., Philadelphia, Fort Benning, Ga.
GROSSMAN, Aaron, Captain, Allentown, Pa., Camp Polk, La.
HOFFMAN, Carl Cooke, 1st Lieut., Harrisburg, Pa., Fort George G. Meade, Md.
HRESAN, Michael George, 1st Lieut., St. Clair, Pa., Camp Davis, N. C.
HULBURT, Richard Stephen, 1st Lieut., Washington, D. C., Fort George G. Meade, Md.
HUROK, Oscar Joseph, Captain, Galetton, Pa., Fort Eustis, Va.

FIFTH CORPS AREA

The following additional medical reserve corps officers have been ordered to active duty by the Commanding General, Fifth Corps Area, which comprises the states of Ohio, West Virginia, Indiana and Kentucky:

BOIARSKY, Julius L., 1st Lieut., Charleston, W. Va., Fort Knox, Ky.
BOSSARD, Samuel L., Major, Gallipolis, Ohio, Fort Knox, Ky.
BOWERS, Jesse W., Lieut. Col., Fort Wayne, Ind., Fort Benjamin Harrison, Ind.
BRINKER, Herbert J., 1st Lieut., Cincinnati, Fort Thomas, Ky.
BROWN, Harry M., 1st Lieut., Indianapolis, Fort Knox, Ky.
CARRIGG, Lawrence G., 1st Lieut., Bowling Green, Ky., Fort Knox, Ky.
CHILDS, Wallace E., 1st Lieut., Princeton, Ind., Fort Knox, Ky.
ELLIS, Stephen R., 1st Lieut., Versailles, Ind., Fort Knox, Ky.
FEISTKORN, Karl H., 1st Lieut., Marion, Ohio, Fort Hayes, Ohio.
FISH, Carlos A., Jr., 1st Lieut., Louisville, Ky., Fort Knox, Ky.
JONES, Edward V., Jr., 1st Lieut., Morgantown, W. Va., Fort Knox, Ky.
KRIZ, Joseph R., Captain, Toledo, Ohio, Fort Knox, Ky.
LAWRENCE, Leslie L., Captain, Canton, Ohio, Louisville, Ky.

SIXTH CORPS AREA

The following additional medical reserve corps officers have been ordered to extended active duty by the Commanding General, Sixth Corps Area, which comprises the states of Wisconsin, Illinois and Michigan:

BRANDEL, John M., 1st Lieut., Owosso, Mich., Station Hospital, Fort Sam Houston, Texas.
CASTALDO, Enzo Frank, 1st Lieut., Chicago, 215th General Hospital, Fort Custer, Mich.
CHECHILE, Dominic T., 1st Lieut., Chicago, Elementary Flying School, Cuero, Texas.

HAMILTON, John S. M., 1st Lieut., Stamford, Conn., Fort Devens, Mass.
HENDERSON, John W., Jr., Captain, Worcester, Mass., Fort Devens, Mass.
HERRMAN, Albert E., Major, Waterbury, Conn., Camp Edwards, Mass.
LEWIS, Frank E., Major, Nantucket, Mass., Camp Edwards, Mass.
SHEINBERG, Jules H., 1st Lieut., Brighton, Mass., Fort Adams, R. I.
TAYLOR, Richard C., 1st Lieut., Spencer, Mass., Camp Edwards, Mass.
TUNICK, George L., 1st Lieut., Greenwich, Conn., Fort Devens, Mass.
WALKER, Lowell S., Jr., 1st Lieut., Middlebury, Vt., Fort Devens, Mass.

Orders Revoked

ASHER, Leonard M., 1st Lieut., Boston.
BLACK, Harry, 1st Lieut., Lowell, Mass.
CUMMINGS, Harwood W., 1st Lieut., Greenfield, Mass.
FEELEY, John R., 1st Lieut., Bangor, Maine.
GLADSTONE, Robert W., 1st Lieut., Pittsfield, Mass.
KEES, Philip A., Captain, Longmeadow, Mass.
LEAVITT, Benjamin, 1st Lieut., Fall River, Mass.
LEVY, William S., 1st Lieut., Woonsocket, R. I.

HUTCHISON, Henry Edward, 1st Lieut., McKeesport, Pa., Camp Davis, N. C.
JARRETT, Marion Fisher, 1st Lieut., Farnham, Va., Fort Eustis, Va.
KLITCH, George Martin, 1st Lieut., Harrisburg, Pa., Camp Lee, Va.
LaFRATTA, Carl William, Captain, Richmond, Va., Fort Belvoir, Va.
LIEBMAN, Joseph, 1st Lieut., Norton, Va., Camp Lee, Va.
MacMINN, Charles Clayton, Jr., 1st Lieut., New Oxford, Pa., Fort Belvoir, Va.
MARTIN, Josef Ernest, 1st Lieut., Kingston, Pa., General Dispensary, U. S. Army, Philadelphia.
MOORE, James Irving, 1st Lieut., Catonsville, Md., Selective Service for State of Maryland, 5th Regiment Armory, Baltimore.
MUZI, Americo Joseph, 1st Lieut., Old Forge, Pa., Camp Davis, N. C.
NORTON, Fred Lee, 1st Lieut., Belle Vernon, Pa., Camp Davis, N. C.
O'BOYLE, James Patrick, 1st Lieut., Dunmore, Pa., Camp Davis, N. C.
PORTER, Walter Albert, Captain, Hillsville, Va., Fort Belvoir, Va.
RUGH, J. L. Keith, 1st Lieut., Bolivar, Pa., Camp Davis, N. C.
STEELE, Frederic Hohman, Captain, Huntingdon, Pa., Fort Story, Va.
TEMPLETON, Frederick Glenn, 1st Lieut., Warren, Pa., Fort Belvoir, Va.
TERRY, William Parker, 1st Lieut., Charlotte Court House, Va., Fort Belvoir, Va.
THOMAS, Harold Wilson, Major, Arnold, Pa., Fort Belvoir, Va.
TOMPKINS, Pendleton Souther, Captain, Philadelphia, Fort Bragg, N. C.
TURNBLACER, Charles Burkle, 1st Lieut., Butler, Pa., Carlisle Barracks, Pa.

Orders Revoked

BARKOFF, Samuel, 1st Lieut., Baltimore.
DRAYER, Calvin Searle, Captain, Upper Darby, Pa.
KISER, Jefferson Bishop, 1st Lieut., Emporia, Va.
LAULER, John William, 1st Lieut., Jersey Shore, Pa.
McKEE, Carlisle Emerson, 1st Lieut., Pittsburgh.
NEALE, Milton Mercer, Jr., 1st Lieut., Heathsville, Va.
STAPINSKI, Stanley Michael, 1st Lieut., Glenn Lyon, Pa.

MATUSKA, Walter H., Captain, Ottawa, Ohio, Fort Knox, Ky.
MERICLE, Earl W., Captain, Indianapolis, Fort Benjamin Harrison, Ind.
MILLER, James W., 1st Lieut., Greensburg, Ky., Fort Knox, Ky.
NICHOLS, William E., 1st Lieut., Manchester, Ky., Fort Knox, Ky.
NIEMAN, Roland E., 1st Lieut., Cincinnati, Fort Knox, Ky.
NORWICK, Sydney S., 1st Lieut., Indianapolis, Fort Knox, Ky.
O'BELL, John J., 1st Lieut., Kingsville, Ohio, Fort Knox, Ky.
OCKULY, Edward F., 1st Lieut., Toledo, Ohio, Fort Knox, Ky.
POTTER, Frederick C., Major, Cuyahoga Falls, Ohio, Fort Knox, Ky.
REED, Roger R., 1st Lieut., Indianapolis, Fort Knox, Ky.
RITTEMAN, George W., Captain, Indianapolis, Fort Benjamin Harrison, Ind.
SALMON, James L., Captain, Cloplint, Ky., Fort Knox, Ky.
SEMONS, Robert J. E., 1st Lieut., Carey, Ohio, Fort Knox, Ky.
SMITH, Beecher L., Captain, Columbus, Ohio, Fort Hayes, Ohio.
SRULOWITZ, Jack, 1st Lieut., Belpre, Ohio, Fort Hayes, Ohio.
STEPHENS, Wilson P., 1st Lieut., Jenkins, Ky., Fort Knox, Ky.
WATSON, Herman L., 1st Lieut., Evansville, Ind., Fort Knox, Ky.
WILSON, Arnold, 1st Lieut., Welch, W. Va., Fort Knox, Ky.

CRANE, Warren B., 1st Lieut., Kalamazoo, Mich., Post Surgeon's Office, Fort Custer, Mich.
FARMER, Donald F., 1st Lieut., Chicago, U. S. Army Induction Station, Chicago.
GEHRINGER, Norman F., 1st Lieut., Richmond, Mich., Medical Replacement Center, Infirmary, Camp Grant, Ill.
GOLDT, Henry B., 1st Lieut., Chicago, U. S. Army Induction Station, Chicago.
GROSSMAN, Solomon C., 1st Lieut., Detroit, U. S. Army Induction Station, Chicago.
HANSON, Frederick N., 1st Lieut., Eloise, Mich., Medical Replacement Center, Camp Grant, Ill.

HINKO, Edward N., 1st Lieut., Plymouth, Mich., Station Hospital, Fort Custer, Mich.
JASINSKI, Thaddeus, 1st Lieut., Chicago, U. S. Army Induction Station, Chicago.
KORANSKY, David S., 1st Lieut., Chicago, U. S. Army Induction Station, Chicago.
MARKS, Ben, 1st Lieut., Detroit, U. S. Army Induction Station, Detroit.
MCCAIN, George H., 1st Lieut., Battle Creek, Mich., 23d Evacuation Hospital, Fort Custer, Mich.
MULLENMEISTER, Hugh F., Captain, Battle Creek, Mich., 11th Station Hospital, Fort Custer, Mich.
MURPHY, Michael R., 1st Lieut., Cadillac, Mich., 119th Field Artillery, Lansing, Mich.
OLSON, William A., 1st Lieut., Greenwood, Wis., 32d Division, Camp Beauregard, La.
PAULY, Roman C., 1st Lieut., Milwaukee, Station Hospital, Camp Grant, Ill.
PINC, Otto C., Captain, Riverside, Ill., Elementary Flying School, Corsicana, Texas.
ROBERSON, Brooks L., 1st Lieut., Wood River, Ill., U. S. Army Induction Station, Chicago.
ROBERSON, William V., 1st Lieut., Wood River, Ill., U. S. Army Induction Station, Chicago.
ROMANO, John Emil, 1st Lieut., Congress Park, Ill., U. S. Army Induction Station, Milwaukee.
SAXON, Michael R., 1st Lieut., Oswego, Ill., Station Hospital, Fort Bliss, Texas.

SEVENTH CORPS AREA

The following additional medical reserve corps officers have been ordered to extended active duty by the Commanding General, Seventh Corps Area, which comprises the states of North Dakota, South Dakota, Minnesota, Nebraska, Iowa, Kansas, Missouri, Arkansas and Wyoming:

BAILEY, William Harold, 1st Lieut., St. Louis, Corps Area Service Command, Station Hospital, Fort Leonard Wood, Mo.
BRANHAM, Donald Stark, Captain, Albert Lea, Minn., 56th Coast Artillery, Harbor Defenses, San Francisco.
HELLUMS, Julius Hopwood, 1st Lieut., Dumas, Ark., 56th Coast Artillery, Harbor Defenses, San Francisco.
JENSEN, Nathan Kenneth, Captain, Minneapolis, Corps Area Service Command Station Hospital, Fort Snelling, Minn.
KIMBALL, Gilbert Leslie, 1st Lieut., DeQueen, Ark., Corps Area Service Command Station Hospital, Fort Riley, Kan.
RANKER, Clarence Andrew, 1st Lieut., Powell, Wyo., Corps Area Service Command Induction Station, Jefferson Barracks, Mo.
SAUNDERS, Everett Lewis, 1st Lieut., Independence, Mo., Corps Area Service Command Induction Station, Jefferson Barracks, Mo.
STENSAAS, Carl Oscar, 1st Lieut., Lindsborg, Kan., Corps Area Service Command Induction Station, Fort Snelling, Minn.
TREHARNE, Frank Edwin, 1st Lieut., Independence, Mo., Corps Area Service Command Induction Station, Fort Leavenworth, Kan.
TROWBRIDGE, Barnard Cole, 1st Lieut., Kansas City, Mo., Corps Area Service Command, Station Hospital, Fort Leonard Wood, Mo.

EIGHTH CORPS AREA

The following additional medical reserve corps officers have been ordered to active duty by the Commanding General, Eighth Corps Area, which comprises the states of Colorado, Arizona, New Mexico, Oklahoma and Texas:

ADLER, Stuart Welsh, 1st Lieut., Albuquerque, N. M., Station Hospital, Fort Bliss, Texas.
ASHBY, John Edmund, Captain, Dallas, Texas, Station Hospital, Fort Sam Houston, Texas.
BUNGARDT, Alfred Hiller, Jr., 1st Lieut., Oklahoma City, Station Hospital, Camp Berkeley, Texas.
CAFFEE, William Milton, Lieut. Col., Dallas, Texas, Station Hospital, Camp Hulen, Texas.
DASHIELL, Albert M., 1st Lieut., Austin, Texas, Station Hospital, Fort Sam Houston, Texas.
DAY, Roy Willard, Jr., 1st Lieut., Magdalena, N. M., Ellington Field, Texas.
DUEWELL, Rudolph Henry, 1st Lieut., Durant, Okla., Station Hospital, Fort Sill, Okla.
ETTER, Forrest Stayton, Major, Bartlesville, Okla., Station Hospital, Fort Sill, Okla.
FAIR, George Kenneth, Captain, Galveston, Texas, Station Hospital, Fort Sam Houston, Texas.
HARRISON, Daniel Allen, Jr., 1st Lieut., Kingsville, Texas, Station Hospital, Fort Sam Houston, Texas.
HELPER, Lewis M., 1st Lieut., San Antonio, Texas, Station Hospital, Fort Sill, Okla.
HUGHES, James Gillian, 1st Lieut., Oklahoma City, Station Hospital, Fort Sill, Okla.
JACOBSON, Harry, 1st Lieut., Post, Texas, Ellington Field, Texas.
JONES, Ernest Lee, 1st Lieut., Longview, Texas, 36th Division, Camp Bowie, Texas.
KAPLAN, Morris, 1st Lieut., Denver, Ellington Field, Texas.

SCHUTZMAN, Benjamin M., 1st Lieut., Detroit, 5th Division, Fort Custer, Mich.
SIMMONS, Warren K., 1st Lieut., Chicago, Station Hospital, Fort Bliss, Texas.
TANNENHOLZ, Harold S., 1st Lieut., Battle Creek, Mich., Medical Replacement Center, Infirmary, Camp Grant, Ill.
TEBOREK, Roy F., 1st Lieut., Chicago, U. S. Army Induction Station, Chicago.
URIST, Maurice D., 1st Lieut., Manteno, Ill., U. S. Army Induction Station, Chicago.
WAGNER, Jack, 1st Lieut., Chicago, 215th General Hospital, Fort Custer, Mich.
WALLER, James B., 1st Lieut., Decatur, Ill., Medical Replacement Center, Infirmary, Camp Grant, Ill.
YOUNG, Francis W., 1st Lieut., Chicago, U. S. Army Induction Station, Chicago.
ZARCONI, Vincent P., 1st Lieut., Decatur, Ill., 103d Corps Area Battalion, Fort Sheridan, Ill.

Orders Revoked

LARIMORE, Granville W., 1st Lieut., Chicago.
MOLL, Clarence D., Major, Detroit.
ROBINSON, Ralph D., 1st Lieut., Moberly, Mo.
SCHIELE, William C., Major, Galena, Ill.
THEIS, Edward H., Major, Granite City, Ill.

TUBOR, Robert Bruce, 1st Lieut., Hibbing, Minn., Camp J. T. Robinson, Ark.
VOLLMER, Frederick John, 1st Lieut., Grand Forks, N. D., Induction Station, Jefferson Barracks, Mo.
WIECHMAN, Frederick Herman, Captain, Montgomery, Minn., Station Complement, Fort Riley, Kan.
WILMOTH, Luther Harmon, Captain, Lander, Wyo., Induction Station, Jefferson Barracks, Mo.
WILSON, Donald Jasper, Major, Omaha, Corps Area Service Command, Station Hospital, Fort Leonard Wood, Mo.
WOERN, William Henry, 1st Lieut., England, Ark., Corps Area Service Command Induction Station, Fort Snelling, Minn.
YANCEY, Daniel Layton, Jr., Major, Springfield, Mo., Corps Area Service Command Station Hospital, Fort Leonard Wood, Mo.
ZAESKE, Edward Vernon, 1st Lieut., Charter Oak, Iowa, 1st Medical Regiment, Fort Ord, Calif.

Orders Revoked

ARNY, Frederick P., 1st Lieut., Preston, Mo.
BLANKENSHIP, George W., 1st Lieut., Boonville, Mo.
BROWN, Merle J., Captain, Davenport, Iowa.
GUCCIANI, Joseph B., 1st Lieut., St. Louis.
HANNA, Joe T. A., 1st Lieut., Scottsbluff, Neb.
HAYS, Albert T., 1st Lieut., Minneapolis.
HEPPERLEN, Harry M., Captain, Beatrice, Neb.
PALMER, Henry P., 1st Lieut., Scott City, Kan.

KENNEDY, Louis James, 1st Lieut., Clinton, Okla., Station Hospital, Fort Sill, Okla.
LONG, James W., 1st Lieut., Port Arthur, Texas, Station Hospital, Fort Sam Houston, Texas.
MCCLURE, Harold M., 1st Lieut., Chickasha, Okla., Station Hospital, Fort Sill, Okla.
McKNIGHT, William Hodges, 1st Lieut., Fort Worth, Texas, Ellington Field, Texas.
PENIX, Lex L., 1st Lieut., Denver, Station Hospital, Fort Sam Houston, Texas.
PITT, Charles Kermit, 1st Lieut., Denver, Station Hospital, Fort Bliss, Texas.
SCHWAB, Irving H., 1st Lieut., Colorado Springs, Colo., U. S. Army Recruiting Station, Oklahoma.
SHANKEL, Harry Weylman, 1st Lieut., Denver, Station Hospital, Fort Sam Houston, Texas.
SHARP, James Calvin, Captain, Corpus Christi, Texas, Camp Wallace, Texas.
SHUPE, Reed Dalton, Captain, Phoenix, Ariz., Basic Flying School, San Angelo, Texas.
STRECKER, William E., 1st Lieut., Oklahoma City, Station Hospital, Fort Sill, Okla.
TOM, Henry K., Captain, Port Arthur, Texas, 36th Division, Camp Bowie, Texas.
WARRENBURG, Clarence B., Captain, Phoenix, Ariz., Station Hospital, Fort Bliss, Texas.
ZARR, Luther Lynn, 1st Lieut., Houston, Texas, 211th Coast Artillery, Camp Hulen, Texas.

Orders Revoked

BARNACLE, Clarke Horace, Captain, Denver.
COTTON, William Walker, 1st Lieut., Atoka, Okla.
RUCKER, Ralph Weller, 1st Lieut., Bartlesville, Okla.
SANGER, Paul Griffith, 1st Lieut., Vinita, Okla.
WIERNIK, Harris, 1st Lieut., Lovelady, Texas.

NEW NAVY MEDICAL OFFICERS

The following candidates were appointed assistant surgeons in the Navy, with the rank of Lieutenant (junior grade), Medical Corps, to rank from March 20:

ALBRITAIN, John W., Baltimore.
BERGMAN, John H., Charleston, W. Va.
BUNN, James H., Jr., Smithfield, N. C.
BURNS, Francis M., Kearny, N. J.
BUTLER, Fred A., Chattahoochee, Fla.
CHESKO, Clement C., Washington, D. C.
DeLAMATER, James N., Pasadena, Calif.
DOBSON, John P., Manhasset, L. I., N. Y.
ETTER, Harry S., Shippensburg, Pa.
FOWLER, James T., Jr., El Paso, Texas.
GRACE, William J., Swampscott, Mass.
GRESSLY, Donald W., Beaver, Pa.
GRISWOLD, Wait R., Indianapolis.
HART, John C., Los Angeles.

HURST, Gerald W., Hanna, Wyo.
JONES, Horace Leonard, Jr., Richmond, Va.
KEARNEY, Edward A., Jr., Boston.
LANGSTON, William G., New York.
MAMONAS, Christopher, Pittsfield, Mass.
MARTIN, Marion T., Memphis, Tenn.
McATEER, Gerald H., Washington, D. C.
MOUNT, Robert A., Houston, Texas.
OLENICK, Everett J., Oak Park, Ill.
PASSMORE, Glen G., San Antonio, Texas.
PITTARD, Knox, Jr., Anson, Texas.
POLLARD, Joseph P., Alexandria, Va.
RADER, George S., Indianapolis.
ROBERTSON, Robert F., Los Angeles.
ROWE, John B., Flint, Mich.
SCHULTZ, Arthur L., Laguna Beach, Calif.
WILLIAMS, Robert Hamilton, Seattle.
YOUNG, Mark I. H., Buffalo.

DOCTORS FOR BRITAIN

More than five hundred applications have been received to date in response to the recent request of the British Red Cross to the American Red Cross for one thousand physicians to serve in Great Britain, and several hundred of them now are in the process of being investigated, the Subcommittee on Medical Personnel for Britain, of the Division of Medical Sciences of the National Research Council, announced in Chicago May 2 following a meeting at the headquarters of the American Medical Association. The National Research Council and the American Medical Association are cooperating with the American Red Cross in endeavoring to meet the British request.

Attending the meeting in Chicago May 2 were Dr. O. H. Perry Pepper, Philadelphia, chairman of the subcommittee; Dr. Morris Fishbein, Editor of THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION, and Dr. Evarts A. Graham, St. Louis, members of the subcommittee; Dr. G. D. Williams of the American Red Cross; Lieut. Col. Charles G. Hutter of the United States Army Medical Corps; Dr. Olin West, Secretary of the American Medical Association, and Dr. R. G. Leland of the American Medical Association.

The subcommittee announced that the names of all applicants are being checked with the biographic files of the American Medical Association.

Within the next few days formal circularization will be made by the American Red Cross of all physicians in the United States under the age of 45 who may be qualified for this service, it was announced.

TESTING A NEW STEEL HELMET

The War Department announces that tests are being made at Fort Benning, Ga., of a new steel helmet, which, if adopted, should provide greater protection to the head and be more comfortable than the present type of helmet. The proposed new helmet weighs about 3 ounces more than the present one and is made of tougher steel, with a dome shaped top which extends down in front to cover the forehead without impairing vision and down the sides of the head and back of the neck. The first World War statistics show that about 12 per cent of all wounds inflicted were head wounds. The steel in the proposed new helmet is sufficiently tough to withstand the majority of shrapnel balls and a high percentage of shell splinters, grenade fragments and spent rifle and machine gun bullets. The front of the new helmet forms a cap style visor and the rear is slightly flanged, so that rain will clear the collar opening. The helmet weighs about 2½ pounds and is lined with fiber designed for use as a field hat to replace the present overseas cap.

EXPERIMENTAL STUDY OF SOLDIERS' CLOTHING

The Fatigue Laboratory of Harvard University, Cambridge, Mass., will undertake an experimental study under simulated field conditions of clothing for soldiers. Thirty volunteers will march on a treadmill for specified lengths of time between four and eight hours, but not oftener than once every ten days, wearing regulation army clothing and carrying full field

equipment. Each of the thirty soldiers during these experiments will be subjected to studies of their water and salt balances and during the ten minute rest periods will be weighed, have their feet examined and their temperature, pulse and blood pressure taken. The treadmill will be heated to simulate the heat of tropical countries, and the soldiers' fatigue reaction will be checked carefully. Conditions in the treadmill will be adjusted also to simulate conditions in various other climates. Efforts will thus be made to discover the best types of underwear, socks, shoes and later other articles of clothing. A study of the treatment of foot ailments will also be undertaken, as well as the possibility of replacing leather soles of shoes with cork or rubber or some other compound.

MEDICAL DEPARTMENT TRAINING PROGRAM

A broad general medical training program has been set in motion by the War Department to train officers, nurses, enlisted men and civilians for duty in military hospitals and in the field forces. The largest class ever to take a refresher course at the medical field service school at Carlisle Barracks, Pa., is now in training, including five hundred and sixty-eight reserve, national guard and regular army officers and one hundred technicians. About fifteen thousand enlisted specialists have reported for three months courses of instruction at special service schools located at fixed general hospitals and, in addition, about forty different refresher courses in hospital administration are being given in six different general hospitals. The courses in hospital administration are designed to acquaint the reserve and national guard officers with the procedures and various forms of the military service. About 75 per cent of the medical department's enlisted strength requires technical instruction. It is estimated that twenty thousand qualified medical technicians of various kinds will be required for an army of one million four hundred thousand. Facilities to instruct eighteen thousand enlisted technicians each year in three months courses are available at the following army hospitals: Letterman General Hospital, San Francisco; Fitzsimons General Hospital, Denver; William Beaumont General Hospital, El Paso, Texas; Army and Navy General Hospital, Hot Springs National Park, Ark.; Station Hospital, Fort Sam Houston, Texas; Army Medical Center, Washington, D. C., and the Medical Field Service School, Carlisle Barracks, Pa.

SIXTEENTH MEDICAL REGIMENT AT FORT DEVENS

The following medical officers are on duty with the 16th Medical Regiment at Fort Devens, Mass.:

BENNETT, Austin W., Captain, Regular Army, Fort Devens, Mass.
GOULD, George I., 1st Lieut., Biddeford, Maine.
HIEHLE, Wilbur W., Captain, Regular Army, Fort Devens, Mass.
JOSLIN, Allan P., 1st Lieut., Boston.
KELLY, Alexander P., Lieut. Col., Regular Army, Fort Devens, Mass.
KNEPP, James W., Lieut. Col., Bridgeport, Conn.
MATTERA, Vincent J., 1st Lieut., Providence, R. I.
OLANS, Sidney, 1st Lieut., Somerville, Mass.
PAGLIARO, Joseph J., 1st Lieut., Derby, Conn.
PALMER, Jay J., Captain, Regular Army, Fort Devens, Mass.
SCHILLER, Irving W., 1st Lieut., Boston.
VOEGTLY, John H., Captain, Regular Army, Fort Devens, Mass.
WEINSTEIN, Barnett, 1st Lieut., Peabody, Mass.

ORGANIZATION SECTION

MARCH 27 (CONTINUED)

TESTIMONY OF DR. CLAUDE C. CAYLOR

DIRECT EXAMINATION

By Mr. Leahy:

Q.—I am showing you a photostatic copy of a letter, the original of which I think was shown you when you were on the stand before. Will you look at that now and see if you can recall having seen and identified the original of it? A.—Yes, sir; I did.

Q.—Doctor, you sent that letter out, did you? A.—Yes, sir.

Q.—Do you recall now under whose direction, if anybody's, the letter was sent? A.—This was sent at the direction of the Medical Staff of Providence Hospital.

Q.—What instructions, if any, had you received with reference to the letter before you sent it out?

Mr. Leahy:—From whom?

Mr. Leahy:—From the Medical Staff.

A.—It was simply to notify the men of this recommendation of the American Medical Association that all members of our staff—the recommendation was that all members of our staff should belong to the American Medical Association or one of its constituent bodies.

Q.—When you sent out the letter had you any instructions as to the form of the letter or the words to be used? A.—No, sir. That was left to my discretion.

Q.—And following sending out the letter, Doctor, did you ever do anything further toward checking up? A.—No; I never did anything further toward checking up. As I recall, I sent this letter to six doctors, and each one of those doctors spoke to me personally about this without ever writing an answer.

Q.—Do you recall now, as a matter of fact, whether all those doctors actually joined the Medical Society or not? A.—I don't know, as a matter of fact, but my impression is that they all did, sir.

Q.—Have you members on the staff now who are not members of the local medical society? A.—Yes, sir.

Q.—And do you recall now whether at any time you considered that the recommendation, as you have stated, of the American Medical Association was a threat or a form of coercion against your hospital? A.—No, sir; I never thought it was a threat.

CROSS EXAMINATION

By Mr. Lewin:

Q.—Doctor, you were secretary of the Executive Staff, were you not? A.—Yes, sir.

Q.—And you signed the minutes, did you not, of the meeting of the Executive Staff at Providence for Feb. 17, 1938? A.—Yes, sir.

Q.—It would be your testimony, then, that shortly after you sent out this letter you were able to note general compliance with the recommendation of the A. M. A. on the part of doctors connected with your staff? A.—Yes, sir.

TESTIMONY OF SISTER ROSA

DIRECT EXAMINATION

By Mr. Leahy:

Q.—Sister Rosa, you are superintendent of Providence Hospital, are you not? A.—Yes, sir.

Q.—How long have you been superintendent, Sister? A.—Four years, I think, this month.

Q.—Before coming to Providence Hospital where were you located? A.—I was stationed in Emmitsburg.

Q.—In what capacity were you engaged there? A.—I was Protectress at the Mother House.

Q.—When you came to Providence Hospital as superintendent, what were your duties generally, Sister? A.—I supervised the entire hospital, in all departments.

Q.—Do you recall now when there came a time that you wanted a residency in surgery approved at Providence Hospital? A.—Yes, sir; I do.

Q.—Do you recall who it was that took that matter up for you over there? A.—Dr. Caylor.

Q.—Do you recall that there came a time when an inspection was made of the hospital? A.—Yes.

Q.—Was that made by the American Medical Association through its representative? A.—Yes.

Q.—Do you remember the name Dr. Peterson? A.—Yes.

Q.—Do you recall whether he was there at your hospital? A.—Yes, sir; I think he was.

Q.—Sister, does Providence Hospital have inspections made of it quite frequently? A.—Yes.

Q.—What is the purpose of those inspections? A.—Well, we had this inspection to give us permission to train residents. That was why I wanted it. And we do have inspections of our school of nursing twice a year, from New York State and the District, and we have had inspections by the College of Surgeons and the American Medical Association.

Q.—What is the purpose of the inspections which are made by the American Medical Association? A.—To raise our standards, I should think. I requested them to come so that I could know wherein we were making mistakes in regard to training interns, and we were trying then to raise our standards for the training of residents.

Q.—In surgery? A.—Yes.

Q.—Do you recall that you finally got that privilege? A.—Yes, sir; we did.

Q.—Do you remember when it was, what year, you got approval for residency in surgery? A.—I think it was 1939.

Q.—Do you remember now whether, after the inspection was made of the hospital, a report came in to you as to what the inspector found? A.—Yes.

Q.—Do you recall whether you read that report over, yourself? A.—I read it over several times, but I just cannot give you an accurate account of everything that was in it, just now.

Q.—Do you recall having written a letter, which I am now going to show you, Sister, after receiving that report? A.—Yes; I do.

Q.—I am going to show you a letter which has been introduced in evidence here, dated Aug. 27, 1937. Is that your signature, Sister (indicating)? A.—Yes.

Q.—You were then the acting superintendent? A.—Yes.

Q.—Would you look that over, please, Sister, and see if you can recall that letter? A.—Yes; I do.

Q.—Do you remember, Sister, the letter of Dr. Peterson or Dr. Cutter which accompanied the report of the inspection made of Providence Hospital? A.—No; I do not remember that.

Q.—But at this time, when you wrote this letter, I will ask you if it was in connection with this letter which I am now showing you, dated Aug. 21, 1937, and numbered 239. A.—This was written by Sister Margaret.

Q.—Did you see that letter? A.—I don't remember it. Maybe I saw it on the file there, but I do not remember it.

Q.—Did you also write another letter to Dr. Cutter of the Council on Medical Education and Hospitals, dated Oct. 12, 1937, which is numbered 241? A.—I think this is the letter. I think Dr. Caylor or some of the doctors wrote this letter, if I am not mistaken, and asked me to sign it. I read it and they asked me to sign it to verify what the hospital thought in regard to this matter; that I represented the hospital, and that if I put my name here (indicating) it would verify the statements made in it.

Q.—And you did so? A.—Yes, sir.

Q.—Sister, with reference to any of the suggestions which you recall were made to Providence Hospital after the inspection, were any of them considered by you to be a threat against the hospital? A.—Well, you see, I invited these men at this time that I have reference to. I didn't know about Sister Margaret's letter. I am only answering for myself and the letter that I wrote. I invited them to come because I was most anxious to train residents, and these young men were anxious for it and I was backing them up, and I wrote it for them to give us constructive criticism; and that is what I considered it.

Q.—You did not consider it coercion or a threat or anything of that kind? A.—No, sir. I never thought of that, any more than when the District Nursing Board examines us and makes recommendations. We always try to carry them out 100 per cent. But I do not consider them a threat, because some of them we can't carry out very well. We try to do the best we can.

Mr. Leahy:—This letter has already been read in evidence, but it deals with recommendations of Dr. Peterson's report. It deals with the intern committee, the records which form the only index of the work done by the attending residents and nursing staff, securing of autopsies, medical library, and it says that "Members of the staff who do not belong to the Medical Society have been contacted and at the present time all non-members have submitted their applications for membership, so that now with those exceptions all members of our staff are members of the American Medical Association or affiliated with its constituent societies." It is signed by Sister Rosa and Dr. Caylor, who was the secretary.

Q.—Sister, at any time do you recall that you discussed matters with Dr. Peterson who made the inspection? A.—Yes; I think I did.

Q.—In anything which you did in connection with meeting the requirements or the recommendations of any report or any suggestion which was made by Dr. Peterson or the American Medical Association, did you have in mind anything whatsoever about G. H. A.? A.—No; I did not.

Q.—Do you remember now whether Dr. Selders ever made an application for privileges at Providence Hospital? A.—Yes; he did.

Q.—When that application was received do you know what was done with it? A.—It was sent to the Academy of Surgery.

Q.—Do you recall whether a recommendation was received back from the Academy of Surgery? A.—Yes; I think it was.

Q.—Can you identify this particular exhibit which I just showed you as the letter which was returned by the Academy of Surgery? A.—I really do not remember whether I saw it or not. I do not take up the medical end of the staff very much. The doctors transact that.

Mr. Leahy:—This has already been identified. It is U. S. Exhibit 448, dated Jan. 31, 1938 and directed to Dr. Valentine Hess, Providence Hospital.

By Mr. Leahy:

Q.—Who is Dr. Hess, Sister? He was our medical director at that time.

Mr. Leahy:

"Dear Dr. Hess:

"The Committee on Hospital Privileges recommends approval of the application of to practice major surgery at your hospital. The committee recommends disapproval

of the applications of and Dr. Raymond E. Selders to do major surgery at Providence Hospital.

"Very sincerely yours

"F. C. Fishback, Secretary,
Washington Academy of Surgery."

The name is there, but I am not mentioning the name.

Mr. Lewin:—I have no questions of Sister Rosa. I wonder if, in connection with this testimony, however, a paragraph of a letter already in evidence might be called to the jury's attention. This was a letter to Sister Margaret that Sister Rosa did not receive.

THE COURT:—I suppose there is no objection to that.

Mr. Leahy:—It is already in evidence.

Mr. Lewin:—Yes. I want the jury to bear it in mind in connection with this testimony.

(The witness left the stand.)

Mr. Lewin:—It is dated Aug. 21, 1937, from Dr. Cutter to Sister Margaret, superintendent of Providence Hospital. I will simply read this sentence from it (reading):

"As matters stand now we believe quite likely that when this statement is submitted to the Council at its regular meeting early in November internship approval will be withdrawn. Similarly the application for approval of a residency in surgery is held in abeyance pending the adjustment of the present situation."

Then:

"We also append for your information a resolution of our House of Delegates of the American Medical Association."

Then follows the Mundt Resolution, and then:

"According to our analysis there are six members of your staff who are not affiliated with any of the constituent societies of the A. M. A."

Mr. Leahy:

"You will recognize that there are several factors that are not in conformity with the Council's regulations governing internship approval. It is a matter of great interest to this office, therefore, to learn whether the recommendations enumerated at the end of the report are acceptable or not."

Then follows the sentence beginning "As matters stand now," which was just read by Mr. Lewin.

(Counsel for both sides approached the bench and conferred with the Court in a low tone.)

Q.—Doctor, I show you this letter and ask you if this is the copy of the letter for which we have been waiting? A.—This is.

Mr. Leahy:

DEFENDANTS' EXHIBIT 53

"Nov. 22, 1937.

"Dr. E. W. Titus,
900 17th Street N.W.,
Washington, D. C.
"Dear Lige:

"Your letter received concerning Dr. Selders, and after inquiry, I found the following facts. He was in Houston during the time stated but he was not anything to brag about. He was quite interested in music, and I found out from some of his associates that he acquired a huge office and tried to attract attention that way. Apparently he has had opportunities to acquire knowledge, but he seems to get in most any one's hair by his pushing tactics. From the reports I have obtained, I do not think that one could give him a most favorable recommendation. I feel sure that you will keep this confidential."

Then the following paragraph:

"I feel that my obstetrics will keep me here and away from the Toronto meeting. It may be possible for me to leave at the last moment.
"With best wishes, I am

"Your friend,
"Robert A. Johnston, M.D."

By Mr. Leahy:

Q.—Now, Doctor, when you received this letter what weight did you give that letter in regard to your recommendation from the Gynecological Society as to his having general gynecological privileges at Columbia? A.—I attached a great deal of importance to this particular letter. I happen to know Dr. Johnston over a great many years: a very prominent man, belongs to a small organization we call the Travel Club, and I see him each December with few exceptions.

By Mr. Lewin:

Q.—What was the name of it? A.—The Gynecological and Obstetrical Travel Club.

By Mr. Leahy:

Q.—Doctor, there was a question I wished to ask you: In the recommendation which you made from the Gynecological Society did you include others besides Dr. Selders among those who were disapproved? A.—Yes.

THE COURT:—Don't mention names.

Mr. Leahy:—No; don't mention names.

The Witness:—Quite a well known surgeon here in Washington, who applied for major operative obstetrics at Columbia Hospital. We reported unfavorably on him.

By Mr. Leahy:

Q.—Did you report favorably or unfavorably on any fellows of your Gynecological Society? *A.*—Yes, we did. Two in number, as I recall.

Q.—Were they members of your own society? *A.*—They were.

By Mr. Leahy:

Q.—Doctor, do you recall while you were at Columbia Hospital during the years 1937 and 1938 that you ever saw any questionnaire which was sent out by the Hospital Committee of the District of Columbia Medical Society? *A.*—No.

Q.—Did any questionnaire from the District of Columbia Medical Society come before any board, to your knowledge, for any action in the Columbia Hospital?

The Witness:—I have seen no questionnaires coming from the Medical Society to the Columbia Hospital Board.

CROSS EXAMINATION

By Mr. Lewin:

Q.—Dr. Titus, have you got your copy of your letter to Dr. Johnston that brought forth this reply? *A.*—No, I haven't. He didn't send me that.

Q.—Did you keep a copy? *A.*—No, I did not.

Q.—Do you remember your letter to Dr. Johnston? *A.*—I remember this much of it: that I told him that we had a man who made application to our hospital, meaning Columbia Hospital; that he had given certain references. One of them was in Houston, Texas. And would he at his earliest convenience send me a report of what he knew or could find out about him.

TESTIMONY OF DANIEL L. BORDEN

DIRECT EXAMINATION

By Mr. Leahy:

Daniel L. Borden, Washington, a practicing physician, graduated from the George Washington University in 1912. He was in Columbia Hospital for Women for three years, and then at the George Washington University Hospital, and received training under the immediate supervision of his father, who was a surgeon before him. He then went into the service in 1917 for a little over two years. He is Chairman and Senior Operating Surgeon of the Board of Police and Fire Physicians of the District.

Q.—Are you also a member of the Academy of Surgery? *A.*—Yes, sir.

Q.—How long have you been a member of the Academy of Surgery? *A.*—I was one of its founders.

Q.—And in what year was it founded? *A.*—My recollection, about 1933.

Q.—And what were the purposes of the foundation of the Academy of Surgery? *A.*—The Academy of Surgery was founded by a group of surgeons in Washington, with the thought of maintaining and if anything increasing the general prestige and standards of practice of surgery in the District of Columbia.

Q.—Were you during 1937 and 1938 a member of any committee in the Academy of Surgery? *A.*—I was a member of the Credentials Committee.

Q.—And what are the functions of the Credentials Committee in the Academy of Surgery? *A.*—As far back as 1935 the Academy of Surgery discussed the question of some type of standard committee to examine applicants for surgery in the various Washington hospitals, and in 1936 this was started as a committee, and I was appointed to that committee and remained on that committee until I was made president of the Academy of Surgery.

Q.—And what year were you made the president of the Academy of Surgery? *A.*—1938.

Q.—Doctor, what investigation is made by the Credentials Committee of the application of a surgeon for courtesy privileges in the hospitals in the District of Columbia? *A.*—The Credentials Committee is composed of five men elected originally by the Society, and in recent years they are elected or appointed by the President of the Academy of Surgery. The functions of this committee are to review all applicants for surgical privileges in the various hospitals of Washington; that is to say, such hospitals that care to submit applicants to the Academy for their opinion. This opinion is an advisory one only.

Q.—And how is the investigation made into the qualifications of a surgeon? *A.*—The investigation is made by filling out an application blank. That is to say, all applicants are required to fill out an application blank giving all of their qualifications.

Then, in addition to that they must give on that blank the names of at least three sponsors: in other words, men who will go on record in writing as stating that they are able and capable of doing general surgery.

Q.—Do you recall, Doctor, whether at any time while you were on the Credentials Committee of the Academy of Surgery the application of Dr. Raymond E. Selders came before the Academy for investigation? *A.*—My memory of that is fairly clear. The first time that I knew about it I was called to a meeting at Dr. John Lyons' office. He was then chairman of the Credentials Committee, and the name of Dr. Selders was presented to the committee. At that time we had nothing except his application blank. Dr. Lyons read the application blank to the committee and referred the application blank to Dr. Fred Sanderson for investigation. The following month—it was in January 1938, that Dr. Fred Sanderson reported to the committee his finding. Now, it was the habit, or custom, rather, for the chairman of the Credentials Committee to investigate most of the applicants; but Dr. Lyons on this particular occasion, and I, myself, were planning to go down to a meeting of the Southern Surgical Association. So Dr. Fred Sanderson, because of this situation, was asked by Dr. Lyons at the meeting to investigate the qualifications of Dr. Selders.

Q.—And do you recall at what meeting it was that report was made back to the Credentials Committee? *A.*—Well, it is my impression that it took about a month's time, and the meeting at which the report was referred back and finally acted on, if my memory serves me right, was January 1938.

Q.—How many were on the Credentials Committee? *A.*—Dr. John Lyons was the chairman of the committee; Dr. Fred Sanderson, Dr. Paul Putzki, Dr. Arch Riddick, and myself.

Q.—Do you recall now whether in whatever application Dr. Selders had made and which you had under investigation there were any names of references subscribed thereon? *A.*—In Dr. Selders' application he gave the names of three sponsors: that is, men whom he gave us to sponsor him as being reliable with regard to the practice of surgery. Those names, as I remember them now, were those of Dr. Walter E. Lee and a Dr. Moore down in Texas, and then some Senator's name.

Q.—Do you recall who the Senator was? *A.*—Senator Lee, but I don't remember his first name.

Q.—Was it Josh Lee? *A.*—Well, that may be.

By Mr. Leahy:

Q.—I think you stated, Doctor, that both Defendants' Exhibit 44 for identification and Defendants' Exhibit 54 for identification were before you on the consideration of Dr. Selders' application. *A.*—They were read at the committee meeting.

Q.—Have you an independent recollection, now, Doctor, as to how many of the sponsors whom Dr. Selders named replied? *A.*—We only received one reply. That is, Dr. Sanderson only received one reply, and only gave that one reply to the committee in its January meeting.

Mr. Leahy:—Defendants' Exhibit 44 is the letter of Dr. Walter Estell Lee, 1833 Pine Street, Philadelphia, Dec. 16, 1937. It is addressed to Dr. Frederick Sanderson:

DEFENDANTS' EXHIBIT 44

"In reply to your inquiry about Dr. Raymond E. Selders, he is a mature man and has had a very varied experience. He is an accomplished musician, a graduate in civil engineering and several other professions, and he studied medicine quite late in life. While in the southwest he practiced medicine and surgery and then finally entered the Graduate School of the University of Pennsylvania two years ago, spending one year in the basic science course in Philadelphia, and one year in clinical work at Worcester, Massachusetts. At Worcester they apparently gave him unusual opportunities, far beyond what we considered his training warranted. However, he seemed to get away with it, and the last I heard of him was the fact that he had made application for this position of surgeon to the Home Owners Loan Medical Service.

"I do not know just what he is aspiring to in Washington and I hope this outline that I have given will answer your purpose.

"Very truly yours,

"Walter Estell Lee,"

This is a carbon copy of a letter:

DEFENDANTS' EXHIBIT 54

Jan. 12, 1938.

"Dr. John D. Moore,

Hugo, Oklahoma.

"Dear Dr. Moore:

"On Dec. 6, 1937 last I wrote you requesting some information concerning the surgical training and ability of Dr. Raymond Selders, Houston, Texas, who has applied for hospital privileges in several Washington hospitals. As yet I have had no reply from you and would appreciate it very much if you would kindly forward me the information I ask.

"Very truly yours,

"Fred R. Sanderson, M.D."

By Mr. Leahy:

Mr. Leahy:—This I think has been offered, your Honor, in evidence. I just wish to read the last paragraph: addressed to "Dear John," on the Washington Academy of Surgery stationery:

"I am anxious to talk to you before you reach any decision on Dr. Selders, especially if there is feeling that he will be disproved purely because of his connection here in Washington. As a matter of policy and tact, and I believe for the good of general public attitude toward the profession, the question of his relationship to the Group Health Association, Inc., should not be permitted to enter the discussion."

That is dated Dec. 9, 1937.

By Mr. Leahy:

Q.—Doctor, I want to ask you now: In the discussion of the qualifications of Dr. Selders for hospital privileges in the hospitals for which he had made application and on which you were acting as one of the committee of credentials, did you or did you not pass on the qualifications of Dr. Selders regardless of any connection which he may have had with the Group Health Association, Inc., as indicated in the letter of Dr. Fishback? A.—The Credentials Committee of the Academy of Surgery depended entirely on the qualifications of the man to do general surgery in making its final judgment. It is true that the letter that has been read was read at that committee meeting.

Q.—And did the Credentials Committee of the Academy of Surgery approve or disapprove the qualifications of Selders for the privileges which he asked with relation to Group Health Association in any degree, Doctor? A.—The Group Health Association situation was purposely kept out of this whole question, as indicated by that letter. That letter was sent really as a precautionary measure—at least, in my opinion—by Dr. Fishback, who was the secretary of our organization. However, so far as I personally was concerned, I was willing to divorce any such thought out of my mind in passing on a man's qualifications to do general surgery.

Q.—Doctor, in your judgment what if any recommendation is contained in Dr. Lee's letter as to the qualifications of Dr. Selders to do general surgery in the hospitals of the City of Washington? A.—Well, of course, we doctors in this committee meeting talked very plainly, and we sense our responsibility rather keenly, and we feel, to put it in common language, that a letter submitted to us as the only written evidence that we had to go on other than that submitted by Dr. Selders himself really damned him with faint praise. That is my interpretation of that letter.

Q.—Did you at that time, then, recommend for or against giving privileges to Dr. Selders in the hospitals for which you investigated? A.—The committee's action was unanimous against giving him general surgical privileges.

Q.—And do you know how many were actually present of the Credentials Committee at that time and voting? A.—No. I have to depend entirely upon my memory, but I think we had a full committee meeting, but I am not absolutely sure. I know I was there.

CROSS EXAMINATION

By Mr. Lewin:

Q.—Dr. Borden, you were, I believe, a member of the Executive Committee of the District Medical Society during the year 1937, were you not, and the early part of 1938? A.—I was appointed first in 1936, and remained through 1938.

Q.—And weren't you a pretty regular attendant at the meetings of the Executive Committee during the latter half of 1937? A.—I attended a great many meetings.

Q.—Yes. As a matter of fact, the minutes, I believe this is fair to say, list you as attending most of the meetings of the Executive Committee during the latter half of 1937. Would you say that corresponded— A.—I think that's a fair statement.

Q.—Yes. And of course you were familiar, weren't you, with the resolutions that were passed, to the effect that Group Health Association was unethical? A.—Well, I was familiar with most of the actions of the Executive Committee, although it was not impressed on my mind then to the extent it is now.

Q.—Yes. But I mean, you do remember those resolutions? One was, "We shall consider it unethical," and then in September of 1937 I believe the resolution was that it was unethical. You remember that, don't you? A.—Well, now, I want to be perfectly frank about this situation.

Q.—I can get you the minutes. A.—I am just not clear in my mind what you have reference to.

Q.—All right. Let me get the minutes; it will take me a little time, I am afraid. A.—If you could repeat the resolution I might remember it.

Q.—Well, the resolutions are fairly long, as I remember them, but there were a number of resolutions to the effect that Group Health Association was unethical. Don't you remember that? A.—Now, is that in the Executive Board or the Medical Society?

Q.—The Executive Committee first, and then reported to the Society.

Mr. Leahy:—I think we ought to have the minutes.

Mr. Lewin:—Very well. We will have to get them.

By Mr. Lewin:

Q.—For instance here, at the September 8th meeting, the special meeting of the Executive Committee (indicating). A.—Was I present then?

Q.—No, I guess you weren't. You weren't present at that meeting? A.—Apparently not. I don't see my name there.

Q.—Well, let's get the next one. A.—I was present at that one (indicating).

By Mr. Lewin:

Q.—Well, now, take September 27. Do you remember this committee's finding? A.—Was I there?

Q.—Yes, you were here. At least, you are listed as being present. A.—Yes. O. K.

Q.—Do you remember the committee's finding that "the conditions of rendering the medical and surgical services offered by Group Health Association as set forth appear to be inconsistent with the criteria for the acceptable form of contract practice by which we are obliged to be guided, and particularly it would appear that at least two of the criteria would necessarily be violated," and then the principles of medical ethics of the American Medical Association are set forth? A.—May I just look to see what this is all about?

Q.—Yes, indeed. A.—Oh, this is report by Dr. Macatee.

Q.—Yes. A.—I recall this report in general.

Q.—Well, to try to shorten it a little bit, don't you remember that the Medical Society took the position that Group Health Association was unethical as violating the principles of medical ethics of the A. M. A.? A.—I think both the Medical Society and I took that at that time.

Q.—You did. That is all. A.—To the best of my memory.

Q.—Yes. That is all I wanted. Well, now, Dr. Lyons, who was on this committee with you in the Washington Academy of Surgery, was likewise a member of the District Medical Society and the Executive Committee, wasn't he? A.—Dr. Lyons was the chairman of the Credentials Committee of the Academy of Surgery.

Q.—Yes. A.—Now, whether he was on the Executive Committee or not, I don't know.

Q.—Wasn't he a member of the District Medical Society? A.—He was a member of the District Medical Society.

Q.—Yes. And Dr. Sanderson was a member? A.—Yes.

Q.—Wasn't he a member of the C. O. & I. M. Committee that was chairmaned by defendant Hooe? A.—Why, I have no idea whether he was or he wasn't. He may have been.

Q.—Whether he was or he wasn't. He may have been. Wasn't Dr. Putzki also a member of the District Medical Society? A.—Dr. Putzki is a member of the Society.

Q.—And Dr. Riddick as well? A.—Yes, sir.

Q.—Yes. Well, now, do you remember that after this letter from Dr. Fishback came to Dr. John Lyons that you gentlemen passed a resolution in the Washington Academy of Surgery? A.—What resolution?

Q.—I call your attention to the minutes of the meeting of Dec. 10, 1937, of the Council of the Washington Academy, which are already in evidence, signed by Fishback.

THE COURT:—Point out the resolution, please.

Mr. Lewin:—Yes.

By Mr. Lewin:

Q.—Do you remember this resolution, Doctor: "Discussion concerning Group Health Association ensued. It was suggested that the professional qualifications of the surgeon of that organization alone be considered as a matter of public policy. However, a motion of Dr. Sager's was passed requesting the hospital privilege committee to consider the ethics of any applicant as well as his strictly surgical training and experience. The ethics were understood to be as defined by the American Medical Association"? Do you recall being present? A.—Yes, I remember that, all about that.

Q.—Yes. Well, didn't you gentlemen follow that resolution when you came to consider Dr. Selders? A.—Well, now, that requires a little explanation.

Q.—Well, all right. You are entitled to give that, but I wonder if you wouldn't answer my question first? Did you consider it? Did you follow that resolution? A.—We did not.

Q.—You did not follow it? A.—We did not. May I? It is very easy to explain how that got into the minutes, if I may.

Mr. Richardson:—Go ahead and explain.

The Witness:—Well, now, this particular resolution that has been brought to my attention just this very second here came about this way: At the scientific meetings of the Academy of Surgery, which are held four times a year, after a scientific meeting we have a business session, and at this business session we take up various matters that are of interest in a business way. Now, it is my recollection that Dr. Fishback brought up the question of G. H. A. at that time, at that meeting; and then Dr. Sager, in accordance with the statement in those minutes, passed or offered a resolution that the Credentials Committee of the Academy of Surgery in passing on the qualifications of surgeons should consider their ethical standing in any organization as well as their professional ability to do general surgery.

Now, that occurred in the early part of December. The meeting of our committee in which we passed on this Dr. Selders occurred in January; but, in accordance with my former statement, we divorced everything in passing judgment on this man, and at the same time passed the same judgment on five other men not associated with G. H. A., adversely.

Q.—Yes, sir. Well, now, it is perfectly clear, isn't it, that Dr. Sager's resolution was passed in connection with a discussion of the Group Health Association? A.—Yes, I see that in the notes there.

Q.—Yes. A.—Yes.

Q.—And the result of the discussion was that a resolution was passed directing you to consider, in connection with the Group Health Association applicant, his ethics as defined by the American Medical Association; am I right? A.—Well, we have always had the ethics of the American Medical Association as our background and by-laws, always.

Q.—Yes, but I am asking you whether you didn't consider that you were directed to consider the American Medical Association's ethics with regard to contract practice in passing on Dr. Selders. A.—Well, now, let's get this absolutely straight. We as a group, the Credentials Committee, have always felt that obviously we must abide by the standards set down by the American Medical Association; but we had to go a step further in passing on men doing general surgery, and that was to ascertain whether they were safe to operate on the public.

Q.—Dr. Borden, is it your testimony that you didn't follow the requirements of this resolution? You personally? A.—If my conscience told me not to follow it, I probably didn't, but my recollection is now, and definitely and honestly, that I passed personally—and I am sure the committee did—entirely on this man's qualifications as a surgeon. Now, there was a reason for that beyond the fact, in my opinion, that it was the right and proper thing to do, and that is for my own protection.

Q.—Well now, if there was a resolution here requiring you gentlemen to do it; how do you know that Dr. Lyons and Dr. Sanderson and Dr. Riddick and Dr. Putzki didn't have that situation in mind when they came to pass on Dr. Selders? A.—Well, it is perfectly obvious that I can't speak for anyone but myself, but I can say this: that I am in accord, after discussing this matter for a long period of time and coming to a studied decision, in the whole situation.

Q.—Now, I think it has been brought out in the evidence that you were considering Dr. Selders' application to Garfield and to George Washington and to Georgetown; am I right? A.—Well, not entirely, as my memory goes. My memory is this: that was the last meeting that I attended, because then I became president and automatically left the Board or the Committee of Credentials, but my memory is that we had but one application blank, in which appeared three names that I gave, and that's the only one that I know of, and I didn't see it. It was read off at the meeting.

Q.—Yes. And which hospital was that? A.—I can't remember which hospital it applied to, but it is my feeling that it was Garfield, but I'm not sure.

Q.—Yes. Well, now, if it were Garfield, then you would have had these references before you: Senator Josh Lee, United States Senator from Oklahoma; Dr. Walter E. Lee, surgeon of Philadelphia; and Dr. John T. Moore, the past president of the Medical Association of Texas, at Houston, Texas, wouldn't you? A.—Well, I think those are the three names I gave.

Q.—Now, did you have any other letters before your committee at that time when you acted than the ones that have been introduced in evidence just now? A.—It has been our

custom, and I have been on this committee ever since it has been developed, to simply take the evidence that was submitted by the applicant and the only evidence that was submitted were these three names.

Q.—Now, did you have anything before you except the letter from Dr. Walter E. Lee, before you, and Dr. Sanderson's letter to Dr. Moore? A.—We had just that one letter and Dr. Sanderson's second letter to Dr. Moore.

Q.—And they are the only things you had before you? A.—No; we had the application blank before us.

Q.—And the application blank. Was there anything else that you had before you? A.—That's about all the written material that we had.

Q.—Yes. Now, you didn't have Dr. Selders before you, I don't suppose? A.—No, sir.

Q.—And you didn't go to Worcester City Hospital or to Houston or to any places like that to investigate it, did you? A.—No, sir. This is a committee composed of five surgeons who are fairly busy men. We get no compensation, and we don't go out beyond our immediate meeting. We expect the material to be supplied to us, and then we will investigate it, but we have never, as a matter of custom, ever, gone outside of our own committee.

Q.—I see. Then, you haven't really any greater facilities for passing on an application for surgery than are held by the surgical staff of one of these hospitals, have you? A.—Well, only in this way: in my opinion, that the Academy of Surgery represents a group of hospitals. It isn't any one hospital. I think that does away with the possibility of possible bias, or we are trying to make it as standard as we can, as a matter of fairness and protection to the public and to ourselves. Now, we doctors circulate in every operating room in this city, and for that reason we rather feel that we honestly have an opportunity to know as much as possible; but here we were dealing with a stranger, a man who was not a Washington man at all, so our problem was much more difficult.

Q.—Well, it would have been just as simple for the surgical staff of a hospital to have considered this letter from Dr. Walter E. Lee as for you five gentlemen to have done it?

THE COURT:—That is obvious, isn't it?

Mr. Leahy:—That goes without saying.

THE COURT:—That goes without saying.

By Mr. Lewin:

Q.—Now, did Dr. Sanderson, as far as you know, write to Senator Lee? A.—He didn't present any letter from Senator Lee.

Q.—As far as you know he wrote only to Dr. Walter E. Lee and to Dr. Moore? A.—That was the only written evidence he brought into the committee meeting.

Q.—And you didn't get any response from Dr. Moore? A.—After two attempts, no.

Q.—Yes. Well, now, isn't it true that Dr. Moore was listed as Dr. John T. Moore; whereas Dr. Sanderson wrote to Dr. John D. Moore? Isn't it also true that Dr. John T. Moore's address on the application was given as Houston, Texas, and Dr. Sanderson wrote to him at Hugo, Oklahoma?

A.—Well, Dr. Sanderson carried out all of that correspondence. I had nothing to do with it.

Q.—Well, now, let me see that letter that you read in evidence a moment ago, will you? The one to Dr. Moore. Let me show you Dr. Lyons' letter to the secretary. Doesn't that show that he wrote to Dr. John D. Moore at Hugo, Oklahoma?

A.—Well, that is what that letter says.

Q.—Well, now, if he wrote to Dr. John D. Moore at Hugo, Oklahoma, and doesn't it also appear on Defendants' Exhibit 54, which was just read to the jury, "Dr. John D. Moore," of Hugo, Oklahoma? A.—Yes, sir.

Q.—Well, now, if that is where the letter went, don't you think that might account for the fact that you didn't get an answer from Dr. Moore? A.—I think that might.

Q.—All right. Now, here is Dr. Selders' application to Georgetown University Hospital, and I believe your committee passed on that application, didn't it? A.—Well, the only one that I personally have any recollection of was the one that gave those three names. Now, they may have all been similar, so far as I know.

Q.—Well; yes. I wonder if this does not refresh your recollection that here Dr. John T. Moore, past president of the Texas State Medical Association, Houston, Texas, is given; the same Dr. Walter E. Lee of Philadelphia; Dr. MacIver, the superintendent of the Worcester City Hospital; Dr. C. J. Burn, the senior surgeon at Worcester City Hospital? A.—I never heard of those last two doctors.

Q.—And you don't remember that Dr. Sanderson could give any report on what they said about Dr. Selders? A.—I am sure that Dr. Sanderson, as far as my memory goes, and it's pretty good—I think that those are the only written documents at that time that we had before us.

Mr. Lewin:—Now, gentlemen, have you found the one of Dr. Moore of Hugo?

Mr. Burke:—The one that has Senator Josh Lee's name on.

Mr. Lewin:—Let us give it to the jury. There is a "Josh." That is the Garfield.

RE-DIRECT EXAMINATION

By Mr. Leahy:

Q.—Doctor, you stated just now that at the same time that you passed on Dr. Selders' qualifications you passed on those of five other men? A.—Well, as a matter of fact, we passed on the qualifications of at least 60 or 70, but we refused privileges or recommended the refusal of privileges of five besides Dr. Selders, making a total of six altogether at that particular meeting.

Q.—And were some of those members of the District Medical Society? A.—I think that at least four were members of the District Medical Society.

Q.—And I think you also were inquired about as to your presence as a member on the Executive Committee of the District Medical Society, and some of the other members on the Credentials Committee also as members of the District Medical Society. A.—Yes, sir.

Q.—Doctor, when you were acting as a member of the Committee of Credentials of the Academy of Surgery here in Washington, what effect, if any, did the membership of anyone of the Credentials Committee on your Academy have with the District Medical Society? A.—Well, I am convinced and I know that none of the members of that committee even thought of the Association. I know I didn't, and it is absolutely impossible to bear in mind what committees you're members of up at that District Medical Society. There are 40 committees, and there are nearly 200 appointments on those committees, and I wouldn't have the faintest idea what committee any other member was on, unless I had had some association to remember it by.

RE-DIRECT EXAMINATION

By Mr. Leahy:

Q.—Doctor, from anything that was stated at the meeting which passed on the qualifications of these six men you say you passed on that night, was there any indication whatsoever that there was anything but an honest determination of the qualifications of those men for the recommendations you made?

Mr. Lewin:—Objected to as leading and asking for a conclusion.

THE COURT:—Yes, the doctor has gone over that.

By Mr. Lewin:

Q.—With regard to your remembering your committee appointments you do remember, don't you, that you and Dr. McGovern and Dr. Hooe formed the committee which drew up the so-called white list which was issued July 29, 1937?

Mr. Richardson:—Objected to as not proper cross-examination.

THE COURT:—Sustained.

TESTIMONY OF HENRY B. BLAIR

DIRECT EXAMINATION

Henry B. Blair, Washington, a member of the Bar of this Court since July, 1892, also of the Court of Appeals, and the Supreme Court of the United States, is connected with the Episcopal Eye, Ear, Nose and Throat, and Columbia hospitals. He was one of the incorporators; it was incorporated in 1897, and he has been continuously connected with the institution since then. During 1937 and 1938, he was the first vice president, which is the active member of the hospital from the executive side; the bishop of the diocese being, ex officio, the president, and he was also chairman of the executive committee. In Columbia Hospital he was on the executive committee perhaps during the entire period.

Q.—In the Episcopal Hospital what is the governing body of that hospital? A.—The governing body is the board of governors, which meets three times a year. The active body is the executive committee, which is appointed from the board of governors and meets monthly except during July and August.

Q.—And in Columbia what is the active governing body? A.—The setup is somewhat the same, I think. They are called "directors" at Columbia. They meet four times a year and the executive committee meets monthly.

Q.—And in between the meetings of the board I presume the executive committee is the controlling or governing body? A.—I would think so.

Q.—Is the Episcopal Eye, Ear, Nose and Throat a general or special hospital? A.—A special hospital, as its name implies.

Q.—Is Columbia a general or special hospital? A.—A special hospital for lying-in and diseases of women.

Q.—Does the Episcopal have an attending staff and a courtesy staff? A.—Yes.

Q.—What has been the rule, if any, in the Episcopal Hospital with reference to the right to practice one's profession therein?

A.—The medical staff makes recommendations annually and the board of governors approves those recommendations unless there is some question raised in regard to them.

Q.—In other words, is it a requisite at the Episcopal Hospital that one must belong either to the attending or courtesy staff before he can practice his profession there? A.—Yes.

Q.—And can you tell us over what period of time such a rule has existed? A.—During the existence of the hospital, so far as I know.

Q.—Is there any rule in the Episcopal Hospital restricting membership on the courtesy staff or attending staff to membership in the local medical society? A.—Not in the hospital itself; there is in the by-laws of the Medical staff.

Q.—During the years 1937 and 1938 was there any by-law in force in the Episcopal Hospital which required membership in the local District Medical Society as a prerequisite to practicing there? A.—I don't so understand it.

Q.—Did you know Dr. Dabney? A.—Quite well, pleasantly, not intimately; pleasantly, though.

Q.—Do you know whether he was a member of the courtesy staff in 1937 and 1938? A.—He was one of the chief surgeons during that time, which means he was a chief of the staff; we have there; one of the twelve chief of staff surgeons.

Q.—And continuously that during those two years, 1937 and 1938? A.—Yes.

Q.—Doctor, as vice president of the hospital during those two years, do you recall whether there was any regulation or rule of the hospital against G. H. A. patients coming into that hospital? A.—Not so far as I have any knowledge.

Q.—Did you know of any rule, or was there any rule of that hospital which made it necessary for Dr. Dabney to bring patients through the back door of the hospital; that is, G. H. A. patients? A.—I never heard of it; in answering your question, there was no such rule.

Q.—Now, with reference to Columbia Hospital, Mr. Blair, the years 1937 and 1938, do you recall whether Columbia Hospital ever put into effect any rule requiring membership in the local medical society as a prerequisite to the enjoyment of hospital privileges? A.—I am sure it did not.

Q.—Do you recall there was any rule or regulation put into effect by Columbia Hospital against G. H. A.? A.—I think not.

Q.—Do you know whether now there are on the staff or were during the years 1937 and 1938 members on the Episcopal Hospital staff who were not members of the District Medical Society? A.—I can't answer that positively; I think not, but I do not know.

Q.—Have you any knowledge as to that in regard to Columbia Hospital? A.—I would have to make the same answer there.

CROSS EXAMINATION

By Mr. Lewin:

Q.—Have you got that by-law you spoke of of the medical staff? A.—I furnished all the information I have. I have nothing with me; at the request of the Government we furnished everything we had.

Q.—The medical staff has by-laws? A.—They have of their own, yes.

Q.—Were you the chairman of the executive committee of the Episcopal Hospital in September 1938? A.—Yes.

Q.—Did you attend a meeting of that committee September 20, 1938? A.—I would expect so; I haven't any independent recollection of it at this particular time.

Q.—I show you what purports to be the minutes of that meeting, signed by Anita Richardson, secretary pro tem; is that her signature? A.—Yes.

Q.—I call your attention to this statement:

"The chairman informed the committee that he had received during the summer several communications regarding Group Health Association and that we would go along on the present basis until the matter had been finally adjusted between the doctors and Group Health Association."

Do remember making that statement?

A.—Substantially: that is Miss Richardson's language; it is not mine.

Q.—By “doctors” in that phrase, “adjusted between the doctors and Group Health Association,” did you mean the Medical Society of the District of Columbia? A.—Our own doctors; whatever conclusion they might reach.

Q.—That is, go along on the present basis until the matter had been adjusted between the doctors on your staff and Group Health Association? A.—That is my response.

Q.—That is the statement you made? A.—Yes.

Q.—Well, do I understand your testimony to be that there was a by-law of the medical staff relating to confining the courtesy list to members of the District of Columbia Medical Society? A.—I think: now, this is impression, and I am not positive about it. I think our medical staff has had both the clause in effect and the clause not in effect, and my information is that at the time of this, 1937 and 1938, as to which inquiry was made, that was not a requirement; that is my information.

Q.—I wonder if you could furnish us with that by-law. A.—I can't furnish you with anything. I have furnished you with everything we had as called for by the subpoena.

Q.—What does the by-law look like? A.—It is very much the same as what you have there. It is not in the reports of the hospital.

Q.—You don't know when that by-law was adopted? A.—Which one do you mean?

Q.—The by-law restricting the courtesy staff to members of the District Medical Society. A.—No, I do not; not during 1937 and 1938, I don't think; it was after that time. I have been told that there was no such by-law at that time, and I have produced the sources of my information and filed them with you in response to a subpoena.

Q.—Was Dr. Jenkins, W. H. Jenkins, a member of your staff? A.—I wouldn't question it; I know he is now, and I think he has been for many years.

By Mr. Leahy:

Q.—Do you know any other place we could go to find that by-law? You say you have turned over to the Government all the information you had, in response to the subpoena? A.—It is my understanding—I am perfectly willing to look further, but I gave them what I had and what I was told was a copy of the by-laws in force at that time, which was what the subpoena called for. If I find anything I shall be glad to furnish it.

Mr. Lewin:—I don't believe our subpoena did call for that in this trial. If you will look for it I will be thankful.

MARCH 28—MORNING

TESTIMONY OF CHARLES D. DRAYTON

DIRECT EXAMINATION

Charles D. Drayton, a member of the bar of this Court for about thirty-five years, also a member of the bar of Court of Appeals and of the Supreme Court of the United States, is also a member of the Board of Education, a director of the Children's Hospital for about ten years, and president of the board of that hospital for about five or six years.

Q.—What are the functions of the board of directors of that hospital? A.—They hold monthly meetings and examine questions of general policy.

Q.—Are they the final administrative board of the hospital? A.—They are.

Q.—How many are on the board, Mr. Drayton? A.—Six.

Q.—Will you tell us about the Children's Hospital; not in detail: just what is the Children's Hospital? A.—The Children's Hospital was incorporated under an Act of Congress seventy years ago for the purpose of caring for indigent children under the age of 12 years. It now does 85 per cent charity or part-charity work. It was originally incorporated entirely as a charitable institution, but subsequently they have moved from one place to another and they now have twenty-seven private rooms, from which we derive some revenue; and, of course, our support is largely dependent on our appeal to the public. That is, if we do a good job the public supports us for these charity patients.

Q.—Do you receive any assistance from the community chest? A.—The community chest now buys services from the private hospitals, including Children's, through the Health Security Administration, and they pay for it at less than our cost, and they don't always pay for all the service they contract for with us.

Q.—Do you have staffs in that hospital? A.—We have a medical staff composed of some of the leading doctors in Washington, the chief of whom is Dr. Joseph F. Wall, a leading pediatrician, or child specialist. We also have had from the first of February 1937, a so-called courtesy staff or list. That

staff assumes no obligation to attend the little patients in the hospital whose parents cannot pay for them. They bring their own patients to the private rooms.

Q.—Are there any prerequisites which the hospital has fixed for applicants to the courtesy staff? A.—Well, for a great many years—I don't know exactly when it started—we have had a prerequisite for admission to the general staff of the hospital and it is and has always been that they shall be members of the local Medical Society or ethical society, as it is referred to; and that same rule when the courtesy staff came into being, in February 1937, naturally applied to the courtesy staff.

Q.—Do you recall approximately how many are on the courtesy staff of Children's? A.—I think about eighty-seven, now. I have a memorandum of that, if I may use it.

Q.—Could you refresh your recollection from it? A.—No, I am wrong. The courtesy staff is one hundred and thirty-nine, and the medical staff one hundred and fifty-four; that is, consulting, and all the house doctors, interns and so on. Q.—Mr. Drayton, did you occupy the chair as president of the board of directors during the years 1937 and 1938? A.—Yes.

Q.—During those years 1937 and 1938, was this requirement with reference to membership in the local Medical Society a prerequisite to your recollection, or not, for applicants to practice on the courtesy staff? A.—It was always a prerequisite, yes, in actual effect, but it was not written; that rule was not written, I think, until October, 1937, but it had always been effective.

Q.—Do you recall whether at any time there came under your notice an application for privileges of Children's Hospital of one Dr. Raymond E. Selders? A.—Yes, I think that matter was brought up by the medical staff at a board meeting.

Q.—Do you recall whether there was any correspondence about it? A.—Yes, there was correspondence, I think, in November of 1937, between Miss Gibson, at the direction of the board—Miss Gibson being the superintendent of the Children's Hospital, and Mr. Penniman, who was president of the Group Health Association.

Q.—Have you the file handy here of Children's Hospital? A.—I have some copies that are available, if there is no objection to the copies.

Q.—Mr. Drayton, I will ask you to look at the copies of this series of correspondence in evidence here. We will save time. Now, looking at that correspondence, can you refresh your recollection as to when it was that Miss Gibson, as the superintendent of the hospital, first communicated any information with reference to the application of Dr. Raymond E. Selders, to Mr. Penniman? A.—That appears to have been on Nov. 15, 1937 in a letter addressed by Miss Gibson to Mr. Penniman. Would you like me to read it?

Q.—Yes, read the letter.

The Witness:

“Dear Mr. Penniman:

“At a meeting of the board of directors of the Children's Hospital, held November 15, I was authorized to reply to your letter of November 8 as follows:

“The Children's Hospital will accept for treatment or hospitalization any patient in need of care, under its charter, rules and regulations.

“This pertains to indigent, semi-indigent, and a very limited number of pay patients—as we have only twenty-seven beds available for pay patients.

“All doctors treating these patients while in the hospital must have staff appointments and be members of local medical societies.

“Dr. Raymond E. Selders has made no application so far for staff appointment.

“Yours sincerely,

“Mattie M. Gibson,

“Superintendent.”

Q.—Do you recall now whether you were present at the meeting of the board of directors at which this matter came up concerning which the superintendent wrote on Nov. 15, 1937? A.—I think I was there.

Q.—Doctor, did anything such as is contained and stated in that letter bear any relation at all to G. H. A.?

Mr. Lewin:—Which letter?

Mr. Leahy:—That letter of Nov. 15, 1937.

A.—No, no reference was made to G. H. A. It was addressed to G. H. A., of course.

Q.—Was there any discussion in the board of directors at the time, or out of which meeting came this letter, which we have just read, indicative at all of opposition to G. H. A. as the foundation of this letter? A.—No.

Q.—Did you personally have any correspondence with reference to Dr. Selders' application? A.—I think I did later in 1938.

Q.—Do you recall about what time in 1938 you had that correspondence? A.—I believe that was in November too. It began in the summer when I was up in Maine and there was some delay in responding to the letters from Group Health Association by reason of that, and also by reason of the fact that our board doesn't meet in August and September, so that my replies were somewhat delayed.

Q.—You have copies of your replies with you? A.—No, they have stripped our files at Children's so that I couldn't find those letters, and no return has been made of them, so that I haven't been able to see what they contained.

Q.—I will show you some letters which have been introduced in evidence, Mr. Drayton. First, I will show you what has hitherto been introduced for the prosecution as Government's exhibit 378—it is Mr. Kirkpatrick to Charles Drayton, dated Aug. 6, 1938.

Another, No. 379, dated Sept. 16, 1938, your letter, which has been identified and offered in evidence as Government exhibit 380; and also Government exhibit 381.

Could you, Mr. Drayton, just quickly glance over, beginning with 378, and see if you can refresh your recollection to advise us whether you personally conducted that correspondence, and what it is about?

A.—Well, this is one of Aug. 6, 1938, from Mr. Kirkpatrick to me, thanking me for a letter I wrote him on August 4, in which he says something about taking up with the board of trustees at its next meeting the question of Dr. Selders' admission to the courtesy staff.

The next letter, of September 16, that was simply a tracer from Mr. Kirkpatrick.

Then I told him on September 19, I had overlooked the fact that we had no September meeting of the board, but that just as soon as the matter could be given consideration I would further advise him; and then the last one here seems to be my letter to him of November 2, in which I stated that in view of the proceedings now under way involving Group Health Association it didn't seem possible for us to give any final answer on any aspect of the controversy. Further, that he had theretofore been furnished with a copy of the memorandum of April 1, 1938 embodying the rule promulgated by our medical staff and adopted by our board governing admission to the hospital where an emergency exists, and also the attendance on such children of members of your staff; and I enclosed another copy of that memorandum.

Q.—Do you recall whether the memorandum of April 1, to which you referred, permitted physicians to treat children in Children's Hospital in emergency cases? A.—It did, and that always has been our rule.

Q.—Do you recall whether there was any further correspondence after Nov. 2, 1938, Mr. Drayton? A.—I don't think there was any more, but I am not certain about that; my memory isn't so good.

Q.—At least you haven't been able to locate any copies of other correspondence? A.—My attention has not been called to any later letter.

Q.—Was it your practice to attend regularly the meetings of the board? A.—Yes.

Q.—Do you recall whether at any time there was any action taken by the board with reference to any of this correspondence, which was directed to G. H. A., to restrain it in any way? A.—No, we didn't care anything about G. H. A. We were trying to do the best we could for the hospital.

CROSS EXAMINATION

By Mr. Lewin:

Q.—Mr. Drayton, you just read from a copy of a letter dated Nov. 15, 1937. Now, as a matter of fact, that letter was never sent, was it? A.—So far as I know it was; I have no other information.

Q.—There is in evidence this letter, Government's Exhibit 359, dated Nov. 16, 1937, from the superintendent, Miss Gibson, to Mr. Penniman, and the testimony here is that this is the letter which was received. A.—Well, I don't know; that may be so.

Q.—It differs from the letter you read in this: the letter you read contained this statement:

"All doctors treating these patients while in the hospital must have staff appointments and be members of local medical societies."

whereas that statement is omitted in the letter Miss Gibson sent Mr. Penniman. Now, isn't it true that was omitted at your direction? A.—Not at all; I had no knowledge of it until this moment, that it had been omitted.

Q.—But it seems perfectly clear that another letter was substituted for the one of November 15? A.—It so appears.

Q.—Do you know why? A.—Not at all.

Q.—You attended, did you not, the meeting of the members and incorporators of Children's Hospital held on Dec. 6, 1937? A.—I guess so.

Q.—That was just about three weeks after the letter I showed you was sent by Miss Gibson, was it not? A.—Yes.

Q.—Don't you find there that on December 6, this occurred:

"Only physicians, surgeons, and dentists who are licentiates of the District of Columbia and also members of the District Medical Society or ethical body in their locality shall be eligible for appointment to the medical staff."

"Physicians, surgeons, and dentists not officially connected with the hospital, but members of their ethical medical societies, may be accorded the privilege of using the facilities of the hospital as a matter of courtesy for a term that shall continue during the pleasure of the board of directors, those accepting such privileges to be known as the courtesy staff;"

and some more which I don't believe is particularly pertinent. A.—That seems to be what this shows.

Q.—So, some three weeks after this letter was written, you amended your by-laws for the first time requiring membership in the District Medical Society as a condition to the appointment to your courtesy staff? A.—That appears to be so, but that has been the practice for many years.

Q.—You had only had a courtesy staff for less than a year, had you not? A.—I correctly stated that in my direct, but said that it applied to the medical staff for many years and, thereafter, applied to the courtesy staff when it was formed in 1937.

Q.—You say it applied to the medical staff for many years, but you say it was the custom to apply it to the courtesy staff from February 1937 on? A.—Yes.

Q.—But you had no such regulation during all those years. A.—The courtesy staff was not in existence until early in 1937.

Q.—You had no such regulation until Dec. 6, 1937. A.—Not any written regulation.

Q.—Is it not true that the reason you made this change on Dec. 6, 1937 was that you had just received, five days previously, a letter from Dr. Conklin of the District Medical Society, enclosing a resolution of December 1, of that Medical Society, stating that as a matter of educational policy the hospitals should adopt a rule confining their entire staffs to members of the District Medical Society, or other local societies of the A. M. A.? A.—That had been the custom so long that we were simply following it in putting it in writing.

Q.—Didn't you put it in writing on Dec. 6, 1937 as a result of the receipt of this communication from the Medical Society of the District of Columbia? A.—I say "No," not as a result of it. It may have called our attention to the fact that the practice that we had been carrying out for many years had not been in writing, and resulted in that being done.

Q.—Will you look at this list of members of the outpatient department of Children's which was obtained, I believe, from your hospital, and tell me—this is September 1938—whether all those doctors are members of the District Medical Society? A.—I couldn't tell you; I don't know.

Q.—Now, as a matter of fact, do you know whether Dr. Sigmond Newman, of Virginia, was a member of the District Medical Society or not? A.—He may be a member of the Virginia society, which would be recognized as of the same ethical standard.

Q.—Do you know whether he is a member of that society? A.—No.

Q.—Do you know whether Dr. Stephen Verges is? A.—I don't know. There is no use going through all those and asking me about them, because I don't know.

Q.—As far as you know, there may be a number of them who are not? A.—As far as I know there may be anything about it that I don't know.

Q.—Did the minutes of your meeting of the medical staff of Children's Hospital for April 4 come to your attention? A.—Let me have a look at it. No, I will say this generally. We don't see the minutes of the medical staff.

Q.—This didn't come to your attention? A.—No.

Q.—And you weren't aware of this action that I am pointing out to you there? A.—No, I have no knowledge of this, but I did write the letter to Senator Capper.

Q.—Now, when was Group Health Association or Dr. Selders notified that his application had been rejected at the Children's Hospital? A.—I don't know, Mr. Lewin.

Q.—As a matter of fact, do you know whether he was ever notified? A.—I don't know whether he was definitely notified or not.

Q.—Apparently we have no letter of such notification. I wondered if you ever saw one. A.—No, I have never seen one. I don't believe there was any such letter, after mine of Nov. 2, 1938.

Q.—I am speaking now of the fall of 1937, or the early part of 1938. A.—I doubt he was definitely notified, but I am not familiar with anything to the contrary.

Q.—Did you understand that his application was definitely rejected in the fall of 1937 or the early part of 1938? A.—Well, I think it was rejected by the committee of the medical staff, which passes on those applications, but I am not certain.

Q.—Doesn't the board of directors pass finally on those applications? A.—Well, yes, it is submitted by the staff, but as your Dr. Cabot stated we rely and must rely on the medical staff.

Q.—Do you remember their making a recommendation to you in the latter part of 1937 or early part of 1938 that Dr. Selders' application should be rejected? A.—I really don't; my memory is bad, and there has been a lot of things since that time; it may have been done.

Q.—You don't remember receiving a letter from Mr. Kirkpatrick, calling your attention to Judge Bailey's decision with reference to Group Health; that was written July 28, 1938? A.—Yes, I guess so; it brings it back to me now.

Q.—Isn't it true that was forwarded to you at your summer home in Massachusetts? A.—Yes.

Q.—And you remember that you replied to Mr. Kirkpatrick August 4. I wonder if this would refresh your recollection as to whether he had been rejected before that time. Don't you say:

"As soon as our board meets in September I shall take up the question as to what position we should now take respecting Group Health Association, Inc. and advise you on behalf of Children's Hospital. Since the matter is one of great importance and since our position heretofore has resulted from formal action taken by our board, you will understand that I am not able now to announce any change."

A.—That action by the board may have been of a general nature. I am not sure it was directed to Dr. Selders' application, because the general rule that had always been in effect may have been what I referred to.

Q.—Your impression is that the action of the board requiring membership in the local society was taken with respect to G. H. A.? A.—I didn't say with respect to G. H. A.; I meant in applying the rule that our staff should be recruited from the Medical Society generally.

Q.—When you say, "our position heretofore has resulted from formal action taken by our board," weren't you talking with respect to the action taken by the board in regard to Group Health, which you mentioned in the sentence just before that? A.—It may have been that; it may have been the general rule or it may have been some specific objection to Dr. Selders' application.

Q.—In any event, what you told Mr. Kirkpatrick was that you would take up the question of your position as regards Group Health in the fall of 1938, and not as regards Dr. Selders. A.—That may be and then subsequently I found we didn't have a meeting in September.

Q.—And when you said the matter is "one of great importance," weren't you referring to your decision with regard to Group Health? A.—Oh, the whole problem of Group Health; that is true.

Q.—Then, I believe it is true, isn't it, that you wrote Mr. Kirkpatrick and told him you would take the matter up with the board at its meeting in September, and then, in September, after receiving another letter from Mr. Kirkpatrick, you told him you were under a misapprehension, that the board had not met in September—and then you say your letter of Nov. 2, 1938 is the last communication on the subject; is that right? A.—The last I know about.

Q.—And that was just about a year after Dr. Selders had applied for privileges? A.—Yes, he had correspondence—Mr. Kirkpatrick with Miss Gibson, and she had given him what we regarded as some definite answer.

Q.—That is what I was looking for. Can you find any definite answer? A.—I mean in advising him that in order to practice in the hospital he would have to be a member of the staff, and then placing back of that the thought that members of the staff must be members of the local medical society. That would seem to have been somewhat of an answer; not as direct and definite, perhaps, as you would like, but an answer.

Q.—Did you know at the time that Dr. Selders himself was a member of the Harris County Medical Society, a constituent society or component body of the A. M. A.? A.—I don't know whether I heard that since or before.

Q.—Did his application show that to you? A.—I never saw his application because, as I say, we leave that to the medical staff to pass on.

Q.—Would that have brought him under the operation of this rule which you adopted in the early part of December, 1937? A.—Oh, you mean the rule concerning membership in the local society or ethical body?

Q.—Yes. Would that have brought him under that rule? A.—That fact alone, if he had been in good standing and recognized as qualified to do the things that he claimed able to do, and made application to do, I would say yes.

Q.—Well, do you know whether he was, or not? A.—Whether he was qualified or not?

Q.—Yes. A.—I know that the medical staff didn't think so and they made inquiries concerning him, and rejected him for that specific reason.

Q.—Do you know what inquiries the medical staff made? A.—They inquired of the College of Surgeons.

Q.—You mean the Washington Academy of Surgery? A.—Yes.

Q.—Did they refer his application to the Washington Academy? A.—They asked it concerning this man's qualifications; his application having been for all sorts of surgery at Children's Hospital.

Q.—Did Dr. Selders give you some references? A.—Probably so.

Q.—Did you write to his references? A.—I presume so and I am aware of one letter written to the Worcester Hospital, of which I have been told.

Q.—That was written by your medical staff? A.—Yes, Dr. Titus wrote the letter and had a reply. He is a member of our staff.

Q.—And he wrote it in his capacity as a member of your staff? A.—I don't know in what capacity he wrote it, but he wrote a letter and the report was adverse on Dr. Selders.

Q.—I wonder if we might have that letter. A.—Well, you will have to get it from Dr. Titus. I haven't it. I am trying to answer your questions as best I can. I am not submitting that letter, because I haven't got it.

Q.—Are you positive that you saw it in the files of the Children's Hospital in response to a letter from your staff making inquiry on the subject?

Mr. Leahy:—He didn't say that.

The Witness:—I didn't say I saw it in response to a letter of our staff. I said I had been told such inquiry had been made.

Q.—You don't know whether your staff or any member representing it communicated with any of Dr. Selders' references?

Mr. Richardson:—He said he did know. He said Dr. Titus did and that Dr. Titus was on their staff.

THE COURT:—He very carefully told you he didn't personally know what went on; that the medical staff took care of those matters, and then you asked him if he heard concerning it, and he answered that question.

By Mr. Lewin:

Q.—Well, I will see if I can make this clear: Do I understand that in the files of the Children's Hospital you have at any time had a letter from Dr. Selders' references? A.—I haven't examined that file; in fact, it was taken over by the Government.

Q.—Did you respond to the subpoena? A.—Yes.

Q.—Did you produce any such letter? A.—I wasn't asked for any such letter.

Q.—Well, such files were not taken over by the Government. A.—There was some indication later that a great many of the letters were taken.

Q.—Do you know, as a matter of fact, that the Government has received any such letter as you describe? A.—No, I said I hadn't seen any such letter.

RE-DIRECT EXAMINATION

By Mr. Leahy:

Q.—Now, in writing your letter of November 2 to Mr. Kirkpatrick, which you state is the last letter you now have any recollection about, I want to ask you about what you referred when you stated:

"I have not been more prompt in replying to your several communications dated July 28 and Aug. 6, 1938, asking that Dr. Raymond E. Selders, a member of your staff, be admitted to the courtesy staff of the Children's Hospital, and that he may attend members of your Association admitted as patients there, for the reason that, in view of the several court pro-

ceedings now under way involving Group Health Association, Inc., it did not seem possible for us to give any final answer on any aspect of the controversy."

What were you referring to when you said:

"In view of the several court proceedings now under way involving Group Health Association, Inc.?"

A.—All of them were not perhaps court proceedings. I was aware, however, that the Corporation Counsel—

Mr. Kelleher:—We object to that, not responsive to the question.

Mr. Leahy:—I think we have a right to know what he referred to in this letter. The letter is in evidence.

THE COURT:—He may answer.

The Witness:—The whole atmosphere was charged with doubt about the legal status of Group Health, as witness the Corporation Counsel's opinion to the effect that it was—

Mr. Lewin:—Did you receive the opinion?

The Witness:—No, but I was informed what it was.

Mr. Lewin:—Well, I object to it then.

THE COURT:—I don't think he may go into details of it.

Mr. Leahy:—No, just the fact that there had been an opinion; that he was informed of it, as explaining this letter.

Mr. Lewin:—I want to object to him testifying to something which is immaterial and outside the issues of this case.

THE COURT:—He is stating his reasons why he wrote that letter; the reference he was making in it. It doesn't make any difference how he got the information. It is part of the explanation for the letter, so the jury may understand what he meant when he wrote it.

A.—Judge Bailey's decision, I think, was in August, 1937. Of course, that was favorable to G. H. A., after they had changed the by-laws, and so on; and then there was a possibility—in fact, it was understood that further action was being taken to determine this question, or might be taken. The whole thing was in doubt, in view of the pendency of these several matters in the court, or in legal channels. Therefore we felt that we were not in position then to do business with a group whose legal status was in doubt.

TESTIMONY OF SAMUEL H. ROGERS

DIRECT EXAMINATION

By Mr. Leahy:

Q.—Just to refresh your recollection and everybody's recollection, you have some connection with Casualty Hospital? A.—President of the board of directors.

Q.—I want to direct your attention to a meeting which has been testified about before, at which a Mr. Loomis and Kirkpatrick, and you, as representative of the hospital, conferred together sometime in 1938. Do you recall the meeting to which I refer? A.—I do.

Q.—Do you remember now who was present? A.—We had two meetings.

Q.—Do you remember a meeting at which Mr. Loomis and Mr. Kirkpatrick were present? A.—I do.

Q.—And the subject was discussed as to whether they could take over a wing or bay of your hospital? A.—That proposition was made, yes.

Q.—And do you recall whether at that meeting, Mr. Kirkpatrick discussed the matter with you? I don't mean you alone, but your group, representing the hospital? A.—Yes, I do.

Q.—Do you remember at that time Casualty Hospital was approaching its fiftieth anniversary? A.—I do remember that very distinctly.

Q.—Was anything said by Mr. Kirkpatrick as to what he would do for Casualty in the event that Casualty would permit him to take over the wing or bay of the hospital? A.—Well, it is just hard to recall which one of the representatives gave the thought. I could hardly say whether it was Mr. Kirkpatrick or Mr. Loomis, but they did point out that it would be an excellent time for us to get some favorable publicity by joining in with Group Health, who had been favored with a great deal of publicity and was being favored with a great deal of publicity at that time.

Q.—Did they say anything to you at that time about having one of the best publicity agents in the world?

Mr. Lewin:—Objected to.

THE COURT:—It is a leading question.

Mr. Leahy:—I think I asked Mr. Kirkpatrick that question and I am just offering this in connection with his answer.

Mr. Lewin:—It is an immaterial statement anyway.

THE COURT:—I don't know whether it is immaterial or not. Mr. Kirkpatrick went into this conference.

Mr. Lewin:—But he didn't talk about publicity agent.

THE COURT:—He probably talked about certain things in connection with it. If so, the rest of it is admissible. It all had reference to the hospital. Proceed.

The Witness:—It was brought to our attention that they had excellent publicity and I couldn't recall the words exactly, but certainly it amounted to the same thing; that they had a very excellent publicity man.

Q.—Did they say anything about what power they had in Congress?

Mr. Lewin:—Objected to as totally immaterial.

THE COURT:—I think we should let the witness testify. I don't think you should lead him.

By Mr. Leahy:

Q.—Will you tell us in your own way just what was said there? A.—They told us that high officials of the Government were very much interested in this movement and that members of Congress were very much interested in it; they didn't mention who or how many. They let us know they had the backing of Government officials and at least some members of Congress.

Q.—Do you recall whether anything was said in the conference with reference to the corporate capacity of the Casualty Hospital to lease a wing? A.—That proposition was made; that they might lease a wing. They had previously had representatives go through the hospital and it happened at that time that we were not crowded; different than it is at some times; today, especially; and that proposition was made. Of course I told them that we were organized for a definite purpose and that didn't fit in with the definite purpose.

Q.—What was the definite purpose you stated? A.—That purpose was and is to maintain an institution for furnishing emergency medical and surgical service and hospitalization to all, regardless of race, color, religion, or ability to pay.

Q.—What did they say about that? A.—Well, I couldn't hardly recall what they said. They, of course, let us know they were not interested in that part of it. They were definitely interested in taking care of Group Health patients and having Group Health doctors attend them.

Q.—Was any arrangements kept after this conference between G. H. A. and Casualty? A.—No, at the second conference we told them we didn't see how we could change our setup to suit their requirements.

TESTIMONY OF HENRY ROLFE BROWN

DIRECT EXAMINATION

Henry Rolfe Brown, retired in June, 1937. He took his medical course in the University of New York, graduated in 1889, and served an internship at Bellevue Hospital, New York. He engaged in private practice in San Francisco until 1898, then moved to Providence, Rhode Island, until 1916, and then joined the army, as a member of the Medical Corps. He remained in the Medical Corps about two years and was overseas. Following return from service overseas, after having a nice rest he went into the Veterans' Administration, operating and organizing hospitals beginning in 1921.

Q.—Do you recall now how many hospitals you supervised the administration of? A.—I organized the Veterans Hospital in Rutland, Massachusetts; spent three or four years there, then transferred to Aspinwall, Pennsylvania, just opposite Pittsburgh; stayed there for ten years, and then came into the Veterans Administration in Washington where I was put in charge of all tuberculosis hospitals throughout the United States, and where I remained until I was retired in June, 1937.

Q.—How many such tuberculosis hospitals are there under the direction of the Veterans Administration? A.—About twenty, at that time.

Q.—Now, do you recall at any time, Doctor, that you were approached by Group Health Association for the purpose of having you head the organization as medical director? A.—Yes, a Mr. Otterman, of H. O. L. C., Home Owners' Loan, approached our medical director, Dr. Griffith, in the Veterans Administration and asked him if there was any member of his staff who would be interested in such a venture. He got in touch with me and talked the matter over two or three times, and laid out the plans for the organization of Group Health Association; and I believed then, as I do now, that such a thing would be a very valuable thing for the community, especially those in low income groups; and being very much in favor of such a thing, I went into it with the idea of developing and making it a success.

Q.—Do you recall when those conversations began? A.—March or April 1937.

Q.—Do you recall now whether a time arrived when definite arrangements were made with you to become the medical director? A.—That was the latter part of April.

Q.—Can you recall when you first met him? A.—I believe I first met Dr. Neill at a meeting of the Executive Committee of the Group Health at the Medical Society Building on M Street.

Q.—Do you remember what date that was, Doctor? A.—I don't believe I do, Mr. Leahy. I don't just recall that date.

Q.—Do you recall whether you ever met Dr. Neill at Mr. Childers' house? A.—Yes, I did.

Q.—Do you recall whether that was before this meeting at the Medical Society or following it? A.—Following it.

Q.—Following it. Who else was there at Mr. Childers' house on that occasion, Doctor? A.—Mr. Childers, Mr. Penniman, Mr. Zimmerman, Mr. Russell, and myself.

Q.—Do you recall in what capacity Mr. Penniman was acting then? A.—He was president of Group Health at that time.

Q.—And Mr. Zimmerman? A.—Mr. Zimmerman never had any position in Group Health but was the real man behind the operation of it.

Q.—And Mr. Russell, did you say? A.—He was the legal advisor and chief counsel of H. O. L. C.

Q.—And in what capacity were you there that night? A.—I was there as Medical Director. I had already assumed the office of Medical Director.

Q.—And I want to ask you, Dr. Brown, whether at that meeting in Mr. Childers' house Mr. Penniman offered the position of Medical Director to Dr. Neill? A.—Not to my knowledge.

Q.—You were there during the entire conversation? A.—I was there during all the time.

Q.—And you had already been employed as Medical Director then? A.—I had already been employed as Medical Director.

Q.—Now, do you recall, with relation to that meeting at Mr. Childers' house, when the meeting was at the District Medical Society? A.—My recollection is that it was at some time in July, I think along at the end of July or the beginning of August. I know the weather was quite warm, but I can't fix the date exactly.

Q.—Do you recall who was present at that meeting, Doctor? A.—Well, I have just told you.

Q.—I mean at the Medical Society. A.—Well, I don't remember all of them. I remember Dr. Neill and Dr. Groover and Dr. Macatee. I really don't remember all of them. There were quite a number.

Q.—Who was present with you? A.—Mr. Zimmerman and Mr. Penniman.

Q.—Do you recall how you all happened to meet that evening at the Medical Society? A.—We had discussed it several days before, and finally I was called on the telephone and asked to meet Mr. Penniman and Mr. Zimmerman at the Mayflower Hotel where we were to have dinner together and then proceed to the medical meeting.

Q.—Do you recall whether that was the first time that you had met the members of the District Medical Society with regard to the subject matter discussed? A.—That was the first time that I had met them.

Q.—Now, in pursuance of the arrangement did you or did you not meet at the Mayflower Hotel? A.—Yes.

Q.—To the Medical Society Building? A.—We met there and had dinner there.

Q.—Who was at dinner with you? A.—Mr. Zimmerman and Mr. Penniman.

Q.—And there did you discuss what you should say at the meeting with the District Medical Society? A.—My inquiry was what we were meeting for, and they said they were meeting—

Mr. Levin:—Objected to.

A.—at the Medical Society—

Mr. Levin:—Objected to as to what they said.

THE COURT:—What is the purpose of this?

Mr. Leahy:—You will recall that both Mr. Penniman and Mr. Zimmerman stated that at this meeting—

Mr. Levin:—Well, wait a minute. Wait a minute. I have objected to that. Now, I don't want it led.

THE COURT:—Sir?

Mr. Leahy:—Do you want us to go to the bench?

Mr. Keller:—No; he is addressing the Court.

Mr. Levin:—I thought you were asking a question.

Mr. Leahy:—No. I was addressing his Honor.

Mr. Levin:—I am awfully sorry.

Mr. Leahy:—Do you want us to go to the bench?

Mr. Levin:—Yes, let us go to the bench.

Mr. Leahy:—All right.

(Counsel for both sides approached the bench and conferred with the Court, in a low tone of voice.)

By Mr. Leahy:

Q.—Doctor, you had just told us that you made an inquiry of Mr. Penniman and Mr. Zimmerman at dinner as to what was the purpose of the meeting. Did they advise you at that time of the purpose? A.—They said that the meeting was for the Society and Group Health to try and get together on the organization of Group Health.

Q.—Then did you discuss as to how much information you should give the District Medical Society at this meeting? A.—I said, "What information are you going to give them, and how far do you want to go with them in their plans?" And the replies from both of them were to go just—not to do any more and not to go any further than necessary, to tell them as little as possible.

Q.—And following that did you then go to the meeting of the District Medical Society? A.—We did. We walked from the Mayflower to the Medical Society on M Street.

Q.—Do you recall now whether, as you were about to enter the room where the meeting was to be held, there was anything further said about what should be done? A.—The last thing I recall was, "Now don't forget, we'll give them just as little as possible," or words to that effect.

Q.—Do you recall how long that meeting lasted, Doctor? A.—Yes. It lasted an hour and a half, perhaps.

Q.—And do you recall whether the advice which you received there was followed out? A.—Pretty fairly, yes.

Q.—Do you recall any other meetings now that the District Medical Society ever had with the trustees or any members of the Board? A.—Yes. There was an arrangement made at that first meeting to meet the Board of Trustees in the H. O. L. C. assembly room at a later date to be fixed.

Q.—And were you present on that occasion, Doctor? A.—I was.

Q.—Do you remember who else was present for H. O. L. C. on that occasion? A.—Almost all of the Board of Trustees were present, and a great many of the committee from the Medical Society.

Q.—Do you recall whether anything further was done at that meeting than allow the District Medical Society members to make some remarks? A.—That meeting was not as satisfactory, I don't think, as the first meeting. Dr. Groover, I think, did most of the talking at that meeting and told us a great deal about the failures of such organizations in different parts of the country and abroad.

Q.—After that did you ever have any other formal meetings of any kind between the District Medical Society and Group Health? A.—Not when I was present, no; not any.

Q.—And how long, may I ask at this point, Doctor, were you Medical Director of G. H. A.? A.—I beg your pardon?

Q.—Over what period of time were you the Medical Director of G. H. A.? A.—From the payroll date of June 7th until the 30th of April, 1938.

Q.—Do you recall, Doctor, when you first became the Medical Director, what arrangements had been made with the hospitals in the District of Columbia, if any, for the reception of patients of G. H. A.? A.—There had been none made.

Q.—Did you, as Medical Director, make any efforts looking toward that end? A.—I had a meeting with Mr. Zimmerman and Mr. Penniman at lunch in the cafeteria at H. O. L. C., and it was decided I would—

Mr. Levin (interposing):—Now, I object.

A.—approach—

Mr. Levin:—Wait just a minute. I object to his conversation with Mr. Zimmerman and Penniman.

THE COURT:—Unless I know about what it is I would not be able to pass on it.

Mr. Leahy:—Should I approach the bench and tell your Honor?

THE COURT:—I will have to know what it is to determine whether it is admissible.

(Counsel for both sides approached the bench and conferred with the Court, in a low tone of voice.)

By Mr. Leahy:

Q.—Doctor, I think you were just telling us of a conversation which you had with Mr. Penniman and Mr. Zimmerman with reference to arrangements to be made with the hospitals for the reception of patients of Group Health. A.—We met at this lunch at the cafeteria, and it was decided that I would approach the hospitals on the question of courtesy privileges for members of our staff.

Q.—Did you so approach the hospitals? A.—I did. I went first to the Emergency Hospital where I contacted Mr. Sandidge, who referred me to Mr. Gist Blair in the Union Trust Building.

Q.—Did you see Mr. Blair? A.—I did.

Q.—And then did anything occur, Doctor, which interrupted those negotiations which you were having? A.—Major Blair asked me to submit a letter requesting what our desire was. I went down to the office, and in the meantime my office had been in with Mr. Zimmerman at the H. O. L. C. That was my headquarters. I formulated a letter requesting privileges at Emergency Hospital, as suggested by Major Blair, and submitted it to Mr. Penniman. Mr. Penniman contacted Mr. Zimmerman, and it was decided that we would meet again the next day at luncheon in the cafeteria where we had a great many meetings.

Q.—And did you meet the next day at luncheon? A.—We met the next day, and I was advised at that meeting that they would take care of the hospital situation: that I need give it no further thought.

Q.—And following that what did you ever do? A.—Nothing whatever.

Q.—What occurred with reference to the mail from hospitals coming to you?

Mr. Lewin:—Objected to.

Mr. Leahy:—Same line, if your Honor please.

THE COURT:—The mail coming to him?

Mr. Leahy:—Yes.

Mr. Lewin:—Well, was there? Was there mail coming to him?

Mr. Leahy:—Well, I will ask that.

By Mr. Leahy:

Q.—Did mail come to you, Doctor, from hospitals? A.—It came to the clinic on I Street. A great many of those letters were directed to the I Street Clinic. That was the headquarters of G. H. A., and they were usually directed to the Medical Director.

Q.—Now, did you receive any instructions about mail which was directed to the clinic and to the Medical Director? A.—Yes. I opened several of those letters which were directed to the Medical Director; and they were, some of them, from the hospitals, and I would return those to Mr. Zimmerman or Mr. Penniman. Later I was instructed not to open any mail; to send it unopened to them.

Q.—From that time of the second luncheon down at H. O. L. C., what authority did you have to deal with the hospitals at all as a Medical Director? A.—None whatever.

Q.—And who did deal with the hospitals, to your knowledge? A.—I think most of it was done by Mr. Penniman.

Q.—Do you recall; Doctor, when the clinic itself opened up? A.—On November 1.

Q.—At that time had you a staff? A.—Yes.

Q.—Do you recall whether one of the members of the staff was Dr. Raymond E. Selders? A.—Yes. I employed Dr. Selders.

Q.—For what purpose did you employ Dr. Selders? A.—I employed him as a surgeon for the clinic, to do the minor surgery of the clinic.

Q.—Did you ever employ him to do general surgery of all kinds? A.—No, he was not employed for that reason.

Q.—And did you consider him competent to do general surgery, Doctor?

Mr. Lewin:—Oh, wait a minute. Objected to.

THE COURT:—Objection overruled. Answer the question.

The Witness:—No, I do not think he was competent to do general surgery.

By Mr. Leahy:

Q.—Now, why do you say that, Doctor? A.—Because he hadn't the training or the qualifications.

Q.—Did you personally have anything to do with the hospitals of Washington, trying to get privileges to do general surgery in those hospitals for Dr. Selders? A.—No, I did not.

Mr. Lewin:—Now, wait a minute. He has already testified about that, that he had no further contact with hospitals.

THE COURT:—Well, yes, I think that is true.

By Mr. Leahy:

Q.—Now, Doctor, with reference to the operation of the clinic, itself, what was your authority therein as the Medical Director? A.—My agreement in the beginning was that I was to take complete charge of the medical direction of the clinic and of Group Health, and I accepted the position on that ground. But they didn't need a medical director there, it soon developed. They needed a rubber stamp. That was all that was required.

Q.—In other words, what did the Board of Trustees do so far as you were concerned, with reference to those duties which were assigned to you as the Medical Director? A.—Well, they took them over themselves, most of them.

Q.—And who were those who took them over? A.—Mr. Zimmerman, Mr. Penniman, generally.

Q.—Doctor, do you recall now how the operations of the clinic proceeded, after it got going? A.—I don't just get the idea of your question, Mr. Leahy.

Q.—With reference to the efficiency of its functioning. A.—When it began, it functioned very efficiently, because we didn't have so many patients. On a small staff of four or five we could handle the patients very well; but gradually they crowded in so that we couldn't give attention to the patients on account of the great numbers of patients with a few doctors.

Q.—And did you have complaints from the doctors and members of the staff about that? A.—Yes.

Q.—Have you any idea, Doctor, as to how many patients a single doctor in a clinic of that character can see reasonably in a professional manner during the course of a day? A.—Of course, it depends very largely on the class of patients or conditions that you meet, but the average would be 20, 25 patients a day, would be a good hard day for any doctor in a clinic of that kind.

Q.—And do you recall, after the clinic opened and when the patients began coming in, how many patients the doctors would be required to see in the course of a day? A.—Well, it ran as high as 60 a day.

Q.—Do you think that a doctor can give efficient service, Doctor, to as many as 60 patients in a day? A.—I do not.

Q.—And how long did this condition continue, Doctor, that you have told us about? A.—As long as I was associated with the Group.

Q.—Doctor, I think you stated that you employed Dr. Selders. A.—I did.

Q.—What was your practice with reference to the agreement? Did you ever have written agreements, or were they verbal? A.—They were all verbal. There never was a written contract or agreement.

By Mr. Leahy:

Q.—Do you recall, Doctor, having employed Dr. Lee? A.—I do.

Q.—Did you employ him under a verbal or written contract? A.—Verbal.

Q.—Do you recall employing Dr. Scandiffio? A.—I do.

Q.—Did you employ him under a written or a verbal contract? A.—Verbal.

Q.—Do you have any knowledge now of what I referred to when I mentioned that there were two proposed written contracts submitted here in evidence? A.—Those contracts were gotten up for the sole purpose of presenting them to the Medical Society. They were not in existence before the hearing of Dr. Scandiffio at the Medical Society.

Q.—And who prepared those contracts? A.—I think they were—Mr. Neuman and Mr. York of the Legal Department of H. O. L. C. prepared them.

Q.—Do you recall, Doctor, whether you discussed with both Dr. Lee and Dr. Scandiffio the question of what they should do when they became members of Group Health? A.—After they had become members they asked me what they should do, resign from the Society or not. My advice was that they resign from the Society; that I did not belong to the Society, therefore was without their jurisdiction and expected nothing from them.

Q.—And do you know whether, now, in pursuance of that advice that you gave them, they did resign from the Society? A.—They did.

Q.—Then do you know whether after they had tendered their resignations somebody advised them to the contrary?

Mr. Kelleher:—Just a second.

The Witness:—They withdrew their contract—their resignation.

Mr. Leahy:—Just a moment.

Mr. Kelleher:—Excuse me, Doctor Brown. The question is, Do you know?

The Witness:—I do know.

Mr. Kelleher:—Will you bring out how he knows it?

Mr. Leahy:—All right.

By Mr. Leahy:

Q.—How do you know that, Doctor? A.—Because they both told me so.

Mr. Kelleher:—We object to that, your Honor.

By Mr. Leahy:

Q.—Do you know as a fact that they did withdraw those resignations after, following your advice, they had resigned?
A.—I do.

Q.—You attended the hearings, didn't you, Doctor? A.—Yes.

Q.—Do you know that when they tendered those resignations they accompanied—or rather, when they withdrew their resignations they accompanied that withdrawal with a letter, each one of them, identical in terms? A.—They said they had done that. I didn't know it, only from them.

Q.—I see. Do you know who was on the legal staff at that time?

Mr. Kelleher:—Of what organization? Legal staff of what?

Mr. Leahy:—H. O. L. C.

The Witness:—Mr. York, Mr. Neuman were the principal advisers, and Mr. Russell.

By Mr. Leahy:

Q.—Was Mr. York present at the trial of Mr. Scandiffo?
A.—He was.

Q.—Dr. Scandiffo. Was Mr. Russell? A.—He was.

Q.—Was Mr. Neuman? A.—He was.

Q.—Was Mr. Keely? A.—Yes.

Q.—Pardon me just a moment. Doctor, further on the question of the operation of the clinic, I wish to ask you this: whether or not Mr. Penniman and Mr. Zimmerman were accustomed to—

Mr. Lewin:—Now, I object to that. It is apparently leading. Apparently leading.

THE COURT:—I haven't got enough of it to determine.

Mr. Leahy:—To tell you the truth, your Honor, I haven't had the thing in mind yet.

Mr. Lewin:—Well, it starts out like a very leading question, to me.

THE COURT:—Well, let us try to avoid leading questions, Mr. Leahy.

By Mr. Leahy:

Q.—I will put it this way, Doctor, to you: Can you give us any other instance of where Mr. Penniman or Mr. Zimmerman displayed any interest in the operation of the clinic and its general administration by you? A.—Displayed a great deal of interest in the clinic, interfered quite frequently in small things, and would frequently meet Dr. Selders and other members of the staff outside of the clinic and discuss matters that should properly have come before the Medical Director and, through him, to the trustees. There was a great deal of interference in many ways.

Q.—Any inquiries with reference to the number of patients treated or how they were treated? A.—I don't think so; not that I recall.

Q.—When was it, again, you said that you left G. H. A., Doctor? A.—April 30, 1938.

Q.—Do you recall, Doctor, whether just before you left you became ill? A.—I certainly do.

Q.—And how long were you ill? A.—About a month, six weeks.

Q.—What time was it you were ill? A.—In February I became ill with pneumonia following a very bad cold, and was ill up through March.

Q.—Do you recall, Doctor, now, how the staff was selected for the clinic? A.—I selected the staff, both professional and lay, almost entirely, with one exception, and that was Dr. Dabney, whom I had contacted and was asked to present him to the Board of Trustees. Later I received a telephone call—

Mr. Lewin (interposing):—Just a minute.

A.—to send Dr. Dabney—

Mr. Lewin:—Just a minute. Just a minute, Dr. Brown.

By Mr. Lewin:

Q.—In pursuance of the telephone call did you send Dr. Dabney anywhere? A.—To Mr. Loomis and Mr. Russell, who employed him.

Q.—Then, you, as the Medical Director, did not arrange the employment of Dr. Dabney? A.—I did not.

Mr. Lewin (sotto voce):—He was ill at the time.

By Mr. Leahy:

Q.—And in what capacity was Dr. Dabney to serve on the staff? A.—The nose and throat specialist.

Q.—Doctor, did you know Mr. Kirkpatrick? A.—Yes, I did.

Q.—When did you first meet him? A.—I met him early in the organization of Group Health, at the H. O. L. C. Building.

Q.—Did he have any position in H. O. L. C.? A.—He was the second president of the Group Health and was vice-president under Mr. Penniman.

Q.—How frequently, if at all, was he in? A.—I didn't get that.

Q.—How frequently was he in the clinic? A.—Until he was president he didn't take much interest in the clinic.

Q.—And when did he become president? A.—He followed Mr. Penniman and then took over the prerogatives of the office of president of Group Health and was frequently at the clinic.

Q.—And what was his attitude toward you? A.—His attitude was—

Mr. Lewin:—Wait a minute. I object to that.

By Mr. Leahy:

Q.—In reference to your administration of the clinic. A.—Why, satisfactory, I think.

Q.—Was anything done at all toward contacting patients or anything of that sort? A.—Yes. They circulated a great deal among the patients when they came to the clinic. Just what occurred, I don't know.

Q.—By the way, at any time did Mr. Penniman and Mr. Zimmerman express to you in any way what their opinion of doctors was, in general?

Mr. Lewin:—Objected to.

The Witness:—Yes.

Mr. Lewin:—Wait a minute. Objected to.

THE COURT:—"Doctors in general"?

Mr. Leahy:—Yes.

THE COURT:—Well, that is a pretty broad question.

Mr. Leahy:—That is right.

THE COURT:—Sustain the objection.

By Mr. Leahy:

Q.—Didn't they at any time manifest in any manner their opinion towards the doctors of organized medicine?

Mr. Lewin:—Objected to as completely irrelevant, immaterial, incompetent.

THE COURT:—It is completely irrelevant except for the possible bias it may show in the testimony of the witnesses.

Mr. Leahy:—That is it.

THE COURT:—If they had any ill feeling towards doctors and organized medicine, it might affect their testimony here. Objection overruled.

The Witness:—Their attitude toward the profession generally was not at all good.

Mr. Lewin:—Wait just a minute.

The Witness:—They held doctors in more or less contempt.

Mr. Lewin:—Wait just a minute.

THE COURT:—I think that is a little broad: the doctors in contempt.

Mr. Lewin:—I move that be stricken, may it please the Court.

THE COURT:—Yes, that will be stricken. The question is what if anything they said antagonistic to doctors and organized medicine.

Mr. Leahy:—Yes.

The Witness:—They very frequently, especially Mr. Penniman, presented me with anything that was—

Mr. Lewin (interposing):—Wait.

A.—against the doctor.

Mr. Lewin:—Wait. Objected to, and move that be stricken.

Mr. Leahy:—That is all right.

Mr. Lewin:—Now, he hasn't said what Mr. Penniman said about any particular doctors and organized medicine.

THE COURT:—I think the question is what he said, what he may have said with reference—

Mr. Leahy:—Well,—

Mr. Lewin:—May that be stricken, your Honor?

Mr. Leahy:—Just a moment, please.

THE COURT:—Just a minute. I will see, Mr. Leahy.

Mr. Leahy:—The point is, if your Honor please, that Mr. Penniman would present certain things to him which were derogatory to doctors and the medical profession, and then they would have statements about it.

Mr. Lewin:—Well, now, that is—

THE COURT:—Then they would have what?

Mr. Leahy:—Then they would have talk back and forth about it.

THE COURT:—Conversation?

Mr. Leahy:—Yes.

THE COURT:—Well, then if that is merely preliminary to the conversation, he may show it. I don't think otherwise it would be competent.

Mr. Leahy:—Well, that is what I intended the question to elicit, your Honor.

THE COURT:—Proceed.

The Witness:—Shall I proceed?

Mr. Leahy:—Yes.

The Witness:—One day Mr. Penniman came in with a very scathing article from a West Coast paper regarding a patient in a hospital out there, and he passed it to me to read. It was a very nasty article. I read it very slowly, and after reading it I passed it to Mr. Penniman, and said, "Mr. Penniman, you don't want to forget that I am a doctor, and I don't want any more such things from you."

Mr. Lewin:—Wait. Objected to.

The Witness:—After that there was nothing ever said further on that subject.

Mr. Lewin:—Wait just a minute now. I move, then, that that be stricken, with regard to some article against a West Coast doctor, and nothing transpired except that.

Mr. Leahy:—Oh, no; that wasn't it.

Mr. Lewin:—Totally—

Mr. Leahy:—A scathing article about doctors, growing out of an incident on the West Coast.

Mr. Lewin:—Removed from this case by the breadth of the continent, and nothing said with regard to it, except that he hands him this article.

The Court:—It may go out. I think that may go out. It is rather indefinite.

Mr. Leahy:—I beg your Honor's pardon.

The Court:—I think it is rather indefinite. I assumed, from what you told me, that what followed elicited certain derogatory remarks from Mr. Penniman himself; but apparently, as the doctor states, there was nothing said by Mr. Penniman.

By Mr. Leahy:

Q.—Well, had Mr. Penniman, Doctor, ever said anything to you of the character or type contained in the article?

Mr. Lewin:—I object to that because he has just said he said nothing more except give him the article.

The Court:—I don't know whether he said it or not, but he may say now whether Mr. Penniman made any remark to him in that conversation.

The Witness:—He did at that time and on many previous occasions; he would hold the doctors in more or less disdain and state, "Well, they don't amount to much."

Mr. Lewin:—Well, wait. I object to that as a conclusion. We ought to have what he said.

By Mr. Leahy:

Q.—Well, tell us what he said, as best you recall, Doctor?

Mr. Richardson:—The substance.

The Witness:—Well, he said, "They are not up to date. They are not businesslike." They don't know how to do this, and they don't know how to do that. A lot of trivial stuff; it didn't amount to anything. It only showed his attitude; that was all.

Mr. Lewin:—I object to the fact that it showed his attitude.

The Court:—Well, that may go out.

By Mr. Leahy:

Q.—Well, now, Doctor, there has been some testimony here that there were a number of, I think they call them, elective operations when Mr. Kirkpatrick took office. Do you recall whether there were or were not members of Group Health who had elected to be operated on? *A*.—Yes, there were quite a number.

Q.—Could you tell us, what is the difference between an elective operation and any other kind of operation? *A*.—An elective operation is one that can be done at any time. An emergency operation is one requiring immediate attention.

Q.—Have you any idea now as to about how many such elective operations there were while you were there? *A*.—Quite a few. I don't just recall how many, but 60, 75, something of that kind.

Q.—And do you know now why it was that those elective operations were not performed? *A*.—Well, some of them were major operations, and I didn't want Dr. Selders to do them, unless they were simple cases. And the other was that the hospitals were not admitting the cases, although we admitted all emergency cases to the hospital, or those that were supposed to be emergency cases.

Q.—And do you recall at that time what the funds were in order to perform an operation?

Mr. Lewin:—Objected to.

The Court:—I don't understand just what the situation is.

Mr. Leahy:—Mr. Kirkpatrick stated. He said the only reason why these elective operations couldn't have been performed is that Dr. Selders was not allowed to go in the hospital.

Mr. Lewin:—Well, now, this witness has given two reasons why they were not done.

Mr. Leahy:—No. He has given one.

Mr. Lewin:—He has given two.

Mr. Kelleher:—He has given two.

Mr. Leahy:—Well, there might have been 20.

Mr. Lewin:—Well, that is—

The Court:—Well, if Mr. Kirkpatrick said there was only one, and there were several, why, I suppose we might as well have them all now.

Mr. Lewin:—Well, now, then, let us qualify this witness on the finances, then, if you can do that.

The Court:—It isn't a question of finance. It is a question of what instructions, if any, he had with reference to the handling of such matters, if he had any, from either Mr. Kirkpatrick or Mr. Penniman.

Mr. Lewin:—Oh, that wasn't the question, your Honor.

Mr. Leahy:—I will ask that. I will adopt his Honor's question.

The Court:—I thought that is what you had in mind.

Mr. Leahy:—That is what I had—

The Court:—That is what I thought.

By Mr. Leahy:

Q.—What instructions, if any, did you have from any of the responsible officials of G. H. A. with reference to dealing with these operations, Doctor? *A*.—Well, the instructions were to put as few in the hospital as possible because funds were low.

Mr. Lewin:—I move that be stricken, "because funds were low." His instructions were not to put them in the hospital, and in these instructions—

Mr. Richardson:—"Because funds were low."

Mr. Lewin:—I object to that last.

The Court:—Well, that may stand.

By Mr. Leahy:

Q.—Do you recall, now, Doctor, whether, in pursuance of this opinion you had about Dr. Selders while you were still there, you had made any attempts whatsoever to supplant him?

Mr. Lewin:—Wait a minute.

The Witness:—Yes.

Mr. Lewin:—Wait a minute. I object to that, may it please the Court.

The Court:—I didn't quite get that, Mr. Leahy.

Mr. Leahy:—I asked if he had been attempting to find some one else to take Dr. Selders' place as the surgeon in G. H. A.

Mr. Lewin:—I object to that as irrelevant.

Mr. Leahy:—It is not irrelevant because it is directly—confirms his opinion as to what he did.

Mr. Kelleher:—It is what?

Mr. Lewin:—"Confirms it."

The Court:—It may be a circumstance in favor of his opinion that Dr. Selders was incompetent to do such work, but I wouldn't want to go into any detail about it.

Mr. Leahy:—Oh, no; I am not going to.

By Mr. Leahy:

Q.—Doctor, what efforts did you make, if any, to find another physician to take Dr. Selders' place?

The Court:—I think it is just a question of whether he did or not.

By Mr. Leahy:

Q.—Did you make such an effort? *A*.—I did.

Q.—Do you recall about when you made that effort? *A*.—Sometime in the latter part of January or early in February.

Q.—How did you first come to meet Dr. Selders? *A*.—I contacted Dr. Selders through the Chicago Physicians' Exchange.

Q.—What is that? *A*.—It is a sort of an employment bureau for professional people, technicians, and so forth.

Q.—Doctor, do you recall now with reference to the membership of G. H. A. in the H. O. L. C., whether, after the clinic had been going a while—

Mr. Lewin:—If your Honor please, obviously this is going to be a leading question.

The Court:—I cannot tell yet. You can scent a leading question better than I can, Mr. Lewin. I have to hear the complete question.

Mr. Lewin:—My objection, when counsel is testifying like that, is likely to come too late. After the testimony has been given by counsel, the objection comes too late.

The Court:—Try to avoid leading questions, Mr. Leahy.

Mr. Leahy:—Yes, your Honor.

By Mr. Leahy:

Q.—Doctor, can you tell us what, if any, changes occurred in the membership of Group Health Association while you were the Medical Director? *A*.—I do not quite get your question, Mr. Leahy.

Q.—Numerically speaking, were there any changes in the membership? A.—Oh yes. The membership grew very rapidly.

Q.—When did it begin to grow? A.—After 70 per cent of the H. O. L. C. membership joined Group Health, then it opened up for other Government departments, and then there was a great rush of applications for membership.

Q.—Do you recall what, if anything, happened to the H. O. L. C. men? A.—A great many of them dropped out.

Q.—Do you recall now, Doctor, what Government departments came in? A.—The greater number, I believe, came from the Agricultural Department, who subsequently were so strong that they took over the management.

Mr. Lewin:—Wait just a minute.

By Mr. Leahy:

Q.—Do you recall now, Doctor, whether Mr. Penniman, Mr. Zimmerman and Mr. Kirkpatrick did anything toward getting in new members in G. H. A.? A.—Yes.

Mr. Lewin:—We object to that.

THE COURT:—Objection sustained.

Mr. Leahy:—May we approach the bench, your Honor?

THE COURT:—Yes. You may have some reason for it that I cannot think of.

(Counsel for both sides approached the bench and conferred with the court in a low tone of voice.)

Q.—Doctor, during the course of your administration as the Medical Director of G. H. A. did you or did you not have occasion to interview applicants for membership on the staff? A.—A great many; yes.

Q.—From what sections of the country would they come? A.—The applications and the interviews were with quite a number from different parts of the country, New York, New Jersey, Pennsylvania, the District of Columbia, Virginia, and as far as West Virginia and Kentucky, and then a correspondence resulting from that, from different parts of the country.

Q.—When these applicants came there whom would they seek? A.—They would see me.

Q.—And you would show them through the clinic, I presume? A.—I interviewed a great many before we had a clinic, and a great many after the clinic was opened.

Q.—Did you do that personally, yourself? A.—Yes, sir.

Q.—Whatever terms were reached as to the employment of any physician were reached by you? A.—Yes.

Q.—Doctor, do you recall now the rate of dues charged when you first became Medical Director?

Mr. Lewin:—I object as irrelevant and immaterial.

THE COURT:—I do not think it is material. Objection sustained.

Mr. Leahy:—Perhaps I might follow it with this question, and maybe the relevancy will be seen.

By Mr. Leahy:

Q.—Doctor, under the schedule of dues charged by G. H. A. what, if anything, have you to say of the capacity of G. H. A. to give adequate and complete medical care?

Mr. Lewin:—Objected to as irrelevant and immaterial; and I suggest that it falls under your Honor's previous ruling with regard to similar questions.

Mr. Leahy:—This is directly within his Honor's ruling with reference to what representations were made as to what this clinic could do for its subscribers. It was testified to on the very first day of the trial.

THE COURT:—Is it part of the indictment?

Mr. Leahy:—Yes, your Honor—adequate medical care.

Mr. Lewin:—There is no allegation about the dues or its financial ability, or anything of that sort.

Mr. Leahy:—No; it is for adequate medical care.

THE COURT:—I am inclined to sustain the objection. I think we are going too far into collateral issues. Objection sustained.

Mr. Leahy:—Would your Honor permit us to approach the bench on that point?

THE COURT:—Yes.

(Counsel for both sides approached the bench and conferred with the court in a low tone of voice.)

By Mr. Leahy:

Q.—Doctor, did there come a time when you resigned from G. H. A.? A.—Yes; there did come a time when I resigned.

Q.—When was that, Doctor? A.—That was the latter part of March.

Q.—How long following your illness? A.—I was just convalescing, just recovering from my illness. I went down to H. O. L. C. one day to talk things over, and it was indicated to me that my resignation would be accepted.

Q.—Is that when you resigned? A.—That is when I resigned.

Q.—Who indicated that? A.—Mr. Penniman, who was always the spokesman for the group.

Q.—Was anybody else present on that occasion? A.—Mr. Zimmerman, Mr. Kirkpatrick, Mr. Penniman—I don't know that there were any others.

Q.—Could you tell us why you resigned?

Mr. Lewin:—Objected to.

THE COURT:—Objection sustained.

By Mr. Leahy:

Q.—Doctor, in the chats which you had with the various doctors who came there and whom you interviewed as possible members of the staff, what interference, if any, was there from the District of Columbia Medical Society or any of its members? A.—I never had any interference from the Society.

CROSS EXAMINATION

By Mr. Kelleher:

Q.—Dr. Brown, did you not know that Dr. Tribble had refused to become a consultant for Group Health Association—A.—Dr. who?

Q.—Dr. Tribble—until— A.—He was never asked by me to become a consultant.

Q.—Let me finish my question, please—until G. H. A. could be organized along lines compatible with organized medicine? A.—As far as I am concerned, I never asked him to be a consultant of Group Health or anything else that I am aware of.

Q.—Did you ask him for advice about Group Health Association? A.—I talked with him a great deal about Group Health and with a great many other doctors.

Q.—Did he not tell you that he could not have anything to do with G. H. A. or anything else unless it met the full approval of the District Medical Society? A.—I don't recall such a conversation.

Q.—Did you execute an affidavit for Dr. Tribble in response to a request from him? A.—Yes, sir.

Q.—I show you Exhibit No. 570 and ask you if that is a photostatic copy of the affidavit which you executed? A.—It has my signature on it. It is.

Q.—Is that your affidavit? A.—Yes.

Q.—In that affidavit do you not state that Dr. Tribble had—

Mr. Leahy:—Show him the affidavit.

Mr. Kelleher:—I showed it to him.

Mr. Leahy:—Point to what you are asking about.

By Mr. Kelleher:

Q.—In that affidavit did you not state that Dr. Tribble had refused to have anything to do with G. H. A. until it was approved by the District Medical Society? A.—I don't recall it. It may be there, but I don't recall it. (After reading document referred to.) Apparently that is right.

Q.—Did you not also attempt to obtain the services of Dr. Cromer? A.—Dr. who?

Q.—Dr. J. Keith Cromer. Do you remember Dr. Cromer? A.—No; I do not.

Q.—Don't you remember talking with a gentleman in Washington by the name of Cromer concerning his coming with G. H. A.? A.—There were so many of those men that I do not really recall the names of all of them. I interviewed a great many, and the names of a great many have gone from my mind.

Q.—Let me show you what purports to be a letter from Cromer to you, dated Oct. 26, 1937, and ask you whether that refreshes your recollection as to whether you ever talked with Dr. Cromer. A.—Yes. I remember him now.

Q.—You remember it now. Did you ask Dr. Cromer to come to G. H. A. on the medical staff? A.—Yes.

Q.—Is this (indicating) the reply you received from Dr. Cromer? A.—I don't quite recall. It is not very clear in my mind. It is no doubt a fact.

Mr. Kelleher:—I offer the letter in evidence (handing paper to Mr. Leahy).

By Mr. Kelleher:

Q.—While counsel is examining that document I will go over another matter. Did you also attempt to secure the services of Dr. C. Tiemeyer? A.—Yes.

Q.—In Baltimore? A.—Yes.

Q.—Did you ask him to come on the staff of G. H. A.? A.—Yes.

Q.—Is this a letter which you received in reply from Dr. Tiemeyer (handing paper to the witness)? A.—Yes.

Mr. Kelleher:—I offer it in evidence as U. S. Exhibit 670.

Mr. Leahy:—They are both objected to as pure hearsay.

Mr. Kelleher:—Would your Honor care to hear my reason for offering them?

THE COURT:—I will hear you both on it.
(Counsel for both sides approached the bench and conferred with the court in a low tone of voice.)

U. S. EXHIBIT 669

Mr. Kelleher:—U. S. Exhibit 669 is a letter from J. Keith Cromer, M.D., to Dr. Brown, dated Oct. 16, 1937 and reads as follows:

"Dear Dr. Brown:

"Pursuant to our recent conversation I wish to state that I would be glad to take care of the obstetrical work for your clinic on a part-time basis if and when such consultation work is recognized by the District Medical Society. I hope you understand my position in this matter.

"Very truly yours,
"J. Keith Cromer, M.D."

By Mr. Kelleher:

Q.—Did Dr. Cromer ever come with Group Health Association while you were there? A.—Did he what?

Q.—Did he ever come with Group Health Association as a consultant while you were there? A.—He took care of quite a few obstetrical cases for Group Health; yes.

Q.—Was he retained as a consultant? A.—Yes.

Q.—On a salary? A.—No; by the case.

Q.—On a fee-for-service basis? A.—Yes.

Q.—He never came there on a salary basis? A.—No, sir.

Q.—Dr. Brown, when you were testifying that some of the lay members of Group Health Association circulated among the patients that were attended by the doctors of G. H. A., you did not mean that there was any interference with the treatment of patients by lay members, did you? A.—I don't think that I made a statement that there was, so far as I recall.

Q.—I just wanted to clarify that, that there was no interference with the treatment. A.—No, sir.

Q.—At any time, to your knowledge? A.—Not that I know of.

Q.—Dr. Brown, you determined the amount of the salaries that were to be paid to the doctors, did you not? A.—That was pre-agreed on; yes.

Q.—And you also passed on the qualifications of the doctors who came with G. H. A.? A.—I did.

Q.—And your recommendations were invariably accepted by the board of trustees while you were there? A.—They were, with one exception; and that was Dr. Dabney.

Q.—When was Dr. Dabney employed by G. H. A.? A.—Sometime in February or March, the beginning of March, or along in there sometime; I don't just recall.

Q.—That was while you were sick? A.—Yes.

Q.—With reference to Dr. Selders, did you not believe that he was a qualified man as a doctor? A.—When I employed him I believed that he was qualified to do clinical work and minor surgery, and the other work I intended to give to consultants outside.

Q.—Did you not believe he was a finely qualified doctor? A.—No; I did not; not for general surgery.

Q.—Did you believe he was finely qualified for whatever work he was equipped to do? A.—For clinical work, minor surgery.

Q.—A finely qualified doctor? A.—A very well qualified doctor in minor surgery for clinical work in the clinic.

Q.—Would you say an appendectomy is a minor operation? A.—It is a major operation, but there are very difficult appendectomies and there are very simple appendectomies.

Q.—But, in general, an appendectomy is a major operation? A.—The average is; yes.

Q.—Did you not know as of December 1937, when you testified in the Lee and Scandiffio hearing, that Dr. Selders was performing appendectomies at Garfield Hospital? A.—He did perform an appendectomy at Garfield Hospital, and I was with him.

Q.—And at that meeting of the Executive Committee did you not tell the committee that you considered Dr. Selders a finely qualified doctor? A.—Yes; but it was not qualified.

Q.—Your answer was not qualified? A.—That statement at that meeting was not qualified. He was very well qualified for the work that I had in mind for him.

Q.—And at that time you also told the Executive Committee that he was doing appendectomies at Garfield Hospital? A.—I did. They were very simple cases.

RE-DIRECT EXAMINATION

By Mr. Leahy:

Q.—Doctor, what did you mean when you stated that you were with him when he operated? A.—I went as a witness; I went with him to the operation and was present at the operation.

Q.—You are thoroughly familiar with appendectomies, are you? A.—Absolutely. I did many of them myself in my time.

Q.—So you stood right by him? A.—I stood as an observer, close to him; yes.

Q.—Who was it that fixed the salaries of the doctors on the staff? A.—That was a matter of discussion and agreement.

Q.—With reference to any limitation in amount which you were authorized to pay, was there or was there not such a limitation? A.—Well, there was a limitation as to the qualifications of the man. The limits were put on at \$4,800 per year to begin with. Anything outside of that naturally would have to be taken up with the Executive Committee or the board of trustees.

Q.—Who would determine whether you could give a man more money or not? A.—That was a matter for the board to determine.

Mr. Leahy:—May we approach the bench for just a moment on the matter of the evidence which we were going to try to find for your Honor?

THE COURT:—Yes.

(Counsel for both sides approached the bench and conferred with the court in a low tone of voice.)

RE-CROSS EXAMINATION

By Mr. Kelleher:

Q.—How old are you, Dr. Brown? A.—I am over 70.

Mr. Kelleher:—That is all.

TESTIMONY OF MRS. BETTY LOGSDON

DIRECT EXAMINATION

By Mr. Leahy:

Q.—By whom are you employed? A.—Dr. Warfield.

Q.—How long have you worked for him? A.—Since 1936.

Q.—In what capacity? A.—Secretary.

Q.—Do you recall, to be specific, a question which was asked you when you were here as a witness for the Government, with reference to sending out some questionnaires? A.—Yes.

Q.—Do you recall the question as to whether you had sent those questionnaires to hospitals? A.—Yes.

Q.—Do you recall now how you answered?

The Witness:—I think I said that my best recollection was that I had mailed them out.

Q.—Have you refreshed your recollection since? A.—Yes. After going back to the office I realized that I had made an incorrect statement.

Q.—Do you wish to correct it? A.—Yes; I would like to.

Q.—Did those questionnaires go to hospitals? A.—No.

Q.—To whom did they go? A.—They were mailed to members of the Hospital Committee.

Q.—Hospital Committee of what organization? A.—Just the Hospital Committee; that is all I know.

Q.—And you did not mail any of them to the hospitals? A.—No; I did not.

CROSS EXAMINATION

By Mr. Lewin:

Q.—Did you mail each one of those questionnaires to the doctors whose names appear on that list (indicating), which is U. S. Exhibit 312? A.—Well, I don't know exactly who the members of the Hospital Committee were. I recall that copies were sent members of the Hospital Committee, but I could not definitely say who they were at that time.

Q.—You cannot remember to whom you sent them? A.—No; I cannot.

Q.—What refreshed your recollection that you sent them to the Hospital Committee? A.—Going back to the office and thinking it over, I remembered very distinctly that they were not sent to the hospitals.

MARCH 31—MORNING

(At a meeting in the Court's chambers, attorneys for the defense offered a number of documents. These included records produced by Mr. J. Francis Moore and Mr. Logan S. Cain on March 11, 1941, for the purpose of showing money advanced by the funds; also one that has to do with the issue of solicitation and coercion of employees of the Federal Home Loan Bank Board to join Group Health Association. The Court said it may be identified and considered as offered and refused, over the objection of Government counsel.)

There were also a number of documents covering the \$40,000 from the Home Owners Loan Corporation; also a letter written in the fall of 1937 by Mr. Russell, General Counsel, pertaining

to the legality of the setup; also one written in the spring of 1938 on the same issue of legality. Next were offered the annual reports of the Twentieth Century Fund, Inc. also refused.

Next was a report on examination of accounts of the Twentieth Century Fund, Inc., from March 1, 1936 to Feb. 28, 1937; and the same with reference to the records of the Joint Committee of the Twentieth Century Fund and the Good Will Fund.

The Court also ruled out any proffer of testimony with reference to the district attorney's office and the corporation counsel's office on the question of legality; and also the comptroller's office.

Mr. Leahy also offered some pleas which have been filed by G. H. A. in two suits in our court against G. H. A. Those pleas set up what G. H. A. alleges to be the trade in which they are engaged. They describe just what they undertook to do and just what they are doing, alleging that they are employing doctors to look out for patients; that those doctors were negligent in taking care of patients. In reply to those allegations G. H. A. has set up what it considers to be its trade or its business and what it is engaged in; and we offer those pleas as an admission of G. H. A. as to the character and type of the trade it is conducting, the Court sustained the objection.

(Subsequently Mr. Magee gave to the reporter the court files in the case of *Kennedy v. Group Health Association, Inc., et al.*, Civil Action No. 6436, and *Kramer v. Group Health Association, et al.*, Civil Action No. 2474.

Mr. Leahy also offered two letters written by Selders, stating that he was dealing with a group which was being managed and administered by a lay board and that he was suffering interference from the lay board in the matter of his selection of doctors.

(The jury reentered the court room and resumed their seats in the box.)

TESTIMONY OF DR. HENRY ROLFE BROWN

DIRECT EXAMINATION (RESUMED)

By Mr. Leahy:

Q.—Doctor, there was one question which I wished to ask you. In your judgment as the Medical Director of G. H. A., was G. H. A. giving adequate medical care to its subscribers? A.—A great many members of Group Health resigned because they did not believe they were getting sufficient medical care; and I do not believe that any doctor can give adequate medical care to forty, fifty or sixty patients daily.

CROSS EXAMINATION

By Mr. Lewin:

Q.—Doctor, I show you an exhibit marked No. 671 and ask you if that is your signature that appears on the bottom thereof? A.—Yes; it is.

TESTIMONY OF DR. DANIEL L. BORDEN

DIRECT EXAMINATION

By Mr. Leahy:

Q.—Doctor, over the week end did you look for the application of Dr. Selders on which the Academy of Surgery acted? A.—Yes; I did.

Q.—Also the letter of transmittal requesting you to report? A.—Yes.

DEFENDANTS' EXHIBIT 55

Mr. Leahy:—Defendants' Exhibit 55 is on the letterhead of the Columbia Hospital for Women, Washington, D. C., dated Nov. 26, 1937 and reads as follows:

"Washington Academy of Surgery,
Care of Dr. H. H. Kerr,
1744 N Street N.W.
"Gentlemen:

"I am directed by the Medical Board of this hospital to request your cooperation and advice, as proffered some time ago, in the matter of an application for courtesy privileges in major gynecological surgery and operative obstetrics.

"Dr. Raymond E. Selders, an employee of the medical cooperative or insurance organization recently formed by employees of the Home Owners Loan Corporation, is applying for such privileges and, as you can see by the enclosed copy of his application, he has not presented evidence of the high degree of training and large experience in gynecology and obstetrics which this hospital has usually demanded of those seeking privileges in Classes 1 and 2, although he may have had both.

"Because of the peculiar circumstances of this case and the Medical Board's desire to act in a fair and judicial manner, your advice will be greatly appreciated.

"Very truly yours,

"P. M. Ashburn, M.D.,

"Secretary of the Medical Board."

DEFENDANTS' EXHIBIT 56

Defendants' Exhibit 56 is the application of Dr. Raymond E. Selders:

"Give name of Medical Board or Courtesy Staff physician for reference. "Walter E. Lee, M.D., Surgeon, Philadelphia. John D. Moore, Past President, Medical Association of Texas."

By Mr. Leahy:

Q.—Just tell where you got the Hugo address. A.—I got it from him, on that letter. That is, he gave me that copy.

Q.—I am now showing you what has hitherto been introduced in evidence and read by you on Friday, Defendants' Exhibit 54, dated Jan. 12, 1938, Hugo, Okla. Is that where you got it? A.—Yes, sir.

CROSS EXAMINATION

(There was a long cross-examination concerning the confusion between Drs. Moore of Texas and of Hugo, Okla.)

REBUTTAL

TESTIMONY OF MRS. CHARLES HARDIN

DIRECT EXAMINATION

By Mr. Kelleher:

Q.—On June 19, 1938 your husband became sick with appendicitis? A.—Yes.

Q.—And Dr. Solette was called by you? A.—Yes.

Q.—And then Mr. Hardin was taken to the hospital and operated on? A.—Yes.

THE COURT:—I think the jury will recall all that.

By Mr. Kelleher:

Q.—When Dr. Solette came to the house after you called him, did you have any conversation with him concerning Group Health Association? A.—Yes, I did.

Q.—What was that conversation? A.—He said Group Health doctors were not permitted to operate in the hospitals. He said that and, therefore, he suggested calling another surgeon to prevent any further waste of time.

Q.—What did you say about Group Health? A.—I said we were members of Group Health and he wanted to know about who should operate, and I said we were members of Group Health; and he said it would be a waste of time to call in a Group Health doctor at that time; that Group Health doctors were not allowed to operate in the hospitals.

Q.—Did Dr. Solette suggest Dr. Bachrach? A.—Yes.

Q.—And did Dr. Bachrach come and examine your husband? A.—Yes.

Q.—Was there any conversation concerning Group Health in Dr. Bachrach's presence? A.—When Dr. Solette said "These people are members of Group Health, but I have already told them Group Health doctors are not permitted to operate," Dr. Bachrach said "that is right."

Q.—Did you conduct the negotiations with Dr. Solette about Dr. Bachrach coming in and seeing the patient? A.—Yes.

Q.—Did your husband participate in them at all? A.—No, other than that he said whatever I said was all right.

Q.—And whatever occurred that evening there with Dr. Solette and Dr. Bachrach, that was done in your presence? A.—Yes.

CROSS EXAMINATION

By Mr. Leahy:

Q.—Do you recollect whether Dr. Solette mentioned some other names at that time? A.—He did.

Q.—Who were they? A.—There were several doctors; the only one I recall at this time is Dr. Cafritz; others were mentioned, two others; I don't recall at this time who they were.

TESTIMONY OF DR. MARIO SCANDIFFIO

DIRECT EXAMINATION

By Mr. Kelleher:

Mario Scandiffo, Medical Director of Group Health Association, said he obtained his medical degree from George Washington University in 1928. He spent three years of internship and residency at the New York Postgraduate School and Hospital; since then he has been in private practice in pediatrics. He came originally from Rhode Island.

Q.—Doctor, when did you become associated with Group Health Association? A.—On Nov. 1, 1937.

Q.—What were your duties when you came to Group Health Association? A.—My duties at the time were as pediatrician to Group Health.

Q.—Who was Medical Director of Group Health Association when you first came there? A.—Dr. Henry Brown.

Q.—Doctor, was it customary during 1938 for Group Health Association Clinic to keep records of the number of patients seen by doctors on the staff of Group Health? A.—Yes, it was.

Q.—Will you describe the nature of the records which were so kept? A.—Each doctor listed his patients "seen" in a book, which was in his own keeping. From this book daily and monthly summaries were made by the staff; the clerical staff.

Q.—Are those records you speak of under your control now as Medical Director? A.—They are.

Q.—Have you produced here in court the daily and monthly summaries showing the treatments by Dr. Richard Price? A.—Yes, I have those.

Q.—Do you have all of the daily summaries concerning Dr. Price's treatments? A.—Not all; the month of September 1938 is missing.

Q.—But the daily and monthly records are missing? A.—Both daily and monthly; all records for that month are completely missing.

Q.—Now, do you have the daily record showing the treatments by Dr. Price for the rest of the year of 1938? A.—Yes, I have.

Q.—All of them, Dr. Scandiffo? A.—All of them with—I should say—with the exception of about 13 days throughout the year.

Q.—For the days for which you have no record, can you tell us where those records are? A.—No, I could not.

Q.—Have you made a search for them? A.—Yes, we have searched thoroughly for them and they are completely missing.

Q.—Now, Dr. Scandiffo, you have studied those records, have you not? A.—I have.

Q.—Pursuant to my request? A.—Yes.

Q.—And I speak specifically of the records of Dr. Price? A.—Yes.

Q.—Will you tell us what was the largest number of patients seen by Dr. Price as shown by these records on any day during the period you have there, 1938? A.—That ordinarily would be a difficult question to answer if you word the question of patients "seen"; patients listed in the record, the maximum number was 51.

Q.—That is, according to those records you have? A.—That is correct.

Q.—Will you tell us what the next highest number was according to those records? A.—The next highest number grades down to 34; there are exactly seventeen days out of the entire year of 1938 when Dr. Price saw more than 34 patients a day; that is, had thirty-four names of patients listed on his daily record.

Q.—And outside of eighteen days then during that period Dr. Price saw them less than 34 patients daily? A.—Yes.

Q.—Have you computed from the records you have concerning Dr. Price's treatments the average number of patients seen by Dr. Price each day? A.—Throughout the year?

Q.—For each month throughout the year? A.—I don't have the average monthly figure; I could give that to you in a very short time by going over my summaries.

Q.—Perhaps I didn't make my question clear: from the monthly summaries will you tell us what the average number is? A.—Yes, the average number of patients listed in Dr. Price's record for the entire year of 1938 was 18.

Q.—Eighteen? A.—Correct.

Q.—I believe you told us, Doctor, that each doctor during 1938 kept his own record of patients seen in a little book. A.—Yes.

Q.—Now, will you tell us what was included within the phrase, or the two words, "patients seen"? A.—The list of patients seen usually included, and did include, with the exception of Dr. Price, those patients seen in the office, home or hospital each day.

Q.—You say with the exception of Dr. Price: what do you mean? A.—I mean by that Dr. Price listed in his records telephonic consultations, the names of patients who accosted him in the hall for a moment or two—

Mr. Leahy:—Object: How would this patient know that?

The Witness:—I know it because I saw him enter in his list the names of those patients who received the services concerning which I am about to recite; also the injections which he gave the patients; also interpretations of x-ray plates; and also every fluoroscopic examination made by Dr. Price and, finally, all x-ray skin treatments usually performed under Dr. Price's supervision by Mrs. Davis, the x-ray technician.

Q.—Now, let us consider these matters which you say you know he entered. First, x-ray interpretation. How long would it take any doctor to interpret an x-ray?

Mr. Leahy:—Objected to, unless he is qualified to read x-rays.

By Mr. Kelleher:

Q.—Do you know, as a fact, how long Dr. Price took for x-ray interpretations? A.—Yes, Dr. Price took an average of one to two minutes for the ordinary chest and skeleton interpretation; an average of about five minutes for a gastrointestinal series and gallbladder series.

Q.—Doctor, are you familiar with and can you read x-rays, make x-ray interpretations? A.—I can't qualify as such.

Q.—Have you any experience in the interpretations of x-rays?

A.—Some: every physician has some experience in that work.

Q.—Would you say that from one to two minutes on a chest picture, and from five minutes, about five minutes on an abdominal picture was a sufficient time for a doctor to spend?

Mr. Leahy:—Objected to; he has just said he was not an expert.

THE COURT:—Sustained.

By Mr. Kelleher:

Q.—Doctor, how long did Dr. Price spend on skin treatments? A.—Not more than two minutes per patient.

Q.—What were those skin treatments; what did they consist of? A.—Simply administering x-ray dosages to particular areas of the skin affected by the disease. The work, the preparation was done by Mrs. Davis, the x-ray technician.

Q.—What were the duties of Dr. Price with reference to those treatments? A.—The actual time consumed by Dr. Price in administering the treatment would occupy just a fraction of a second.

Q.—Now, Dr. Scandiffo, will you tell us how long was spent in a fluoroscopic examination? A.—The average time spent on fluoroscopic examination wasn't more than five minutes; that includes the preparation of the patient. The actual examination was probably less than one minute.

Q.—And there again was the patient prepared by the nurse? A.—Mrs. Davis, yes.

Q.—And the doctor's duty was solely to make the examination? A.—That is correct.

Q.—Dr. Scandiffo, have you also produced the daily and monthly summaries of the doctors of G. H. A. during the period from Jan. 1, 1938 to March 1, 1938, when Dr. Brown was Medical Director?

THE COURT:—Just that period of time?

Mr. Kelleher:—Yes.

The Witness:—Yes, I have.

By Mr. Kelleher:

Q.—You have. What were the names of the doctors who were on the staff of G. H. A. during that period? A.—Dr. Selders; Dr. Brown; Dr. Hulburt; Dr. Price and myself. I should judge that there were one or two other part-time physicians.

Q.—Dr. Richardson? A.—Yes, I believe he was the only one at that time.

Q.—Taking the records of Dr. Selders, Dr. Hulburt and Dr. Price, and yourself: will you tell us what the monthly averages were for Dr. Selders? A.—I can give you monthly totals for Dr. Selders, but not the monthly averages unless I stopped to compute them.

Q.—Give us the monthly totals first for Dr. Selders. A.—Dr. Selders was 533.

Q.—That was the month of January? A.—Yes.

Q.—In February? A.—He saw 481.

Q.—What is the daily average? A.—Daily average for the two months was 20 a day.

Q.—Take Dr. Hulburt. A.—He in January 1938 saw 644 patients and in February 428. His average for the day was 22.

Q.—Now, Dr. Price. A.—Dr. Price, in January 1938 saw 333 patients, and in February 375. His average 15 a day.

Q.—Was there any time, Doctor, during those two months when any doctor in the clinic treated as many as 60 patients a day? A.—No.

Q.—Dr. Scandiffo, were these daily and monthly summaries of patients seen by the various doctors in the clinic kept for November and December 1937? A.—They were kept, but we have only the total summary of patients seen by doctors from Nov. 1, 1937 to June 1, 1938. We do not have the daily or monthly summaries for the individual months November and December 1937.

Q.—Yes. You have told us, Dr. Scandiffo, that you were engaged in private practice from 1929, I believe you said, until 1937. Is that correct? A.—That is correct: 1931, I am sorry.

Q.—1931 to 1937? A.—Yes.

Q.—Will you tell us whether there is any difference in the personal relationship between the doctor and patient in private practice and in a group such as G. H. A.?

Mr. Leahy:—I object.

THE COURT:—I don't know what he has relation to.

Mr. Kelleher:—I have relation to Dr. Brown's testimony.

Mr. Leahy:—What did he say?

Mr. Kelleher:—He testified that it was impossible for doctors to maintain the proper relationship with their patients when they had to deal with so many.

Mr. Leahy:—That had nothing to do with the question you put.

THE COURT:—I don't see that a comparison would be the proper way to approach it. If you can show the actual circumstances with reference to G. H. A. and generally with reference to private practice I will permit that.

By Mr. Kelleher:

Q.—Will you tell us from your experience with G. H. A. whether you were able to maintain the proper relationship between you and your patients?

Mr. Leahy:—I object to the question: that is not what his Honor suggested. It is not rebuttal.

Mr. Lewin:—I submit it is.

THE COURT:—I think Dr. Brown brought out the fact that the method pursued by G. H. A. presented difficulties in the way of a patient continuing with one doctor after having seen another. I think there is something to that effect, is that correct? I will permit you to offer evidence on that, if you wish.

Mr. Kelleher:—I will go to something else and probably come back to this.

By Mr. Kelleher:

Q.—Dr. Scandiffo, while you were with G. H. A. during the period from November 1937 until Dec. 20, 1938 in your view, did Group Health Association supply its members adequate medical care? A.—Most certainly; it was much more medical care—

Mr. Leahy:—Objected to. The question has been answered.

THE COURT:—He has answered the question.

By Mr. Kelleher:

Q.—What is the reason for your answer? A.—The reasons are that we could give the patient better and more adequate medical care than we could as private practitioners.

CROSS EXAMINATION

By Mr. Leahy:

(The witness listed the various physicians employed in 1937 and 1938.)

By Mr. Leahy:

Q.—In that period to which your attention was called, Nov. 1, 1937 to May 1, 1938, it treated 19,130 patients? A.—Who treated?

Q.—G. H. A. A.—I wish you would make your question more definite.

Q.—Doesn't it show that the number of patients in the clinic was 19,130 in that period of time? A.—I wish to qualify it now, if I may—

THE COURT:—Just answer the question.

The Witness:—Yes. The answer is yes.

Q.—Now, what is your explanation? A.—The 19,000 and some odd included medical care, surgical, eye, nose and throat, pediatrics, obstetrics, and also laboratory tests; physiotherapy treatments, basal metabolism, electric treatments, cardiographs, x-rays and fluoroscopic examinations.

Q.—Well, it shows that; it is broken down here, isn't that true? A.—Yes.

Q.—You treated 6,218 medical cases? A.—Yes.

Q.—Two thousand four hundred and forty-three surgical cases, is that right? A.—Yes.

Q.—Two thousand seven hundred and seventy eye, nose and throat? A.—Yes.

Q.—Two thousand one hundred and seventy-nine pediatrics? A.—Yes.

Q.—And 94 obstetrics? A.—Yes.

Q.—And in that time you had medical, surgical and obstetric cases in the hospital in number 58? A.—Yes.

Q.—You made one thousand three hundred and eight home calls? A.—Yes.

Q.—And two hundred and fifteen hospital calls; is that right? A.—Yes.

Q.—And you referred 248 cases to consultants? A.—Yes.

Q.—Physiotherapy you had 3,464? A.—Yes.

Q.—Ultraviolet treatments, 1,735? A.—Yes.

Q.—Short wave treatments? A.—One thousand seven hundred and twenty-nine.

Q.—Basal metabolism, 330? A.—Yes.

Q.—Electrocardiographs? A.—Sixty-six.

Q.—X-ray? A.—Eight hundred and twenty-two.

Q.—Fluoroscopic examinations? A.—Four hundred and seventy-three.

Q.—Prescriptions? A.—Five thousand eight hundred and sixty-four.

Q.—Laboratory; clinical laboratory reports? A.—Five thousand five hundred and twenty-eight.

Q.—Eye refractions by Dr. Haller? A.—Four hundred and twenty-two.

Q.—Eye, ear, nose and throat in clinic? A.—Sixteen.

Q.—You treated 9,278 members and 9,013 dependents, is that correct? A.—Yes.

Q.—Now, you averaged for us the amount of time which was spent on the various examinations. I made some notes; I want to be sure that I have your testimony correctly. On a general chest interpretation of an x-ray plate you spent one to two minutes, is that right? A.—That is correct. May I qualify that answer?

Q.—Yes. A.—I should like to state that many of our chest x-rays were simply routine procedures, not for the detection of any pathology. If a chest plate showed any pathology, the average time spent in interpreting that plate would be considerably more.

Q.—Well, how much more, do you know? A.—Yes, I should say the average interpretation of a pathologic x-ray plate should take at least five minutes.

Q.—Can you detect a pathologic condition in a chest in one or two minutes? A.—You can detect the fact that there is pathology within a minute.

Q.—And can you then interpret an x-ray plate of pathologic condition in the chest in one or two minutes? A.—In some you may; in others you should take longer.

Q.—You have taken these times which were required to make interpretations of x-rays of chests; x-rays of gastrointestinal tracts, from the records, haven't you? A.—No, sir.

Q.—You didn't stand by and see each x-ray taken, did you? A.—I saw many.

Q.—Did you see Dr. Price and notice how long he spent on each x-ray? A.—No, not every one; I watched him make the examination and watched him interpret the plate.

Q.—But, you have given the time which Dr. Price spent on these interpretations from an inspection of the records, which you have; isn't that true? A.—Oh, no.

Q.—Will you state it as a fact that Dr. Price spent only one to two minutes on chests? A.—On the average routine chest x-rays, yes.

Q.—How many were average routine chest x-rays? A.—It would simply be a guess; I should say about 90 per cent.

Q.—What would be the routine of taking x-ray chest pictures? A.—The routine would simply be to make out the requisition for an x-ray of the chest, and then the appointment for the patient would be made for the x-ray.

Q.—You didn't x-ray the chest of each patient? A.—No.

Q.—You only x-rayed the chests of those you thought should have x-rays. A.—That is what I tried to bring out. Many were routine x-rays; simply on the basis of requests of patients, or as a preventive measure.

Q.—If a patient requested an x-ray you gave him one? A.—In most cases, yes.

Q.—If you thought he should have an x-ray of his chest you did that? A.—Yes.

Q.—There wasn't any routine in giving x-ray examinations of all patients? A.—No.

Q.—And that is true of gastrointestinal tracts also? A.—Yes.

Q.—You wouldn't take an x-ray of an abdomen unless there was some reason for it, in your judgment? A.—No.

Q.—Or unless the patient thought there was some reason for it? A.—Correct.

Q.—And you say he would spend how long on his interpretation of a gastrointestinal tract x-ray? A.—I would say on an average of about five minutes where no pathology was evident.

Q.—Is there anything in the record to indicate as to what time he spent? A.—No, there is not.

Q.—Then your testimony is that in cases where you saw Dr. Price interpreting such x-rays he would take a minute or two minutes in ordinary cases; and in the case of a gastrointestinal x-ray he would take four to five minutes, you say that is correct? A.—That is correct.

Q.—How many cases do you think you saw Dr. Price interpret a day? A.—I should say roughly—I will have to put that on a weekly basis—I would say about ten a week.

Q.—Ten a week? A.—Yes.

Q.—And why do you base it on a week instead of a day? A.—Because I couldn't give an average daily; a daily average, I mean, because I wasn't with Dr. Price every day; didn't have time.

Q.—Then your testimony to be accurate is that each week you saw Dr. Price give at least ten x-ray interpretations? A.—Yes.

Q.—Now, who did the fluoroscopic examinations? A.—Dr. Price.

Q.—How long did you say he spent on a fluoroscopic examination? A.—The actual time spent on a fluoroscopic examination was just a matter of seconds; a minute or two at most. You cannot expose the patient too long.

Q.—You are referring now to an examination on a fluoroscopic table? A.—Usually upright.

Q.—And any examination which you saw Dr. Price make would take only a minute? A.—Roughly about that.

Q.—What were those examinations being made for when you saw them? A.—Many of them for checking of physical findings; many of them to determine whether there was any pathology in the chest; that is in the heart or lungs.

Q.—How many of those would you say Dr. Price made in a week? A.—I didn't attend many of those; I couldn't give you a weekly average of those.

Q.—Did Dr. Price also attend patients outside the clinic; house calls? A.—You mean Group Health patients?

Q.—Yes. A.—Yes.

Q.—How many house calls would he make a day? A.—I don't think you could break it down to daily average. If broken down it would be very small; I should say roughly about one or two a day.

Q.—Who else made the calls on patients who were sick at home? A.—All of our doctors; all of those listed in that summary.

Q.—Have you any breakdown there of the monthly home calls made? A.—I have not. I have the total, as you know, of the period Feb. 1, 1937 to August 31, 1937—one thousand three hundred and eight home calls.

Mr. Lewin:—That is the seven month period?

The Witness:—Yes.

By Mr. Leahy:

Q.—How many doctors were making that number of calls in that period? A.—Seven.

Q.—That included the District of Columbia, adjacent territory in Virginia, and also Maryland? A.—That is correct.

Q.—And the clinic, the hours of the clinic, were from? A.—From 9 to 6; 9 to 1 on Saturdays.

Q.—When was it Dr. Price resigned, do you recall?

Mr. Lewin:—Objected to as being beyond the indictment period.

By Mr. Leahy:

Q.—Do you recall? A.—Yes.

Mr. Lewin:—May the question be asked: Was he still there at the time of the indictment?

THE COURT:—He may answer that question.

The Witness:—Dr. Price was still with us at the time of the indictment. Is that the information you want?

By Mr. Leahy:

Q.—When did he resign? A.—In January 1939, to the best of my recollection.

Q.—Do you have the records made by Dr. Price with you? A.—What records are you referring to?

Q.—You said he marked down in a little book everybody he saw; talked to? A.—No, I don't have those records.

Q.—Where are they? A.—I don't know; I believe he took them with him.

Q.—Now, how do you know Dr. Price's book contains the records you state it contains? A.—Because these are copies from the doctor's book.

Q.—Did you ever test the copy that you have with Dr. Price's book? A.—I personally did not because I wasn't responsible for these records at that time.

Q.—Do you know of anybody who has transferred from Dr. Price's record book the number of patients he saw there in the clinic? A.—Yes, I do.

Q.—Where are those records? A.—Those are the ones that I have.

Q.—Did you ever see anybody transfer them from Dr. Price's book? A.—I have from time to time seen the process done, yes.

Q.—Did you ever examine Dr. Price's book yourself? A.—No.

Q.—Never did? A.—No, I had no occasion to.

Q.—Do you know now whether he saw only the number of patients which he had on the records you testified from? A.—I wish you would repeat that question.

Q.—I said, do you know now that the only patients who Dr. Price saw were those shown on the records to which you testified? A.—No, I don't know that. I mean by that this: I do know that the patients, the names listed and the numbers listed are the exact copies of his own records. I do know it, that the names listed do not agree with the number of patients seen by him.

Q.—You mean that he saw more patients than are listed on the records? A.—He saw less patients than are listed on his records.

Q.—You mean that the records he made show as patients seen people in fact he did not see? A.—That is correct. I testified that he included telephonic conversations, casual meetings in the hall with patients, injections—not injections—x-ray interpretations were listed as patients seen when they were not seen.

Q.—Is there any record now to which you can draw our attention which is an original record made by Dr. Price? A.—Yes, not in our possession, however; it must be in his possession.

Q.—Did you answer also that all throughout this period which you have inquired about that you believed G. H. A. was supplying adequate medical care to patients? A.—I did.

Q.—And that you felt throughout this period that you could give better care to patients than you could in private practice? A.—Undoubtedly.

Q.—Do you recall talking with Dr. Wall and Dr. Macatee in the early fall of 1938? A.—I do.

Q.—You knew Dr. Wall very well, did you not? A.—I think I did.

Q.—You served with him for a good while before you joined G. H. A.? A.—Yes.

Q.—He was your preceptor, so to speak, was he not? A.—In a manner of speaking, yes.

Q.—Did you and Dr. Price and Dr. Selders go to Dr. Wall and Dr. Macatee and offer to resign in a body from G. H. A. at this very time that you are talking about, because you couldn't give adequate medical care to patients? A.—No.

Q.—Did you and Dr. Price and Dr. Selders go to Dr. Wall's home and there talk with Dr. Wall? A.—We did.

Q.—Did you all three offer to resign from the staff of G. H. A.? A.—We did not offer to resign.

Q.—Did you say that the three of you wanted to resign? A.—I will say that we discussed the resignation of us from G. H. A.

Q.—At the same time you thought all the others on the staff of G. H. A. would resign also? A.—No.

Q.—And then did you ask Dr. Wall and Dr. Macatee to help you? A.—No.

Q.—Did any one say anything about what would happen if you all resigned at once? A.—I did not.

Q.—And did you then say to Dr. Wall and Dr. Macatee that would break up G. H. A. if you all resigned in a body? A.—I said it might break up G. H. A. if we all resigned.

Q.—And didn't Dr. Wall and Dr. Macatee say, "No," they couldn't do anything for you? A.—I don't recall that, because there was no occasion for it; no questions were asked to get an answer like that.

RE-DIRECT EXAMINATION

By Mr. Kelleher:

Q.—Tell us the complete conversation at that meeting. A.—This occurred in the fall of 1938, at a time when Dr. Selders brought to the attention of the staff certain—

Mr. Leahy:—I object to anything like that; just tell the conversation.

The Witness:—The conversation of what?

By Mr. Kelleher:

Q.—With Dr. Macatee and Dr. Wall. A.—Dr. Wall and Dr. Macatee were seen by Dr. Selders, Dr. Price, and myself at Dr. Selders' request to me—Dr. Selders being thoroughly dissatisfied with his position asked me to arrange—

By the Court:

Q.—What was said? A.—I thought that would include it.

THE COURT:—I want you to confine yourself to the question and answer it.

The Witness:—We discussed exactly what Mr. Leahy has brought out in my testimony. We asked Dr. Wall to meet

with the three of us and at the time of the meeting Dr. Selders and Dr. Price asked certain questions of Dr. Wall and Dr. Macatee particularly regarding the Medical Society privileges and hospital privileges. The question of resignations was brought up; that is the question of our resigning from Group Health staff was brought up at the time and discussed.

Q.—By whom? A.—By all of us.

Q.—And in connection with the hospital privileges and membership in this Medical Society? A.—No, not in that connection. We simply—the question of hospital privileges and of medical society privileges was brought up by Dr. Selders and Dr. Price, Dr. Selders particularly because he was a surgeon and—

Mr. Leahy:—I object.

THE COURT:—Yes. Sustained.

TESTIMONY OF MRS. CAROLINE REECE EPPERLEY

The witness identified some documents.

TESTIMONY OF E. M. ROGERS

As superintendent of Casualty Hospital, she identified some documents.

TESTIMONY OF EDNA TREASURE

As the superintendent of the National Homeopathic Hospital she identified documents.

TESTIMONY OF RAYMOND R. ZIMMERMAN

DIRECT EXAMINATION

By Mr. Lewin:

Q.—Do you recall a meeting at a dinner on the evening of June 24, 1937, between you, Mr. Penniman, and Dr. Henry Rolfe Brown? A.—I think so; that was at a dinner meeting at the Mayflower Hotel, prior to going over to the District Medical Society.

Q.—Now, Dr. Brown testified here, page—

Mr. Leahy:—Just ask a question. You don't have to characterize Dr. Brown's testimony.

Mr. Lewin:—I am going to ask him about the testimony.

THE COURT:—Put the question.

By Mr. Lewin:

Q.—Did you at that meeting tell Dr. Brown in connection with the anticipated meeting at the District Medical Building to tell them—meaning the doctors of the District Medical Society, or its executive committee—as little as possible? A.—Nothing of the sort. That was not the spirit of the meeting.

Q.—Did you hear Mr. Penniman make that statement? A.—Do I understand the question to be: you are asking me if I instructed Dr. Brown to say as little as possible to the doctors over there?

Q.—Yes, I asked that question. A.—There was no such instruction given at all.

Q.—Did you say to Mr. Penniman to say as little as possible? A.—No.

Q.—Any words to that effect? A.—On the contrary we said—

Mr. Leahy:—I object.

THE COURT:—Sustained.

By Mr. Lewin:

Q.—What did you say?

Mr. Leahy:—I object.

Mr. Lewin:—Dr. Brown went into this.

THE COURT:—He didn't go into everything that was said. Dr. Brown said that Mr. Zimmerman made some specific statement, as I understood it. Mr. Zimmerman has denied it; that ends it.

By Mr. Lewin:

Q.—Did you three gentlemen go to the District Medical Building following that dinner meeting? A.—Yes.

Q.—And in the lobby did you say to Dr. Brown, Penniman, or either of them: "Now, don't forget; we will give them just as little as possible," or words to that effect, meaning by them the doctors of the Executive Committee of the District Medical Society. A.—I made no such statement at all. We looked on this as an opportunity—

THE COURT:—Just a minute: please answer the question.

By Mr. Lewin:

Q.—Now, you attended that meeting at the District Medical Society Executive Committee on June 24? A.—Yes.

Q.—Was any advice of the character I have called your attention to followed up at that meeting by your conduct: in other words, at that meeting did you tell them as little as pos-

sible: did you tell them as little as possible? A.—We gave them a full statement of the purposes of Group Health.

THE COURT:—Just a moment. I have to take some control of this situation. There is no foundation for that. If it was objected to, I would have sustained the objection.

Mr. Lewin:—May I approach the bench?

THE COURT:—Yes.

(Thereon Mr. Lewin approached the bench and handed the Court a transcript of the testimony, indicating certain portions thereof.)

THE COURT:—Yes, I am sorry; I was mistaken. Dr. Brown was asked about that. What you want to ask is whether any such arrangement was followed at that meeting?

By Mr. Lewin:

Q.—Yes. A.—We gave them full and complete information. At the conclusion of the meeting they thanked us for—

THE COURT:—You answered the definite question; that was sufficient.

The Witness:—We gave them full information; nothing withheld.

By Mr. Lewin:

Q.—Do you ever recall discussing the qualifications of Dr. Raymond E. Selders as a surgeon with Dr. Henry Rolfe Brown in the fall of 1937?

Mr. Leahy:—Objected to. Immaterial; no foundation laid.

THE COURT:—I don't recall that: sustained.

By Mr. Lewin:

Q.—Did you give any instructions to Dr. Henry Rolfe Brown that he was to leave the approach to the hospitals for Group Health alone? A.—That is for him not to deal with the hospitals?

Q.—Yes. A.—Never at any time.

Q.—Did you ever hear any one in connection with the management of Group Health Association give such instructions to Dr. Brown? A.—Never did.

Q.—Did you ever give such instructions to Dr. Brown that he should send you or send the president of Group Health mail received from the hospitals addressed to him unopened? A.—Never heard anything of the sort.

Q.—Did you do anything or say anything which would be calculated to lead Dr. Brown into thinking that you desired not a medical director but a rubber stamp?

Mr. Leahy:—Objected to.

THE COURT:—Sustained. That was a mere characterization by Dr. Brown. I think you might ask him whether or not Dr. Brown's authority was limited to doing what he was directed to do by lay officers of the Board.

By Mr. Lewin:

Q.—Was Dr. Brown's authority limited to doing what he was specifically directed to do by lay members of the Board? A.—Well, as far as I know he was never restricted. I certainly never did anything to restrict him.

Q.—Do you know of anything having been done to restrict him? A.—Never heard anything of it.

(The witness left the stand.)

TESTIMONY OF WILLIAM F. PENNIMAN

DIRECT EXAMINATION

By Mr. Lewin:

Q.—Mr. Penniman, you are Mr. William F. Penniman; and you have been on the witness stand heretofore in this case? A.—Yes.

Q.—You were the first president of Group Health Association? A.—Yes.

Q.—And I believe held that office until January 1938? A.—Yes.

Q.—Do you recall a meeting at the Mayflower Hotel on the evening of June 24, 1937 between yourself, Mr. Zimmerman and Dr. Brown? A.—I do.

Q.—Did you tell Dr. Brown on that occasion that in connection with the forthcoming meeting of the District Medical Society Executive Committee he should tell them as little as possible about the plans of Group Health Association? A.—No, sir, I never made any remark like that at all.

Q.—Did you hear Mr. Zimmerman make any such remark on that occasion? A.—No.

Q.—Did you go with Dr. Brown and Mr. Zimmerman to the Medical Society Building? A.—I did.

Q.—Out in the lobby did you say to Dr. Brown or Mr. Zimmerman: "Now, don't forget, we will give them just as little information as possible," or words to that effect, meaning by them the doctors who were going to be present when you interviewed them that night? A.—I did not.

Q.—Did you hear Mr. Zimmerman make any such statement?
A.—No.

Q.—Now, as a matter of fact, when you entered the meeting, did you carry out any course of conduct designed to give the doctors with whom you were talking as little as possible of information regarding Group Health Association? A.—On the contrary—

THE COURT:—I think you may just answer yes or no.

The Witness:—We did not follow any such course as that.

By Mr. Lewin:

Q.—Do you remember how long the conference lasted?

Mr. Leahy:—It's been testified it was two hours.

By Mr. Lewin:

Q.—I would like to refresh his recollection. Did you first make a statement at that meeting that you would be glad to answer any questions?

THE COURT:—He has been all over that.

Mr. Leahy:—He has read the whole transcript two or three times.

Mr. Lewin:—There are three portions of it that I would like to read.

THE COURT:—I am not going to permit any repetition. I think that has all been gone into.

By Mr. Lewin:

Q.—You had occasion to glance at the minutes of the meeting taken by the District Medical Society doctors themselves? A.—That is right.

Q.—And would you say they rather faithfully recorded what was transpiring there?

Mr. Leahy:—Objected to as calling for a characterization; they speak for themselves.

By Mr. Lewin:

Q.—Yes. Now, on whose recommendation was Dr. Selders admitted to the staff of Group Health Association? A.—The Medical Director, Dr. Brown.

Q.—Did you receive a report from Dr. Brown dated Oct. 1, 1937 on the personnel of the staff chosen up to that time? I show you Exhibit 671. A.—Yes.

Q.—Is this the report you received from Dr. Brown? A.—Yes.

Q.—Attached to it, is it not, on the third page, is the record of the experience of Dr. Selders and certain remarks about his qualifications from Dr. Brown? A.—That is right.

Q.—I should like now to offer that in evidence, if I may, the first three pages of his report.

THE COURT:—Have you seen it, Mr. Leahy?

Mr. Leahy:—No, I have not, your Honor.

By Mr. Lewin:

Q.—Did you as president of Group Health Association ever limit Dr. Brown's activities? A.—You mean medical or otherwise?

Q.—Medical. A.—No, at no time.

Q.—Did you exclude him from making approaches to the hospitals on behalf of the staff of Group Health Association? A.—No.

Q.—It is in evidence that you wrote a number of letters to the hospitals in November 1937 and following that: Will you state the circumstances under which you rather than Dr. Brown wrote those letters?

Mr. Leahy:—Objected to.

THE COURT:—Sustained.

Mr. Lewin:—Can I show your Honor the testimony?

THE COURT:—I don't think it is necessary.

By Mr. Lewin:

Q.—Did you ever give Dr. Brown any instructions that he should send over to you unopened mail which he might receive from the hospitals? A.—I did not.

Q.—Was anything in substance to that effect done at any time? A.—No, at no time.

Q.—Did you keep Dr. Brown informed about your correspondence with the hospitals? A.—Continually and constantly.

Q.—Did you inform him of the November letter and of its contents?

Mr. Leahy:—Objected to.

THE COURT:—I think that is going beyond proper limits.

Mr. Lewin:—I wonder if I might ask him whether he brought the letters from the hospitals to the attention of Dr. Brown.

THE COURT:—I think he might answer that.

By Mr. Lewin:

Q.—Did you bring to Dr. Brown's attention currently the answers which you received from time to time from the hospitals? A.—I did; I kept him constantly informed.

Q.—Did you ever receive any objection from Dr. Brown?

Mr. Leahy:—Objected to.

THE COURT:—Sustained.

Mr. Lewin:—I want to ask him about the rubber stamp episode.

THE COURT:—Put the question similarly to the one I indicated. How long do you expect to take, Mr. Lewin?

Mr. Lewin:—I think I can complete this in five minutes.

THE COURT:—Well, I think we will adjourn until 1:30.

MARCH 31—AFTER RECESS

TESTIMONY OF WILLIAM F. PENNIMAN

FURTHER DIRECT EXAMINATION

By Mr. Lewin:

Mr. Penniman identified applications by Dr. Selders which he sent to the hospitals.

LETTER OF DR. MATTINGLY

The Court admitted a letter, Nov. 27, 1937, Sibley Memorial Hospital to Dr. Mattingly and reply dated Dec. 25, 1937.

Mr. Leahy:—Ladies and gentlemen, I wish to read a communication from Sibley Memorial Hospital, dated Nov. 27, 1937:

"Dear Doctor:

"Dr. Raymond Everett Selders has requested the privilege of treating the following in Sibley Memorial Hospital:

"Medicine

Minor and Major Surgery & Abnormal Obstetrics

Minor & Major Gynecology.

"As a member of the Advisory Committee on Medicine will you kindly indicate your approval or disapproval at the bottom of this letter and return it to the office of the President of the Hospital before Tuesday.

"Very sincerely yours,

"R. Lee Spire, M.D.

"Chairman.

"Applicant's credentials on file in the office of the President.

"Attention of the Committee is called to the fact that above applicant is one of the salaried physicians of the Home Owner's Loan Corporation Group Health Association and that information as to his qualifications and correspondence in connection with his application will be found on file in the president's office available to members of the various committees concerned for their information.

"Disapproved.

"Thomas E. Mattingly, M.D.

"Explanation appended.

Dec. 25, 1937.

"Dr. Lewis H. Taylor,
Sibley Memorial Hospital,
Washington, D. C.

"My Dear Dr. Taylor:

"As a member of the Medical Council, I have been asked to indicate my approval or disapproval of the application of Dr. Raymond Everett Selders for the privilege of practicing 'Medicine' in Sibley Memorial Hospital. Ordinarily I would regard it presumption to disapprove a candidate because in his application he requested hospital privileges, other than those it is my jurisdiction to pass upon. Yet in this particular case, I cannot ignore the fact that this applicant, just ten years out of medical school, has requested, and has certified himself as eligible to receive such additional hospital privileges that, should they be granted, it will be the equivalent of the hospital board certifying him to prospective patients, as competent to practice without restraint or exception, all of the highly specialized branches of the Healing Arts, with the possible exception of psychiatry.

"Approval of this application, in its present form, would give to a stranger in our midst privileges and sanctions not accorded to any other physician of professional eminence, practicing in our hospitals or occupying major chairs in our two, white, grade A medical schools. This rather unprecedented application for extraordinary privileges comes strangely from one whose unsurpassed erudition has not as yet been recognized by honorary degrees bestowed by appreciative universities of learning or, stranger still, has not been admitted to membership in either the American College of Surgeons or the American College of Physicians.

"I did note with interest his alleged membership in our parent body, the American Medical Association, and logically assume that he subscribes to its ideals and is obedient to its regulation and discipline. If such be the case, he will readily appreciate its injunction, making it mandatory for responsible hospital executives and hospital trustees to protect their prospective patients from the preventable hazards incident to a desultory and indifferent exercise of their appointive powers, in passing upon the qualifications of members of the visiting staff. Whereas a moderate degree of leniency and compromise is excusable, relative to their approval of general practitioners, both the American Medical Association and the American College of Surgeons most emphatically insist that the credentials of those soliciting the privilege of practicing the specialties be thoroughly and conscientiously challenged. These credentials are challenged by responsible agencies of the organized medical profession despite the fact that the applicant may be already possessed of a mandate and authority from the state, in the form of a license, to do the very act or acts he petitions the hospital board to approve.

"In this particular case, this applicant, like myself, is already licensed by the state to practice each and every branch of the Healing Arts for which he requests hospital privileges. So far as the state, in this instance the Federal Government, is concerned, both the applicant and I have a legal right to practice medicine and surgery in all of its many branches,

yet it is generally conceded that hospitals would be criminally derelict in their duty if they allowed their visiting staff the comprehensive privileges sanctioned by the law. To protect the unsuspecting patient against incompetence, poor judgment, criminal negligence and rash experimentation, any or all of which might be legally defensible, the organized medical profession, acting through the appointive power of hospital boards and hospital executives, has forced high and exacting standards of internal discipline, professional competency and ethical liability upon all hospitals, without the dutiful observance of which no hospital may continue to operate with its seal of approval.

"To this end each and every applicant for hospital privileges, particularly in the specialties, must prove beyond any reasonable doubt their indubitable fitness to receive the same. This means not only certification of professional competency but those qualities of character commensurate with the extent of the authority so delegated. I can hardly conceive of our Medical Council being so derelict in its duty and responsibility to prospective patients as to admit by inference that one person can adequately qualify as internist, obstetrician, gynecologist, nose and throat specialist and general surgeon, clothing him with authority and permission to perform the most hazardous and difficult procedures of these specialties.

"It is not unreasonable to demand that the Medical Council of Sibley Memorial Hospital apply the same conscientious rules of procedure in granting these most extraordinary privileges to a stranger in our midst as were used in the case of those of us who have been under the Medical Council's direct observation for a far longer period than this applicant has been out of medical school.

"I personally shall continue to disapprove this applicant until he with some modesty and reasonableness makes up his mind whether he desires hospital privileges as a general practitioner, nose and throat specialist, obstetrician and gynecologist, or a general surgeon. Because this applicant has reduced his own request for hospital privileges to an absurdity by the unreasonable enormity of his demands, I heartily disapprove of it and petition the Executive Committee to reject it, in its entirety.

"Fraternalty yours,

"Thomas E. Mattingly, M.D."

The Court refused to admit the applications made for Dr. Selders to the hospitals.

REPORT ON DR. SELTERS

Mr. Lewin:—Ladies and gentlemen of the jury, Exhibit 671 is a letter from Henry Rolfe Brown, Medical Director, to Mr. Penniman, President, Group Health Association, dated Oct. 1, 1937, to which is attached information regarding the staff of Group Health which had been obtained up to that time.

I am permitted to read to you the third page of the report, which relates to Dr. Raymond E. Selders. It gives his name, Raymond E. Selders; age, 44; nativity, born in Illinois; position, surgeon; salary, \$4,800.

Mr. Lewin (reading):

"Salary, \$4,800.

"Religion, Protestant.

"Marital Status, Married (No children).

"Licensed: Oklahoma, Texas; licensed in New York and Massachusetts by endorsement of National Board Credentials.

"Licensed District of Columbia.

"Degrees: B.A., University of Oklahoma, 1918.

B.S., Ch.E., University of Oklahoma, 1919.

B.S. in Medicine, University of Oklahoma, 1925.

M.D., University of Oklahoma, 1927.

M.Sc., University of Pennsylvania, 1937.

"Experience:

"July 1927 to July 1928: Interned, St. Joseph's Infirmary (two hundred and nine beds) Houston, Texas.

"July 1928 to October 1935: General Practice including surgery, Houston, Texas.

"October 1935 to June 14, 1936: Postgraduate work at Graduate School of Medicine, University of Pennsylvania, Philadelphia.

"1936-1937: Resident Surgeon, Worcester City Hospital (six hundred beds) Worcester, Massachusetts. Has performed about three hundred and thirty-eight operations which was a part of the clinical and postgraduate work taken by Dr. Selders for the purpose of securing the diploma and degree of Master in Surgery.

"Dr. Selders is an experienced surgeon and has been in practice for about seven years and is splendidly qualified by his experience as a general surgeon.

"Address: Home, 2445 15th Street N.W.

"Telephone: Adams 5302."

Mr. Lewin:—That concludes the case for the Government.

EVIDENCE IN SURREBUTTAL ON BEHALF OF THE DEFENDANTS

TESTIMONY OF HENRY ROLFE BROWN

DIRECT EXAMINATION

By Mr. Leahy:

Q.—I am showing you what has been just identified and read as U. S. 671. I am showing you the third page thereof. Would you look at that and see if you can identify it as anything which you wrote? *A.*—Yes, this was the letter of recommendation for Dr. Selders and the others for a position on the staff of the clinic of G. H. A. on I Street.

Q.—And referring to that portion of the third page which states:

"Dr. Selders is an experienced surgeon and has been in practice for about seven years and is splendidly qualified by his experience as a general surgeon,"

what did you mean? *A.*—I referred to his work in the clinic. We had no general outside work, of course, in hospitals, and Dr. Selders was to take care of the clinic and the minor surgery of the clinic.

TESTIMONY OF EDWIN A. MERRITT

DIRECT EXAMINATION

By Mr. Leahy:

Edwin A. Merritt said he is a practicing physician in the District of Columbia, specializing in radiology.

Q.—And will you just tell us without going into detail what radiology is? *A.*—Radiology is the use of radium energy in the diagnosis and treatment of diseases, both x-ray and radium.

He graduated from the University of Nebraska in 1904. After seven years of country practice he went to Rush Medical College in Chicago for internal medicine. Then he took up x-ray in Council Bluffs, Iowa, in 1912.

Q.—Doctor, I want to ask you what length of time is required in order to make a diagnosis of a condition of the chest where an x-ray is taken of the chest.

Mr. Lewin:—Objected to.

THE COURT:—Overruled.

The Witness:—Well, there are two different procedures, as a matter of fact. One consists of taking x-ray films or plates of the chest and the subsequent reading of them. That involves one period of time. There is another medical examination which is used sometimes, or a fluoroscopic survey of the chest is made, and then a plate is made; that takes another. From the start we will say; we begin now and make a fluoroscopic examination of a person's chest. It would take about thirty minutes.

By Mr. Leahy:

Q.—If you had an x-ray taken of the chest, how long would it take to make the x-ray and interpret it? *A.*—We take the x-ray film: the matter of getting a person undressed takes the larger part of the time. The taking of the films is a matter of a few seconds; developing is ten minutes; drying thirty minutes; and reading, five minutes.

Q.—What is a fluoroscopic examination? *A.*—It is an examination of the patient before a fluorescent screen and it penetrates the patient's body and is reflected on a screen. It must be done in an absolutely dark room and the eyes must be perfectly accommodated to it.

Q.—How long does it take to make such an examination? *A.*—To begin, it would take a minimum of twenty-five to thirty minutes, because you have to allow twenty-five minutes for adjustment of the eyes for the dark room. That is an invariable rule; the actual examination consumes perhaps five minutes.

Q.—Is there any difference between the times required to interpret an x-ray of the gastrointestinal tract and chest? *A.*—Yes, it takes longer, of course; gastrointestinal is a longer procedure.

Q.—How long would you say? *A.*—As a matter of fact, a complete gastrointestinal involves a study of an individual over three successive days, and the reading of the film ten to fifteen minutes, reviewing the fluoroscopic evidence; the evidence secured in the three previous examinations; reviewing that evidence plus the films that are taken consumes perhaps ten minutes, maybe fifteen minutes.

Q.—Could the process be done in four or five minutes? *A.*—No, sir; it could not.

Q.—Could the x-ray plate on the chest be taken and interpreted in a minute? *A.*—In a minute?

Q.—Yes. *A.*—Not at all sir; no, sir.

Q.—Where pathology is indicated does it make any difference as to the time for the interpretation of the x-ray plate? *A.*—No—well, yes, in a way, where there is the presence of pathology, the presence of abnormality, it leads to additional study and it takes longer, because if conditions are obscure you might spend hours on an x-ray examination.

CROSS EXAMINATION

By Mr. Kellcher:

Q.—The interpretation of an x-ray plate is the study of the x-ray plate after the picture has been taken, is it not? *A.*—That is right.

Q.—And you say it takes five minutes for an x-ray of the chest, ordinarily? A.—I should say a fluoroscopic examination of the chest would consume five minutes, probably.

Q.—And of the gastrointestinal tract ten to fifteen minutes for the interpretation? A.—I suppose, on the average, fifteen minutes; yes, sir.

TESTIMONY OF DR. JOSEPH S. WALL

DIRECT EXAMINATION

By Mr. Leahy:

Joseph S. Wall said he has been a practicing physician in the District of Columbia for forty-five years. He graduated from Georgetown University Medical School in 1897. Then he did postgraduate work in New York, the New York Post Graduate School, and postgraduate work in Oxford, England. He now devotes his work exclusively to pediatrics.

Q.—Doctor, do you know Dr. Scandiffio? A.—I do.

Q.—How long have you known him? A.—I cannot tell exactly, but I think for a period of eight or ten years.

Q.—At any time was he studying his profession or practicing it under your direction? A.—He was my associate at the Children's Hospital for a number of years, and also was associated with me in the teaching of pediatrics at Georgetown Medical School.

Q.—Do you recall, Doctor, some time in the early fall of 1938, a conversation between Drs. Selders, Price and Scandiffio at your office? A.—I do.

Q.—Do you recall the date of that conversation? A.—It was not in the fall. It occurred on the Wednesday after Christmas 1938. I cannot remember the date because I have no calendar for 1938.

Q.—Do you recall now, Doctor, how that conversation came about?

Mr. Lewin:—We object, because it is beyond the scope of the indictment. The time has not been fixed. It is evidently to contradict Dr. Scandiffio. The time was not fixed at the time when he was on the stand, and it now appears that the conversation took place after the indictment period.

Mr. Leahy:—It would not make any difference.

THE COURT:—Did you bring it out in your cross examination?

Mr. Leahy:—Yes, I did, your Honor.

THE COURT:—It was collateral, was it not?

Mr. Leahy:—No, your Honor; I don't think so. May I approach the bench and give your Honor my theory?

THE COURT:—Yes.

(Counsel for both sides approached the bench and conferred with the court in a low tone of voice.)

(Counsel resumed their places at the trial table.)

By Mr. Leahy:

Q.—Doctor, can you recall now who was present at the time this conversation occurred? A.—Dr. Scandiffio, Dr. Price, Dr. Selders, Dr. Macatee and myself.

Q.—Where did the conversation take place? A.—It took place in my office.

Q.—At whose request? A.—At the request of Dr. Scandiffio.

Q.—How arranged? A.—Dr. Scandiffio called me by telephone on December 23 and asked if he could talk with me about a matter which he could not discuss by telephone. I arranged an appointment at 9 o'clock in the morning, the day before Christmas, and he came in to see me. Shall I state what he told me?

Q.—Was he there on that occasion himself? A.—He was there alone on that occasion. He asked me to arrange a meeting with himself and other members of the Group Health Association and with one or more of my colleagues in the Medical Society. I went the next day to see Dr. Mallory, the president of the Society, and talked with him and we agreed upon Dr. Macatee as being one of the senior members of the Medical Society.

Q.—And then in pursuance of that conversation did a talk occur at which Dr. Scandiffio, Dr. Price and Dr. Selders were present? A.—It did. As the result of this meeting with him on that morning I arranged to meet him on the following Wednesday evening when those three doctors were present, and Dr. Macatee and myself.

Q.—Doctor, I want to ask you if, in substance, those three gentlemen did not tell you—

Mr. Kellcher:—That is leading, isn't it?

Mr. Leahy:—I will ask for the conversation if you want me to.

THE COURT:—If you would rather proceed to put the direct questions by way of impeachment—

Mr. Leahy:—I think I will limit it to what Dr. Scandiffio said, because I think that is within your Honor's ruling.

THE COURT:—The conversation was in the presence of Dr. Scandiffio and the three of them. There was one conversation participated in by several of them. So it is a little difficult to differentiate. But confine your questions to the questions put to Dr. Scandiffio.

Mr. Leahy:—I will try to do that, your Honor.

By Mr. Leahy:

Q.—Doctor, do you recall that in that conversation the doctors stated to you that they were so dissatisfied with the work which they had to do down at the clinic that they wanted to resign in a body? A.—Yes. That was the substance of the conversation at the conference. Dr. Scandiffio—

THE COURT:—Just answer the questions, Doctor. Was that the substance of it, the best you can recall?

The Witness:—Yes, sir.

By Mr. Leahy:

Q.—Then did those doctors ask you if you would try to do something for them so that they could have a living, or words in substance to that effect, if they resigned? A.—If they did resign they asked Dr. Macatee and myself if we thought they would be taken back into membership in the Medical Society, and, secondly, Dr. Selders asked if he could be accorded hospital privileges if he resigned from Group Health Association. Dr. Macatee and I replied—

Mr. Lewin:—We object to the reply.

By Mr. Leahy:

Q.—Then did they say that the other members of the staff of Group Health Association would probably resign in a body if they resigned? A.—They did.

Q.—And that that would probably result in breaking up G. H. A.? A.—They did.

CROSS EXAMINATION

By Mr. Lewin:

Q.—Doctor, are you a member of the District Medical Society? A.—Yes.

Q.—How long were you a member of the District Medical Society prior to the fall of 1937? A.—I think, about thirty-nine years. About two years ago I was put on the life membership basis because I had served forty years.

Q.—Have you ever been a member of its Executive Committee? A.—Yes.

Q.—Do you remember when? A.—It was in the three years following, I think, 1926. At that time I was president of the Society and upon retirement I served three years on the Executive Committee.

Q.—Did you ever have occasion to state to Dr. Woodward, a defendant in this case, that you had regretted that Dr. Scandiffio had gone into the camp of the enemy, together with five other members—meaning by "the camp of the enemy" joining Group Health Association? A.—I probably so stated; yes, because I did regret it.

Q.—You all called the Group Health Association the camp of the enemy and so regarded it? A.—If I so stated in the letter, I did.

Q.—Did you say on Nov. 1, 1937 "I feel that this group of physicians"—meaning the Group Health doctors—"will have visited upon them the displeasure of the medical profession in Washington and will probably become medical outcasts, so far as we are locally concerned"? A.—Yes, because that was my belief.

Q.—Did you also call the A. M. A.'s attention to Dr. Richard Cabot's address on the occasion of the opening of Group Health Association and suggest that some disciplinary proceedings be taken against him for that? A.—I did.

Mr. Leahy:—I object to that.

THE COURT:—Sustained. That goes further than my ruling.

By Mr. Lewin:

Q.—Did you also say to Dr. Woodward in that letter that "You," meaning the group of doctors in the Medical Society of the District of Columbia, "should certainly be grateful for the help which may be accorded us by the American Medical Association"? A.—I did.

Mr. Leahy:—I object, if your Honor please. It is beyond your Honor's ruling.

THE COURT:—That answer may stand.

TESTIMONY OF DR. HENRY C. MACATEE

DIRECT EXAMINATION

By Mr. Leahy:

Q.—Doctor, I want to direct your attention immediately to a conversation held in the fall of 1938 at the office of Dr. Wall at which Drs. Scandiffo, Price, Selders and you were present with Dr. Wall. Do you recall the occasion? A.—I do.

Q.—Were you present? A.—I was.

Q.—And the three doctors whom I have mentioned, Drs. Selders, Price and Scandiffo? A.—They were all present.

Q.—And a conversation was had there between the five of you? A.—There was.

Q.—I want to ask you, Doctor, if in substance this was said by the doctors who were there with you and Dr. Wall.

Mr. Lewin:—Objected to as being beyond the scope of the indictment.

THE COURT:—Objection overruled.

By Mr. Leahy:

Q.—That they were dissatisfied with the work which they were called on to do at the G. H. A. clinic and were prepared to resign in a body? Did they so state? A.—That is true.

Q.—Did they further state anything to the effect that if they resigned, probably the other members of the staff would likewise resign? A.—That was my understanding.

Q.—Did they further state to you that in the event they all resigned in this fashion it would probably break up G. H. A.? A.—That was my understanding.

Q.—And then did they ask you two gentlemen if you would try to do something for them in the shape of helping them out if they did resign and if the remaining members of the staff of G. H. A. resigned? A.—They did.

Mr. Leahy:—That is all.

Mr. Lewin:—No questions.

DEFENSE RESTS

THE COURT:—Members of the jury, you will be excused until Wednesday morning at 10 o'clock. Be here when court is opened, a few minutes early. In the meantime, be very careful to observe the admonition that I have given you before.

PRAYERS AND MOTIONS

(At 2:45 o'clock p. m., court and counsel proceeded to the chambers of Associate Justice Proctor, where the following proceedings took place:)

THE COURT:—I am refusing the general prayer for a directed verdict.

Mr. Burke:—Are you going to hear us on any motions for a directed verdict?

THE COURT:—No.

Mr. Burke:—We are very anxious to present certain points to you.

THE COURT:—You can make the motion on the record and it will be denied.

Mr. Richardson:—I might just as well submit four other motions here, and possibly it would be better if I read them right into the record.

THE COURT:—Either that, or hand them to the reporter.

Mr. Lewin:—That is better.

(The four motions referred to and submitted by Mr. Richardson are as follows:)

MOTION TO STRIKE (BACKGROUND)

Now Come the above named defendants, jointly and severally, and move the Court to strike from the record and advise the jury not to consider any and all evidence submitted in the record relating or having reference to the so-called background of the conspiracy and consisting of evidence with respect to acts and deeds of the defendant American Medical Association, its officers and agents, occurring and transpiring outside of the District of Columbia and prior to Jan. 1, 1937, on the ground that such evidence and the whole thereof is incompetent, irrelevant, and immaterial to any of the issues in the above-entitled action.

Respectfully submitted.

MOTION TO STRIKE (HOSPITALS)

Now Come the above named defendants, jointly and severally, and move the Court to strike from the record and advise the jury not to consider any and all evidence submitted in the record relating or having reference to the so-called Washington hospitals for the purpose of proving that said hospitals were co-conspirators with the defendants herein upon the ground and for the reason that said evidence and the whole thereof is insufficient, as a matter of law, to make or constitute the said hospitals or any of them co-conspirators as charged by the Government and alleged in the indictment.

Respectfully submitted.

MOTION TO DIRECT VERDICT

Now Come the above named defendants, jointly and severally, and move the Court to direct and advise the jury to return a verdict of not guilty in the above-entitled proceeding upon the ground and for the reason that the record in said case, and the whole thereof, shows as a matter of law that Group Health Association, its officers, members and operations were, with reference to all matters shown in the record, unlawfully engaged in the practice of medicine in the District of Columbia in violation of the laws applicable thereto, and were not, and none of them, unlawfully subject to or affected by any alleged restraints as charged and identified in the indictment.

Respectfully submitted.

MOTION TO DIRECT VERDICT

Now Come the defendants, jointly and severally, and move the Court to direct and advise the jury to return a verdict of not guilty in the above-entitled proceeding as to all defendants, upon the ground and for the reason that the facts, acts, and circumstances, as shown by the evidence, and the entire record herein submitted does not establish or tend to establish any violation of Section 3 of the Sherman Act relating to trade or commerce, as set forth or defined in said Act.

Respectfully submitted.

THE COURT:—The first and second ones will be refused. The third is what we have been through before, and there is nothing new there. The fourth is also refused.

DISCUSSION ON PRAYERS

(The prayers of the respective parties were submitted and are published with the action of the Court noted. In the discussion the Court indicated he would not read the prayers to The jury but would incorporate them in his instructions.)

For the general interest of the readers some of the points discussed are here noted:

The Court said: "I never call the attention of the jury to the failure of a defendant to take the stand unless the defense itself asks me to do so and to explain the rule that no presumption should be taken. I am afraid it would be an error to do it, just as much for me as for counsel, unless it is asked.

Mr. Kelleher:—This is as to the ones that took the stand.

THE COURT:—But it brings the others in, and the next prayer couples up with it.

Mr. Richardson:—It is an incorrect statement of the law, because there is no such thing as to "consider the temptation which arises under such circumstances to testify to a state of facts favorable to himself."

Mr. Lewin:—Oh, yes.

THE COURT:—They have the right to consider the vital interest they have in the outcome of the case. But I will refuse this prayer for the reasons I have stated. I think that what I shall say on that will be satisfactory.

Mr. Richardson:—Of course, twenty-two cannot be so. That is, it cannot be so and keep the society in existence.

Mr. Kelleher:—It probably ought to be dissolved; if we get a verdict then maybe it will be.

Mr. Leahy:—The trouble is you are argumentative in your instructions. You cannot assemble points of evidence and throw them to the Court and ask the Court to argue it for you.

THE COURT:—Well, I think you are entitled in a colorless way to have the rule stated, without argument, that if they did in fact conspire to restrain, and they find that beyond a reasonable doubt, then the use of ethics and those other things as justification for it would afford no justification. That is very roughly stated, but that is what you mean.

Mr. Lewin:—That is it.

THE COURT:—I will revise it.

THE COURT:—I instruct them very carefully that the indictment is no evidence and raises no presumption of guilt, but on the contrary there is a presumption of innocence.

Mr. Lewin:—We would like to get away from these good motives.

Mr. Richardson:—I don't blame you.

THE COURT:—You said this was not sufficient?

Mr. Kelleher:—Here is what we were after in this charge: that it makes no difference if they find that Group Health did in fact violate the principles of ethics or that the defendant believes that they did.

THE COURT:—Yes, I understand. Of course, I shall tell them that it is unquestionably the law they are not required to live up to the ethics of the American Medical Association. They are not required to have the ethics and standards of the Association. If they didn't have it, it would make no difference.

Mr. Richardson:—And if as a result of their not living up to the principles of ethics and they desired to associate with those who do, and are not accepted, they get what they deserved.

Mr. Leahy:—You can't make anybody consult with somebody else.

Mr. Kelleher:—If they refused to consult in order to drive G. H. A. out, it is illegal regardless of the reason. Even if they thought it was unethical.

THE COURT:—If they thought it was agreed that "we are going to rush G. H. A., put it out of business; and we are going to do it by enforcing our rules of ethics" against them, then, of course, you have a conspiracy.

Mr. Richardson:—But you cannot take the action that was directed against G. H. A. and prove backwards by inference how the thing started.

THE COURT:—No, I can't say to the jury you have to assume that they did these things. The first thing is to find out whether they had a conspiracy.

Mr. Leahy:—What you want the Court to say is the refusal to consult amounts to conspiracy.

Mr. Lewin:—Well, here is a concerted refusal.

Mr. Kelleher:—If it is a refusal to consult for the purposes charged in the indictment, it is illegal.

THE COURT:—I am underscoring here "if a conspiracy"; then "employment of ethics, et cetera, to restrain would not be a defense"; the violation of ethics by G. H. A.

Mr. Lewin:—Or the belief on the part of the defendants that G. H. A. had violated these ethics.

Mr. Leahy:—I would like your Honor also to state that these various pieces of evidence are not proof per se of conspiracy.

THE COURT:—I shall tell them that there was no legal obligation, legal ethical obligation on the part of any physician to consult with any other physician.

Mr. Leahy:—Therefore even though they find that the members of the society refused to consult with G. H. A., they must further find that that was done with intent to destroy it.

THE COURT:—You see, let us assume that these regulations against consulting, et cetera, are an unlawful agreement to restrain physicians in medical practice. That is not what you are charged with. We don't have to deal with that.

Mr. Richardson:—No, but you have this situation: Here is a group of people in a meeting. Oh, they are confederating; one says something; they are all conspirators because of the very fact they were in a meeting. You are dealing with a society.

THE COURT:—I know you are arguing the matter now, but as a matter of fact anything that brings alleged conspirators together is a thing that may be considered by the jury whether it is reasonable or not, and the thing, in view of the fact that they are members of the society, will be argued on the one side; and whether it is unreasonable and may be treated as the act of a conspirator, may be argued on the other. That is a matter for argument. I cannot say the fact that men got together, this is some evidence. I can't consider it one way or the other, and I don't want to.

(To be continued)

MEDICAL ECONOMIC ABSTRACTS

MEDICAL SERVICE ADMINISTRATION OF NEW JERSEY

Before proceeding with the organization of any prepayment plan, the Medical Society of New Jersey made extensive preparation. New Jersey had been one of the most successful states in the operation of care for the indigent under the FERA and derived much valuable information concerning the provision of medical service through this experience. The state medical society had also participated thoroughly in the national study of "Medical Care in the United States—Demand and Supply" and prepared one of the most elaborate reports on the results of that study. As early as 1938 the Medical Society of New Jersey dedicated itself to three objectives:¹

1. To make available to every man, woman and child in New Jersey adequate personal and sympathetic medical care, preventive and curative, at the lowest cost compatible with efficient service.

2. To preserve for all the people of New Jersey, regardless of income, the free choice of physicians among those licensed by the state to engage in the healing art.

3. To advance medical science, elevate professional standards, foster friendly relations between doctors and promote mutual understanding between the doctors and the public.

A voluntary health insurance fact finding committee was appointed in October 1938 and submitted a report to the meeting of the house of delegates in June 1939. This report contained the outlines of a proposed plan, which was then kept under continuous discussion and frequent revision for several months. The plan was finally incorporated on Oct. 27, 1939 as the Medical Service Administration of New Jersey. The administration is directed by a board of governors of eight members appointed by the board of trustees of the Medical Society of New Jersey. At least five of these are to be members of the medical society. Their terms are to be overlapped. The board of governors determines all policies, rules and regulations and appoints all administrative personnel, including a medical director and such assistant medical directors as are considered necessary.

An advisory committee in each county is composed of members appointed by the board of governors subject to the approval of the county medical society. All licensed physicians are entitled to become professional participants on application and agreement to abide by the rules and regulations.

Beneficiaries must reside in or be employed in the state of New Jersey. A single person or the head of a family must not receive an income of more than \$1,600 annually, with an allowance for the first dependent of \$400 and \$200 for each additional dependent. If more than 65 years of age, a satisfactory physical examination is required. Married women are not accepted unless the husband is also included in the plan. Only persons within groups of not less than ten persons are admitted without physical examination.

The subscription rates have been fixed as follows:

Subscribers	\$1.50 per month
First dependent	1.25 per month
Second dependent	1.00 per month
Third dependent50 per month
Fourth dependents50 per month
Other dependents	No extra charge

Service in the office, home and hospital is covered. Medical and surgical services are available immediately in case of accident, but elective surgery is not provided during the first year. Drugs, nursing care, surgical appliances and maternity care during the first contract year, except antepartum advice, are also not furnished. There are the usual exclusions of functional mental, nervous and venereal diseases, institutional tuberculosis, drug addictions and injuries covered by workmen's compensation.

The administration will pay to participating physicians for the necessary services rendered by them to beneficiaries such fees as are determined by the board of governors. The fees will be based on the charges which the board determines are usually and ordinarily made by physicians, in the certain locality involved, to patients of like responsibility and financial circumstances, for services identical with or similar to those rendered the beneficiary; and further, according to the amount of money available to the administration for the payment of physicians' fees. Payment for roentgen ray services will be limited to \$15 annually per individual beneficiary.

The certificate of authority to operate was accepted on March 25, 1941. At the present time the Medical Service Administration is qualified to operate in thirteen counties and a number of others are preparing to qualify for the plan. The physicians have readily entered into the agreement to participate. In twenty-one counties with a total membership of the Medical Society of New Jersey of 3,767 there were on March 26 2,172 physicians who had signed agreements. No report has yet been issued on the number of beneficiaries who have entered into the plan.

1. Carrington, W. J.: Objectives and Administrative Policies of the Medical Society of New Jersey for 1938-1939, J. M. Soc. New Jersey 35: 374 (June) 1938; The President's Annual Report, ibid. 36: 257 (May) 1939.

MEDICAL CARE IN NEW YORK STATE

In 1939 the New York legislature appointed a committee to "formulate a long range state health program." This committee has just issued its report.¹ There is a study of medical care in welfare districts and of various features of health care by hospitals and public institutions.

Various plans of voluntary insurance including "group practice" and prepayment plans of state medical societies are discussed. It is concluded that "Whatever may be done to fill the present gap, voluntary prepayment plans will still be needed. They are susceptible of certain expansion and ought to be developed—along sound lines and in a socially desirable direction."

The history of compulsory health insurance in the United States is followed with a discussion of systems in foreign countries, and the necessity for placing administrative responsibility in the medical profession is recognized. It is somewhat surprising to read as one of the "lessons from experience" that "restoration and improvement of health, originally a by-product of the plans, has become a major objective." No example of this trend is cited. Another lesson is that:

Administration of compulsory sickness insurance has been severed from some of its worst original features by the development of professional supervision of professional services and by the attempts to create efficient large-size administrative units.

Experience has also shown that no human being has been able to present a formula which suits all.

It would be indefensible indeed if any state in this country imported and repeated the mistakes made abroad. Foreign experience can clearly demonstrate stumbling blocks and shortcomings which must and can be avoided. From the oldest law, the German, we can learn how detrimental it is if the medical profession is kept out from active participation in administering sickness insurance.

In considering the "problems of compulsory health insurance with special reference to New York State" the report says:

Compulsory health insurance has proved to be primarily feasible for industrialized areas with large and stable groups of employees working for salaries or wages, and a densely settled population. The problem in the rural areas is so loaded with difficulties that it would be a waste of effort to consider health insurance for residents of such areas as long as there

is no established program in the industrial areas. In a state in which a substantial part of the population consists of independent farmers and persons employed in agriculture, support of compulsory health insurance by contributions would be insufficient, and considerable allocations from taxation would be needed.

Emphasis is laid on the "necessity for coordination of any proposals for compulsory health insurance with existing voluntary and public health and welfare activities." There are no specific recommendations for legislative action.

PRIVATE PRACTICE IN GERMANY

An incident in connection with a proposal to revise payments to physicians in Germany during and after the war has shown that in spite of more than half a century of sickness insurance German physicians still object strenuously to further incursions on private practice. The plan suggested that physicians who were receiving fees in private practice in addition to their income from insurance should have these fees included in a scheme for the equalization of physicians' incomes. The advocate of the plan, Dr. J. Hartmann,¹ replies to some of these criticisms. In listing the objections that have been raised to his plan by physicians, he says that these ask "Where did I get the right to interfere with the private practice of my confrères and to abolish the last remnant of medical freedom, namely, the income from private practice, and thereby transform the physicians into officials"? He denies strenuously that he has any intention of interfering with private practice. He insists, however, "that the need for physicians in the new reich is so tremendous and so difficult to meet that we simply cannot permit any physician to be excluded from insurance practice." He continues in words that must sound somewhat strange to those who believe that German physicians are all converted to some sort of "socialized medicine": "In many of the communications I have received, the fear of further measures of socialization or of a threatening regimentation plays an important part." He is also emphatic in insisting that there is no intention to interfere with that "confidential relation" between physician and patient which he recognizes as an essential factor in good medical care.

WOMAN'S AUXILIARY

California

A review of "For Whom the Bell Tolls" was given by Mrs. V. W. Bours at the February 21 meeting of the Alameda County auxiliary; nearly 300 attended the "Husband's Dinner," March 4.

The Fresno County auxiliary, of which Mrs. Otto Diederich is president, had as its May meeting a box supper at the home of Mrs. J. R. Walker. Each box sold for 25 cents and the money collected was added to the fund for needy doctors. A communication from the secretary of the British War Relief thanking the auxiliary for its contribution was read.

Audiometers were presented to the Santa Cruz and Watsonville schools to aid children with defective hearing by the Santa Cruz auxiliary membership.

On March 11 a health conference was sponsored by the San Diego auxiliary in conjunction with the county medical society. The California Physicians' Association plan was discussed. A "Medical Information Please" panel was given. Three doctors sit informally at a table with an auxiliary member who asks questions of first one, then another. The questions are answered as briefly as possible. The audience has shown a great interest.

One hundred and sixty members and guests attended the San Francisco meeting, at which presidents of women's clubs were invited to hear Dr. Chauncey Leake, professor of pharmacology at the University of California, speak on the "San Francisco Blood Bank." Guests were taken to see the medical society's blood bank, which is installed in the home of the society.

Miss Behrens of the Sonoma County Hospital gave an illuminating talk at the Sonoma meeting in Santa Rosa last month on "The Nurse Practice Act" and the "Trained Attendant Act."

Lloyd C. Douglas, writer and lecturer, addressed 162 regular members, 35 new members and representatives of the press at the Los Angeles meeting on "Mental Defense."

Georgia

A questionnaire game similar to radio quiz programs was played at the recent meeting of the Woman's Auxiliary to the Bibb County Medical Society, held at the home of Mrs. C. C. Harrold, in Macon, with Mrs. C. H. Richardson as co-hostess. Mrs. J. L. King, acting as interrogator, asked questions about the auxiliary and the national medical association. Members brought toys for the children's ward at the Macon Hospital.

New York

The regular meeting of the Onondaga County auxiliary was held in the Syracuse Memorial Hospital, March 4, Mrs. Edgar M. Neptune, presiding. Dr. Robert Ainslie, pathologist of Syracuse Memorial Hospital, spoke on "His Experiences in China." A skit representing "A Model Meeting" was portrayed, Mrs. Winthrop Pennock acting as chairman. Over \$2,500 worth of medical equipment and medicine were collected by the public relations committee for the Bundles for Britain, Mrs. Nobel Chambers acting as chairman.

Texas

The December meeting of the Dallas County auxiliary at Dallas was in the form of a wedding anniversary party and a style show of wedding gowns of various periods. The choral club of the auxiliary, under the direction of Mrs. Joseph Wolf, furnished the music and introduced each bride with songs

popular in the year she was wed. Mrs. Gordon B. McFarland was in charge of arrangements for the party.

The Jefferson County auxiliary held its annual Christmas party. Mrs. J. D. Thompson, Port Arthur, president of the auxiliary to the South Texas District Medical Society, introduced the guest of honor, Mrs. William Hibbitts, of Texarkana, president of the state auxiliary. Wives and daughters of members of the Jefferson County Medical Society sang Christmas carols under the direction of Mrs. R. B. Leggett, accompanied by Mrs. H. B. Williford.

Wisconsin

Mrs. D. F. Gosin addressed eighteen members of the Fond du Lac auxiliary on the aims of the organization at the October meeting. This auxiliary has voted an appropriation for the Children's Home, makes bandages for the Red Cross and sponsors a Girl Scout Troop.

Miss Beatta Geiger spoke to the Douglas County auxiliary on the Womens' Industrial Home at Taycheedah. Sixteen members attended the December meeting and voted to give twenty-six *Hygeia* subscriptions to rural schools this year, an increase of eight over last year.

Seventeen members of the Winnebago County auxiliary, of which Mrs. W. N. Linn of Oshkosh is president, voted to place *Hygeia* in the beauty parlors of Oshkosh, Neenah and Menasha. Members are knitting and making surgical dressings and layettes

for the Red Cross and layettes for the Visiting Nurses Association.

"The Doctor and Democracy," a speech by Dr. Eben J. Carey, dean and professor of anatomy at Marquette University School of Medicine, given by him at the annual dinner at the state medical society at Milwaukee, was read to the Rock County auxiliary members at their November meeting by Mrs. W. W. Crockett. A report of the Philanthropic Committee revealed gifts of eighty glasses of jelly, Thanksgiving favors for patients' trays and Christmas packages to Pinehurst Sanatorium, Janesville. This committee has a project for each month of the year. The Rock County auxiliary is devoting three to five minutes of each meeting to *Hygeia*, discussing its interesting articles. This auxiliary has gone "over the top" with subscriptions this year.

Part of the philanthropic work of the Waukesha County auxiliary this year has been the presentation of Christmas gifts to boys at the Wisconsin Home and Farm School at Dousman.

Twenty members of the Kenosha County auxiliary met in December at Kenosha and voted a gift of \$10 value and a one year subscription to *Hygeia* to four hospitals and a one year *Hygeia* subscription to the Orthopedic School.

The Dodge County auxiliary of which Mrs. A. W. Hammond of Beaver Dam is president is making layettes for use by the county and city nurses and presented Christmas baskets, magazines, books, playing cards and games to two hospitals and the Dodge County Infirmary.

MEDICAL LEGISLATION

MEDICAL BILLS IN CONGRESS

Changes in Status.—The Senate Committee on Education and Labor, April 29 and May 2, reconsidered the Murray bill, S. 783, relating, among other things, to the deferment of medical students, interns and residents under the Selective Training and Service Act. No action was taken by the committee. It is reported that further consideration will be given the bill on May 16. H. R. 4293 has been reported to the House, providing that any person who furnishes blood for transfusion into the veins of any person entitled to and undergoing treatment at government expense, or who shall furnish blood for blood banks or for other scientific and research purposes, shall be entitled to be paid therefor a sum not to exceed \$50 for each blood withdrawal.

DISTRICT OF COLUMBIA

Bills Introduced.—S. 1349, introduced by Senator Bilbo, Mississippi, proposes to create a Board of Funeral Directors and Embalmers for the District of Columbia. S. 1423, introduced by Senator Reynolds, North Carolina, and H. R. 4498, introduced by Representative Randolph, West Virginia, propose to authorize the Federal Security Administrator, on application of the Secretary of State, to admit to St. Elizabeth's Hospital, for treatment, insane persons belonging to the Foreign Service of the United States who are legally adjudged insane in any foreign country and whose legal residence in one of the states, territories or the District of Columbia it has been impossible to establish.

STATE MEDICAL LEGISLATION

Florida

Bills Introduced.—S. 267, to amend the Uniform Narcotic Drug Act, proposes, among other things, that the provisions of the act shall not apply to the administering, dispensing or selling at retail of any medicinal preparation that contains in 1 fluidounce, or if a solid or semisolid preparation in 1 avoirdupois ounce, not more than 1 grain of codeine or any of its salts. The present law provides a similar exemption with respect to preparations which in the quantities stated do not contain more than 2 grains of opium, one-fourth grain of morphine, 1 grain of codeine, $\frac{1}{8}$ grain of heroin or $\frac{1}{2}$ grain of extract of cannabis. S. 318, to amend the chiropractic practice act, proposes, among other things, that "Any chiropractor who has complied with

the provisions of this Act may: (1) Examine, analyze and diagnose the human living body and its diseases by the use of any physical, chemical, electrical, thermal or radionic method, and use the x-ray diagnosing, and may use any other general method of examination for diagnosis and analysis taught in any school of chiropractic recognized at any time by the Florida State Board of Chiropractic Examiners. (2) Chiropractors may adjust, manipulate or treat the human body by manual, mechanical, electrical, or natural methods, or by the use of physical means, Physiotherapy (including light, heat, water or exercise) or by the use of foods and food concentrates, food extracts, and may apply first aid and hygiene, but chiropractors are expressly prohibited from prescribing or administering to any person any medicine or drug included in *Materia Medica* or from performing any surgery except as hereinabove stated or from practicing obstetrics." H. 356 proposes to authorize a county having a population of 250,000 or more to establish and operate a hospital for the care of such residents of that county as may have been committed to the hospital for the insane of the state of Florida. H. 428 proposes to prohibit the operation of a convalescent home for the care of persons recovering from illness, semi-invalids, or persons of unsound mind, unless the home is in the charge and under the direction of a duly licensed physician, or unless a licensed physician is employed to visit and direct the care of the patients of the home at least once a week. H. 497 proposes to enact a separate practice act for medical technologists and to create a board of medical technologists to examine and license persons desiring to practice as registered medical technologists. The bill defines a "Medical Technologist" as a natural person who is engaged in the practice of approved or experimental technical procedures, the results of which are interpreted by the physician in the diagnosis of disease. After July 1, 1942 the bill proposes to make it unlawful for any person not registered by the board to practice as a medical technologist. However, the bill is not to apply to an office assistant or a nurse who in addition to his or her routine duties performs laboratory procedures the results of which are used only by the employer physician in his private practice of medicine and who assumes responsibility for the work so performed. An applicant for registration must present evidence satisfactory to the board that he has satisfactorily persued at a reputable college or university an eight hours course in biology (of which four hours must be in zoology),

three hours in bacteriology, eight hours in inorganic chemistry and four hours in organic chemistry.

Illinois

Bill Introduced.—H. 629 proposes so to amend the Uniform Narcotic Drug Act as to include within the definition of "narcotic drugs" diethyl-barbituric acid.

Michigan

Bill Introduced.—S. 322 proposes to appropriate \$50,000 to the superintendent of public instruction "to be expended in assisting the education of children and adults afflicted with speech impediments." S. 382 proposes to enact what is cited as the "Uniform Michigan, Food, Drug and Cosmetic Act" to regulate the manufacture, sale, distribution and advertising of foods, drugs, cosmetics and therapeutic devices.

Missouri

Bill Introduced.—S. 185, to amend the medical practice act, proposes that "any person who having attended any medical college, and has received at least three courses of lectures from any medical college or colleges, and has had at least one course as practitioner in any general or special hospital, who is now and has been for a period of at least twenty years a resident of the state of Missouri, and who has during twelve years of such time been actively engaged in the practice of medicine in the locality where he resides, shall be regarded as a licensed and registered physician under the provisions of this act."

New Jersey

Bills Introduced.—S. 345 proposes that judgments entered against a decedent in his lifetime, funeral charges and expenses, and the hospitals', physicians' and nurses' bills during the last sickness shall have preference and be paid first out of the personal and real estate of the decedent. Committee Substitute for Assembly 60 and 257, to amend the laws relating to the practice of chiropody, proposes to clarify the statement as to the scope of a license to practice chiropody.

Oklahoma

Bills Introduced.—H. 545 proposes to enact a separate physiotherapy practice act and to create a board of physiotherapy to examine and license applicants for licenses to practice physiotherapy. The bill states "For the purpose of this Act Physiotherapy is defined to be the employment of the following methods: Hydrotherapy, electrotherapy, massage, baths, thermotherapy, heliotherapy, light-therapy, corrective gymnastics and diet for the stimulation and correction of the human body." H. 549 proposes that no ambulance shall be used for transporting sick or injured persons except under the charge of a licensed first-aid, an intern in an approved hospital, or a licensed physician. The bill proposes to authorize the governor to appoint a board of first aid examiners, who are to be authorized to examine and recommend for licensure by the state commissioner of safety of first aiders. Applicants for such a license must be 20 years or more of age and have completed a practical course in first aid of a minimum of twenty-five hours' class work or a semester's work in practical first aid in the junior or senior year of high school or a semester's work in practical first aid in a college or university. H. 560, to supplement the medical practice act, proposes to require licentiates to renew their licenses annually with the board on or before June 10 and at that time to pay annual renewal fees of \$3.

Pennsylvania

Bills Introduced.—S. 644 proposes that all hospitals having one hundred beds or more and receiving any appropriation from the state shall at all times have in attendance at least one licensed physician or at least one student intern. A student intern may remain in attendance only during the period for which he or she is exempt from licensure to practice medicine and surgery. The bill proposes to define "student intern" as any one pursuing a course in an approved hospital as required by the medical practice act of an applicant for licensure to practice medicine. H. 911 proposes that in every trial or hearing where testimony is taken in any civil proceeding the hospital records referring solely to injuries sustained by the patient and the treatment thereof made as a part of the ordinary hospital routine or in the course of the ordinary business of the hospital shall be admissible in evidence on identification by the custodian of such records and it shall not be necessary that such records be proved by the physician or intern who made them. H. 1270, to amend the law requiring the licensing of private nursing homes and private hospitals by the department of welfare as a condition precedent to their operation, proposes, in effect, that such requirement shall apply only to private nursing homes and private hospitals operating for profit. H. 1339 proposes to enact a separate naturopathic practice act and to create an independent board of naturopathic examiners to examine and license applicants for licenses to practice naturopathy. The bill proposes to define naturopathy as "that system of the healing art which uses and prescribes the following practices and usages, diagnosis and the practice of the combined physiological, mechanical and material sciences of healing as taught in reputable schools, institutes and colleges of naturopathy which shall include physiotherapy, hydrotherapy, mechanotherapy, psychotherapy, phytotherapy and electrotherapy, corrective and orthopedic gymnastics, external application, manipulation and nutritional control."

Rhode Island

Bill Introduced.—H. 1031 proposes to regulate the manufacture, sale, distribution and advertising of foods, drugs, cosmetics and therapeutic devices.

Wisconsin

Bills Introduced.—A. 821, to amend the law requiring the several counties, except those having a population in excess of 250,000, to provide, without prior authorization from county officials, hospitalization for relief clients in emergency cases, proposes to make such counties liable also for the care rendered by a physician and surgeon to a relief client in such cases when in the reasonable opinion of a physician called to attend such person immediate care is required and a delay to obtain authorization would likely be injurious to the patient. There is to be no liability, however, for a physician's care under such circumstances unless within twenty-four hours after the admission of the patient to a hospital written notices by the attending physician and of the hospital are mailed to the appropriate county officials. A. 827 proposes to require every licensed physician engaged in the prenatal care of a pregnant woman, or attending such a woman for the first time at the time of delivery, to take, or cause to be taken, a sample of her blood and to submit the sample to a laboratory, approved by the state board of health, for a standard blood test for syphilis.

OFFICIAL NOTES

RADIO BROADCASTS

"Doctors At Work" is the title of the sixth annual series of dramatized radio programs that are being presented by the American Medical Association and the National Broadcasting Company.

Tickets are available for each broadcast. Address the Bureau of Health Education, American Medical Association, 535 North Dearborn Street, Chicago. Tickets are free, but a stamped, self-addressed envelop should accompany requests.

The program for April 30 was canceled in order to yield the time to the President of the United States. In consequence the program originally scheduled to depict the "doctor in arts and letters" will be combined with that on the "doctor as a citizen," and all programs except the closing program will be postponed one week. The new schedule is as follows:

- May 14. So Mothers May Live.
- May 21. Physician to the Community.
- May 28. Doctors' Hobbies and The Doctor as a Citizen.
- June 4. A. M. A. Convention.

Medical News

(PHYSICIANS WILL CONFER A FAVOR BY SENDING FOR THIS DEPARTMENT ITEMS OF NEWS OF MORE OR LESS GENERAL INTEREST: SUCH AS RELATE TO SOCIETY ACTIVITIES, NEW HOSPITALS, EDUCATION AND PUBLIC HEALTH.)

CALIFORNIA

Personal.—Dr. Alson R. Kilgore, San Francisco, secretary-treasurer of California Physicians' Service since its inception, has resigned as secretary but will continue as treasurer. Dr. Albert E. Larsen, San Francisco, medical director, will also serve as secretary.—Dr. Everett Morris, superintendent of Wish-ia-h Sanatorium, Auber 7, resigned recently. He had been medical director since the opening of the sanatorium on May 16, 1929.

Cardiac Program in San Francisco Area.—Three counties have been selected near the San Francisco area as a field for demonstration in a cardiac program which is part of the crippled children's services of the state department of public health. Funds have been supplied by the U. S. Children's Bureau. The program seeks to reduce the losses resulting from heart disease by providing:

1. Diagnostic services for all children referred including home visits for diagnosis of patients acutely ill. Children already under medical care are cleared with their physicians before admittance to the clinic.
2. Medical, hospital and convalescent care for patients whose parents are unable to pay. Children suffering from congenital and functional heart disease at present are not eligible for care.
3. Medical, public health nursing and social work service in following all patients accepted for care under the program.
4. Epidemiologic services in the case of rheumatic fever.
5. Continuity of educational opportunities for patients through the cooperation of state and local education departments.

The program is in charge of a pediatrician who conducts screening clinics in the counties to examine all children referred. Children with a rheumatic history are referred for complete diagnostic study to the Children's Hospital in Oakland, where the medical services are centered for the present and where hospitalization is provided for active cases of rheumatic fever. Concurrently a survey of heart disease in children is being conducted by the state department of public health at the request of the California Heart Association through social security funds.

CONNECTICUT

Physicians Wanted.—The personnel department of Connecticut announces that open competitive examinations will be held to fill the positions of assistant superintendent (psychiatric), physician and psychiatrist, senior physician (psychiatric), assistant physician (psychiatric), director of clinical laboratories, senior physician, assistant physician and local health consultant. Applications must be filed on or before May 15 or bear a postmark of that date. The Connecticut residence requirement is waived for these positions, but candidates must be citizens of the United States. All foreign born candidates will be required to submit evidence of citizenship; naturalization papers should be submitted with the application. Additional information may be obtained from the Personnel Department, State Capitol, Hartford.

DELAWARE

Society News.—Dr. Joseph S. Wall, Washington, D. C., addressed the New Castle County Medical Society in Wilmington, March 18, on "Pneumonias of Childhood." Dr. Charles F. Geschickter, Baltimore, discussed "Primary Bone Tumors" before the society April 15 and Dr. John F. Hynes, Wilmington, "Metastatic Bone Carcinoma—Diagnosis and Treatment."

IDAHO

Hospital News.—A new wing at St. Joseph's Hospital, Lewiston, was recently opened, increasing the hospital's capacity by thirty beds.—Mrs. William E. Borah, widow of the late senator, has offered a 15 acre tract of land near Boise for construction of a state tuberculosis hospital. The offer was made to the Idaho Anti-Tuberculosis Association through Mr. C. C. Anderson, a merchant in Boise.

Occupational Licensing Board.—A board composed of six physicians to examine applicants for license in certain occupations has been appointed by Governor Clark. The physicians who will conduct medical examinations for persons applying for licenses in any of seventeen occupations for which

the law requires licenses are Drs. Albert B. Pappenhagen, Orofino; Joseph E. Baldeck, Lewiston; Harold W. Stone, Boise; William B. Handford, Caldwell; Casper W. Pond, Pocatello, and George C. Halley, Twin Falls.

ILLINOIS

Meeting of Pathologists.—The Illinois Society of Pathologists will meet at the Palmer House, Chicago, May 20. Dr. Raphael Isaacs will open the session with a lecture entitled "Changes in the Blood Cells of Diagnostic and Prognostic Value." Dr. Samuel A. Levinson will conduct a clinical pathologic conference, and Drs. M. Herbert Barker, Robert Bruce Malcolm and James P. Simonds will participate in a symposium on the role of pathology in medicine. All the speakers are of Chicago.

Postgraduate Conferences.—The First Councilor District Medical Society conducted a postgraduate conference in Freeport, April 23. The following participated:

- Dr. Harry Leichenger, Chicago, Scarlet Fever.
- Dr. Harry A. Oberhelman, Chicago, Physical Problems in Intestinal Infections.
- Dr. Eric Oldberg, Chicago, Head Injuries.
- Dr. Geza de Takats, Chicago, Management of Peripheral Vascular Disease.
- Dr. Charles E. Galloway, Evanston, Management of Abortion.
- Dr. Nathaniel G. Alcock, Iowa City, Value of Urologic Findings in Diagnosis of Abdominal Tumors.
- Dr. Chauncey C. Maher, Chicago, Etiologic Diagnosis of Heart Disease.

The Fourth Councilor District Medical Society sponsored a similar conference in Galesburg on April 24 with the following speakers, all of Chicago:

- Dr. Robert S. Berghoff, Heart Disease.
- Dr. Carlo S. Scuder, Fractures from a General Practitioner's Viewpoint.
- Dr. Lee C. Gatewood, Gastrointestinal Diseases.
- Dr. Frederick H. Falls, Ectopic Pregnancy and the New Test for Pregnancy.

Public Health Meeting.—The first annual public health conference of the Illinois Public Health Association in cooperation with the Cook County public health agencies and the public health and hygiene section of the Illinois State Medical Society will be held at the Hotel La Salle, Chicago, May 19-20. There will be round table discussions on the typhoid epidemic at Manteno State Hospital; public health problems in military areas; nurses in national defense; public health dentistry; community planning in public health and tuberculosis as a national health problem. One session will be devoted to a summary of the possible relationship of poliomyelitis to sanitation. At the banquet with Dr. Nathan S. Davis III, Chicago, presiding, speakers will be Dr. Reginald Atwater, New York, executive secretary, American Public Health Association, on "The New Day in Public Health," and Dr. Henry A. Holle, Chicago, district medical consultant, U. S. Public Health Service, "National Defense and the Public Health." A luncheon session will be addressed by Drs. Clifford J. Barborka, Chicago, and J. Howard Beard, Urbana, on "Nutrition and the Public Health" and "A Community Plans for Health," respectively.

Chicago

The Luckhardt Lecture.—Dr. Howard T. Karsner, professor of pathology, Western Reserve University School of Medicine, Cleveland, will deliver the eighth annual Arno B. Luckhardt Lecture at the University of Chicago on May 15. His subject will be "Ovarian Tumors with Endocrine Dysfunction." The lecture is given under the auspices of Delta chapter of Phi Beta Pi.

Nutrition in Defense of Democracy.—The Chicago branch of the American Association of Scientific Workers conducted a symposium on "Nutrition in Defense of Democracy," April 15, with Dr. Anton J. Carlson presiding. Speakers included Hazel K. Stiebeling, Ph.D., bureau of home economics, U. S. Department of Agriculture, Washington, D. C., on "Nutrition in the United States Today"; Paul E. Howe, Ph.D., colonel, sanitary corps, U. S. Army, Washington, "Nutrition in the Armed Forces," and Dr. Russell M. Wilder, Rochester, Minn., chairman of the committee on nutrition and foods of the National Research Council, "Nutrition in the United States—A Plan for the Future."

KANSAS

Society News.—The Shawnee County Medical Society was addressed in Topeka, April 7, by Drs. Lewis L. Robbins on "Anorexia Nervosa"; Robert P. Knight, "Military Psychiatry," and Carl G. D. Tillman, "Recently Developed Diagnostic and Therapeutic Technics in Neuropsychiatry."—The speakers before the Golden Belt Medical Society in Junction City, April

3, were Drs. Laurence S. Nelson, Salina, on "Commoner Injuries of the Hand"; Robert Lee Hoffmann, Kansas City, Mo., "Diseases of the Female Urethra"; Fred J. McEwen, Wichita, "Cardiac Emergencies," and Earl L. Mills, Wichita, "Functional Heart Disease."—Dr. Hyman I. Spector, St. Louis, addressed the Kansas Tuberculosis Association, April 14, in Topeka on "Early Discovery of Tuberculosis, Particularly with the Use of the X-Ray."

MASSACHUSETTS

Doctors' Symphony Orchestra.—The Boston Doctors' Symphony Orchestra will give its second annual concert, May 11, in Jordan Hall. Alexander Thiede will conduct, and Dr. Werner Mueller will appear as soloist. Proceeds of the concert will be used to establish a fund for a free bed in each of the following hospitals: Beth Israel Hospital, Children's Hospital, Massachusetts Eye and Ear Infirmary and Boston Dispensary.

State Medical Meeting in Boston.—The one hundred and sixtieth annual session of the Massachusetts Medical Society will be held at the Copley-Plaza, Boston, May 21-22, under the presidency of Dr. Walter G. Phippen, Salem. Section meetings will be divided between the University Club and the Hotel Lenox. Out of state speakers will include:

- Dr. William H. Sebrell Jr., Washington, D. C., The Clinical Value of Vitamins.
- Dr. John Scudder, New York, Fluid Administration in Surgery in the Light of Recent Advances in Water and Electrolytic Balance.
- Dr. Irving S. Wright, New York, Problems in the Management of Peripheral Vascular Disease.
- Dr. Richard S. Weiss, St. Louis, Treatment of Common Skin Diseases.
- Dr. Eugene P. Pendergrass, Philadelphia, The Value of the Roentgen Examination in the Diagnosis of Intestinal Obstruction.
- Dr. William Osler Abbott, Philadelphia, Indications for the Use of the Miller-Abbott Tube.
- Dr. Allan T. Kenyon, Chicago, Problems in the Recognition and Treatment of Testicular Insufficiency.

The section on pediatrics will conduct a symposium, Wednesday, on the conditioned reflex of Pavlov. Thursday morning a symposium on hormones will be held. Thursday afternoon will be given over to a military symposium with the following speakers:

- Dr. Wesley Bourne, Westmount, Que., Canada, Procedure in Anesthesia for War Purposes.
- Dr. Philip D. Wilson, New York, Treatment of Compound Fractures Resulting from Enemy Projectiles.
- Ross A. McFarland, Ph.D., Boston, Problem of Fatigue in Aviators.
- Dr. Gilbert Horrax, Boston, Treatment of Gunshot Wounds of the Brain.
- Dr. Walter B. Cannon, Boston, A Report of Newer Work on the Shock Problem.
- Dr. Stuart Mudd, Philadelphia, Blood and Blood Substitutes in the Treatment of Hemorrhage, Secondary Shock and Burns.

Dr. Edward William Alton Ochsner, New Orleans, will deliver the Shattuck Lecture at the annual dinner, Wednesday evening, on "Thrombosis and Thrombophlebitis," and the annual discourse will be presented, Thursday morning, by Dr. Albert Warren Stearns, Boston, on "The Role of the Physician in a Competitive Society."

MINNESOTA

State Medical Meeting in St. Paul.—The eighty-eighth annual session of the Minnesota State Medical Association will be held at the St. Paul Auditorium, St. Paul, May 26-28, with headquarters at the Hotel St. Paul, with the Ramsey County Medical Society as host. Out of state speakers will include:

- Dr. Walter M. Simpson, Dayton, Ohio, New Development in the Diagnosis and Treatment of Brucellosis.
- Dr. Edward D. Churchill, Boston, War Injuries of the Chest.
- Dr. Henry C. Sweany, Chicago, Pathologic Interpretations of Radiological Shadows in Pulmonary Tuberculosis.
- Dr. Archibald D. McCannell, Minot, N. D., Eye Injuries.
- Dr. Thomas M. Joyce, Portland, Ore., Twenty-Five Consecutive Compound Fractures.
- Dr. Sumner L. S. Koch, Chicago, Primary Treatment of Wounds.
- Dr. Henry H. Kessler, Newark, N. J., Rating of Disabilities.
- Dr. Albert D. Kaiser, Rochester, N. Y., Role of Tonsils and Adenoids in Respiratory Infections.

The Russell D. Carman Memorial Lecture, sponsored by the Minnesota Radiological Society, will be delivered Tuesday afternoon by Dr. LeRoy Sante, professor and head of the department of radiology, St. Louis University School of Medicine, on "Roentgen Observations of Chest Injuries." The annual banquet will be addressed in the evening by Dr. Berton J. Branton, Willmar, president of the state medical association, and Col. John R. Hall, Washington, D. C., director of the hospital division, surgeon general's staff, U. S. Army.

The medal of the Southern Minnesota Medical Association will also be awarded at this time. Wednesday afternoon will be devoted to a symposium on medical preparedness for national defense with the following speakers:

- Dr. Frederick L. Smith, Rochester, Preparedness in Minnesota: A Report.
- Colonel Hall, The Doctor in the New Army.
- Dr. Russell M. Wilder, Rochester, Nutrition and Defense.
- Dr. Richard B. Hullsiek, St. Paul, Physical Defects of Selectees.
- Dr. Harold S. Diehl, Minneapolis, Medical Officers of the Future.

A special all day program on the surgery of trauma will be offered Tuesday for the state association and the Great Northern Railway Surgeons' Association, which will also be in annual session at this time. The Minnesota Society for the Prevention of Blindness will sponsor a dinner meeting Monday May 26 at the Hotel St. Paul, and Dr. Gaylord W. Anderson, Minneapolis, will discuss "Conservation of Vision." Societies sponsoring guest speakers at the state society meeting this year include the St. Paul Clinical Club, Dr. Churchill; the Trudeau Society, Dr. Sweany; the Northern Minnesota Medical Association, Dr. Kessler, and the Northwestern Pediatric Society, Dr. Kaiser. John M. Pratt, executive administrator, National Physicians' Committee for the Extension of Medical Service, Chicago, will address a meeting of this committee on Monday May 26. The fortieth annual reunion of the class of 1901 of the University of Minnesota Medical School will be held Monday at a dinner. There will be other reunions and entertainment, including the annual golf tournament at the White Bear Yacht Club on Sunday. The woman's auxiliary to the state medical society will meet in annual session May 26-28, and the Minnesota branch of the American Medical Women's Association will hold a luncheon meeting May 26.

MISSISSIPPI

Health Units.—Dr. George E. Gibbons, Macon, is now health officer of the Noxubee County health unit and Dr. George B. Neukom, Batesville, has been placed in charge of the health department in Panola County. New health units have been created for Benton-Tippah counties with headquarters in Ripley; Prentiss County with headquarters in Booneville, and a Tri-County District composed of Covington, Jefferson Davis and Lawrence counties with headquarters in Prentiss. Dr. John C. Powell, Coldwater, has been named health officer of Prentiss County. Dr. Aubrey A. Aden, Yazoo City, has been appointed health officer of the Benton-Tippah unit. Dr. Isee L. Connell, Birmingham, has been placed in charge of the Clarke County health department.

Grant for Medical Library.—The University of Mississippi Medical School, University, has received a three year grant totaling \$7,500 for the Rowland Medical Library. The gift is part of the University Library Fund created by grants from the General Education Board and matched by the university. The first year's grant will be used to complete the files of the scientific periodicals now carried by the library. In most cases this will be carried back to 1920, but in special cases the files will be completed back to volume one of the respective periodicals. Additional periodicals, monographs and special textbooks will be purchased. The routine program of the library will be pursued as usual with funds from the regular budget and "The Friend of the Library," an organization sponsored by Dr. Peter W. Rowland, Oxford, field director of the library. The library contains seven thousand volumes, of which one hundred have been added since the first of the year. In 1938 the university launched a five year program to enlarge the library.

NEBRASKA

Sentenced for Forgery and Illegal Practice.—According to the Grand Island *Independent*, Bruce L. Van Wyck, who posed as a physician at Wood River in January, was sentenced to three years in the state penitentiary on each of two counts of forgery and fined \$100 on a charge of practicing medicine without a license after he pleaded guilty before District Judge E. G. Kroger in Grand Island, February 10. Van Wyck is reported since 1930 to have served two terms in federal prisons at Lewisburg, Pa., and Stillwater, Minn., for impersonating a federal officer and for grand larceny by check. He was released from Stillwater on Dec. 21, 1940 and in less than a month he appeared in Wood River posing as "Dr. H. B. Remore," it was said. Later he was located in Cheyenne, Wyo., where he said he was an operator of night clubs. He was arrested there, January 26, on charges of forgery and later released to the Nebraska authorities for prosecution.

NEW JERSEY

Chemist Appointed.—Oskar Wintersteiner, Ph.D., assistant professor of biochemistry at Columbia University College of Physicians and Surgeons, New York, since 1929, has been appointed head of the division of organic chemistry at the Squibb Institute for Medical Research, New Brunswick, effective July 1. Dr. Wintersteiner succeeds the late Erhard Fernholz, whose body was recently found in Lake Carnegie near his home in Princeton.

Society News.—Dr. Emil Novak, Baltimore, addressed the Passaic County Medical Society, April 17, at Hope Dell on "Cancer as It Concerns the Gynecologist."—Dr. Hugo Roessler, Philadelphia, addressed the Hudson County Medical Society, Jersey City, April 1, on "Aspects of Circulatory Disturbances."—Dr. Catharine Macfarlane, Philadelphia, discussed "Progress in Cancer Prevention Research" at a meeting of the Cumberland County Medical Society, Bridgeton, April 8.—Dr. Francis Carter Wood, New York, addressed the Essex County Medical Society, Newark, April 10, on "Improvements in Diagnosis and Treatment of Lymph Node Disease."—Dr. Walter I. Lillie, Philadelphia, addressed the Medical Society of Atlantic County, Atlantic City, April 18, on "Fundal Changes Associated with Arterial Hypertension."

NEW YORK

Research in Urology.—The department of urology of the University of Rochester School of Medicine is to receive about \$1,200,000 from the estate of the late Dr. Henry C. Buswell, at one time associate professor of medicine at the University of Buffalo. The estate is set up in trust funds for Dr. Buswell's widow and two sisters and on their deaths will revert to the university. Dr. Buswell died in Strong Memorial Hospital, Rochester, March 4, 1940.

Society News.—Drs. John C. M. Brust and John B. Alsever, Syracuse, addressed the Steuben County Medical Society, Corning, April 10, on "Diagnosis and Management of Common Anorectal Diseases" and "Organization of a Plasma and Blood Transfusion Service in the Syracuse University Medical Center" respectively.—Dr. Henry H. Ritter, New York, addressed the Fulton County Medical Society, Gloversville, April 4, on "The Fracture Problem" and the Oswego County Medical Society, Fulton, April 3, on "Treatment of Common Fractures."—Col. Charles M. Watson, M. C., U. S. Army, surgeon, Second Corps Area, Governors Island, addressed the Medical Society of the County of Westchester, White Plains, April 15, on "Expansion of Medical Department Activities in the Army."—Dr. Cecil K. Drinker, Boston, gave an Eastman Memorial Lecture at the University of Rochester School of Medicine, April 3, on "Some Practical Considerations of the Lymphatic System."—Clarence Cook Little, Sc.D., Bar Harbor, Maine, managing director of the American Society for the Control of Cancer, gave a public lecture on "The Optimistic Side of Cancer" in Rochester, March 30, under the auspices of the Rochester Academy of Medicine, the Medical Society of the County of Monroe and the University of Rochester School of Medicine.

New York City

The Brickner Lecture.—Dr. Franklin C. McLean, professor of pathologic physiology, University of Chicago, The School of Medicine, delivered the tenth Walter M. Brickner Lecture at the Hospital for Joint Diseases, May 2, on "Calcification and Ossification: Some Aspects of the Physiology of Bone."

Harvey Lecture.—The eighth Harvey Lecture of the current series sponsored by the Harvey Society at the New York Academy of Medicine will be delivered, May 15, by Rebecca C. Lancefield, Ph.D., associate at the Rockefeller Institute for Medical Research. Her subject will be "Specific Relationship of Cell Composition to Biological Activity of Hemolytic Streptococci."

Film on Wassermann and Kline Tests.—The New York City Department of Health has prepared a 16 mm. film on the Wassermann and Kline tests on specimens of blood and spinal fluid. The film, produced by the bureau of social hygiene, is called "The Laboratory and Venereal Disease Control." It is available in black and white and in color and offered without charge by the bureau for showings to medical schools and societies, to hospital staffs, to nursing groups and to laboratory and public health workers in New York.

Symposium on Syphilis.—The annual symposium on syphilis at Columbia University College of Physicians and Surgeons was held March 28-29 and April 4-5. The first week-end meetings were devoted to lectures by Drs. Harry C. Solomon, Boston; Norman R. Ingraham and John A. Kolmer, Philadelphia; Edwin P. Maynard Jr., Ross Golden, Paul C. Swenson and A. Benson Cannon. The second period was spent on demonstrations in the Vanderbilt Clinic. Fourth year students of Cornell University Medical College and New York University College of Medicine were invited to participate.

Publication of Dr. Schilder's Books.—The Society for Psychotherapy and Psychopathology of New York has appointed a committee headed by Dr. Bernard Glueck to arrange for the publication of one or more of the books of the late Dr. Paul F. Schilder. Contributions to make the publication possible may be sent to the secretary of the committee, Dr. Frank J. Curran, 404 East Fifty-Fifth Street. Dr. Schilder, who died on Dec. 8, 1940 as a result of injuries received when struck by an automobile, was research professor of psychiatry at New York University College of Medicine and clinical director of the psychiatric division of Bellevue Hospital. He was the author of "Introduction to a Psychoanalytic Psychiatry" and several books published in Berlin and Vienna.

NORTH CAROLINA

Courses in Medicine.—The University of North Carolina School of Medicine, Chapel Hill, and its extension division have recently sponsored graduate courses in medicine in Wilson and Raleigh. The speakers on the Wilson series were:

- Dr. Eldridge L. Eliason, Philadelphia, The Catastrophes of Peptic Ulcers, March 5.
- Dr. Alexis F. Hartmann, St. Louis, Gastrointestinal Diseases in Children, March 19.
- Dr. Joseph Earle Moore, Baltimore, Interpretation of Serologic Tests for Syphilis, March 26.
- Dr. William B. Porter, Richmond, Va., The Heart in Pregnancy, April 2.
- Drs. Baldwin H. E. W. Lucke and Francis C. Wood, Philadelphia, clinico-pathologic conference, April 9.
- Dr. Edward A. Schumann, Philadelphia, Management of Pregnancy, April 16.

In the series at Raleigh the speakers were:

- Dr. Harrison F. Flippin, Philadelphia, Uses and Abuses of Sulfanilamide, Sulfapyridine and Sulfathiazole, March 14.
- Dr. Hartmann, Gastrointestinal Diseases in Children, March 20.
- Dr. Louis A. Buie, Rochester, Minn., Diagnosis and Common Treatment of Diseases of the Colon and Rectum, March 28.
- Dr. William Wayne Babcock, Philadelphia, Diagnosis of Acute Abdominal Conditions, April 4.
- Dr. Russell L. Haden, Cleveland, Diagnosis and Treatment of Anemias, April 11.
- Dr. Schumann, Management of Pregnancy, April 17.
- Dr. Percy S. Pelouze, Philadelphia, Office Urology, April 25.

OKLAHOMA

State Medical Meeting.—The forty-ninth annual session of the Oklahoma State Medical Association will be held in Oklahoma City, May 19-21, with headquarters at the Skirvin Tower Hotel. The following guest speakers will address the general sessions:

- Dr. Ralph Pemberton, Philadelphia, Present Status and Treatment of Arthritis.
- Dr. Axel N. Arneson, St. Louis, Carcinoma of the Cervix Uteri.
- Dr. Lauren H. Smith, Philadelphia, Psychiatric Aspects of the National Emergency.
- Dr. Earl Garside, Chicago, Conservative Treatment of Appendiceal Peritonitis.
- Dr. Meyer Wiener, St. Louis, Significance of Accurate Detailed Ophthalmological Information and Its Interpretation as a Factor in Neurological Diagnosis.
- Dr. James R. Reinberger, Memphis, Tenn., Diagnosis and Treatment of Puerperal Infections with Special Reference to Sulfanilamide.

The guests will also address section meetings. The Oklahoma County Medical Association will entertain members of the state association at supper Monday evening May 19, after which there will be addresses by Col. William Lee Hart, surgeon of the Eighth Corps Area, U. S. Army, Fort Sam Houston, Texas, on "Organized Medicine in the National Defense Program" and Col. Raymond W. Bliss, commanding officer, station hospital, Fort Sill, on "The Present World War from the Medical Standpoint." There will also be a meeting of the selective service examining physicians, with Lieut. Col. Richard H. Eanes, of the Selective Service National Headquarters, Washington, D. C., and Gov. Leon Phillips as the speakers. The Oklahoma Pediatric Association will meet Monday May 19 with Dr. Herbert J. Rinkel, Kansas City, Mo., as guest speaker on allergy. At a public health meeting Tuesday, May 20, Dr. Robert B. Greenblatt, Augusta, Ga., will discuss "Public Health Aspects of the Five Venereal Diseases" and I. Forrest Huddleson, Ph.D., East Lansing, Mich., "Diagnosis

and Control of Brucellosis." The woman's auxiliary to the state association will hold its annual meeting May 19-20. Dr. Henry H. Turner, Oklahoma City, is president of the association.

PENNSYLVANIA

Tuberculosis Meeting.—The forty-ninth annual meeting of the Pennsylvania Tuberculosis Society was held at Erie, April 16-17. The speakers included Dr. Edgar S. Everhart, Harrisburg, medical adviser, state selective service board, on "Public Health in Relation to National Defense Preparations"; Dr. Robert E. Plunkett, New York State Department of Health, Albany, "The Chest Clinic as a Diagnostic and Consultation Center for the General Practitioner of Medicine," and Theodore Hatch, M.S., associate professor of industrial hygiene, department of public health and preventive medicine, University of Pennsylvania School of Medicine, Philadelphia, "Tuberculosis Control in the Industrial Health Program." At a medical session at Hamot Hospital Drs. Louis H. Clerf, Philadelphia, and Walter L. Rathbun, Cassadaga, N. Y., spoke on "Use of Bronchoscopy in Tuberculosis and Other Bronchopulmonary Diseases" and "Tuberculosis of the Lungs in the Younger Age Groups" respectively.

Philadelphia

Physical Therapy Meeting.—The Pennsylvania Physical Therapy Society and the Philadelphia Orthopedic Club held a combined meeting at Jefferson Hospital, April 10, with the following speakers, among others: Drs. Abraham M. Rechtman, on "Early Treatment of Infantile Paralysis"; Robert P. Sturr, "Physical Therapy in Relation to Peripheral Vascular Disease of the Extremities," and Benjamin Ulanski, "Treatment of Sciatica."

Collection of Apothecaries' Wares.—A collection of apothecaries' jars and mortars assembled by the late Mr. David Costello, a New York pharmacist, has been bought by Mr. Josiah K. Lilly, Indianapolis, chairman of the board of directors of Eli Lilly and Company, and presented to the Philadelphia College of Pharmacy and Science. Both Mr. Costello and Mr. Lilly are graduates of the college. The collection contains more than one hundred and fifty rare pieces, some of which are several hundred years old, including jars of faenza and majolica, decorated with coats-of-arms and heraldic insignia, many of blown glass, Spanish, Italian, Delft and French alberellos and an extensive collection of mortars and pestles in bronze, marble, wood and ivory.

TENNESSEE

State Medical Election.—Dr. James B. Stanford, Memphis, was named president-elect of the Tennessee State Medical Association at the annual meeting in Nashville, April 8-10, and Dr. Hiram A. Laws Jr., Chattanooga, became president. Vice presidents elected were Drs. Cassius W. Friberg, Johnson City; John S. Freeman, Springfield, and Glenn D. Batten, Jackson. Dr. Harrison H. Shoulders, Nashville, was reelected secretary. The 1942 meeting will be held in Memphis.

New Health Officers.—Dr. Roy J. Settle, formerly of Inman, S. C., has been appointed director of the Monroe County health unit with headquarters at Madisonville.—Dr. Harry E. Wright, formerly of Dallas, Texas, has been appointed health officer of Marshall County.—Dr. Clifford B. Cole, Dyersburg, has been appointed health officer of Fayette County to succeed Dr. Henry N. Moore, Somerville, who resigned to enter private practice.—Dr. Landon H. Gurnee, Knoxville, has been named director of the Unicoi County health unit to succeed Dr. Walter C. Humbert, Erwin, who is in military service.

WASHINGTON

Society News.—Drs. Conrad Jacobson and Roger Anderson, Seattle, addressed the King County Medical Society, Seattle, April 7, on "Factors in Surgical Mortality (Critical Hospital Survey)" and "Advances in the Treatment of War Injuries" respectively.—Dr. Edward R. Anderson, Tacoma, addressed the Pierce County Medical Society, Tacoma, April 22, on "Oral and Parenteral Use of the Synthetic Vitamin K."

Personal.—Dr. Albert I. Bouffleur, Seattle, has retired as chief surgeon of the Chicago, Milwaukee, St. Paul & Pacific Railroad after thirty years in that position and fifty-one years with the road. His successor will be Dr. Harry Eugene Allen, Seattle, who has been Dr. Bouffleur's assistant for many years.—Dr. Cecil R. Fargher, Vancouver, has been named health officer of Vancouver and Clark County.

GENERAL

Branch Meeting.—The Western branch of the American Public Health Association will hold its annual meeting at the Hotel San Diego, San Diego, Calif., May 26-29. Among the speakers will be Drs. Jacob C. Geiger, San Francisco, on "England's Wartime Experience in Public Health and What We Can Learn from It" and Walter T. Harrison, San Francisco, "The Public Health Program in Areas Adjacent to Military Centers."

Awards for Investigation of Epilepsy.—The Laymen's League Against Epilepsy announces that two awards of \$100 each for the best original unpublished observations or investigations bearing on the subject of epilepsy have been granted. Dr. Walter L. Bruetsch, Central State Hospital, Indianapolis, received one offered for work done in a state epileptic colony or mental hospital for his observations on "Rheumatic Epilepsy." The second award, offered for work done elsewhere than in state institutions, went to Dr. Frederick A. Fender, Stanford University Hospital, San Francisco, for his work on "Convulsions Following Remote Electrical Stimulation of Subcortical Cerebral Levels."

Certification of the General Practitioner.—The National Board of Medical Examiners has appointed a committee to study the question of certifying the general practitioner, with Dr. Waller S. Leathers, Nashville, Tenn., as chairman. Dr. Louis B. Wilson, director of the Mayo Foundation, Rochester, Minn., has been asked to serve as consultant to the committee. The committee will confer with various medical authorities and organizations as to the best method of providing recognition for the progressive, up-to-date, efficient and well trained general practitioner, the announcement said. Such a certification would bear a relation to general practice similar to that of the certificates now granted by the examining boards in the specialties, it was said.

Grants for Cancer Research.—The National Advisory Cancer Council at its regular meeting at the National Cancer Institute, Bethesda, Md., March 31, approved the following grants for research:

Meharry Medical College, Nashville, Tenn., \$1,100 for maintenance of clinical records for statistical analysis.
Jackson Memorial Laboratory, Bar Harbor, Maine, \$15,000 for research on genetics of cancer.
Barnard Free Skin and Cancer Hospital, St. Louis, \$5,000 for research on changes in cancer cells.
American Registry of Pathology, Army Medical Museum, Washington, D. C., \$1,000 for collection and registry of pathologic specimens.
Cornell University Medical College, New York, \$2,700 for study of "butter yellow" liver tumors of rats.

The council approved a plan to organize programs of research and of education on cancer of the stomach.

Meeting of Otologists.—The seventy-fourth annual meeting of the American Otological Society, Inc., will be held at the Marlborough-Blenheim Hotel, Atlantic City, N. J., May 26-27, under the presidency of Dr. George M. Coates, Philadelphia. A military symposium is one feature of the program with the following speakers:

Dr. Harris P. Mosher, Boston, Lessons Learned from the Last War.
Dr. Edmund P. Fowler, New York, Hearing Standards for Acceptance, Disability Rating and Discharge.
Dr. William E. Grove, Milwaukee, Management of Injuries to the Middle and Internal Ear, Including Fractures of the Petrous Bone.
Dr. Douglas Macfarlan, Philadelphia, Prevention and Treatment of Acoustic Trauma in War and Civil Life.
Dr. Eugene R. Lewis, Los Angeles, Malingering and Neuro-Otologic Considerations in Army Service.
Comdr. John R. Poppen, medical corps, U. S. Navy, Washington, D. C., Otologic Problems on Naval Vessels.

Meeting of Clinical Pathologists.—The twentieth annual meeting and eighth seminar of the American Society of Clinical Pathologists will be held at the Hotel Cleveland, Cleveland, May 29-June 2, under the presidency of Dr. Armin V. St. George, New York. Among the speakers will be:

Dr. Clara Raven, Youngstown, Ohio, Clinical and Laboratory Diagnosis of Leptospirosis.
Dr. Normand L. Hoerr, Cleveland, Effect of Different Fixing Methods on the Histologic Appearance of Liver and Kidney Cells.
Victor C. Myers, D.Sc., and Alfred H. Free, Ph.D., Cleveland, Clinical Significance of the Enzymatic Activity of Duodenal Contents, with a Practical Method of Recording Values.
Drs. Donald C. Beaver, David J. Sandweiss and Harry C. Saltzstein, Detroit, Effect of Urine Extracts on Healing of Experimental Peptic Ulcers in Dogs.
Drs. Harry Eagle and Joseph Earle Moore, Baltimore, The Confusing Multiplicity of Serologic Tests for Syphilis.
Dr. Harry J. Corper and Maurice L. Cohn, Ph.D., Denver, Effect of Paraffin Hydrocarbons on Tuberculinallergy and Tuberculinimmunity Produced by Tubercle Bacilli.

Dr. Howard T. Karsner, professor of pathology, Western Reserve University School of Medicine, Cleveland, will conduct a seminar, Sunday, on "Tumors of the Endocrine Glands."

Dr. Karsner will lecture on this subject Monday morning, following a clinical pathologic conference conducted by Dr. Harry Goldblatt, professor of experimental pathology at Western Reserve.

Teachers of Sight-Saving Courses.—The National Society for the Prevention of Blindness announces that it is again cooperating with several colleges and universities in offering courses for the preparation of teachers and supervisors of sight-saving courses. An elementary course is to be given at Wayne University, Detroit, under the direction of Miss Margaret Soares, June 23 to August 2. An advanced course will be given at Western Reserve University, Cleveland, by Miss Olive S. Peck, June 23 to August 2, and another at State Teachers College, Buffalo, by Mrs. Winifred Hathaway, New York, associate director of the national society, July 7 to August 15. Details may be obtained from the university or college or from the directors of the courses.

American Laryngological Association.—The sixty-third annual meeting of the American Laryngological Association will be held at the Marlborough-Blenheim Hotel, Atlantic City, N. J., May 28-30, under the presidency of Dr. Gordon Berry, Worcester, Mass. Papers to be presented include:

- Dr. Irwin G. Spiesman, Maywood, Ill., An Experimental and Clinical Study of the Common Cold.
- Dr. John A. Kolmer, Philadelphia, Science of Chemotherapy.
- Dr. Brien T. King, Seattle, Further Report on the Surgical Treatment of Bilateral Abductor Paralysis.
- Dr. Louis H. Clerf, Philadelphia, Paralysis of the Larynx.
- Dr. William D. Gill, San Antonio, Texas, Pathogenic Molds and the Lesions They Produce in the Respiratory Tract.

A symposium on bronchiectasis will be presented by Drs. Harry P. Schenck, Simon S. Leopold, Eugene P. Pendergrass, Harry Johnson and Gabriel Tucker, all of Philadelphia.

Tuberculous Ex-Soldier Missing.—Physicians are asked to be on watch for Joseph E. Taylor, aged 26, who was discharged from the U. S. Army April 11 at Camp Devens, Mass., after it was found that he had tuberculosis. He had been inducted into the service March 18. He was last seen in the railroad station at Ayer, Mass. It was said that he had bilateral tuberculous lesions and a large cavity in the upper lobe of the right lung. Taylor is 5 feet 7 inches tall, weighs 140 pounds, has blue grey eyes, may be wearing glasses. When last seen he was wearing a dark gray overcoat, light gray sport coat with plain gray trousers and a brown hat. Any one who sees this man is asked to communicate with his sister, Mrs. Austin L. Duffy, 80 Oakdale Street, Lakewood, R. I., the state department of health, Providence, R. I., or the Rhode Island state police.

Association of Genito-Urinary Surgeons.—The fifty-third annual meeting of the American Association of Genito-Urinary Surgeons will be held at The Homestead, Hot Springs, Va., May 29-31, under the presidency of Dr. Montague L. Boyd, Atlanta, Ga., who will speak on "Ulcer of the Bladder: An Unusual Ulcer Associated with Streptococcus Faecalis Infection." Included among the speakers will be:

- Dr. Albert J. Scholl, Los Angeles, Gunshot Wounds of the Kidney.
- Drs. William J. Baker and John I. Brewer, Chicago, Endometriosis of the Urinary Bladder.
- Dr. Hugh H. Young, Baltimore, Intravesical Resection of the Bladder Wall and Peritoneal Coat for Certain Bladder Tumors.
- Dr. Hermon C. Bumpus Jr., Pasadena, Calif., Cancer of the Prostate: Difficulties in the Evaluation of Treatment.
- Drs. Roger C. Graves, Boston, and Knowles B. Lawrence, Wrentham, Mass., Bilateral Embryonal Carcinoma of the Testes.
- Drs. Reed M. Nesbit and Robert H. Cummings, Ann Arbor, Mich., Use of Prostigmine in the Management of Postoperative Urinary Retention.

American Gynecological Society.—The sixty-sixth annual meeting of the American Gynecological Society will be held at the Broadmoor Hotel, Colorado Springs, Colo., May 26-28, under the presidency of Dr. Jennings C. Litzenberg, Minneapolis. Among the speakers will be:

- Dr. Leighton C. Conn, Edmonton, Alta., A Critical Review of Blood Loss in 2,000 Obstetrical Cases.
- Dr. Robert D. Mussey, Rochester, Minn., Pelvic Pain.
- Dr. Norman R. Kretschmar, Ann Arbor, Mich., Intrauterine Oxygen Exchange.
- Dr. Norman Harris Williams, Beverly Hills, Calif., Varied Significance of Heartburn of Pregnancy.
- Dr. Henry Close Hesseltine, Chicago, Vitamin Therapy in Vulvar Dermatoses.
- Dr. Charles H. Peckham Jr., Cooperstown, N. Y., Time of Onset and Duration of the Toxemias of Late Pregnancy in Relation to the Development of Permanent Vascular Change.
- Dr. Henry E. Sigerist, Baltimore, Development and Trends in Gynecology.
- Dr. Francis L. McPhail, Great Falls, Mont., The Cause and Possible Late Effect of Anoxia in the Newborn.
- Dr. Carl E. Bachman, Philadelphia, Application of Chemical Methods to Studies of the Excretion of Estrogens During Pregnancy.

CORRECTION

Skin Peeling and Scarification.—Following publication in THE JOURNAL, March 8, of the article by Eller and Wolff on skin peeling, a number of letters were received protesting that the photographs were misleading. Most of these letters asserted that the photographer had utilized light effects which emphasized unduly in the "before" pictures the shadows made by pits, scars and discolorations and which minimized the cosmetic defects in the "after" pictures. Such letters were received from:

- Dr. S. Miles Bouton Jr., Albany, N. Y.
- Dr. Eugene A. Field, Providence, R. I.
- Dr. L. Henry Garland, San Francisco.
- Dr. Hans W. Liepmann, Monroe, N. Y.
- Dr. Ira C. Nichols, Providence, R. I.
- Dr. Carl C. Pfeiffer, Detroit.
- Dr. Joshua Schwartz, New York.
- Dr. William B. Swarts, Greenwich, Conn.
- Dr. L. P. Tischler, Schenectady, N. Y.
- Dr. Stanley R. Truman, Oakland, Calif.
- Dr. H. P. Worstell, Columbus, Ohio.

These letters were sent to the author, Dr. Joseph J. Eller, asking for a statement. The author, in turn, referred the letters to the professional photographer, Mr. Martin Haggett, 220 West Forty-Second Street, New York. Mr. Haggett stated that the biggest offender was the engraver who prepared the halftones. "For he evidently washed out in etching or in too light a negative any detail that should have been retained from the original print. . . . The lesser offender is myself, who did all the photography, except the one used as figure 3." Mr. Haggett then carefully analyzed the lighting effects secured in each of the illustrations.

The explanations and statements of Mr. Haggett were referred to the Wallace-Miller Company, 466 West Superior Street, Chicago, the photo engravers who prepared the halftones. The engraver writes: "I find the halftones have been overetched and I wish I had seen the proofs before they were printed. I have been away and did not see the job until now."

"We have been making halftones for you for many years and this is the first time we have made this mistake. I am sorry it happened and I will assure you it won't happen again."

Government Services

The Army Medical Library

A contract for preliminary sketches and planning, including the selection of a site, has been awarded to Eggers & Higgins, New York, for the Army Medical Library and Museum, Washington, D. C., the estimated cost of which will be \$3,750,000.

Commissions in Public Health Service

The following physicians have been commissioned as assistant surgeons in the regular corps, U. S. Public Health Service, effective February 1, terminating their commissions in the same rank in the reserve:

- Clarence K. Aldrich, New York.
- Robert D. Berkebile, Memphis, Tenn.
- Roy E. Wolfe, Galveston, Texas.
- John G. Crawford, Baltimore.
- Paul W. Lucas, Baltimore.
- Evert A. Swenson, New Orleans.
- Vernon W. Foster, Boston.

Examination for Interns in the Navy

The surgeon general of the navy recently announced that a large number of appointments as acting assistant surgeon for intern training in naval hospitals are being offered. Examinations for these appointments will be held June 23-26, inclusive, at all the larger naval hospitals in the continental limits of the United States. Applications for authorization for these examinations should be forwarded before May 23 to the Bureau of Medicine and Surgery, Navy Department, Washington, D. C. Applicants must be citizens of the United States over the age of 21 but less than 32 at the time of acceptance of the appointment; must be graduates or members of the graduating class of recognized medical schools and must meet the physical and other requirements. Other information may be obtained from the Bureau of Medicine and Surgery.

Health in Factories as Good as Before the War

It has previously been reported in *THE JOURNAL* that the general health of our people has not suffered in consequence of the war. This is confirmed by the latest official returns. It was feared that, as typhoid is water borne, the damage of drains by bombing would increase it. But its incidence, as well as that of the other common infectious diseases, is below normal. Actually there were only 32 cases of typhoid up to February 8 this year, 1 more than for the same period last year, but only a third of those for 1939 and half those for 1938. The government's attention to health in factories has been well rewarded. The provision of canteens in and out of factories, the reduction of the long hours in the first year of the war and the development of medical services have kept the workers in good condition. It was feared that the congregating of people in air raid shelters would spread disease. But disease has

Incidence of Influenza, Scarlet Fever and Diphtheria

	Cases	Deaths
Influenza		
1941	778	
1940	1,827	
1939	1,309	
1938	407	
Scarlet Fever		
1941	3,568	12
1940	2,689	12
1939	4,788	10
1938	7,701	31
Diphtheria		
1941	3,787	244
1940	2,053	129
1939	3,563	156
1938	6,224	236

diminished; it seems that the result is a self-immunizing effect. Moreover, when illness does occur it is attended to much more quickly, in many cases, than if the person had been leading the ordinary home life, because of the medical service organized for the shelters. Nor has evacuation to the country spread disease, as some physicians predicted. The official figures for the period up to February 8 and for the 20,000,000 persons inhabiting London and the other large cities show that 1941 is below the average of the preceding three years.

The Bread Controversy

The rationing of food has brought the question of nutrition to the front, and bread is again a matter of controversy. The tide has set in favor of wholemeal bread. It is being recognized how large is the loss in the removal of the germ and husk from the wheat berry. The government has ordered the addition of vitamin B₁ and calcium to the white loaf. But critics say that this is only a partial restoration. White bread is wanting in the other elements of the B complex, in iron and in other salts. Why allow valuable ingredients to be removed and then go to the trouble and expense of restoring only some of them? The government has therefore also ordered the production of a standard flour of 85 per cent extraction from the wheat berry (instead of the 73 per cent for white flour). Experts have advised that this percentage gives the maximum of digestibility and nutriment. But other experts declare that the 15 per cent removed in making the new flour contains the germ and its vitamins and that the bran removed contains mineral salts and gluten. The government is therefore considering the production of flour of 100 per cent extraction.

This would be a true wholemeal flour—a thing unknown. The view of many dietitians is that extraction of the husk from the wheat berry is desirable because of its indigestibility, but they have not attempted to justify the extraction of the germ. Moreover, the need for "roughage" in our food, as a preventive of constipation, is admitted.

The government proposes that the new bread, of 85 per cent extraction, will be on sale everywhere at the same price as white bread, 16 cents the 4 pound loaf. Special breads containing more fat, which are popular in the North, may be sold at a higher price. The decision to produce the standard loaf was taken because it was found that a substantial proportion of the population wanted it. The existing brown bread on sale differs much in the degree of extraction—a point overlooked in the controversy between white and brown bread, the latter being often assumed to be equivalent to "wholemeal bread."

Canadian Red Cross Supplies

The first annual report of the Canadian Red Cross in England states that several millions of pounds were presented to the Dominion and British forces and bombed civilians during the year. More than 350,000 hand knitted woolen comforts from homes in every part of the dominion were distributed to Canadian troops and airmen in England, to British and Canadian naval men and to merchant marine organizations. These included knitted blankets from the far west, bags for patients' belongings, bed jackets, a million pairs of socks, 42,000 towels, 500,000 handkerchiefs and 500,000 bandages. In addition large quantities of hospital supplies were sent to British, French and Polish organizations. There were also 154 ambulances (one presented by a New York citizen), 10,000 shaving sticks, 10,000 mirrors, 4,000 tooth brushes and 112 radio sets. Food supplies included 80,500 cans of mixed fruits, vegetables, meats and fish, 21,600 cans of corn, 47,000 cans of jam, 14,800 cans of butter, 40,000 cans of sardines, 85,000 pounds of sugar and 26,775 pounds of prunes. A large part of the food was distributed by organizations attending to bombed civilians and the remainder has been stored for future emergency use of military hospitals. All these supplies were sent from Canada to England in 85,000 cases, of which only 1,800 were lost by enemy action.

The Influenza Epidemic

The fear that war might produce some increase of epidemic diseases has not been realized. In the early part of the year we expect an epidemic of influenza, which has now occurred. It is mild, as shown by the age distribution of the deaths, a large proportion of which are of persons over the age of 65 years. This is in striking contrast with the influenza pandemic of 1918, which marked the close of the last great war, when most of the victims were young and no treatment seemed availing against the malignant form of bronchopneumonia which was rife. The figures for the total weekly deaths attributed to influenza in the one hundred and twenty-six large cities were, for the four weeks ended February 8, respectively 99, 120, 176 and 261. The available London figures of hospital admissions suggest that we have already passed the maximum period of the epidemic.

Further Extension of the Medical Register

In a previous letter, the extension of the Medical Register which enables Canadian and United States physicians to register for the duration of the war was reported. A further extension is now announced. It extends this permission to physicians qualified in any part of the British Empire, in the countries of our European allies or in Germany or Italy. Under this order the physician must be selected either for a medical commission in one of the fighting forces or for employment in a hospital, institution or service not involving attention in the patient's own home.

ITALY

(From Our Regular Correspondent)

Feb. 15, 1941.

International Radiomedical Center

The board of directors of the International Radiomedical Center recently presented the annual report. There were ninety-two radiomedical calls from steamers on voyages, seventy-two being for medical diseases, nine for surgical diseases and eleven for accidents. In grave conditions the consulting center directed care of the patients all through the course of the disease until they were completely cured or until they were disembarked and sent to hospitals. The Italian Radiomedical Center had the majority of calls during the year, ninety-two; France had twenty-two, England seventeen and Belgium five.

Tumors of the Lung

At a meeting of the Società di Chirurgia of Naples, Professor Rizzi discussed carcinoma of the lung. In 1 of 3 cases reported, the carcinoma of the upper lobe was composed of flat epithelium with epithelial pearls and marginal sclerosis. In another case the diagnosis was made by means of a biopsy of an inguinal metastasis which showed carcinoma with polygonal epithelium with foamy clear cells. Macroscopically, tumors of the lung may be single or multiple, massive, pleuropulmonary and cirrhotic. The microscopic classification is difficult, as it depends on the various types of cells (cylindricobronchial, cubicobronchial, fat alveolar and mucous glandular) in the lung. Morphologically there are four types of tumors: (1) those with undifferentiated small cells, (2) those with cornified or uncornified flat cells, (3) those with cylindric cells and (4) those with polyform cells. In the cases reported by the speaker, diffusion took place by contiguity: without involvement of the pulmonary lymphatic routes in the first case, limited in the sclerotic cavity of the lung in the second and diffused from an apical node to the involved lung in the third case. Apical sclerosis plays an important part in the development and evolution of pulmonary tumors. It blocks the territorial lymphatic circulation on the one hand and stimulates production of the tumor on the other.

Anthropologic Identifications

Prof. Lido Cipriani, head of the Museo Antropologico of the University of Florence, made observations on the bones of Pico della Mirandola and Angelo Ambrogini, known in literary annals as Angelo Poliziano, which are preserved in the San Marco Church of Florence. [Pico della Mirandola, Italian philosopher and writer and Angelo Poliziano, Italian scholar and poet, both died in 1494.] He observed that the cranium of Pico della Mirandola showed abnormalities which may explain Pico's remarkable intelligence and extraordinary memory. The right half of the coronal suture was abnormal. The sagittal suture presents signs of an early ossification. Examination of the cranium and the skeleton suggested that endocrine dysfunction may have influenced the development of the body to a high degree. The tomb of Poliziano, which is about 2 meters deep, contained bits of a wooden box and some fragile bones. Examination of the bones suggested that Poliziano was short in stature and that the body inclined toward the left as a result of abnormal development of the facets of the cervical vertebrae. The cranium was very large. The face was long and the nose was large. The neck and nose were slightly deformed.

Experiments on Esophageal Dilatation

In a lecture at the surgical clinic of the University of Sassari, Prof. Mario Agrifoglio reported experiments on sympathetic dystonia of some segments of the digestive tract. The author studied the pathogenic mechanism of idiopathic dilatation of the esophagus. There is the opinion that megaesophagus is due to spasm of the cardia; there are other theories. Professor Agrifoglio induced, in dogs, esophageal idiopathic

dilatation by decortication of the cardiac segment of the esophagus without injury to the main pneumogastric trunks. The functional esophageal changes depend on dysfunction of the nerves which supply the esophagus. The functions of the sympathetic nerves which regulate the muscular tonus of the smooth fibers of the tunic of the lower wall of the esophagus are predominantly involved. Those of the vagal nerves are secondarily involved, as observed by the behavior of the peristaltic waves, which slowly cross the esophagus down to the cardia and appear to be shallow.

From these experiments the speaker believes that grave diffuse dilatation of the esophagus originates in a dysfunction of the sympathetic tonicity as the primary factor, and a functional imbalance of the peripheral visceral nervous segments as a secondary factor. Because the intrinsic and extrinsic nerve supply of the large intestine is analogous to that of the esophagus, the speaker repeated these experiments on a segment of the colon with the aim of producing megacolon. However, it could not be reproduced, as even slight decortication of the sympathetic nerves to the colon caused an immediate and persistent diminution of the lumen of the intestinal segment from contracture of the muscular tunic of the colon. These experiments help to explain postoperative intestinal occlusion.

Marriages

WILLIAM LOUIS JANUS, Lieut. (j. g.) M. C., U. S. Navy, Swedesboro, N. J., to Miss Dorothy Taylor Alexander of Kennett Square, Pa., at Waikiki, Hawaii, February 5.

NATHANIEL WHITE KUYKENDALL JR., Memphis, Tenn., to Miss Sara Pauline Williamson of Water Valley, Miss., in Osceola, Ark., January 31.

THOMAS LEONARD WATSON, Charlottesville, Va., to Miss Elizabeth Baumeister of Portsmouth in December 1940.

HERMAN FRANKLIN EASOM, Sanatorium, N. C., to Miss Kathryn Amanda Scroggs of Raleigh in December 1940.

ZACHARY FILLMORE LONG to Miss Virginia Fay Cox, both of Rockingham, N. C., at High Point, February 1.

RALPH CONNER REID, Charlotte, N. C., to Miss Nancy Lanier of New York at Greenwich, Conn., January 1.

FRED BRINNING ROACHE, Owensboro, Ky., to Miss Martha Vivian Whitehouse in December 1940.

LEWIS B. HUNTER, Wallace, Idaho, to Miss Willadene Berberet of Spokane, Wash., February 8.

GEORGE BARKSDALE CRADDOCK to Miss Mary Spencer Jack, both of Lynchburg, Va., February 1.

L. RAGAN LONNERGAN JR. to Miss Dorothy Liles, both of Gadsden, Ala., in December 1940.

TRUMAN WALTER WHITFIELD JR., Jasper, Ga., to Miss Mozell Creech in Atlanta, February 9.

LEE E. BRANSFORD JR. to Miss Edna Earle Hobbs, both of Jacksonville, Fla., February 8.

PHILIP BERNARD BLEECKER to Miss June Boyer, both of Memphis, Tenn., February 8.

BEVERLY KENNON PETER to Miss Mary Shanklin, both of Beckley, W. Va., February 8.

CLYDE A. SMITH to Miss Mary Caperton Banks, both of Beckley, W. Va., February 8.

PRENTISS BAILEY, Montgomery, Ala., to Miss Edith Larabee of Chicago, January 29.

ALEX E. FAIRSHTER, Brookport, Ill., to Miss Jeanne Gorman in Philadelphia, February 4.

JAMES J. REDMOND to Miss Frances Ann Peck, both of Cedar Rapids, Iowa, February 5.

LOUIS ERIC MARSHALL to Miss Helen Brandt, both of New York, February 23.

CHARLES N. EARL, Portland, Ore., to Miss Betty Vogel of Union, January 4.

HENRY ROSS, New York, to Miss Glenda Farrell in Passaic, N. J., in January.

HAROLD S. FRIEDMAN to DR. MARY ZELDES, both of Chicago, Feb. 1, 1939.

Deaths

Henry Larned Keith Shaw * Albany, N. Y.; Albany Medical College, 1896; instructor in diseases of children from 1899 to 1903, lecturer from 1903 to 1906, clinical professor of pediatrics from 1906 to 1938 and since 1938 professor of pediatrics at his alma mater; consulting pediatrician, New York State Department of Health, from 1912 to 1914; in the latter year organized its division of child hygiene, of which he was director until 1919; since that time had continued his association with the department in an advisory capacity and for many years had been consultant in child hygiene; was a member of its advisory committee on maternal and child welfare; past president of the American Pediatric Society and the American Child Hygiene Association; member of the American Academy of Pediatrics; in 1906 a delegate to the International Medical Congress in Lisbon, Portugal; medical examiner for the American Board of Pediatrics; served during the World War; attending to the pediatrician, Albany Hospital; medical director of the St. Margaret's House and Hospital; consulting pediatrician to the Little Falls (N. Y.) Hospital, Brady Memorial Hospital, Albany, Glens Falls (N. Y.) Hospital, Vassar Brothers Hospital, Poughkeepsie, Memorial Hospital of Greene County, Catskill, and the Mary McClellan Hospital, Cambridge; author of "Communicable Diseases in Children"; translator of Pfandl and Schlossman's "Diseases of Children"; aged 67; died, March 26, of coronary thrombosis.

John Larrabee Pomeroy, Los Angeles; Hospital College of Medicine, Louisville, Ky., 1903; University and Bellevue Hospital Medical College, New York, 1909; member of the California Medical Association; professor of public health and preventive medicine at the College of Medical Evangelists; assistant surgeon in the United States Army from 1907 to 1909; served during the World War; past president of the Western Branch of the American Public Health Association; was a director of the Los Angeles County Tuberculosis Association; for many years health officer of Los Angeles; in 1934 was awarded the Peter Ling Award by the American Public Health Association; aged 57; died, March 24, in the California Lutheran Hospital of chronic nephritis.

Collier Ford Martin * Philadelphia; University of Pennsylvania Department of Medicine, Philadelphia, 1900; professor and vice dean of proctology at the Medico-Chirurgical College, Graduate School of Medicine, University of Pennsylvania; formerly professor of proctology at the Temple University School of Medicine; member of the American Proctologic Society; fellow of the American College of Surgeons; served during the World War; aged 68; died, March 22, in the Graduate Hospital, of diabetes mellitus and acute hepatic insufficiency.

Henry Garnsey Ohls * Chicago; Rush Medical College, Chicago, 1887; served for many years as assistant chief of the bureau of vital statistics, Chicago Department of Health; in 1909 became a member of the editorial staff of the *Illinois Medical Journal* and four years later was named its managing editor, which position he held for twenty-eight years; aged 80; died suddenly, March 17, of coronary thrombosis.

Leo Handel Neuman * Albany, N. Y.; Albany Medical College, 1892; member of the American Gastro-Enterological Association; professor of gastroenteric diseases and clinical professor of theory and practice of medicine at his alma mater in 1908; on the staff of the Albany Hospital from 1908 to 1919; aged 72; died, March 15, of mesenteric thrombosis.

Andrew James Gilmour * New York; Columbia University College of Physicians and Surgeons, New York, 1899; aged 70; consulting dermatologist, Englewood (N. J.) Hospital; at various times on the staffs of the Manhattan State Hospital and the New York Hospital, where he died, March 9, of arteriosclerosis and heart disease.

Leroy K. Leslie, Bareville, Pa.; Jefferson Medical College of Philadelphia, 1889; member of the Medical Society of the State of Pennsylvania; past president of the Lancaster County Medical Society; deputy coroner in Upper Leacock and Leacock townships and for many years registrar of vital statistics; aged 79; died, February 26.

Samuel Alfred Beddall, Beacon, N. Y.; University of Louisville (Ky.) Medical Department, 1917; member of the Medical Society of the State of New York; served during the World War; on the staff of the Veterans Administration Facility, Castle Point; aged 47; was asphyxiated, March 9, by illuminating gas.

William Joseph Anderson, Chicago; Chicago Homeopathic Medical College, 1898; Rush Medical College, Chicago, 1903; fellow of the American College of Surgeons; past president of the Dickinson County (Mich.) Medical Society; aged 64; died in February at the Veterans Administration Facility, Hines, Ill.

Harmon Talley Rhoads Sr. * Everett, Wash.; University Medical College of Kansas City, Mo., 1910; fellow of the American College of Surgeons; past president of the Medical Association of Montana; on the staffs of the General Hospital and the Providence Hospital; aged 61; died, February 6.

Anna Gove Richardson, Lakeville, Mass.; Woman's Medical College of Pennsylvania, Philadelphia, 1891; member of the Massachusetts Medical Society; fellow of the American College of Surgeons; for many years on the staff of the Vincent Memorial Hospital, Boston; aged 79; died, February 1.

Emmet Bernard Anderson, Americus, Ga.; Atlanta Medical College, 1916; member of the Southeastern Surgical Congress; fellow of the American College of Surgeons; served during the World War; visiting surgeon, Americus and Sumter County Hospital; aged 48; died, February 21.

Crittenden Joyes, Fort Worth, Texas; University of Louisville (Ky.) Medical Department, 1892; fellow of the American College of Surgeons; on the staffs of the Methodist and All Saints hospitals and St. Joseph's Infirmary; aged 71; died, March 23, of coronary occlusion.

John Henry Fenelon * Bloomington, Ill.; Rush Medical College, Chicago, 1889; past president of the McLean County Medical Society; aged 76; on the staffs of the Mennonite Hospital and St. Joseph's Hospital, where he died, March 3, of uremia and myocarditis.

Milton Stanton Ireland, Atlantic City, N. J.; Jefferson Medical College of Philadelphia, 1902; formerly on the staff of the Atlantic City Hospital; at one time a member of the board of education; aged 60; died, March 1, in Philadelphia of coronary thrombosis.

John B. Fleet, New Franklin, Mo.; American Medical College, St. Louis, 1887; member of the Missouri State Medical Association; formerly mayor; aged 79; died, March 16, in Portland, Ore., of acute coronary thrombosis, myocarditis and arteriosclerosis.

James Love Collins * Turlock, Calif.; St. Louis College of Physicians and Surgeons, 1909; veteran of the Spanish-American and World wars; at one time president of the school board and board of health of Sheffield, Iowa; aged 65; died, February 1.

Thomas F. Robertson, Brockville, Ont., Canada; McGill University Faculty of Medicine, Montreal, Que., 1891; was chairman of the public utilities commission in Brockville several times and senior coroner for Leeds County; aged 71; died, January 29.

Hiram B. Russell, Sheffield, Pa.; Western Reserve University Medical Department, Cleveland, 1890; member of the Medical Society of the State of Pennsylvania; past president of the Warren County Medical Society; aged 73; died, February 19.

Charles Mark Brookings, Du Quoin, Ill.; Missouri Medical College, St. Louis, 1898; member of the Illinois State Medical Society; aged 72; on the staff of the Marshall Browning Hospital, where he died, March 9, of arteriosclerosis and uremia.

Robert Reeve Dockweiler, Los Angeles; Harvard Medical School, Boston, 1933; member of the California Medical Association; on the staffs of the Presbyterian and St. Vincent's hospitals; aged 34; died, February 21, of carcinoma of the left kidney.

Carl Ellsworth Evans * Newark, Ohio; Ohio Medical University, Columbus, 1903; fellow of the American College of Surgeons; on the staff of the Newark City Hospital; aged 61; died, February 26, in Ocala, Fla., of a self-inflicted bullet wound.

Henry Buchanan Fuston * Bokchito, Okla.; University of Nashville (Tenn.) Medical Department, 1909; formerly county health officer; past president of the Bryan County Medical Society; aged 55; died, February 22, in a hospital at Durant.

Adolph Zeh, New York; College of Physicians and Surgeons, medical department of Columbia College, New York, 1887; member of the Medical Society of the State of New York; aged 77; died, February 24, of arteriosclerotic heart disease.

William Prewett Parks, Hot Springs National Park, Ark.; Hospital College of Medicine, Louisville, Ky., 1896; past president of the state board of health; at one time mayor of Mena; aged 67; died, February 7, in a hospital at Fort Smith.

Jose M. Rodriguez, Alpine, Texas; Universidad Nacional Facultad de Medicina, Mexico, D. F., 1898; aged 70; died, February 15, in a hospital at San Antonio of incarcerated inguinal hernia with perforation of the ileum and peritonitis.

De Witt Clinton MacClymont Ⓢ Northport, N. Y.; Bellevue Hospital Medical College, New York, 1897; on the staff of the Huntington (N. Y.) Hospital; aged 65; died, February 17, of chronic myocarditis and cirrhosis of the liver.

Sidney Norman Gholsen, Waynesboro, Va.; University of Cincinnati College of Medicine, 1935; captain in the medical reserve corps of the United States Army; aged 28; was killed, February 28, in an automobile accident near Fort Meade, Md.

John Edward Herrity, New York; Yale University School of Medicine, New Haven, Conn., 1897; member of the Medical Society of the State of New York; for many years city medical examiner; aged 65; died, February 17, in Southern Pines, N. C.

Edgar McMillen Ickes, Fremont, Ohio; Western Reserve University School of Medicine, Cleveland, 1901; for many years on the staff of the Memorial Hospital of Sandusky County; aged 66; died, February 21, of cerebral hemorrhage.

Joseph Harold Ralston, Cleveland; University of Wooster Medical Department, Cleveland, 1913; member of the Ohio State Medical Association; served during the World War; aged 54; died, February 12, of carbon monoxide poisoning.

Cullen Bryant Wilson, Sarasota, Fla.; Medical College of Alabama, Mobile, 1906; member of the Florida Medical Association; aged 62; died, February 24, in a hospital at Tampa of chronic nephritis and hypertensive heart disease.

James P. Marsh, Troy, N. Y.; Albany Medical College, 1885; fellow of the American College of Surgeons; consulting surgeon, Samaritan and Leonard hospitals; aged 78; died, February 23, of pulmonary thrombosis following influenza.

Oscar Rudolph Engelmann Ⓢ St. Louis; Washington University School of Medicine, St. Louis, 1906; served during the World War; aged 56; died, March 8, in the Deaconess Hospital of mitral insufficiency and cirrhosis of the liver.

Benjamin Griswold Webb, Andrews, N. C.; Louisville (Ky.) Medical College, 1885; member of the Medical Society of the State of North Carolina; aged 78; died, February 9, of acute cardiac dilatation and chronic interstitial nephritis.

Byron Lee Arthur, Lindale, Texas; University of Louisville (Ky.) Medical Department, 1896; member of the State Medical Association of Texas; aged 67; died, March 7, in the Mother Frances Hospital, Tyler, of coronary occlusion.

William Lee Clark, Harrisburg, Pa.; Johns Hopkins University School of Medicine, Baltimore, 1923; member of the Medical Society of the State of Pennsylvania; aged 44; was found dead, February 28, of an overdose of a sedative.

Isaac Marion Huskey, Cave City, Ark. (licensed in Arkansas in 1903); member of the Arkansas Medical Society; past president of the Independence County Medical Society; aged 59; died, February 26, of coronary occlusion.

Samuel Ford Talbott, Morgantown, W. Va.; University of Cincinnati College of Medicine, 1921; member of the West Virginia State Medical Association; aged 51; died, February 24, in the City Hospital of cerebral hemorrhage.

Moses Hoge Tredway, Emporia, Va.; Maryland Medical College, Baltimore, 1911; member of the Medical Society of Virginia; aged 54; died, February 8, in the Stuart Circle Hospital, Richmond, of diverticulitis and pneumonia.

Edwin Lyle Campbell, Superior, Wis.; University of Colorado School of Medicine, Denver, 1934; member of the State Medical Society of Wisconsin; aged 32; died, February 14, of ruptured aneurysm of the circle of Willis.

George Calder Dunlevy Ⓢ Evansville, Ind.; New York Homeopathic Medical College and Hospital, New York, 1890; for many years on the staff of the Deaconess Hospital; aged 72; died, March 19, of carcinoma of the larynx.

Charles Wesley Pettit Ⓢ Minneapolis; University of Minnesota College of Medicine and Surgery, Minneapolis, 1903; an Affiliate Fellow of the American Medical Association; aged 63; died, February 25, in St. Mary's Hospital.

Compton Ney Crook, Moscow, Tenn.; Memphis (Tenn.) Hospital Medical College, 1904; served during the World War; aged 61; died, March 12, in the Veterans Administration Facility, Memphis, of carcinoma of the larynx.

Franklin Lafayette Warren Ⓢ Bridgewater, Mass.; University of Pennsylvania Department of Medicine, Philadelphia, 1899; aged 69; died, February 11, in the New England Baptist Hospital, Boston, of carcinoma of the rectum.

George Albert Baker, Hardin, Mont.; Keokuk (Iowa) Medical College, College of Physicians and Surgeons, 1908; member of the Medical Association of Montana; served during the World War; aged 61; died, February 3.

James Jernigan Crumbley, Sylvester, Ga.; Vanderbilt University School of Medicine, Nashville, Tenn., 1914; member of the Medical Association of Georgia; served during the World War; aged 53; died, February 17.

Carleton Shurtleff Francis, Brookline, Mass.; Harvard Medical School, Boston, 1892; member of the Massachusetts Medical Society; aged 74; died, March 8, at Kerrville, Texas, of arteriosclerosis and coronary occlusion.

William Andrew Jackson, Monteagle, Tenn.; College of Physicians and Surgeons, Baltimore, 1896; member of the Tennessee State Medical Association; aged 77; died, March 9, of myocarditis and aortic regurgitation.

Emerson Ellwood Darlington Ⓢ New Bloomfield, Pa.; Maryland Medical College, Baltimore, 1900; formerly on the staff of the Polyclinic Hospital, Harrisburg; aged 66; died, March 16, of coronary disease.

William Almon Werner, Niles, Ohio; Western Reserve University Medical Department, Cleveland, 1885; for many years city health commissioner; aged 84; died, February 15, of arterial thrombosis.

Sidney Fitzhugh Mioton, New Orleans; Tulane University of Louisiana School of Medicine, New Orleans, 1895; aged 66; died, February 9, of injuries received in an automobile accident.

Hugo Robert Chaloupka, Los Angeles; John A. Creighton Medical College, Omaha, 1911; member of the California Medical Association; aged 53; died, February 20, of coronary thrombosis.

John Martin Dumm, Mackeyville, Pa.; University of Pennsylvania Department of Medicine, Philadelphia, 1878; aged 87; died, March 8, in the Lockhaven (Pa.) Hospital of pneumonia.

Samuel Wesley Mellott, Woodstock, Va.; Howard University College of Medicine, Washington, D. C., 1897; aged 79; died, February 15, in the Cora Miller Memorial Hospital of uremia.

George W. Combs, Indianapolis; Medical College of Indiana, Indianapolis, 1884; member of the Indiana State Medical Association; aged 81; died, February 8, in the Methodist Hospital.

Edward Ford, Parma, Mo.; Barnes Medical College, St. Louis, 1905; aged 65; died, March 18, in the Veterans Administration Facility, Jefferson Barracks, of coronary arteriosclerosis.

George Emmett Bell, Montclair, N. J.; Howard University College of Medicine, Washington, D. C., 1920; aged 49; died, March 31, in New Rochelle, N. Y., of chronic myocarditis.

George Francis Woodruff, Joliet, Ill.; Reliance Medical College, Chicago, 1909; aged 75; formerly on the staff of the Silver Cross Hospital, where he died, February 16, of lung abscess.

LeRoy Pope Walker, Middle Haddam, Conn.; College of Physicians and Surgeons, medical department of Columbia College, New York, 1878; aged 86; died, February 4, of pneumonia.

Charles Henry Nicholas Heffron Ⓢ Adrian, Mich.; University of Wooster Medical Department, Cleveland, 1893; aged 70; died, March 22, of intestinal obstruction due to duodenal ulcer.

Franklin Albert Butterfield, Oregon, Ill.; Rush Medical College, Chicago, 1880; member of the Illinois State Medical Society; aged 86; died, February 17, in a hospital at Freeport.

James Skene Campbell, Lebanon, Tenn.; Vanderbilt University School of Medicine, Nashville, 1888; member of the Tennessee State Medical Association; aged 77; died, February 3.

Mary Glover Thompson Lowrey, Berkeley, Calif.; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1886; aged 84; died, March 2.

Philip A. Brown, Poe, W. Va.; Kentucky School of Medicine, Louisville, 1894; aged 83; died, February 27, of heart disease.

Bureau of Investigation

SWINDLERS' SWAG—\$200,000

Mexicans Use Old Spanish Scheme to Gyp Physicians and Others

A procedure used in an attempt to mulct leading citizens of the United States of considerable quantities of money is frequently called "The Spanish Prisoner Swindle." It has been mentioned previously in *THE JOURNAL*, most recently under "General Medical News," Feb. 3, 1940, page 423.

Now comes a recrudescence of the letters. They are so similar in every respect to all their predecessors, even as to the amount of money involved, that there can be no question about their common general origin.

Reproduced herewith is one such letter that was received by a Chicago physician:

Mexico City, Feb. 25, 1941.

Dr. W. C.,
3 Sheridan Rd.,
Chicago, Ill.
Dear Sir:

A person who knows you and who has spoken very highly about you has made me trust you a very delicate matter on which depends the entire future of my dear daughter, as well as my very existence.

I am in Prison sentenced for bankruptcy, and I wish to know if you are willing to help me to save the sum of \$285,000.00. U. S. Cy, which I have in Bank bills hidden in a secret compartment of a trunk that is now deposited in a customhouse in the United States.

As soon as I send you some undeniable evidence it is necessary for you to come and pay the expenses incurred in connection with my process, so the embargo on my suit-cases can be lifted. One of these suit-cases contains a baggage check that was given to me at the time of checking my trunk for North America; this trunk contains the sum above mentioned.

To compensate all your troubles I will give you the THIRD PART OF THE SAID SUM.

Fearing that this letter may not come to your hands, I will not sign my name until I hear from you and then I will entrust you with my whole secret. For the time being I am only signing "R."

Due to serious reasons of which you will know later, please reply via AIR MAIL or WIRE. I beg you to treat this matter with the most absolute reserve and discretion.

Due to the fact that I am in charge of the Prison school I can write you like this and entirely at liberty.

I cannot receive your reply directly in this Prison, so in case you accept my proposition, please air-mail your letter to a person of my entire trust who will deliver it to me safely and rapidly. This is his name and address.

Miguel Ordoñez.
Humboldt 22.-
Mexico, City.-

"R."

The signatures on these letters vary extensively. In view of the present influx of such letters in the United States, attention is called at this time to a press release issued by the Post Office Department last August. This release states that Camilo Lopez Vasquez, Jose Gonzalez Vasquez, Jose Barron Meza, Manuel Gomez and Maria De Rosos are all indicted after the evidence in regard to this international confidence game known as the "Spanish Prisoner swindle" was presented to the grand jury by United States Attorney Frank J. Hennessy. The Post Office Department has received as many as seven hundred complaints a month regarding this type of swindle, and such complaints come from every state in the Union.

Because of the increasing number of victims, every effort was made to stamp out this type of fraud, both by criminal prosecution and by general publicity. This swindle is of ancient origin.

If the addressee responds, he is induced by further correspondence to come to Mexico and bring with him approximately \$3,000, the amount of money needed to "lift the embargo" mentioned in the first letter. On his arrival in Mexico, the victim is met by swindlers and is thereafter quickly relieved of his funds by trickery or, if necessary, by physical force, according to the Post Office Department release.

It is the opinion of the Post Office Department that the phenomenal success of the existing operations is doubtless accounted for by the nearness of Mexico and its easy accessibility to American citizens. It is estimated that within a year

and a half up to August 1940 individuals operating out of Mexico have swindled citizens of this country of approximately \$200,000. The Department of Justice and the Post Office Department urge the cooperation of all citizens in eradicating this fraud and request that any one receiving a Spanish swindle letter bring it to the attention of the Department of Justice or the Post Office Department. At various periods in the past few years those engaging in these activities have given special attention to the physicians of this nation. At present they seem to be repeating this procedure, and it is hoped that this warning will serve to place all such communications in the hands of the proper authorities.

"ELECTREAT MECHANICAL HEART" MISBRANDED

Government Agency Considers Peoria Gadget

The Federal Food and Drug Administration recently completed successful court proceedings against the Electreat Manufacturing Company of Peoria, Ill., which manufactures and distributes a small electrical gadget which it called a "mechanical heart." This was the first proceeding against an electrical device under the new Federal Food, Drugs and Cosmetic Act.

The trial was held in Kansas City, Mo., in the District Court of the United States with District Judge J. C. Collet presiding. Assistant United States Attorneys Charles King and Charles F. Lamkin Jr. presented a formidable array of experts to refute the contention of the manufacturer, C. W. Kent, that the queer machine was valuable in the treatment of many diseases such as "headache, neuralgia, sinus congestion, neuritis, sore throat, weak lungs, athletic strains, lumbago, rheumatism, gout, indigestion, constipation, piles, sexual weakness, enlarged prostate, paralysis, deafness, tooth ache, catarrh, broken bones, hardening of arteries, cramps of calf and nervousness," to mention but a few. It was also claimed that the device could be used "to enlarge bust or increase the flow of milk."

The Kansas City *Star* of Tuesday, Jan. 28, 1941 reported: "A queer gadget with a big name and an imposing list of human benefits claimed for it was being called bad names and its value questioned today by doctors and lawyers in the federal court of Judge John Caskie Collet. . . . Out of the contrast between the gadget and the claims for it the government seeks to build a case that will bar interstate shipment as a violation of the Federal Food and Drug Act because of mislabeling and misbranding.

"The 'heart' is manufactured at Peoria, Illinois, by C. W. Kent, who, the government asserts, receives \$100,000 a year from its manufacture and sales and that he has sold instruments valued at \$3,000,000 in the last ten years."

The gadget itself looks like a flashlight handle with a metal roller at one end. Inside the hollow handle are two ordinary flashlight batteries, a mechanical interrupter and faradic coils. Actually, the machine is a small faradic inductor which, when applied to the body, produces a tingling sensation and causes muscular spasm.

The Kansas City *Journal* for Jan. 28, 1941 stated that the manufacturer, C. W. Kent, "describes himself as a graduate of the United States Institute of Phrenology." The report continued: "Kent's pamphlets, designed to promote sales, were colorful in their language. They represented that the device, when applied to ailing human beings, produced 'rhythmic contraction of muscles, aiding the heart in forcing blood along its channels to carry away languishing tissue and to add healthful cells to normal tissues.'"

The various government experts rapidly pointed out the absurdities in the claims of the manufacturer. Finally the manufacturer went on the stand in his own defense. The Kansas City *Journal* of Jan. 30, 1941 reported that Kent "testified in Federal Court today he had devoted twenty years to the invention, and had sold between 240,000 and 250,000 of the 'hearts' to retail dealers."

"The dealers, he said, sell them for \$15. . . . Kent said he collaborated with a Dr. L. T. Bates, whom he described as 'a medical doctor much interested in the Abrams machine,' in preparing the pamphlet describing his 'mechanical heart.' . . . In direct examination by his attorney, Frederick Whitten, Kent testified: 'I had a course in high school entitled physics. I took another course about electric motors. The tuition was \$4 and the course ran three months, meeting twice a week. I missed a couple of classes.'"

"Kent added he was a graduate of the American Institute of Phrenology and said he attended classes of the institute in New York in 1896.

"Angered by a question by Charles F. Lamkin Jr., assistant United States district attorney, Kent snapped 'How was you born? I don't know.'"

On Jan. 30, 1941 Judge Collet decreed that the "Electreats" were misbranded. He allowed ten days for filing of briefs before the decision would be formally filed.

In a "Findings of Fact and Legal Conclusion" in this case, dated at Kansas City the 28th day of February 1941, Judge Collet pointed out that the misbranding is alleged on the basis of the charge that the labeling was misleading. In his findings it is stated that "Many claims are made for the instrument in the printed matter which accompanied the devices in the shipment thereof in interstate commerce. These claims are based, to a great extent, upon the premise that the use of the instrument will produce pulsations of the muscles of the body. The evidence is overwhelming that no such effect is or can be produced by this device. The claims are therefore misleading and cannot be and are not substantiated."

Judge Collet issued a Memorandum dated the same as the Findings, in which, among other things, he stated:

"An adequate amount of highly respectable and convincing testimony was offered by the Government to demonstrate that even the principle sought to be followed by the makers of the instrument. . . . Among others appearing for the Government was the eminent Physiologist, Dr. Carlson. His testimony and the illustrations he gave supporting his conclusions were in all respects as fully convincing of the accuracy of his judgment as was his test for the determination of which of two fluids was a sugar solution.¹

"The extent of the accuracy of the actual claims made for the Electreat in the literature accompanying it may be summarized much as one of the witnesses expressed it, when, in describing a diagram of the human anatomy with accompanying descriptive matter which appeared in one of the Exhibits, he stated that there was an element of truth in the diagram, the element of truth being . . . that the head was on the right end in the picture and the 'rump' appeared in the proper position. From a practical standpoint, the benefit to be derived from the use of the instrument was tersely stated by one of the several leading physicians of Kansas City, to be that the use of the instrument would not injure one if there was nothing the matter with him, but that if the person was suffering from any disorder or ailment, its use might and probably would be injurious."

Continuing, the judge stated:

"Further detailed reference to the fact should be unnecessary to demonstrate the irresistible conclusion arising from the evidence that the claims made for the devices in the literature accompanying them were as falsely misleading as might well be possible by the use of the English language. The conclusion follows that the Act of Congress has been violated and the requested order for the destruction of the devices must be made."

The final sentence of the Opinion is: "Formal findings of fact and conclusions of law are filed herewith. Judgment will be entered in accordance with the view herein expressed."

1. Time magazine, Feb. 10, 1941, page 44, l. c. 47: "Another time he had two beakers of liquid before him: one containing urine, the other, sugar solution. He stuck his finger in one of the containers, tasted it and said: 'Ya, dot's sugar.'"

Medical Examinations and Licensure

COMING EXAMINATIONS

BOARDS OF MEDICAL EXAMINERS

- ALABAMA: Montgomery, June 17-19. Sec., Dr. J. N. Baker, 519 Dexter Ave., Montgomery.
- ARKANSAS: * Medical, Little Rock, June 5-6. Sec., Dr. D. L. Owens, Harrison. Eclectic, Little Rock, June 5-6. Sec., Dr. Clarence H. Young, 1415 Main St., Little Rock.
- CALIFORNIA: Oral examination (required when reciprocity application is based on a state certificate or license issued ten or more years before filing application in California), Los Angeles, July 14. Written, San Francisco, June 30-July 3. Sec., Dr. Charles B. Pinkham, 1020 N St., Sacramento.
- CONNECTICUT: * Medical, Written, Hartford, July 8-9. Endorsement, Hartford, July 22. Sec., Dr. Thomas P. Murdock, 147 W. Main St., Meriden. Homeopathic, Derby, July 15-16. Sec., Dr. Joseph H. Evans, 1488 Chapel St., New Haven.
- DELAWARE: July 8-10. Sec., Medical Council of Delaware, Dr. Joseph S. McDaniel, 229 S. State St., Dover.
- DISTRICT OF COLUMBIA: * Washington, May 12-13. Sec., Commission on Licensure, Dr. George C. Ruhland, 203 District Bldg., Washington.
- FLORIDA: * Jacksonville, June 23-24. Sec., Dr. William M. Rowlett, Box 786, Tampa.
- GEORGIA: Atlanta, June. Sec., State Examining Boards, Mr. R. C. Coleman, 111 State Capitol, Atlanta.
- HAWAII: Honolulu, July 14-17. Sec., Dr. James A. Morgan, 48 Young Bldg., Honolulu.
- INDIANA: Indianapolis, June 17-19. Sec., Board of Medical Registration and Examination, Dr. J. W. Bowers, Citizens Trust Bldg., Fort Wayne.
- IOWA: * Iowa City, June 3-5. Dir., Division of Licensure and Registration, State Department of Health, Mr. H. W. Grefe, Capitol Bldg., Des Moines.
- KANSAS: Kansas City, June 17-18. Sec., Board of Medical Registration and Examination, Dr. J. F. Hassig, 905 N. 7th St., Kansas City.
- KENTUCKY: Louisville, June 5-7. Sec., State Board of Health, Dr. A. T. McCormack, 620 S. Third St., Louisville.
- MAINE: Augusta, July 1-2. Sec., Board of Registration in Medicine, Dr. Adam P. Leighton, 192 State St., Portland.
- MARYLAND: Medical, Baltimore, June 17-20. Sec., Dr. John T. O'Mara, 1215 Cathedral St., Baltimore. Homeopathic, Baltimore, June 17-18. Sec., Dr. John A. Evans, 612 W. 40th St., Baltimore.
- MASSACHUSETTS: Boston, July 8-11. Sec., Board of Registration in Medicine, Dr. Stephen Rushmore, 413-F State House, Boston.
- MICHIGAN: * Ann Arbor and Detroit, June 11-13. Sec., Board of Registration in Medicine, Dr. J. Earl McIntyre, 202-4 Hollister Bldg., Lansing.
- MISSISSIPPI: Jackson, June 25-26. Asst. Sec., State Board of Health, Dr. R. N. Whitfield, Jackson.
- MISSOURI: St. Louis, May 29-31. Sec., State Board of Health, Dr. Harry F. Parker, State Capitol Bldg., Jefferson City.
- NEBRASKA: * Omaha, June 12. All applications must be on file not later than May 29. Dir., Mrs. Jeanette Crawford, 1009 State Capitol Bldg., Lincoln.
- NEW JERSEY: Trenton, June 17-18. Sec., Dr. Earl S. Hallinger, 28 W. State St., Trenton.
- NEW YORK: Albany, Buffalo, New York and Syracuse, June 23-26. Chief, Bureau of Professional Examinations, 315 Education Bldg., Albany.
- NORTH CAROLINA: Raleigh, June 16-20. Sec., Dr. W. D. James, Hamlet.
- NORTH DAKOTA: Grand Forks, July 1-4. Sec., Dr. G. M. Williamson, 4½ S. Third St., Grand Forks.
- OHIO: Practical, June 11 and 14. Written, June 12-13. Sec., Dr. H. M. Platter, 21 W. Broad St., Columbus.
- OKLAHOMA: * Oklahoma City, June 11-12. Sec., Dr. James D. Osborn Jr., Frederick.
- PENNSYLVANIA: Philadelphia and Pittsburgh, July 8-12. Act. Sec., Bureau of Professional Licensing, Department of Public Instruction, Mrs. Marguerite G. Steiner, 358 Education Bldg., Harrisburg.
- RHODE ISLAND: * July 10. Acting Chief, Division of Examiners, Mr. E. Clyde Thomas, 366 State Office Bldg., Providence.
- SOUTH CAROLINA: Columbia, June 23-25. Sec., Dr. A. Earle Boozer, 505 Saluda Ave., Columbia.
- SOUTH DAKOTA: * Pierre, July 15-16. Dir., Medical Licensure, Dr. J. F. D. Cook, State Board of Health, Pierre.
- VERMONT: Burlington, June 17-19. Sec., Dr. F. J. Lawless, Richmond.
- VIRGINIA: Richmond, June 17-20. Sec., Dr. J. W. Preston, 30½ Franklin Road, Roanoke.
- WEST VIRGINIA: Wheeling, July 7-9. Sec., Public Health Council, Dr. C. F. McClintic, State Capitol, Charleston.
- WISCONSIN: * Milwaukee, June 24-27. Sec., Dr. H. W. Shutter, 425 E. Wisconsin Ave., Milwaukee.
- WYOMING: Cheyenne, June 2-3. Sec., Dr. M. C. Keith, Capitol Bldg., Cheyenne.

* Basic Science Certificate required.

BOARDS OF EXAMINERS IN THE BASIC SCIENCES

- ARKANSAS: Little Rock, May 19. Sec., Mr. Louis E. Gebauer, 701 Main St., Little Rock.

- WISCONSIN: Milwaukee, June 7. Sec., Prof. Robert N. Bauer, 3414 W. Wisconsin Ave., Milwaukee.

Bureau of Legal Medicine and Legislation

MEDICOLEGAL ABSTRACTS

Malpractice: Sponge Left in Wound; Applicability of Doctrine of Res Ipsa Loquitur.—The defendant physicians, in the course of an operation on the plaintiff's hip, left a gauze sponge deeply buried in the operative wound about ½ inch from the femur. The gauze remained there until it was removed by a second operation some months later. During the intervening period the plaintiff's leg became infected and discharged quantities of offensive pus through suppurating channels or sinuses, which originated in the vicinity of the sponge and extended through intervening tissues to the exterior. She suffered excessive pain, physical and mental disorders and possible permanent injury through the stiffening of the knee joint. Subsequently the plaintiff sued the defendants for malpractice. The defendants admitted that a gauze sponge had been left in the plaintiff's body, but they testified that nearly one hundred such sponges had been used during the operation and that they had exercised great care in the usual and customary manner to prevent any of them being left in the wound. They described the system used as "palpating," or feeling for the sponges, and claimed that they had done this thoroughly and with due care. Furthermore, several expert witnesses called by the defendants approved the methods used by the defendants during the operation. From a judgment for the plaintiff the defendants appealed to the Supreme Court of North Carolina.

The defendants contended that the plaintiff had produced no evidence of negligence except that which could be inferred under the doctrine of *res ipsa loquitur*, if it were applicable, and that such inference had been overcome by the defendants' evidence of due care. But they further contended that the doctrine of *res ipsa loquitur* was not applicable to malpractice cases. The Supreme Court admitted that a physician is not an insurer of results and that no presumption of negligence can arise merely because a particular course of treatment is unsuccessful. However, said the court, the doctrine of *res ipsa loquitur* is applicable in malpractice cases as well as in other cases involving negligence, where the only proper inference is that the injuries would not have happened except in the absence of due care. Furthermore, the doctrine of *res ipsa loquitur* has uniformly been applied to instances in which foreign objects, such as sponges, towels, needles, pieces of glass and the like, have been introduced into a patient's body during a surgical operation and left there. The court held, therefore, that the doctrine of *res ipsa loquitur* was applicable to the present case. It further held that the inferences which arise when that doctrine applies were not overcome simply by the introduction of evidence by the defendants. Such inferences are more than a mere *prima facie* case; they constitute evidence to be considered by the jury along with whatever evidence the defendants may also have produced. The court concluded, however, that the plaintiff was entitled to a judgment in her favor even without relying on the doctrine of *res ipsa loquitur* because the mere fact of leaving the sponge in the plaintiff's body was "so inconsistent with due care as to raise an inference of negligence." The judgment for the plaintiff was accordingly affirmed.—*Mitchell v. Saunders et al.*, 13 S. E. (2d) 242 (N. C., 1941).

War Risk Insurance: Permanency of Total Disability When Indicated Surgical Treatment Is Refused.—While serving with the Army in France in 1918 the insured was operated on for acute appendicitis. During the operation it was discovered that he was also suffering from a hernia, but nothing was done then to relieve that situation. On his discharge and return home, in 1919, the insured consulted his local physician concerning his condition and was advised, as early as May of that year, that he was suffering from adhesions following the appendectomy and that he should go to a hospital for observation and treatment. He failed to follow this advice, however, until he suffered a violent attack in August 1919. It was then found that his condition was already

beyond surgical aid and he died seven days later from acute dilatation of the stomach caused by the adhesions. The plaintiff, administrator of the insured's estate, subsequently sued the United States on a war risk insurance policy and obtained a judgment from which the defendant appealed to the United States circuit court of appeals, fourth circuit.

It was conceded that the insured was suffering from adhesions prior to the lapse of his policy and that these adhesions resulted in total disability. The only question for determination was whether or not the insured's total disability had become permanent at the time his policy lapsed. The government contended that the condition had not become permanent because (1) the evidence showed that proper surgery, which had been recommended to the insured in due time prior to his death, would relieve adhesions and result in a cure in 80 to 90 per cent of cases of this type, if performed before the patient was dying, and (2) because there was nothing in the record to show that the insured would not have been relieved by such an operation. The court held that, when the cause of a condition is known and when it is also recognized that such condition is curable frequently, permanence cannot be said to exist until a reasonable effort to cure has failed. Since the insured had failed to undergo treatment deemed reasonably certain of curing his ills, the court concluded that the plaintiff had failed to prove that the insured was permanently disabled. Judgment for the plaintiff was therefore reversed.—*United States v. Marsh et al.*, 107 F. (2d) 173 (1939).

Optometry Practice Act (Minnesota): Right of Unlicensed Person to Own Eye Testing Devices for Use by Licensed Optometrist.—The defendants operated a jewelry store in which they sold eyeglasses for the correction of vision. They were not licensed to practice optometry but they employed a duly licensed optometrist who had exclusive charge, supervision and control of the optometric phase of the defendants' business. The optometrist made examinations of eyes, prescribed eyeglasses, had prescriptions filled by an optical firm and fitted the eyeglasses to the customers' eyes. He was paid a weekly salary by the defendants. He made no specific charge for his services, as the price of the eyeglasses included compensation for all professional services rendered. The money collected from the optometric business was turned over to the defendants. The defendants owned all the equipment, apparatus and materials used by the optometrist in conducting the business, including apparatus for testing and measuring the powers of vision of the human eye. The state petitioned for an injunction to enjoin the defendants from engaging in the unlawful practice of optometry, and from an order denying the injunction the state appealed to the Supreme Court of Minnesota.

Both parties relied on the following provision in the Minnesota optometry practice act (Mason's Minn. St. 1938 Supp., sec. 5789), which provides:

And it shall be unlawful for any person, not licensed as an optometrist hereunder, to sell or dispose of, at retail, any spectacles, eye glasses or lenses for the correction of vision in any established place of business or elsewhere in this state except under the supervision, direction and authority of a duly licensed optometrist holding a certificate under this chapter, who shall be in charge of and in personal attendance at the booth, counter or place where such articles are sold or disposed of.

The defendants contended that their sales of eyeglasses were not illegal because they were made under the supervision, direction and authority of a duly licensed optometrist. In a prior decision, *Williams v. Mack*, 202 Minn. 402, 278 N. W. 585, abstr. J. A. M. A. 111:2332 (Dec. 17) 1938, said the Supreme Court of Minnesota, this court held that the employment of an optometrist under an arrangement identical with that used by the defendants in the present case was lawful. Accordingly, the court held that the defendants were not engaged in the unlawful practice of optometry by employing a licensed optometrist to conduct the optometric phase of their business. The state contended, however, that the defendants' ownership and possession of the eye testing apparatus constituted the unlawful practice of optometry under another provision of the same section of the Minnesota optometry practice act which provides that any person shall be deemed to be practicing optometry who shall "have in his possession testing appliances for the purpose of the measurement of the powers

of vision." The court held that the two provisions quoted, being parts of the same section of the act, must be construed together and, as already pointed out, the defendants had the right to engage in the business of selling eyeglasses as long as such sales were made under the personal charge and direction of a duly licensed optometrist. Permission to engage in the selling of eyeglasses includes also the right to do the things reasonably and properly incident to such dealing. Ownership and possession of eye testing instruments and other appliances by the unlicensed vendor for the sole use of the licensed optometrist rendering the optometric services, in the judgment of the court, is incident to the rendition of such services and to the right to engage in the business of selling eyeglasses. The court pointed out that there was no provision in the law requiring an optometrist employed by another to furnish and provide his own apparatus in carrying on his employer's business. The court concluded, therefore, that the defendants' possession of the eye testing apparatus and equipment under the circumstances disclosed did not constitute the unlawful practice of optometry. Accordingly, the judgment for the defendants was affirmed.—*State v. Goodman et al.*, 288 N. W. 157 (Minn., 1939).

Osteopathy: Osteopath a "Licensed Physician" Under Statute Relating to Coroners.—The relator, an osteopathic physician and surgeon licensed by the state medical board of Ohio to practice osteopathy and surgery, petitioned the defendant Board of Elections of Darke County, Ohio, to accept and file his declaration of candidacy for nomination to the office of coroner on the Democratic ticket and to cause his name to be printed on the official primary election ballot. On the refusal of the board to take the action requested, the relator applied to the Supreme Court of Ohio for a writ of mandamus to compel such action.

The defendant contended that an osteopathic physician and surgeon is not a "licensed physician" within the purview of section 2856-3 of the General Code of Ohio, which provides:

No person shall be eligible to the office of coroner in any county except a licensed physician of good standing in his profession or a person who shall have previously served as coroner prior to his election.

The Supreme Court, however, held that the legislature, in passing the section quoted, was interested only in the duties of a coroner and in providing that a layman, unless he had previously been a coroner, should not be eligible for the office. The legislature thus used the term "licensed physician," or a "physician" who is "licensed," merely to distinguish such persons from laymen in general. The use of such phraseology, continued the court, was not for the purpose of distinguishing between the various schools of medicine or the different kinds of licensed physicians. The court concluded that, until such time as the legislature by appropriate legislation indicates more definitely what it intended by the term "licensed physician," a licensed osteopath is a "licensed physician" within the meaning of section 2856-3. The writ of mandamus was therefore allowed.—*State ex rel. Kester v. North et al.*, Board of Elections, 26 N. E. (2d) 1020 (Ohio, 1940).

Society Proceedings

COMING MEETINGS

American Medical Association, Cleveland, June 2-6. Dr. Olin West, 535 North Dearborn St., Chicago, Secretary.

American Association for the Study of Allergy, Cleveland, June 2-3. Dr. J. Harvey Black, 1405 Medical Arts Bldg., Dallas, Tex., Secretary.

American Association for the Study of Goiter, Boston, May 12-14. Dr. W. Blair Mosser, 133 Biddle St., Kane, Pa., Secretary.

American Association for the Surgery of Trauma, Montreal and Montebello, Canada, May 29-31. Dr. Ralph G. Carothers, 409 Broadway, Cincinnati, Secretary.

American Association for Thoracic Surgery, Toronto, Canada, June 9-11. Dr. Richard H. Meade Jr., 2116 Pine St., Philadelphia, Secretary.

American Association of Genito-Urinary Surgeons, Hot Springs, Va., May 29-31. Dr. Charles C. Higgins, 2020 East 93d St., Cleveland, Secretary.

American Association of Medical Milk Commissions, Cleveland, June 1-2. Dr. Paul B. Cassidy, 2037 Pine St., Philadelphia, Secretary.

American Association on Mental Deficiency, Salt Lake City, June 20-24. Dr. E. Arthur Whitney, Washington Road, Elwyn, Pa., Secretary.

American Broncho-Esophagological Association, Cleveland, June 3. Dr. Paul H. Holinger, 1150 North State St., Chicago, Secretary.

American College of Chest Physicians, Cleveland, May 31-June 2. Dr. Paul H. Holinger, 500 North Dearborn St., Chicago, Secretary.

American Gynecological Society, Colorado Springs, May 26-28. Dr. Richard W. TeLinde, Johns Hopkins Hospital, Baltimore, Secretary.

American Heart Association, Cleveland, May 30-31. Dr. Howard B. Sprague, 50 West 50th Street, New York, Secretary.

American Laryngological Association, Atlantic City, May 28-30. Dr. Charles J. Imperatori, 108 East 38th St., New York, Secretary.

American Laryngological, Rhinological and Otolological Society, Los Angeles, June 16-18. Dr. C. Stewart Nash, 277 Alexander St., Rochester, N. Y., Secretary.

American Medical Women's Association, Cleveland, June 1-2. Dr. Etta Gray, 649 South Olive St., Los Angeles, Secretary.

American Neurological Association, Atlantic City, N. J., June 9-11. Dr. Henry A. Riley, 117 East 72d St., New York, Secretary.

American Ophthalmological Society, Hot Springs, Va., May 29-June 1. Dr. Eugene M. Blake, 303 Whitney Ave., New Haven, Conn., Secretary.

American Orthopedic Association, Toronto, Canada, June 9-12. Dr. Charles W. Peabody, 474 Fisher Bldg., Detroit, Secretary.

American Otolological Society, Atlantic City, N. J., May 26-28. Dr. Isidore Friesner, 36 East 73d St., New York, Secretary.

American Pediatric Society, Hot Springs, Va., May 22-24. Dr. Hugh McCulloch, 325 North Euclid Ave., St. Louis, Secretary.

American Proctologic Society, Cleveland, June 1-3. Dr. William H. Daniel, 1930 Wilshire Blvd., Los Angeles, Secretary.

American Radium Society, Cleveland, June 2-3. Dr. William E. Costolow, 1407 South Hope St., Los Angeles, Secretary.

American Rheumatism Association, Cleveland, June 2. Dr. A. R. Shands, Dupont Institute, Wilmington, Del., Secretary.

American Society of Clinical Pathologists, Cleveland, May 30-June 1. Dr. A. S. Giordano, 531 North Main St., South Bend, Ind., Secretary.

American Therapeutic Society, Cleveland, May 30-31. Dr. Oscar B. Hunter, 1835 Eye St. N.W., Washington, D. C., Secretary.

American Urological Association, Colorado Springs, Colo., May 19-22. Dr. Clyde L. Deming, 789 Howard Ave., New Haven, Conn., Secretary.

Association for Research in Ophthalmology, Cleveland, June 3. Dr. Conrad Berens, 35 East 70th Street, New York, Secretary.

Connecticut State Medical Society, Bridgeport, May 21-22. Dr. Creighton Barker, 258 Church St., New Haven, Secretary.

Georgia Medical Association of, Macon, May 13-16. Dr. Edgar D. Shanks, 478 Peachtree St., N.E., Atlanta, Secretary.

Idaho State Medical Association, Sun Valley, June 18-21. Dr. F. B. Jeppesen, 105 North 8th St., Boise, Secretary.

Illinois State Medical Society, Chicago, May 20-23. Dr. Harold M. Camp, 224 South Main St., Monmouth, Secretary.

Iowa State Medical Society, Davenport, May 14-16. Dr. R. L. Parker, 3510 Sixth Ave., Des Moines, Secretary.

Kansas Medical Society, Topeka, May 13-15. Mr. C. G. Munns, 112 West Sixth St., Topeka, Executive Secretary.

Maine Medical Association, York Harbor, June 22-24. Dr. Frederick R. Carter, 22 Arsenal St., Portland, Secretary.

Massachusetts Medical Society, Boston, May 21-22. Dr. Robert N. Nye, 8 Fenway, Boston, Secretary.

Medical Library Association, Ann Arbor, Mich., May 29-31. Miss Anna C. Hilt, 25 Shattuck St., Boston, Secretary.

Minnesota State Medical Association, St. Paul, May 26-28. Dr. B. B. Souster, 493 Lowry Medical Arts Bldg., St. Paul, Secretary.

Mississippi State Medical Association, Biloxi, May 13-15. Dr. T. M. Dye, Box 295, Clarksdale, Secretary.

Montana Medical Association of, Great Falls, June 24-26. Dr. Thomas F. Walker, 206 Medical Arts Bldg., Great Falls, Secretary.

National Gastroenterological Association, New York, May 13-16. Dr. G. Randolph Manning, Room 319, 1819 Broadway, New York, Secretary.

New Hampshire Medical Society, Manchester, May 13-14. Dr. Carleton R. Metcalf, 5 South State St., Concord, Secretary.

New Jersey Medical Society of, Atlantic City, May 20-22. Dr. Alfred Stahl, 55 Lincoln Park, Newark, Secretary.

New York State Association of Public Health Laboratories, Syracuse, May 19. Miss Mary B. Kirkbride, New Scotland Ave., Albany, Secretary.

North Carolina Medical Society of the State of, Pinehurst, May 19-21. Dr. I. H. Manning, Chapel Hill, Secretary.

North Dakota State Medical Association, Grand Forks, May 19-21. Dr. L. W. Larson, 221 Fifth St., Bismarck, Secretary.

Ohio State Medical Association, Cleveland, June 3. Mr. C. S. Nelson, 79 East State St., Columbus, Executive Secretary.

Oklahoma State Medical Association, Oklahoma City, May 19-22. Dr. L. S. Willour, 210 Plaza Court Bldg., Oklahoma City, Secretary.

Pacific Coast Oto-Ophthalmological Society, Los Angeles, May 26-29. Dr. C. Allen Dickey, 450 Sutter Street, San Francisco, Secretary.

Pacific Northwest Medical Association, Spokane, Wash., June 25-28. Dr. C. W. Countryman, 407 Riverside Ave., Spokane, Wash., Secretary.

Rhode Island Medical Society, Providence, May 28-29. Dr. Guy W. Wells, 124 Waterman St., Providence, Secretary.

Society of Surgeons of New Jersey, Plainfield, May 28. Dr. Walter B. Mount, 21 Plymouth St., Montclair, Secretary.

South Dakota State Medical Association, Mitchell, May 18-20. Dr. Clarence E. Sherwood, 107½ Egan Ave., Madison, Secretary.

Texas State Medical Association of, Fort Worth, May 12-15. Dr. Holman Taylor, 1404 West El Paso St., Fort Worth, Secretary.

Utah State Medical Association, Salt Lake City, June 12-14. Dr. D. G. Edmunds, 610 McIntyre Bldg., Salt Lake City, Secretary.

West Virginia State Medical Association, Charleston, May 12-14. Mr. Joe W. Savage, Public Library Bldg., Charleston, Executive Secretary.

Current Medical Literature

AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1931 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied by stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (*) are abstracted below.

American Heart Journal, St. Louis

21:1-132 (Jan.) 1941

- *Changes in Heart Volume in Addison's Disease and Their Significance. T. H. McGavack, New York.—p. 1.
- Use of Cathode Ray for Recording Heart Sounds and Vibrations: II. Studies on Muscular Element of First Heart Sound. J. R. Smith, A. S. Gilson and W. B. Kountz, St. Louis.—p. 17.
- Effect of Intravenous Injection of Papaverine Hydrochloride on Mortality Resulting from Sudden Occlusion of Coronary Arteries in Dogs. C. G. McEachern, F. H. Smith and G. W. Manning, Toronto.—p. 25.
- Tetralogy of Eisenmenger. O. Saphir and M. Lev, Chicago.—p. 31.
- Studies of Criteria for Classification of Arterial Hypertension: Parts I to VII. J. Q. Griffith Jr., E. Roberts and H. O. Corbit, R. B. Rutherford, M. A. Lindauer, W. E. Fry, Philadelphia.—p. 47.
- *Treatment of Congestive Heart Failure with Orally Administered Mercurial Diuretic. R. C. Batterman, A. C. DeGraff and O. A. Rose, New York.—p. 98.
- Electrocardiographic Observations on Athletes Before and After a Season of Physical Training. W. W. Tuttle and H. M. Korn, Iowa City.—p. 104.

Changes in Heart Volume in Addison's Disease.—McGavack studied the relationship between cardiac mensuration and the stage of Addison's disease in 6 cases. He observed an average reduction of 31.9 per cent in heart volume in five instances of crisis and of 16.1 per cent in 3 patients with cortical insufficiency who were not having crises. Prior to the development of Addison's disease, 1 patient had a cardiac volume within normal limits. Two others, 1 first observed during a crisis and 1 with a crisis impending, regained a normal heart volume after adequate therapy. Serial estimations of the blood volume of 2 patients were performed, and significant lowering was seen only during crises. Patients with cortical insufficiency who were not having crises had valves within the normal range. The conclusion is that the reduction in cardiac volume in Addison's disease is a direct effect of the deficiency of adrenocortical hormone. When a crisis supervenes the diminished blood volume plays an accessory role in still further decreasing the size of the heart.

Oral Mercurial Diuretic for Congestive Heart Failure.—Batterman and his co-workers evaluated the diuretic effect of salyrgan-theophylline given orally in tablet form to patients with congestive heart failure. Nine patients were given five tablets of the drug (each tablet is equivalent to 30 mg. of mercury) whenever a diuretic was necessary, usually at intervals of from three to five days. All but 1 patient obtained a satisfactory effect, but even he on further treatment had a good response. The tablets were administered four times to 2 patients and five times to 1 without evidence of toxicity. The effectiveness of the oral preparation was compared with that of other diuretics. Of the fifty-six trials with the salyrgan-theophylline tablets on 29 patients a satisfactory diuresis was produced forty times, or 71.5 per cent. Parenteral preparations were more consistently effective, producing diuresis in from 90 to 95 per cent of the cases. Suppositories were effective in from 50 to 63 per cent of the trials. Oral administration causes a loss of from 3 to 5 pounds (1.3 to 2.3 Kg.) in body weight; occasionally the loss exceeds 8 pounds (3.6 Kg.). Parenteral preparations produce a greater diuresis, and weight losses of more than 8 pounds are common. Although the onset and peak of diuresis after oral administration occurred slightly later than after parenteral injection, usually the diuresis was complete within twenty-four hours. In 35 per cent of the trials a significant weight loss occurred within the second twenty-four hours. In eight of the sixteen instances in which the oral preparation failed to elicit a satisfactory response it was successful at other times. As with parenteral prepara-

tions, previous administration of ammonium chloride and digitalis increased the effectiveness of the oral preparation. Failure in some cases appeared to be related to the advanced state of heart disease and lack of digitalis or of ammonium chloride; in others there was no apparent reason. Three patients experienced gastrointestinal symptoms after taking the oral preparation. Dividing the dose or giving a smaller one might result in diuresis without these untoward effects (diarrhea and epigastric discomfort). Only extended studies on ambulatory patients or patients with chronic congestive heart failure will show whether repeated use is safe.

Edema in Preeclampsia and Eclampsia.—Dieckmann studied the physiology of normal pregnant and toxemic women. In more than 2,700 patients with toxemia he made various examinations. He believes that his data and those in the literature indicate that the increased capillary permeability and a delayed or impaired water and sodium chloride elimination incidental to normal pregnancy are greatly augmented in certain patients, because either of internal or of external factors, resulting in an abnormal gain in weight and eventually in edema. From his studies he concludes that the following physiologic changes occur in normal pregnancy: 1. The venous pressure in the legs is increased and causes an increased loss of fluid from the blood into the tissues of the legs. 2. There is an increased capillary permeability. 3. The elimination of water and solids by the kidney is delayed or impaired. 4. The average serum protein concentration is 6.5 Gm. per hundred cubic centimeters. 5. The average colloid osmotic pressure of the serum protein is 28.7 cm. of water. If these changes are of greater magnitude than normal or if they are exaggerated by internal or external factors, preeclampsia and eclampsia may

occur. Thus the following is observed in these diseases: 1. Greater alterations than normal are present in the venous and capillary pressures and capillary permeability. 2. The average serum protein concentration in edematous patients with pre-eclampsia is 6.22, with eclampsia it is 6.7, and with vascular-renal disease and normal renal function it is 6.67 Gm. per hundred cubic centimeters. 3. The average colloid osmotic pressure of edematous preeclamptic patients is 24.9 and of toxemic patients without edema it is 26.5 cm. of water. 4. The retention of sodium, chlorine and water is greatly increased in some pregnant patients, resulting in an abnormal gain in weight and finally in edema. 5. Changes in the concentration of the female hormones are apparently associated with edema, but whether this is the cause or the result is not known. 6. The prevention and treatment of the edema depend on the dietary limitation of sodium chloride and water, the principal components of edema fluid. Sodium chloride restriction presents fewer difficulties and causes less discomfort than the restriction of water.

Are Estrogens Carcinogenic in Women?—In an effort to determine whether estrogen therapy induces endometrial or vaginal epithelial proliferation which may lead to the formation of neoplasms, Geist and Salmon made biopsies of the vaginal and endometrial mucosas of 206 women during various stages of treatment with estrogens. Treatment lasted for from six months to five and one half years. The first effect of estrogen, seen as early as four days after 100,000 international units of estrogen intramuscularly, on the atrophic vaginal mucosa is a rapid proliferation of the basilar epithelial cells. This proceeds at a rapid pace and leads to an increase in the number of epithelial layers and results in desquamation of some superficial epithelial cells. The proliferative activity is not uniform. Areas of hypoplasia are found adjacent to areas of active proliferation. If estrogen therapy is continued there is a progressive increase in the epithelial layers, accompanied by desquamation. There is a wide individual variation in the response to the same amount of the hormone. This variation is probably due to the degree and duration of estrogen deficiency prior to estrogen therapy and the rate of its absorption and excretion. Once morphologic restitution has been attained, further increase in dosage does not increase the proliferative response. The response of the atrophic endometrium to estrogen therapy is slower than that of the vaginal mucosa. Not infrequently from 400,000 to 600,000 international units of estrogen, which produces striking epithelial growth in the vaginal mucosa, will cause only slight proliferation in scattered areas of the endometrium. As the dosage approaches 1,000,000 international units the endometrium shows a more definite and uniform response, which resembles the proliferative pattern of the normal postmenstrual phase of the cycle. Uterine bleeding usually occurs after the patient has received from 1,000,000 to 1,500,000 international units during a period of from four to six weeks. Examination of the uterine blood revealed desquamated fragments of endometrium containing glands and stromal cells. Biopsies during this time exhibited various proliferative changes associated with distended (cystic) glands. Biopsies after bleeding ceased usually revealed a quiescent and, in many cases, an atrophic endometrium. Continued administration of estrogens after bleeding ceased resulted in a repetition of the proliferative process. In some cases this cyclic bleeding occurred at intervals of from four to ten weeks for from six to thirty-eight months. In these cases the endometrium at the end of these long periods does not show any greater proliferative activity than after the initial estrogen therapy. Essentially the same response followed therapy with estradiol dipropionate administered intramuscularly, orally, by cutaneous inunctions and by vaginal suppositories. In human beings it is impossible to administer the huge doses of estrogens that would justify comparison with the experimental production of carcinoma in rodents. However, within the limits of the dosage used in this investigation (up to 53,400,000 international units) there is no justification for the fear that genital carcinoma may result from the therapeutic use of estrogens.

Rheumatic Heart Disease in Pregnancy.—Gorenberg and McGleary reviewed the 345 cases of rheumatic heart disease admitted to the Margaret Hague Maternity Hospital from 1933 to 1939. There were 77 cardiac failures among the group. The authors believe that unless adequate bed rest is enforced the patients with heart disease who will fail are those whose measure of functional capacity is in the relatively severe grades of heart disease, those who are more than 30 years of age and those who give a history of previous decompensation. These patients should be willing, if they wish to assume the burden of pregnancy, to submit to frequent antepartum observations from the beginning of pregnancy and must be willing and able to spend the greater part of the pregnancy at absolute bed rest if necessary. The incidence of cardiac failure in pregnancy can be reduced if early and absolute bed rest is adhered to. There were 2 failures among the authors' last 103 cases; 1 of these was possibly preventable. Of the 77 cardiac failures 80 per cent occurred before the last month of gestation. Acute failure during labor is rare. A lightening of the steadily increasing circulatory burden that pregnancy exerts occurs from four to six weeks before delivery with a consequent clinical improvement. Therefore the authors feel that resort to late pregnancy terminations are not wise and they follow the general rule of allowing gestation to go to term. Each pregnancy is an individual problem in the management of labor. Twenty-nine, or 8.4 per cent, of the patients were delivered by the abdominal route and 91.5 per cent vaginally. The incidence of morbidity and the mortality are significantly higher following cesarean section and, as cardiac decompensation is rare during labor, the authors feel that the "burden of proof" in these cases lies with cesarean section. Therefore the patients who go into labor well compensated may in general be handled as though not suffering from heart disease.

Reaction of Serums from Patients with Yaws.—Maltaner examined 44 specimens of serum from patients with yaws by the quantitative tests for syphilis and tuberculosis. Forty-one of the serums reacted to the complement fixation test for syphilis. Thirty-five had titers greater than 10 and 24 were 100 or higher; 12 ranged from 100 to 200 and 12 from 200

to 400. Thus the degree of reaction was generally severe. The absence of a reaction in the other 3 cases was not explainable on the basis of the clinical data that were furnished. The same linear relations between the reagents were observed in the reactions of the serums from patients with yaws and the cholesterolized tissue extract antigen as characterize those of syphilitic serum. Precipitation tests for syphilis were made with 3 highly reacting serums with titers of 251, 347 and 384. Only partial reactions were obtained with 2 each in the Kahn and Kline tests of the undiluted serum. When the serum was diluted, well defined precipitation occurred. No specimens from patients with yaws reacted strongly in the complement fixation test for tuberculosis. All but two had titers in the range below 3, and the 2 were 3.5 and 3.8. Twenty-seven of the patients were said to show no evidence of tuberculosis; for the others no information regarding tuberculosis was given. The previously reported severe reactions of the leprosy serums with tubercle antigen, like those of the yaws serums in the test for syphilis, are undoubtedly associated with common antigenic constituents in the acid-fast, incitants of leprosy and tuberculosis and in the spirochetes of yaws and syphilis. This is further borne out by the characteristic linear relationships obtained in all these reactions. It would be interesting to have for comparison with observations in leprosy and yaws some results with serums from patients with malaria in which the significance of reactions obtained in serologic tests for syphilis so often comes into question.

Sulfamethylthiazole and Sulfathiazole for Septicemia.

—During the last year Hamburger and Rueggesser treated 12 patients with staphylococcal septicemia by means of thiazole derivatives of sulfanilamide; 8 recovered. The fatalities occurred among patients with acute staphylococcal endocarditis. The distribution of the foci among the 12 patients was as follows: osteomyelitis 3 (1 of whom had meningitis in addition), carbuncle 2, gluteal abscess 1, pyarthrosis 1, fracture 1 and endocarditis 4. If the deaths associated with acute bacterial endocarditis, a condition which still resists the best efforts of the therapist, are disregarded, there were 8 consecutive cases in which the blood stream was cleared of staphylococci. These patients might have survived had they received only supportive treatment; nevertheless their recovery indicates that the thiazole compounds should be given further trial. Study of the cases adduces no evidence of any effect on the local lesions. There were 2 instances of peripheral neuritis among patients treated with sulfamethylthiazole but none among those treated with sulfathiazole. The complication occurred at the beginning of the authors' experience with the drugs, when they were using larger doses than were later found necessary. Smaller doses may have prevented the neuritis. The "minor toxicities"—nausea, vomiting, rashes—appeared to be less frequent among patients receiving sulfa-

methylthiazole. Between 1933 and 1939, 27 cases of staphylococcal septicemia were recorded at the Cincinnati General Hospital, with only 4 recoveries.

Premonitory Symptoms of Acute Coronary Occlusion.

—Master and his associates prepared a special questionnaire to elicit the history of premonitory pain or discomfort in the chest prior to (as long as four weeks before) the attack of acute coronary occlusion of 260 patients. The physical and emotional activities associated with premonitory symptoms were also inquired into. Such symptoms were present among 44.2 per cent of the 260 patients. Of the majority they consisted of substernal or precordial pain or discomfort. Other prodromes were fatigue, weakness, gastric distress, dyspnea, palpitation, nervousness and dizziness. The sudden typical anginal syndrome or its sudden acceleration frequently preceded the attack of occlusion. The premonitory symptoms usually appeared within twenty-four hours of the acute attack, but sometimes two or three weeks before. Their duration varied from a few minutes to several hours. Although the premonitory pain was usually intermittent or continuous, frequently a period free from pain intervened before the occlusion. The premonitory symptoms occurred during rest 28.5, during mild or moderate activity or walking 68.5 and during strenuous effort 2.9 per cent of the time. The symptoms were not associated with clinical evidence of myocardial infarction. Fever, leukocytosis, tachycardia, drop in blood pressure and characteristic electrocardiographic changes were absent. The anatomic basis for the premonitory symptoms is assumed to be a gradual occlusion of the lumen of the coronary artery by progressive or recurrent intramural hemorrhage or by primary thrombosis on a plaque, which may take hours or days for completion. Early recognition of the premonitory symptoms should reduce the incidence of heart failure and decrease the mortality therefrom as immediate bed rest, which probably will not prevent the impending occlusion, will be possible.

Sulfapyridine, Sulfathiazole and Serum for Pneumonia.

—Finland and his colleagues state that, of the 911 cases of pneumonia admitted to the Boston City Hospital from July 1939 through June 1940, 691 were treated with sulfapyridine or sulfathiazole alone or with serum. Among these 691 specifically treated patients there were 113 deaths, a mortality of 16.4 per cent. The previous year 54 per cent of all patients with pneumococcal pneumonia received sulfapyridine or serum or both and the mortality was 17.5 per cent. The mortality among the patients who received no specific therapy (except sulfanilamide in a few instances) was 49.5 per cent. In more than three fourths of these fatal cases the etiologic diagnosis and usually the anatomic diagnosis was first made at necropsy. Most of these patients were being treated primarily for other serious and highly fatal illnesses. The gross mortality among 518 patients treated with sulfapyridine alone or with serum was 17.4 per cent, as compared to 12.4 per cent among the 169 who received sulfathiazole with or without serum. These two groups of cases were comparable with respect to all factors but age. More than half of the deaths among the sulfapyridine treated patients occurred in those who were more than 60 years of age, whereas only a third of those treated with sulfathiazole were of this age. As patients more than 60 years of age were relatively twice as frequent among the former and the mortality of the two groups was essentially the same, this factor alone may account for most, if not all, of the difference in mortality between the sulfapyridine and the sulfathiazole treated patients. The fact that the mortality in the sulfapyridine treated patients was higher after February 1 than before that time, when all the patients were treated with that drug, also is supportive. Many specifically treated patients had other serious illnesses, and the mortality among patients with such "secondary" pneumonias was particularly high. The only death among 14 cases complicating pregnancy occurred in a case in which pneumonia complicated a septic abortion. The mortality among patients with acute alcohol intoxication or who had delirium tremens in the course of their pneumonia was also comparatively low.

Exsanguination.—Missildine discusses 33 cases of exsanguination from the point of view of recent advances in this field. The material was collected from about a thousand post-mortem examinations. Ten of the cases were due to trauma (usually automobile accidents), 4 to a malignant condition, 3 were postoperative, 3 were due to nonsyphilitic rupture of blood vessels, 2 each to postoperative jaundice, obstetric shock, blood dyscrasias, gastric ulcer and syphilitic aortitis and 2 each to suicide, tuberculosis and ruptured esophageal varix. Each type of case is considered separately. No matter how well hemorrhage is controlled, if the fluids given the patient leak out into the tissues instead of remaining in the circulation the

patient remains in shock. Even if the circulating volume is restored by fluids which remain in the circulation, they will not be life saving if the source of the bleeding is not controlled. Seven patients of the entire group who were most intensively treated lived an average of fourteen hours after hemorrhage began, and an average of 1,250 cc. of blood was lost. They received an average of 2,100 cc. of crystalloid fluid (5 per cent dextrose in physiologic solution of sodium chloride) and an average of only 200 cc. of blood. It is stated that adequate treatment has not been carried out until at least 80 per cent of the lost blood is replaced by whole blood or blood serum. Crystalloid solutions are no substitute. When untyped pooled human serum is proved innocuous, every hospital should always have it on hand for emergency use; then cases of hemorrhage can be treated promptly and much more effectively than they have been in the past.

Calcification in Callus in Healing Fractures.—Urist and McLean studied microscopically the healing processes of the fractures of fifteen litters of normal rats. The right tibias were fractured at 7 weeks of age and allowed to heal for varying periods of time. The first reaction to the injury is a sterile inflammation as a consequence of the trauma and hemorrhage. At from four to eight hours after the bone is broken the defect is filled and surrounded by extravasated blood, hemorrhagic debris and inflammatory exudate, including leukocytes. At twenty-four hours there is reparative new formation of connective tissue (fibrocartilaginous callus), which continues to proliferate and to form dense fibrous connective tissue. A part of this differentiates to form hyaline cartilage and fibrocartilage. As these changes take place, new bone begins to form under the periosteum and endosteum at some distance from the fracture line. This new bone invades and replaces the fibrocartilaginous callus and leads to bony union at about the twenty-fourth day. The reparative process as

a whole is an example of organization of diverse means to a common end—healing of the fracture by bony union. The progress of calcification has been observed by impregnation of undecalcified sections with silver nitrate. Bone matrix is formed subperiosteally and subendosteally, first at some distance from the fracture line, at about the second or third day following a fracture. It is calcified as it is laid down under optimal conditions with no appreciable interval between its formation and the deposition of bone salt within it. The new matrix is calcifiable as soon as it is recognizable as osseous tissue. A lag in calcification of newly formed osseous tissue may occur, because of failure in the supply or transport of bone minerals rather than to lack of calcifiability in the bone matrix. The matrix of hyaline cartilage becomes calcifiable when the adjacent cartilage cells become vesicular or hypertrophic. The calcification is further conditioned by its relationship to the bone tissue invading the fibrocartilaginous callus. Only matrix in contact with the invading bone calcifies. Only tissues recognizable as bone matrix or cartilage matrix calcify in the callus.

Compensation-Derotation Treatment of Scoliosis.—Steindler and Ruhlin present the results of 100 cases of scoliosis treated by the compensation-derotation method five or more years ago. The method consists of equilibration of the pelvis, elimination of weight stress, mobilization of the spine and development of muscle tone. The authors' criteria for muscle sufficiency are equal standing and recumbent lengths of the thorax, diminished distensibility of the spine, active permanent maintenance of posture without effort and restoration of a normal sense of thoracic equilibrium. The compensation-derotation treatment is adequate when the following conditions are present: (1) complete lumbar compensation of a thoracic primary curve with horizontal pelvis and horizontal fifth lumbar vertebra, (2) complete lumbar compensation of the thoracic primary curve with horizontal pelvis but oblique fifth lumbar, (3) a short and moderate thoracic curve with a straight upper and straight lumbar spine and (4) a primary lumbar curve, with a horizontal pelvis and a horizontal fifth lumbar. The method is not indicated in (1) all paralytic cases, (2) severe cases with rigid lumbar spines of all ages and types, (3) all scolioses with oblique pelvis except those of patients close to the completion of growth, (4) all high thoracic or cervicothoracic curves and (5) congenital scoliosis with oblique pelvis and oblique fifth lumbar vertebra. Of the authors' 100 patients 80 were treated conservatively and 20 were operated on. At examination 64 had mobile and 36 rigid spines. At the time spontaneous compensation had occurred in 30; 24 were habitual, 3 congenital, 2 rachitic and 1 paralytic. Complete compensation was obtained by treatment in 50, incomplete or no compensation in 20. Nine of the failures were cases of paralysis indicating an error in selection. Of the 20 cases which could not be adequately compensated, only 1 held; the others failed. All cases of spontaneous compensation held in the presence of good musculature. No attempt was made to correct the primary curve except in 5 cases in which compensation was finally lost and failed because of inadequate musculature; the rest were kept under careful observation, proper support and development of the musculature and remained compensated. Paralytic and severe structural nonparalytic scolioses (not considered in this discussion) did not respond to conservative treatment; the spines had to be fused. Of 21 patients treated conservatively by the combined derotation-compensation method with a follow-up of two years or more, 4 were compensated on admission and were treated by support and muscle development and they maintained the correction. For the 17 not compensated on admission and treated by manipulative correction, derotation, muscle development and support an average of eight months was required for complete compensation. Of these 17, only 1 patient with a congenital scoliosis and a hemisacralization of the fifth lumbar vertebra failed to respond. Therefore the correction held in 20, or 95 per cent, of 21 patients. The improvement over the previous series is due to the better selection of cases. Attempts to correct the thoracic deformity by rotation to the concave side are preposterous. Derotation is directed toward the lumbar and cervico-

thoracic section of the spine. Compensation-derotation and adequate muscle development promise success in the majority of all nonparalytic cases. Adequate compensation-derotation and fusion in the presence of inadequate musculature promises success in all paralytic and many congenital cases.

Sulapyridine in Experimental Brucellosis.—King and Lucas infected three groups of normal healthy guinea pigs with *Brucella suis*, *Brucella melitensis* and *Brucella abortus* organisms. The dose of organisms used was one half of a beef liver infusion agar slant culture. Each group of injected animals was divided into four subgroups and the subgroups were treated as follows: One was given 100 mg. of sulapyridine daily by mouth one and one half hours after the injection of the organisms, one 200 mg. six days after injection, one 100 mg. subcutaneously six days after injection, and the last group served as a control. All treatment ended twenty-one days after injection when a necropsy was performed on all the animals except half of each subgroup receiving 200 mg. These were held for twenty-one days longer to determine whether a flare-up occurred when the drug was discontinued. During treatment all animals looked fairly normal except a few that appeared sick, some of which died. The greatest mortality rate occurred in the *Brucella suis* group. At necropsy the abdominal organs were observed for obvious

pathologic change. In some animals gross evidence of disease was obvious, as small abscess-like lesions were seen on the surface of the liver. In some animals tough, exudative adhesions were present between the intestine and liver, liver and abdominal wall and intestine. The size of the liver and spleen generally did not exceed the normal. The results of the experiments showed only a slight preventive or curative effect. However, in the group of animals receiving 200 mg. of the drug no animals showed pathologic evidence or a positive culture except in the group that was held over for quiescent infection determination, in which the infection was being held under control by the drug and flared up after it was discontinued. The best results with the drug were obtained in *Brucella suis* infections and poorest results in *Brucella abortus*. Among the animals held over for twenty-one days without treatment, heavy infections in both *Brucella suis* and *Brucella abortus* animals were found and negative pathologic and cultural evidence in *Brucella melitensis* animals. In vitro tests showed that 1:1,000 and 1:10,000 concentrations of the drug against *Brucella suis* resulted in complete destruction of the organism. Against *Brucella melitensis* the 1:1,000 concentration showed complete bactericidal power, the 1:10,000 nearly complete killing power. *Brucella abortus* was far more resistant; only the 1:1,000 concentration showed a definite bactericidal effect.

Hypertension, Prostatism and Chronic Urinary Retention.—Campbell determined the value of gradual decompression of the bladder preceding the prostatectomies of 173 consecutive unselected patients. There were 36 patients with acutely distended bladders and 137 with chronic retention. The latter group was composed of 118 patients with a low blood pressure and a group of 19 patients with high pressure (more than 160 mm. of mercury systolic). Analysis of these groups suggested the following disposition with regard to the propriety of decompression: Decompression of the acutely distended bladder can be dismissed, for the changes which must occur are those of physiologic counterbalance dependent on the normal protective mechanism of the urinary tract provided for such an emergency. Many of the patients with a low pressure in the chronic retention group were treated with gradual decompression, because it is the rule for the intern to "decompress when in doubt." The average fall of blood pressure in this group was 18 mm. of mercury. The blood pressure of most of these patients subsided gradually regardless of the institution of decompression, and the blood pressure was stabilized without untoward physical manifestations. Of the 19 patients whose systolic pressure on admission was above 160 mm. of mercury the hypertension of 15 was relieved. It must have been due to the chronic retention of urine. The author believes that gradual decompression is still a valuable procedure and is often a life-saving procedure for the prostatic patient with chronic urinary retention and hypertension. Pyelonephritis, often thought the actual cause of death, is undoubtedly a secondary complication precipitated by the too rapid evacuation of a chronically distended and infected bladder. Hypertension evidently occurs in a small group of prostatic patients because the upper part of the urinary tract is unable to dilate because of an anatomic factor: an intrarenal pelvis.

Sulfathiazole as a Urinary Antiseptic.—Helmholz studied the urinary antiseptic qualities of sulfathiazole and from 2,003 observations, he states that sulfathiazole is bactericidal for the six most common urinary bacteria: *Streptococcus faecalis*, *Staphylococcus aureus*, *Escherichia coli*, *Aerobacter aerogenes*, *Proteus ammoniae* and *Pseudomonas aeruginosa*. A concentration of 200 mg. per hundred cubic centimeters should prove sufficient for the cure of practically all infections except *Pseudomonas*, which will probably require 300 mg. per hundred cubic centimeters. The effectiveness of the drug for the various bacteria on an ascending scale is as follows: *Pseudomonas aeruginosa*, *Streptococcus faecalis*, *Escherichia coli*, *Aerobacter aerogenes*, *Proteus ammoniae* and *Staphylococcus aureus*. The bactericidal range is from 300 to 25 mg. per hundred cubic centimeters. There is some variation in the effect of the drug at various μ n levels, particularly for *Streptococcus faecalis*.

Enterobiasis.—Weller and Sorenson endeavored to determine the incidence of *Enterobius vermicularis* infection in the New England area by examining 505 white children from 2 to 12 years of age admitted to the medical wards (118) or the outpatient department (387) of the Children's Hospital. The patients were consecutive with no attention being paid to age, sex or type of illness. The anal swabs were examined on the same day on which they were obtained. The swabs were never taken before the morning toilet. The symptoms of the 387 outpatients were studied. The blood studies done as a part of the routine medical examination of the 118 ward children were reviewed for any eosinophilia. Among the 505 children examined 97 (19 per cent) were found to have enterobiasis. An analysis of the data showed that the average number of children less than 14 years of age in the families of 91 of the positive cases was 3.1; in the 396 negative cases the average number was 2.2. Additional data showed that for the 91 positive cases the average total family size was 5.5 persons and for the 394 negative children 4.6 persons. Forty-two of the 387 outpatients gave a history of previous pinworm infection, and of these 16 proved to be positive on swab examination. Of the 345 children with no previous history of infection, 56 were positive. In the present series 23 per cent of the girls, and 15 per cent of the boys were infected. Enterobiasis was less common among the younger children. The children with pinworms did not complain of gastrointestinal symptoms more frequently than the uninfected children, with the exception of a slight but not significant variation in "loss of appetite." Likewise, vulvitis and night restlessness occurred with the same frequency. Anal pruritus, perianal cutaneous lesions, enuresis and masturbation were a little more common among the positive group. The variation was not statistically significant. The relatively asymptomatic nature of the infection would appear to indicate that subclinical enterobiasis is a common condition. Of the 72 positive cases among the 387 outpatients 64 per cent had no gastrointestinal symptoms, 80 per cent no perineal symptoms, 58 per cent no nervous symptoms

and 36 per cent none of these three symptoms. This does not mean that the pinworm is incapable of causing symptoms—4 cases showed a symptom complex approximating the classic description of enterobiasis. At least two factors combine to overemphasize the importance of symptoms: the symptoms tend to be misleading and in the past only those patients showing symptoms have been studied. Further work is necessary to determine why some patients have symptoms and others do not. The intensity of infection, the nervous constitution of the infected person and an allergic response to products of the parasite may be important.

Cutaneous Cancer and Occupation.—Phillips reports the particulars of the study carried out by the United States Public Health Service as to the incidence of occupational cutaneous cancer in Texas. The data that he analyzes are those of occupation, as they pertained to 1,190 individuals having 1,569 microscopically verified cutaneous cancers. The cases were obtained from 187,831 registrations of the Scott and White Hospital and the Gulf, Colorado and Santa Fe Railroad Hospital in Temple, Texas, from January 1920 to January 1940. In order of frequency these lesions were found to be basal cell epithelioma, squamous cell epithelioma, melanoma, mixed basal and squamous cell epithelioma, transitional cell epithelioma, adenocarcinoma of the sweat or sebaceous glands, fibroxanthosarcoma and epithelioma in sebaceous cysts. The occupations of the largest group of these patients was outdoor work: farming and ranching. The work of housewives comes next in order, followed by various business activities requiring moderate outdoor life. The professions were next, followed by laborers and carpenters. The railroad and petroleum industries furnished few cutaneous cancers. There were 738 basal cell epitheliomas among 546 patients; 34.7 per cent belonged to the farmer-rancher classification. All but 12.2 per cent of the total were traced as to occupation. The squamous cell epitheliomas accounted for 644 lesions and 596 patients; 49.1 per cent of these patients were either farmers or ranchers. There were 128 housewives in the basal cell group as against 70 in the squamous cell group. The occupation of 15.8 per cent of these patients was not known. Study of 124 persons having 143 melanomas confirms previous observations that occupation apparently has no particular relationship as to etiology and that women are as likely to have the neoplasm as men. Melanoma does not appear to be much stimulated by sunshine. Seventeen patients had 19 cancers of the mixed basal and squamous cell type; 48.5 per cent were farmers and ranchers. There were 19 transitional cell epitheliomas among 16 patients. The incidence for outdoor exposure was 50 per cent. There were 6 carcinomas in the sweat and sebaceous glands and in the hair follicle epithelium; 2 of the patients were farmers and 1 was a rancher. Farmer-rancher occupation amounted to 39.9 per cent of the whole series of 1,190 persons. When farm and ranch housewives are added to that of the farmer-rancher men the figure rises to 46.05 per cent.

Hemorrhage into Lungs in Deaths Due to Trauma.—Ross reviews hemorrhagic pulmonary lesions due to trauma that are seen in peacetime. Blood may be inhaled after hemorrhage from lesions of the upper air passages or nasopharynx or even from a fracture of the base of the skull. The lung tissue is undamaged, but in cases in which the inhaled blood is not immediately fatal it will have coagulated. A lacerated wound of the lung associated with hemorrhage may occur after the wall of the chest is penetrated by a sharp object or by a broken rib. The pulmonary appearance varies according to whether the penetrating object or rib remains in the lung while respiration continues and the resultant hemorrhage varies with circumstances. It may spread for some little distance beyond the margins of the wound. Hemorrhagic lesions (contusions or bruises) of the lung may be found in cases which show no penetrating wound of the chest or broken ribs. Such cases are comparatively frequent in road accidents after violent impact of a moving vehicle or when the victim is hurled against a hard obstacle such as a wall. In children it is most often associated with a history of the rapid passage of a wheel over the thorax. The hemorrhagic lesion in the lung takes the form of a contusion or localized bruise. Microscopically there is rupture of the pulmonary tissue and hemorrhage into the damaged area. In another group of cases death may be said to be due to asphyxia. Asphyxia from any cause produces hemorrhagic lesions in the lungs. The lesions consist of punctiform subpleural hemorrhagic patches. These ecchymoses—Tardieu's spots—are sometimes separated, sometimes in groups. In asphyxia due to pressure on the trachea (strangulation) there will be frothy blood-stained mucous fluid in the upper air passages and intense congestion of the lungs, and, in addition to Tardieu's spots, larger patches of hemorrhage may be present. The lungs of patients dying of fat embolism following crushing injuries are typically deeply congested throughout with no localized hemorrhagic patches. These hemorrhagic lesions seen in peacetime are compared to lesions produced as the result of the detonation of high explosives. Flying missiles produce penetrating wounds of the chest and lacerated wounds of the lung which differ in no way, except in degree, from peacetime penetrating lesions. Impact damage from these missiles or forcible hurling of the victim by the force of the explosion (blast) may produce contusions of the lung similar to those of road accidents. These contusions may be present without visible external injury. Cases of asphyxia are frequent under bombing conditions, when persons may be buried under debris. Dust may have been inhaled or the victim may have been pinned under a pile of debris. In the former group the postmortem observations are those of asphyxia only. In the other group the picture is that of compression asphyxia. In these cases death has presumably been slow, with attempts at

respiration. In such conditions rib markings have been observed; a dark purple line of the size and direction of the rib. In addition these cases showed some scattered hemorrhages into the lung, with subpleural Tardieu's spots. There are localized areas of collapse. Microscopically there is disruption of the alveolar walls when the rib marking has been sectioned. There is fresh blood in the alveoli, and clotting may have begun in some areas. Elsewhere there is general congestion of all the capillaries in the alveolar walls and thromboses in the smaller arterioles and veins. Edema is present in many areas. Another group of wartime injuries without parallel peacetime lesions is that in which death occurred without or with only trifling external injury, but in which intrapulmonary hemorrhage is common. These cases are found near the site of explosion. The condition may well be called "hemorrhagic pulmonary concussion." When these pulmonary lesions have been found and there have been external markings of small splinters and the like, the superficial lesions are on the anterior surface of the body. The hemorrhagic areas are scattered through and the two lungs are affected to the same degree. Edema as in compression asphyxia is not a feature. Thromboses are not present. Further, the hemorrhage is fresh and clotting has not occurred. There is widespread and intense capillary congestion in the lungs. There is hemorrhage into the walls of the small bronchioles but no bleeding into the walls of the bronchi. There is some overdistention of air vesicles and respiratory bronchioles in some cases with no anatomic relation to the ribs. It is not known how many victims of air raids, dying with gross fatal injury, apparent externally, show the foregoing pulmonary lesions. The lesions are distinct from heretofore familiar conditions. They are distinguishable from lesions of compression asphyxia or pulmonary hemorrhage from impact of solids against the thoracic wall.

*Relations Between Pulmonary Tuberculosis and Menstruation: Clinical and Statistical Study. M. Valli.—p. 825.

Pulmonary Tuberculosis and Menstruation.—Valli made observations on 1,000 women with pulmonary tuberculosis and normal menstrual function. Menstruation appeared at the age of 14 in the majority of cases, before 10 in 2 and after 19 in 2. There was no relation between the age of the patient at the appearance of menstruation and the more or less acute onset and severity of tuberculosis, with the possible exception of women who began to menstruate late. In the latter group the number of grave cases was greater. Amenorrhea was the most frequent irregularity. It was improved when the tuberculous process improved. Fever, especially premenstrual, hemoptysis and focal reactions were the most frequent disorders observed during menstruation. Menstrual fever was frequent in women with grave forms of pulmonary tuberculosis. Fever was the only symptom in half the number of patients in the febrile group. In the other half it was combined with transient focal reactions which aggravated the pulmonary disease and the general conditions of the patients in 23. Hemoptysis occurred in 82 patients, either in the presence or in the absence of fever. Acute bronchogenic tuberculous dissemination of the disease took place in 19. Headache, nausea, vomiting, abdominal and lumbar pain and fast pulse were observed in 112. The author has previously reported that the resistance of the body diminished during menstruation in tuberculous women, as manifested by the variations in tuberculin allergy, increased sedimentation speed of the erythrocytes and increased tuberculous bacilleemia during menstruation.

"Angioneurotic Hematuria" in Young Men.—In the course of examining two thousand young men for aviation service, Heinsen observed that three hundred and fifty had a microscopically demonstrable hematuria. This number included neither those with massive hemorrhages nor those in whom notable amounts of protein, casts or leukocytes in addition to erythrocytes indicated a nephritis, pyelitis or inflammation of the urinary passages, but only those in whom the microscopically demonstrable hematuria was the only abnormal sign. The hematuria was slight. Some of these young men were repeatedly examined. In many instances subsequent tests failed to disclose a hematuria and urologic examination disclosed no organic defects that could explain the hematuria. The author cites factors indicative of a hematuria on a vasomotor basis. Nearly all the young men whose urine contained erythrocytes were hardly 20 years old, and about two thirds had the signs of hyperirritability of the vasomotor system, such as hyperhidrosis, coarse tremor and severe dermatographism. The fact that the physical examination was of vital importance for the career of these young men made them even more excited. An analogy is presented by polyuria nervosa spastica occurring in easily excitable persons and by the "urine flood" following an attack of migraine. Just as a decrease in the tonus of vasoconstrictive nerves can lead to polyuria as the result of increased blood perfusion of the kidney, hyperemia may cause stasis and diapedesis. He presumes that great instability of the vasomotor nervous system is the cause of hematuria in these otherwise healthy young men. Their kidneys are not diseased and their vasolability is physiologic rather than pathologic. The author warns against including all microscopic hematurias in young persons in the category of "angioneurotic hematuria." Every

hematuria must be regarded as a serious symptom and subject to careful urologic examination. Only if organic changes can be definitely excluded and other factors suggest a vasomotor basis should angioneurotic hematuria be considered.

Diagnosis and Treatment of Addison's Disease.—Recognition of a fully developed Addison's disease is comparatively simple, but the diagnosis of early and latent forms, as well as the exclusion of other diseases, is difficult. This difficulty, according to Dzsinich, is due to the fact that the symptoms of incipient adrenal insufficiency are meager and insignificant and that functional tests are not sufficiently exact to enable one to detect a beginning adrenal insufficiency. Differential diagnosis is made possible by the detection of the objective symptoms: severe emaciation, weakness, low blood pressure, low blood sugar, subnormal temperature, circulatory changes, brown discoloration of the skin, severe gastrointestinal disturbances and disturbances in the sexual life. These symptoms are not always present in the incipient stage and some of them are present in other disorders. Pigmentation which together with disturbances in the carbohydrate metabolism and hypotension is one of the most characteristic symptoms of chronic adrenal insufficiency, is found also in carcinoma of the abdominal organs, anemias, leukemias, cirrhoses, chronic intoxications (silver, arsenic) and avitaminoses. The author cites facts which prove that the hormone of the adrenal cortex plays an important part in the water, mineral, protein, carbohydrate and fat metabolisms of the organism. The examination of these interrelations is difficult for the practitioner. The author suggests that all provocative tests be made in hospitals because they may elicit crises. Withdrawal of sodium chloride is a test which usually results in exacerbation, but the fact that some tolerate this test well makes it less reliable. Another test is a diet with a high potassium content; this likewise intensifies the symptoms of Addison's disease. For the treatment of the disease the author recommends large doses of adrenal cortex extract and infusion of hypertonic solution of sodium chloride, to which sodium citrate (0.5 per cent) and dextrose solution (10 per cent) may be added. He also gives vitamin C, alkaline substances and a diet deficient in potassium. The treatment must be individualized. When it can be demonstrated that syphilis is the cause, antisyphilitic treatment is indicated. Surgical interventions on patients with Addison's disease are no longer as hazardous as they were formerly, when even extraction of a tooth could be fatal. The author prepares his patients for the operation with a course of intense treatment.

Prognosis of Ulcerative Colitis.—Henning points out that ulcerative colitis is always a serious disease whose prognosis requires caution, particularly in view of the unpredictable complications. Although small hemorrhages in the form of mucosanguineous stools are present in all cases, massive hemorrhages, particularly if they are recurrent, may be fatal. Perforation with fatal peritonitis and paralytic ileus of the entire colon with peritonitis are rare complications. Frequent sequels are the cicatricial changes, which may be localized or diffuse. The localized lesions may give the impression of stenosis, which usually forms in the sigmoid or rectum. Gallart Mones regards rectal stenosis as one of the most frequent complications. If the shrinking process is diffuse, the lumen may become small and the haustra may disappear. There may even be shrinkage in length. Pericolitic, perisigmoiditic and periproctitic abscesses are rare complications. Colonic polyps concur with colitis, but the author asserts that the inflammatory pseudopolyps may completely disappear with improvement of the colitis. Secondary anemia, rheumatoids, neuritis, sepsis with endocarditis, suppurating parotitis and acute yellow atrophy of the liver are some of the remote complications. As a rare complication in his own material the author mentions multiple thromboses in the extremities and cerebral embolism with hemiplegia. Even if there are no complications, the disease has unpredictable fluctuations. Certain general clinical aspects furnish some prognostic hints. Although the fever at the onset of an acute case is of no significance, an unfavorable prognosis is indicated if it does not subside after suitable treatment has been continued for from four to six weeks. The same applies to loss of weight, exsiccosis, tachycardia, anemia and severe prostration. The endoscopic aspects are of some value even though they do not disclose the entire extent of the lesion. Extensive and deep ulcerations with

fibrin, pus and pseudopolyps require more restraint in evaluation than do the flat erosions. The author differentiates between anatomic and functional cure. Retroscopic examinations disclose that complete anatomic cure is unusual. Roentgenoscopy provides reliable prognostic information about the extent of the ulceration. Cases in which the process involves large portions of the colon have a more unfavorable prognosis than have those in which the ulcerations are limited to the rectum. Cases in which the ascending colon is involved have a mortality of 50 per cent (Snapper, Lockhart-Mummery and the author's observations). The prognosis in many cases of ulcerative colitis is to a great extent determined by the treatment. Early and persistent treatment in the form of bed rest and a mixed diet without roughage often restores the patients to such an extent that they become able to work again. The author cites statistics on the mortality and thinks that the great differences between the figures are due to the composition of the case material.

*Diagnostic Significance of Serum Reactions in Malaria. T. Miyagi.—p. 788.

*Urinary Excretion of Vitamin B₁ in Beriberi Patients. I. Ishihara.—p. 804.

Serum Reactions in Malaria.—Miyagi reports the results of serum reactions in 27 cases of tertian malaria, 17 plasmodium carriers, 110 cases of cured malaria and 141 healthy subjects. The reactions tested are (1) the melanoflocculation test of Henry, (2) the fibrin test of Livieratio, Vagliano and Kokaraki and (3) the congo red test of Ishioka and Akashi. The Henry reaction was positive in 80.4 per cent of active cases of tertian malaria, while the congo red test gave 80 per cent positive reactions. In chronic cases the percentage of positive reactions was somewhat lower (47.1 per cent for Henry's reaction and 52.9 per cent for the congo red test). As a rule the patients who had had splenomegaly gave positive reactions to these tests. The author expresses the opinion that the tests are not specific immune reactions but merely the phenomena of altered colloid stability.

Urinary Excretion of Vitamin B₁.—Employing the thiochrome method of Otto and Rühmekorb, Ishihara made quantitative determinations of urinary excretion of vitamin B₁ in 37 patients suffering from beriberi. This method, by use of a Pulfrich photometer, can be easily carried out in the average laboratory. The amount of the vitamin excreted was calculated for twenty-four hours. In beriberi patients the author found the average daily excretion of vitamin B₁ to be 50 micrograms or less, but increasing when these patients received a diet rich in this vitamin. In spite of the persistence of clinical manifestations, the daily excretion increased to 300-400 micrograms. From these observations it may be said that a low urinary excretion of vitamin B₁ is diagnostic of either active or latent beriberi.

*Statistical Studies on Genitourinary Tuberculosis. A. Okada.—p. 491.

Genitourinary Tuberculosis.—Okada reports the results of cystoscopies in 165 cases of urogenital tuberculosis. The greater number of patients (93 per cent) showed definite changes of the bladder mucosa at the urethral orifice, followed in order by the pathologic condition in the trigon, lateral wall, posterior wall, neck, fundus and the anterior wall. No relationship seemed to exist between the sex or the side of the diseased kidney and the extent of bladder disease. The bladder capacity appeared to decrease in direct proportion to the extent of the disease. In all cases, irrespective of the degree of disease, the earliest manifestations of the disease were frequency of micturition and pain on urination. Hematuria and lumbar pain were less frequent. In mild cases pyuria was also frequent. With the increase in cystoscopic signs, the degree of positive findings on palpation of the bladder also increased. No definite relation, however, was observed between the cystoscopic findings and the presence or absence of genital tuberculosis. The ease with which the urethral catheter could be inserted decreased with the progress of the bladder disease. Chromocystoscopy showed a delay on the affected side as compared with the normal side; the excretion of indigo carmine was evident in ten minutes from the healthy side in 93.8 per cent of cases, whereas from the affected side

the appearance of the dye was delayed beyond ten minutes in 51.4 per cent. The amount of phenolsulfonphthalein excreted from the normal side in fifteen minutes was over 15 per cent in 85.3 per cent of cases, while it was less than 15 per cent in 70.7 per cent of cases. Catheterized urine collected from the affected side was turbid and contained pus clumps, albumin and tubercle bacilli. The study includes roentgenographic examination of the genito-urinary tract by intravenous and retrograde pyelocystography. The specific gravity of the urine, determined after intravenous pyelography and compared with the phenolsulfonphthalein test, in conjunction with roentgenographic examination, were found to be valuable in estimating the total renal function. The cystogram, however, was useful only in cases with moderately advanced tuberculosis of the urogenital system. By the combination of all these methods positive diagnoses were established in 139 cases of unilateral tuberculosis of kidney, 34 of bilateral involvement and 2 of tuberculosis of the bladder, while in 20 cases the affected side eluded diagnosis. Of the unilateral kidney tuberculosis, 79.8 per cent of the cases were found to be operable and 20.2 per cent inoperable. As to the relationship between the changes in the extirpated kidneys and the clinical symptoms, Okada found the predominance of fully developed tuberculosis (60.5 per cent), followed by the early stage of changes (29.6 per cent) and the terminal stage (9.9 per cent). In the early stage of disease the involved kidney is of normal size, but it gradually diminishes with the progress of the infection. The changes in the renal pelvis and in the size of the ureter parallel one another. The healing of operative wounds took place on an average of two months or less in nearly half of the cases (46.8 per cent). The survival time after the operation was three years in 47.4 per cent; the prognosis was most favorable in patients with minimal pathologic change in the lung. Permanent cure (survival time of over three years) was encountered in 55.1 per cent of all surgical cases; in cases in which for any reason operation was not performed, the mortality was high (81.1 per cent).

*Takata Reaction in Malarian Serums. T. Ou.—p. 1825.

*Serodiagnosis of Malaria. M. Asai.—p. 1836.

Takata Reaction in Malaria.—Using the modified Jezler technic, Ou performed Takata tests on 116 malaria patients in various stages of infection, with 24 normal subjects as controls. In acute cases the reaction was negative in every instance; the incidence of positive reactions increased with the chronicity of the disease. In patients with hepatomegaly the reaction was usually positive but became negative with improvement following specific therapy. If turbidity and transient flocculation are regarded as positive reactions, the minute changes which take place in the serums in acute cases can be detected and the progress of such changes may be followed as the disease becomes more chronic. In chronic malaria with hepatomegaly such reactions are 100 per cent positive. No agreement in results between the Takata reaction and the Henry test was detectable in acute cases of malaria, but in chronic cases both tests frequently give positive results. From these experiences the author believes that in malaria serums some definite changes in colloid chemistry occur, the changes being relatively slight in acute stage and increasing with the progress of the disease. No parallel relationship was demonstrated between the liver function test (azorubin S method) and the Takata reaction.

Serodiagnosis of Malaria.—Asai has found that a complicated mixture such as employed in Henry's reaction is unnecessary, since a simple mixture of 1 cc. of retinal melanin and 0.2 cc. of serum is as satisfactory. The melanin was prepared from the buffalo retina and diluted ten times with alkaline water. In testing serums from 133 patients with retinal melanin, artificial melanin and alkaline water, he found the first of these reagents to give coarse flocculation in chronic cases, and the second reacted with finer precipitation mostly in acute cases, while the third was effective only in a small percentage of the chronic cases. The author believes that the melanin tests are valuable in the serodiagnosis of malaria at all stages of the disease.

Book Notices

The Working Environment and the Health of Workers in Bituminous Coal Mines, Nonferrous Metal Mines, and Nonferrous Metal Smelters in Utah. By the Division of Industrial Hygiene, National Institute of Health, U. S. Public Health Service and the Utah State Board of Health. Paper. Pp. 310, with 38 illustrations. Salt Lake City: Industrial Hygiene Division, Utah State Board of Health, 1940.

This report is a notable one in the series of joint investigations by the U. S. Public Health Service and individual states. As the result of a preliminary survey by the federal agency in 1936 it was discovered that the major industrial health hazards in this state occurred in bituminous coal mines, nonferrous metal mines and nonferrous smelters and involved exposures to dusts of silica, lead and other metals and to various fumes and gases. Three representative coal mines, three metal mines and two smelters, employing in all two thousand eight hundred and thirty-nine men, were selected for detailed study. This involved complete physical examination of all employees with roentgenograms of their chests, serologic tests for syphilis, blood examinations for evidence of lead absorption where indicated, a routine urine examination in all cases and in 961 a spectroscopic examination of the urine for lead. Engineering studies of the environments of each plant pointed out places where hazards from silica, lead, arsenic, cadmium, sulfur dioxide, carbon monoxide, carbon dioxide, hydrogen sulfide, hydrogen cyanide and methane might be anticipated. Correlation of these findings with evidence of disease in previously exposed employees permitted the establishment of certain tentative standards of safe concentrations for these irritants in the local industries. In accordance with its agreement on the completion of the preliminary survey, the state of Utah has appropriated \$25,000 toward the development of a permanent industrial hygiene service for the continued inspection and control of its industrial hazards.

This report, covering all details of the causation, diagnosis and prognosis of the diseases involved, constitutes an excellent textbook. Its detailed data constitute a valuable contribution to industrial hygiene. The volume would be a useful textbook for physicians practicing in the state. It contains eleven illustrations of characteristic roentgenograms of silicosis.

In the bituminous coal mines the major health hazard was from silicosis, but in this state as elsewhere the number of cases was small. Among five hundred and forty-five employees in three mines (about one fifth of the total employed in the state) the total incidence of anthracosilicosis was 4.6 per cent. The incidence of reinfection tuberculosis, 2.6 per cent, was little above that of the general population.

Among seven hundred and twenty-seven metal miners working in rock whose free silica content varied from insignificant quantities to over 99 per cent, there were 9.1 per cent with definite silicosis and another 5.8 per cent in a presilicotic condition. The total incidence of reinfection tuberculosis was low, only 2.5 per cent. In the silicotic subjects alone it was nearly 14 per cent, but with this group excluded only 1 per cent of the remaining miners showed evidence of this infection.

Lead poisoning was the next most frequent industrial disease, and this involved chiefly the miners at the face. During a period of five years preceding the survey twenty men reported disabling attacks of plumbism and at the time seventy-five had signs of lead absorption. The only other significant condition discovered was a mild dermatitis attributed to sulfide ores, which occurred in a few of the miners. Cardiovascular disease was of normal frequency for the age group.

In smelters there was a silica hazard in the concentrating department, a lead hazard, particularly prevalent in the bag houses, where atmospheric concentrations as high as 6,000 mg. in 10 cubic meters of air were measured, a carbon monoxide hazard in furnace charging and a sulfur dioxide hazard in many different departments. Excluding men who had had two or more years' exposure elsewhere the crude silicosis rate was 2.7 per cent among one thousand three hundred and ninety-one employees. In the concentrating departments alone exposures of twenty or more years caused silicosis in 22.6 per cent of the employees. No cases of acute plumbism were discovered, but 2.9 per cent of the group had clinical manifestations of lead absorption. Histories of lead poisoning in the past were infrequent. The only possible

evidence of arsenical poisoning was the discovery of 75 cases of nasal septal perforation. Conjunctivitis, rhinitis, pharyngitis and gastrointestinal symptoms that may have been due in part to sulfur dioxide to exposure were frequent.

The most striking feature of the smelter survey was the high frequency of adult type tuberculosis with a crude rate of 5.4 per cent. No particular group was affected, and even after the silicotic members had been excluded the rate for the rest of the men was 4.9 per cent. The cause could not be ascertained. It was concluded that if the inhalation of sulfur dioxide was of importance it was probably only one of several factors involved.

The recommendations for the control of these hazards conform to generally accepted practice. The standards of permissible concentrations of dusts and gas are based on local experience but they also are in conformity with measures applied elsewhere.

Structural and Other Precautions Against Air Raid Risks in Hospitals. Issued by the Ministry of Health and the Department of Health for Scotland. Emergency Medical Services Memorandum No. 1. Paper. Price, 10 cents; 3d. Pp. 12. New York: British Library of Information; London: His Majesty's Stationery Office, 1939.

The object of the memorandum is to indicate to hospital authorities what can be done to provide protection against air raid risks both in existing hospitals and in the planning and construction of new hospitals. The main sources of danger in an air raid are high explosive bombs, incendiary bombs and poison gas. There is, in addition, danger from falling fragments of anti-aircraft shells. It is not practicable to provide hospital buildings which would resist a direct hit by a high explosive bomb or the blast effect of high explosive bombs falling close to them, though by careful planning and design something can be done to mitigate or localize the damage. Specific suggestions are made for the existing hospitals with regard to special protection of the ground floor, the windows and the roof. It is advised that hospitals in dangerous situations provide special shelter accommodation for the staff off duty and for such patients as may be able to use it. Basements or cellars may be suitable for this purpose. Trenches or arched steel shelters may be provided in the ground. It is essential to prevent the direct admission to hospitals of persons who have been contaminated with persistent gas, such as mustard gas, and to exclude gas-contaminated articles from the main hospital buildings. In the construction of new hospitals the selection of a site is of great importance. A frame building is the type that offers the greatest resistance to blast pressure and is least likely to collapse completely. The buildings should be of fire resisting material throughout. Roof light for the operating should be dispensed with, and windows should be designed in such a way that they can be readily blocked up. In large hospitals especially, additional or alternative operating rooms should be designated in as safe positions as possible. The basement may be so constructed as to be suitable for an air raid shelter.

Dietetics Simplified: The Use of Foods in Health and Disease. By L. Jean Bogert, Ph.D., Instructor in Experimental Medicine, Yale University, New Haven. With Laboratory Section by Mame T. Porter, M.A., Nutritionist, State Department of Social Welfare, Albany. Second edition. Fabrikoid. Price, \$3. Pp. 742, with 76 illustrations. New York: Macmillan Company, 1940.

This is an elementary textbook on dietetics intended for use primarily by hospital dietitians, nurses in training and medical students. As might be expected, the larger part of the book is concerned with the discussion of various types of special diets. In addition the book contains an introductory discussion of the fundamentals of human nutrition and of the principles underlying the selection of adequate diets in normal conditions, among which are included infancy and pregnancy and lactation. To aid the classroom teacher a list of discussion questions and problems has been appended to each chapter, and there are included also plans for a series of laboratory lessons in general cookery and in methods of preparation of a variety of special diets. An appendix provides tables of food composition, including vitamin content, and height-weight tables for children and adults. The tables of food composition include data for canned and cooked as well as raw foods.

Largely because of the effort to simplify and condense the material which deals with normal nutrition and with diet under

normal conditions, a number of factual errors have been allowed to enter. Some of these errors were pointed out by an earlier reviewer and have not been corrected in the second edition. For example, on page 34 cocoa and chocolate are still incorrectly classified as foods rich in sugar, and fish in general is still listed as a food rich in fat (10 to 25 per cent). Apples are listed on page 135 as "among the best body alkalinizers" although there is published evidence to the contrary, while tomatoes and pineapple, which have been shown to be much more effective in reducing the alkalinity of the urine, have been omitted from the list. Also several of the recommendations for children's diets, particularly the advice to serve only cooked vegetables, and those finely minced or mashed, to children of 5 to 9 years of age are not in accord with the best modern pediatric practice. It is difficult to keep printed material abreast of the rapid developments in the field of the vitamins. However, it is unfortunate that in a book published as recently as this one has been chemical names of the vitamins have not been used, vitamin requirements have not been expressed in units of weight as well as in terms of biologic units, and the possibility of a deficiency of riboflavin in the diet has not been recognized. In the tables of food composition, vitamin potencies are expressed in terms only of biologic units. These inaccuracies and omissions mar the value of the book for use by the elementary student of nutrition or for the general reader. It should be valuable, however, for the primary purpose for which it was intended; that is, as a textbook for use in teaching elementary courses in diet therapy or diet in disease. The teacher should remember, however, that more extensive reading on the subject of the fundamentals of human nutrition is desirable for students who do not already have a good foundation in this subject.

Elementary Atlas of Histology. By Burton Bradley, M.B., Ch.M., M.R.C.S. With foreword by J. B. Cleland, M.D., Professor of Pathology, University of Adelaide, Adelaide. Fabrikoid. Price, 15s. Pp. 122, with 58 plates. Sydney & London: Angus & Robertson Limited, 1940.

This collection of rough sketches of representative microscopic fields of most of the organs is intended as "some sort of liaison between what the junior student sees with his eyes in the average preparation given out in classes and the very excellent descriptions in textbooks." In most colleges and medical schools in this country each student is required to make a series of rough sketches of zoological and histologic material like those in this book. This induces the student to label the structures seen in the microscopic preparation and tests his knowledge of what he has seen. He would not profit if the teacher identified the structures in his sketches, which would be the result of the use of this book. The reviewer is completely out of sympathy with attempts at spoon feeding and accordingly sees no value in a book such as this.

Radiologic Physics. By Charles Weyl, S. Reld Warren, Jr., and Dallett B. O'Neill, Moore School X-Ray Laboratory, Moore School of Electrical Engineering, University of Pennsylvania, Philadelphia. With a foreword by Eugene P. Pendergrass, M.D., Director of the Department of Radiology, University of Pennsylvania. Cloth. Price, \$5.50. Pp. 459, with 166 illustrations. Springfield, Illinois, & Baltimore: Charles C. Thomas, 1941.

A general practitioner, thumbing through this volume and glancing hurriedly at the charts, curves, diagrams and tables, would probably come to the conclusion that this book is not written for him. A more careful reading of the work will convince him that it is still readable although it abounds with mathematical expressions, and much about physics can be learned even though the reader may not have a knowledge of mathematics. Because of the significant advance in the field of radiology and physical therapy, physics is now playing a greater role in the fundamentals of medicine. A practicing physician to be on his toes should now learn to interpret physical formulas the same as he does a chemical formula. The book is divided into two parts. The first part consists of the fundamentals of electromagnetism and electromagnetic devices. The second part deals specifically with radiant energy and its inner actions with matter. The fundamentals of electricity, magnetism and radiation are dealt with in a convincing manner. There are descriptions and diagrams of electromedical equipment such as x-ray hook-ups, diathermy and testing equipment. There are a large

number of diagrams of instruments for measuring electrical and radiation quantities. The second part concerns x-ray radiation almost entirely although there is a chapter on the disintegration of matter, radioactive in molecular physics. This volume is probably more suitable for the student who wishes to specialize in radiology and, as it is stated in the foreword, "in order that a physician might develop and be worth his salt in the modern department of radiology, it is necessary for him to master at least the fundamentals of modern physics. . . ." Chapter 1, on scientific method, contains fundamental information every physician should know and appreciate. This volume would serve as a good textbook in school where radiology is taught and would also be an excellent reference work for the library of such a school.

Blutdruckmessung und Kreislauf in den Arterien des Menschen: Geschichte und heutige Lage der Probleme neue Lösungsversuche. Von Dr. Heinrich von Recklinghausen. Kreislauf-Bücherei. Herausgegeben in Verbindung mit der Deutschen Gesellschaft für Kreislaufforschung. Band IV. Paper. Price, 30 marks. Pp. 532, with 197 illustrations. Dresden & Leipzig: Theodor Steinkopff, 1940.

In this volume are considered determination of blood pressure of animals, indirect methods of determination of blood pressure such as palpation and auscultation, the influence of the arterial wall on determination of blood pressure and the various instruments for measuring blood pressure. Studies of pulse waves are considered in detail. There are chapters on direct measurement of blood pressure of man, and on hemodynamics. More than three hundred references are presented.

The Officers' Guide: A Ready Reference on Customs and Correct Procedures Followed Within the Army Which Pertain to Commissioned Officers. For the Use of All Officers of the Regular Army, National Guard and Officers' Reserve Corps. Fourth edition. Cloth. Price, \$2.50. Pp. 383, with illustrations. Harrisburg, Pa.: Military Service Publishing Company, 1941.

A doctor in the Army is an officer. He has to know about customs and correct procedures from a military as well as a medical point of view. There is probably no other book available which gives all this information as compactly and as accurately as does this volume. The new medical officer can find here the customs that prevail. There is a chapter on pay and allowances, another on leaves of absence, promotion and retirement. There is information concerning life insurance, participation in post activities, an analysis of the Selective Service Act of 1940, and much other useful information. Indeed, the book is so up to date as to supply a complete list of Army posts with the type of assignments for each and the nearest town or city. An appendix provides a guide to military symbols and abbreviations, and there is a well constructed index.

Trudy Ukrainського Mechnikovskogo Instituta. Pod redaktsiyei M. S. Segal i M. M. Tsekhomovitsera. Tom pyaty. [Works of Ukrainian Mechnikov Institute. Volume V.] Paper. Price, 17 rubles. Pp. 280, with illustrations. Kharkov: Izdanie Ukrainського Mechnikovskogo Instituta, 1940.

The volume is a collection of papers emanating from the Ukrainian Mechnikov Institute. The papers are brief reports dealing with investigations on the bacteriologic, immunologic and related aspects of infectious diseases, in particular of diphtheria, scarlet fever, typhus, bacillary dysentery and rabies. The standard achieved is that of routine laboratory research. The text is in Russian. It should prove of interest to workers in this field.

The American College of Physicians: Its First Quarter Century. Illustrator: William Gerry Morgan, M.D., LL.D., Sc.D., Professor of Gastroenterology, Georgetown University School of Medicine, Washington, D. C. Cloth. Price, \$2. Pp. 275, with illustrations. Philadelphia, 1940.

In addition to Dr. Morgan, whose long association with the American College of Physicians eminently qualifies him to write this book, it contains contributions from Edward R. Loveland, secretary of the college since 1926, Maurice C. Pincoffs, Walter L. Bierring, Charles F. Martin and James Alexander Miller. The history of the college is interwoven with the general medical events of the period from 1915 to the present and is an integral part of it. This book records the history of the college and the contributions of its most active officers. It is an excellent addition to the growing literature on American medical history.

Queries and Minor Notes

THE ANSWERS HERE PUBLISHED HAVE BEEN PREPARED BY COMPETENT AUTHORITIES. THEY DO NOT, HOWEVER, REPRESENT THE OPINIONS OF ANY OFFICIAL BODIES UNLESS SPECIFICALLY STATED IN THE REPLY. ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT BE NOTICED. EVERY LETTER MUST CONTAIN THE WRITER'S NAME AND ADDRESS, BUT THESE WILL BE OMITTED ON REQUEST.

HEMORRHOIDECTOMY AND PELVIC SURGERY AFTER LABOR

To the Editor:—In the interest of formulating a policy for guidance of a large hospital obstetric service, I should like your opinion of (1) hemorrhoidectomy immediately after the completion of the third stage of labor or hemorrhoidectomy two to seven days post partum; (2) anterior and/or posterior colporrhaphy with or without repair of old cervical lacerations immediately following the third stage, or the same procedures several days to one week later; (3) abdominal sterilization by an accepted form of tubal operation immediately after a vaginal delivery, or laparotomy several days to one week later for the same purpose in cases in which pregnancy is contraindicated, as for example by tuberculosis and chronic nephritis. Considerable discussion of these questions, without consistent conclusions, has taken place among several of our obstetricians. An opinion would be invaluable to our obstetric staff, which, in addition to obstetricians, has a large "courtesy" group. M.D., New York.

ANSWER.—1. In general it is better practice not to do multiple operations at one time, but since experience has shown that third degree lacerations heal better when repaired directly after labor than later it would seem that little objection could be raised against hemorrhoidectomy just after the third stage. If an extensive repair of the pelvic floor is done it may be better to postpone the removal of hemorrhoids, because the two would require so many sutures that the vitality of the tissues might be so reduced as to cause sloughing or infection and embolism. The comfort of the woman afterward must also be considered. Further, the fact that the hemorrhoids go down considerably after the congestion due to pregnancy and labor is over would counsel conservative practice.

2. If a previously torn cervix is torn again it should be repaired right after the third stage. The same is to be said of perineal tears and, further, one may dissect the flaps a little more so as to reach the levator pillars and the intercolumnar fascia, thus to make a more anatomic repair; but it would be better to postpone an extensive dissection for the interim period or after active childbearing is past. The reasons for this conservatism are the dangers of hemorrhage, hematoma, infection and embolism, all of which have been found to be more common after these operations.

3. Tubal ligation for proper indication is best done within twelve hours after delivery. There is good reason for believing that bacteria invade the uterus during the puerperium and that they even get into the fallopian tubes. All who operate on the tubes after cesarean section have experienced cases of peritoneal irritation, fever or at least an increase of pain, which indicate that something has been stirred up.

In general if these operations of expediency cannot be done immediately after delivery they should be postponed until the parturient canal, indeed the whole pelvis, has had time to cleanse itself and all local immunities, disturbed by pregnancy and labor, are reestablished.

Expediency for the patient is not a good indication for operation under the circumstances named, and indeed it rarely is, while expediency for the physician is even less an indication and more rarely, if ever, may be invoked.

PTYALISM WITH COATED TONGUE

To the Editor:—A man aged 21 has a complaint of excessive thick, whitish foamy saliva of several months' duration. The thickness at times interferes with the act of talking. Examination reveals nothing abnormal in general, and the salivary glands seem to be normal in size without any tenderness. The upper surface of the tongue looks whitish, and on scraping it with a tongue blade one obtains plenty of a thick, whitish secretion which is only slightly foamy and is acid to litmus paper. There is no tenderness or evidence of glossitis. The papillae do not look unduly enlarged. I believe that application of a mild silver nitrate or gentian violet and hydrogen peroxide mouth wash probably will check the condition. Not having seen or heard of such a case, I am in a quandary.

S. H. Babington, M.D., Berkeley, Calif.

ANSWER.—The primary condition which has been described is probably ptyalism (hypersecretion), and it can arise from a variety of causes, including mental and nervous conditions, acute fevers, stomatitis and other conditions. Mercury, iodine and tobacco have been described as causes, and irritation of the

esophagus, gastric hyperacidity and peptic ulcer have also been found to be associated. Since there is no general abnormality and no local inflammation the cause would apparently fall into one of the other groups. It is assumed that there is not an obstruction of a salivary duct, since the absence of swelling was noted.

The condition of the tongue may be due to the same fundamental condition and is of secondary importance. The presence of a white coating is not characteristic of a fungous infection and simply suggests a failure of the cells to exfoliate normally.

It is suggested that the gastric acidity be tested; tincture of belladonna may be used in doses of 5 to 10 minims (0.3 to 0.6 cc.) or so three times a day, and mouth washes of zinc chloride or magnesia magma preparations may be used for a trial. A definite prohibition against taking drugs should be made, and smoking should be stopped if the patient smokes at the present time. If these methods do not give a clue or a cure, observation of the local and general condition may be the only answer.

HAZARDS FROM LATEX CEMENTING

To the Editor:—Can you give me any information concerning the solvent used in connection with latex in the manufacture of shoe soles? I have a patient who has been working for the past six months with latex, which she sprays on shoes. She has a severe dermatitis, cough and secondary anemia, and I am wondering if some benzene derivative is used which might be causing her anemia. There is apparently no depression of the granulocyte or lymphocyte series. M.D., Illinois.

ANSWER.—Latex as used in the manufacturing of shoe soles consists of a suspension of rubber in a weak solution of ammonia. It is used as a cementing agent. Such a material may cause a dermatitis, and in an allergic person it is possible that bronchial asthma may develop. The concentration of the ammonia in the latex cement is so low that it is unlikely to cause bronchial irritation. The presence of secondary anemia in the patient described cannot be ascribed to the latex cement. Assuming that other causes of secondary anemia have been ruled out, anemia of this type might indicate that rubber cements containing benzene are also being used. Rubber cements, unlike latex cements, which ordinarily contain no organic solvent, consist of rubber dissolved usually in either benzene or naphtha. Of the latter two solvents, benzene is by far the more dangerous, and, if it is found that benzene cements are being used, the patient should be removed from such exposure. Ventilation should be applied to any operation in which there is a likelihood that benzene vapors from the process might build up a dangerous concentration in the area of work.

FISH TAPEWORMS

To the Editor:—Would you give me the information concerning the possibilities of infection with fish tapeworms through infected water? Any additional information which you can send concerning the diagnosis of the condition and treatment of the patients, as well as methods of clearing the water, will be appreciated. M.D., W. Va.

ANSWER.—As many species of tapeworms which parasitize fish are not capable of infecting man it would be advisable, if this has not been previously done, to submit specimens to a specialist to make sure that *Diphyllobothrium* is the tapeworm in question. Identification of the worm in this case would involve experimental completion of the life cycle in a susceptible vertebrate, since the sparganum stages of the various species of this genus found in fish are at present indistinguishable by direct examination. Human infection by the adult worm is established only by the ingestion of the sparganum stage from fish, which occurs either by eating poorly cooked infected fish or by accidental transfer of the spargana to the mouth after handling infected fish. Human sparganosis might be obtained from the drinking of water containing infected Cyclops. The prevention of human infections would vary considerably in method, depending on the species of worm involved.

MALARIA NOT CAUSE OF EYE INFLAMMATION

To the Editor:—Recently I heard of a case in which a physician told a patient that the cause of his ocular inflammation was a malarial infection of the eye. I had understood that a malarial infection was always an infection of the blood stream; if this is wrong I want to know it. Is there such a thing as a malarial infection of the cornea and other ocular structures? M.D., Mississippi.

ANSWER.—There are no inflammatory reactions of the eye that have been shown to be the result of a malarial infection. This is not unexpected, as malaria is a noninflammatory type of infection and in general does not invade tissues other than

the red cells. Not infrequently malarial infections caused by *Plasmodium falciparum* are so overwhelming that by capillary occlusion symptoms are produced referable to the area most involved, as cerebral, gastrointestinal or urinary, but disorders of the cornea or of the other ocular tissues have not been recognized as complications of malaria. It is entirely possible, however, that any inflammatory condition of the eye could coexist in a patient with malaria, but there would be no direct connection between the two infections.

POLLEN INJECTIONS AND PURPURA

To the Editor:—A man aged 36 has had symptoms of pollinosis due to ragweed and has received preseasonal immunization followed by one injection a month. During the past nine months he has received once a month an injection of 1,000 protein nitrogen units of ragweed combined extract. Six weeks ago the patient had a dermatitis identified by two competent skin specialists as purpura simplex. The rash disappeared after three weeks. Two weeks later he was given 800 protein nitrogen units of the ragweed extract, following which he had a few purpuric spots appear. I should like comment and recommendations.

M.D., Connecticut.

ANSWER.—The occurrence of purpura after injections of pollen extract is extremely rare, and it is questionable whether there is any connection between the two. The fact that the patient is allergic to pollen leads to the belief that he may be allergic also to foods, and a search should be made for one or more foods as a possible cause for the purpura. The patient should receive his pollen extract regularly and should discontinue only if purpura follows each injection. Many men believe that injections once a month are spaced too far apart. In most cases the perennial treatment is done at intervals of once every two weeks.

SULFONAMIDE DERIVATIVES IN INFLUENZA

To the Editor:—Some of my patients have told me that while in the United States they contracted influenza and were given sulfanilamide or sulfapyridine, and that this seemed to be a common procedure. As far as I can find out from *The Journal* and other publications, no recognized authority advises the use of these drugs, and I am inclined to think that their use in such a mild disease should be criticized rather than encouraged. What is the consensus on this subject? The free use of these drugs in many minor diseases causes some patients to think that those physicians who do not use them are behind the times.

David Hoehn, M.D., Fairbanks, Alaska.

ANSWER.—In experimental procedures there has been no evidence that the sulfonamide drugs have any beneficial effect on the course of infection with influenza virus. There is no basis, therefore, on which to assume that such therapy would be effective in human beings with the virus infection. On the other hand, complications are to a great extent due to the bacterial agents. Since they respond to the chemotherapeutic agents, the drugs may be of definite value in reducing the incidence of complications. It seems unwise, however, in the case of the relatively mild epidemics to subject the patients with the uncomplicated disease to extensive administration of sulfonamides.

OPERATIVE TREATMENT FOR OCCLUDED OVIDUCTS

To the Editor:—At the age of 18 a woman had acute gonorrheal bilateral salpingitis. She was treated in bed a month or two and made a good recovery. The gonococcus was identified on slides. Since the recovery she has had no recurrences or flare-ups. She is now 33 and has been married since the age of 22. She has been nervous since the gonorrhea, and red blotches appear on the neck and the chest when she becomes nervous. Her blood pressure is now 160 systolic and 75 diastolic, and she weighs 125 lbs. (56 Kg.). She complains of fatigue on some days. The thyroid is not palpable and there is no tremor of the hands. She has never been pregnant; she menstruates monthly. Is there any treatment for the nervousness and fatigue? Is there any operation or anything that can be done so that she can become pregnant? What would be the effect of removing the lateral two thirds of each tube, and would an abdominal pregnancy be as apt to occur as an intrauterine pregnancy? In abdominal pregnancies in which the cord is cut and tied close to the placenta, and the placenta left adhering to the intestines, what are the possibilities for ultimate results?

M.D., Pennsylvania.

ANSWER.—The nervousness and fatigue should be accorded the usual medical care for such troubles.

Abdominal operations on the oviducts in cases such as this are followed by normal pregnancy in about one third of the cases. If the patient wishes an operation (she should not be urged to have one) the husband should first be examined for fertility. Then the patient's tubes should be tested for patency. If these are occluded, some gynecologists resort to uterosalpingography before attempting operative relief. The risk of tubal or abdominal pregnancy is not notably greater than in the average normal patient.

DETERMINATION OF ANDROGENIC HORMONES IN URINE

To the Editor:—I have been testing the content of androgenic hormone on a twenty-four hour specimen of urine by the capon method, according to the directions given in Kracke and Parker's *Textbook of Clinical Pathology* (ed. 2, Baltimore, Williams & Wilkins Company, 1940, chapter 24). I have found that the extracted residue after evaporation does not go into solution with ether but remains insoluble as a brown powder. Can you give me any suggestions as to the reason for this or suggest the further carrying out of the assay with this residue? I shall appreciate any information you may be able to offer.

M.D., Nebraska.

ANSWER.—The only reason for the appearance of a powder-like residue in the benzene extract could be failure to remove all precipitates from it before evaporation. The filtered benzene extract should be a clear, colored liquid without any droplets of water or particles in emulsion. The evaporation on a hot plate should be done without unnecessary overheating, and the residue should be a thick, oily fluid of about a fraction of a cubic centimeter. This will go completely into solution in the ether, producing a clear, highly colored ether extract. Any small precipitated matter which is found after evaporation of the benzene may be filtered off from the ether and removed.

COW'S MILK IN INFANT FEEDING

To the Editor:—1. What dilutions of cow's milk are commonly used by the large maternity centers during the first two weeks of the neonatal period? 2. Where and by whom was reported a high incidence of tetany in connection with high concentrations of cow's milk during this period? 3. Is it now a common procedure to boil the cow's milk for five minutes before making the dilution? What is the scientific basis for such a procedure?

M.D., California.

ANSWER.—1. The usual dilution is equal parts of boiled cow's milk and water with 3 to 5 per cent carbohydrate. After the first week if the mother's milk is scanty this may be increased to the full caloric requirement.

2. There has never been a high incidence of tetany in the newborn reported from any cause, certainly not from high concentrations of cow's milk. This was simply suggested as a possible etiologic factor by Bakwin (*Pathogenesis of Tetany of the Newborn*, *Am. J. Dis. Child.* 54:1211 [Dec.] 1937). 3. Cow's milk should be boiled for five minutes for two reasons. Boiled milk is bacteriologically the safest, and it is more easily digestible, as the curd of boiled milk is finer, softer, more porous and more permeable to digestive enzymes.

USE OF PROCAINE HYDROCHLORIDE WITH EMETINE

To the Editor:—The parenteral administration of emetine hydrochloride is definitely a painful procedure at best, especially after the patient is well into his course of treatment. As a result, not infrequently the patient will evade treatment. In order to avoid this result I have been using procaine hydrochloride, 1 or 2 per cent solution, as the solvent. This has made intramuscular injections painless, much to the relief of the patient, which in turn assures one an unbroken course of treatment. Although I began this but three months ago, no untoward symptoms have been noted nor has the efficacy of the treatment been impaired. Are there contraindications to giving emetine in this manner from a pharmacologic standpoint or otherwise?

M.D., U. S. Navy.

ANSWER.—There would not be any pharmacologic interference of procaine with emetine, nor would there be danger of toxic effects from the repeated hypodermic injection of 1 cc. of 1 to 2 per cent procaine solution, except with hypersusceptible patients.

ATROPHIC BREASTS

To the Editor:—A patient complains that since the delivery of her three children her breasts have been atrophic and she desires to know, for cosmetic reasons, if there is anything she can do to make the breasts larger.

T. C. McDougal, M.D., La Grange, Ill.

ANSWER.—Enlargement of atrophic breasts has been reported as following the use of estrogen, either by injection or by local application of an ointment containing estrogen. The breasts, it has been stated, may recede in size following cessation of therapy. Prolonged administration of estrogen to maintain breast growth is not advised, as this therapy may well disturb the ovarian function and result in an abnormal menstrual cycle.

ALLERGIC CONJUNCTIVITIS

To the Editor:—The answer to a query on allergic conjunctivitis, March 22, 1941, page 1337, contains an error apparent to the allergist. In the second paragraph of the answer it states that "the intradermal testing for the causative agent may reveal little, as cutaneous tests seem to be of little value in allergic conditions of the eye." Conjunctivitis due to pollen is the frequent condition, and its diagnosis may be readily determined by the cutaneous test, a most useful procedure. Other inhalants which produce conjunctivitis may also be identified by the cutaneous test, but I cite the pollinosis cause in view of its frequency. Even the less sensitive scratch test is of value in diagnosing pollen conjunctivitis.

NERVOUS INJURY PRODUCED BY SULFANILAMIDE

AND SOME OF ITS DERIVATIVES IN THE CHICKEN:
PRELIMINARY REPORT

RAYMOND N. BIETER, M.D.

A. B. BAKER, M.D.

J. GORDON BEATON, B.S.

JAMES M. SHAFFER, B.S.

THOMAS M. SEERY, M.S.

AND

BURTON A. ORR, A.B.

MINNEAPOLIS

One of the toxic manifestations that has followed the clinical use of sulfanilamide and some of its derivatives is what has most commonly been called peripheral neuritis. Although not so dangerous or so frequent as certain other toxic symptoms produced by these drugs, this nervous phenomenon has given rise to a certain amount of concern and apprehension. Reactions of this nature are not unknown, for similar symptoms have been produced occasionally by other drugs, such as the arsphenamines.

Up to the present time little consideration from an experimental standpoint has been given to the pathologic effects that might arise from a toxic action of these drugs on the brain, the spinal cord and the peripheral nerves. Rosenthal¹ and Nelson² have conducted such a study with sulfanilamide and sulfanilyl sulfanilamide in the chicken and the rabbit. However, they felt that their data were inconclusive, even those obtained on the chicken, in which they observed the greatest injury.

In the study herein described six drugs, namely sulfanilamide, sulfapyridine, sulfathiazole, sulfamethylthiazole, sulfanilyl dimethyl-sulfanilamide (uliron) and sulfaphenylthiazole have been administered daily to young chickens with the aim of determining the extent and degree of injury, if any, produced on the nervous tissues previously mentioned. The first three drugs have been accepted by the Council on Pharmacy and Chemistry of the American Medical Association,³ and

a nonproprietary name has been given to the fourth compound in the series by the Council.⁴

The clinical literature indicates that these drugs show wide variations in the number of chronic toxic nervous reactions which have been observed during therapeutic use. In 1938 Long and Bliss⁵ noted 2 cases of possible peripheral neuritis caused by sulfanilamide. Since that time several other cases have been reported. Considering the extremely wide use of this drug, this low incidence is significant. Sulfapyridine and sulfathiazole, the uses of which have been more limited, apparently have not produced peripheral neuritis. On the other hand, Brown and his associates⁶ at the Mayo Clinic observed 3 cases of possible peripheral neuritis among 106 patients treated with sulfamethylthiazole. Likewise, they⁷ have observed 2 cases of possible peripheral neuritis among 70 patients treated with sulfanilyl dimethyl-sulfanilamide. Long and Bliss also recorded a number of cases of possible peripheral neuritis associated with therapy with sulfanilyl dimethyl-sulfanilamide. No data are available on the nervous effects of sulfaphenylthiazole because it has not been used clinically.

It was startling, therefore, to find that the trend of pathologic lesions herein observed in the chicken presented a rough parallel with this trend of clinical experience. Consequently our preliminary report of the work on the chicken is being made in order to ascertain, with the help of clinicians, to what extent this correlation may be true. If such a correlation is found to exist, the chicken might serve as an index as to whether a given drug is safe or moderately or severely dangerous for clinical use.

The chickens used in these experiments were single-combed white Leghorns, and they varied in age from 8 to about 26 weeks. In the laboratory most of the chickens were fed a commercial ground feed, namely "Purina Growena," although a few were maintained on whole grains. For the most part, the drugs were administered orally by stomach tube or in capsules, generally in doses of 0.5 or 1 Gm. per kilogram of body weight once a day. A few chickens received sulfapyridine and sulfathiazole orally in doses of 0.3 and 0.5 Gm. per kilogram of body weight at intervals of twelve hours. Doses were continued, as a rule, for periods of one or two weeks. Concentrations of the various drugs in the blood have been determined with the Bratton and

Marshall modification of Marshall's method.⁸ The readings were made with a Duboscq microcolorimeter.

Table 1 presents the range of blood concentration determined at four, twelve and twenty-four hours after single oral daily doses of 0.5 Gm. per kilogram of body weight of each of the drugs. Despite the fact that the doses administered to the chickens were extremely high in comparison with clinical doses, the resulting levels of the drugs in the blood with the exception of that of sulfanilamide, were not greatly out of proportion to the concentrations obtained in clinical use. The concentrations of sulfanilamide in the blood, as was to be expected, were the highest of the group. Just as in other animals, this is probably due to a more complete absorption. Furthermore, after a few days cumulation tends to occur, probably because of an elimination which is slower than the absorption. Litchfield⁹ and other investigators have also made this observation. It is to be noted that the concentrations of the six drugs in the blood differ one from another, although the administered doses of each were the same. This is probably due chiefly to variable rates of absorption, especially with sulfapyridine and sulfathiazole, a phenomenon noted by other investigators. Concentrations of the drugs in the blood after doses of 1 Gm. were somewhat

myelin, and the swollen axons began to show bulblike formations. The injury to the spinal cord with this drug was slight. With sulfathiazole, the changes in the peripheral nerves were even more severe and occasionally irreversible. Fragmentation and vacuolation began to appear in both the myelin and the axons. Similar lesions were noted in the spinal cords and brains. In the latter there appeared endothelial proliferation of the walls of the blood vessels with narrowing of the vascular lumens. The three remaining drugs, sulfamethylthiazole, sulfanilyl dimethyl-sulfanilamide and sulfaphenylthiazole, respectively, produced an increasing degree of injury within the neural elements. The injury of normal nervous structure in the peripheral nerves reached its peak with sulfaphenylthiazole, with which complete destruction of all elements was produced in 2 of the 7 chickens. Similarly the effects on the spinal cord and the brain were most extensive. For example, in the brain the proliferative endarteritis often progressed to complete occlusion of the lumens of the vessels.

SUMMARY OF PATHOLOGIC DATA

Controls.—All nervous tissue was normal, except in 2 peripheral nerves in each of which an occasional area of mild condensation of myelin was observed.

TABLE 1.—Range of Concentrations in the Blood of the Chicken in Milligrams Per Hundred Cubic Centimeters of Blood

Drug	Times After Oral Administration of One Dose (0.5 Gm. per Kilogram of Body Weight) per Day *					
	4 Hours		12 Hours		24 Hours

higher and persisted through a greater part of each twenty-four hour period.

The chickens were killed at the end of the period of medication, and immediately thereafter the brains, spinal cords and sciatic nerves were dissected out and placed in solution of formaldehyde. Sections of each of these tissues were stained with hematoxylin and eosin, Bodian stain for nerve fibers and axons and azocarmine for myelin. Sections of the peripheral nerves were cut in both cross and longitudinal sections. Table 2 presents a comparative summary of the severity of lesions observed in a series of 55 chickens, 6 of which were controls.

It can readily be seen that sulfanilamide produced the mildest injury. For the most part this consisted of a slight condensation of the myelin in the nerve sheaths of most of the chickens, beginning axonal swelling in 1 peripheral nerve and a slight injury of the myelin in 1 spinal cord. This mild injury confirms the changes observed by Nelson² with the same drug in the chicken. Next in extent of injury was that produced by sulfapyridine. The damage to the peripheral nerves was again patchy but more extensive. Geometric figures began to appear in the condensed

Sulfanilamide.—The peripheral nerves in 4 out of 6 chickens showed small areas of condensation of myelin and a mild swelling of the axons in 1. One spinal cord presented slight destruction of the myelin sheaths in the posterior and lateral regions. All other elements of nervous tissue from these 6 chickens were normal.

Sulfapyridine.—The changes produced in tissue by this drug were similar to those produced by sulfanilamide. In 10 out of 11 chickens the myelin of the peripheral nerves presented an injury varying from a patchy swelling or a mild condensation to a more extensive condensation with the occasional appearance of geometric figures. In only 3 instances were the axons involved, i. e. occasional irregular swellings to more extensive bulblike formations with loss of tinctorial properties. One spinal cord showed slight injury consisting of swelling of myelin sheaths in the posterior columns. The brains were normal.

Sulfathiazole.—Every peripheral nerve presented some injury. Four showed a mild, patchy condensation of myelin with the appearance of an occasional truncated cone. In 2 of these 4 nerves the axons were normal; in the other 2 the axons showed mild swelling. In 4 other peripheral nerves more extensive condensation of myelin with formation of truncated cones was present together with occasional fragmentation and vacuolation. The axons of these nerves were also involved. In the remaining 3 nerves more extensive

9. Litchfield, J. T., Jr.: The Effects of Sulfanilamide in the Lower Vertebrates, *J. Pharmacol. & Exper. Therap.* **67**: 212-223 (Oct.) 1939.

degenerative changes, such as the partial disappearance of both myelin and axons, were also present. In 6 of the 11 chickens the spinal cords showed the following injuries: swelling of the myelin sheaths and axons, demyelination, vacuolation and fragmentation of all neural elements and pyknosis of nerve cells. The brains of 4 chickens showed a patchy reduction in staining ability of the tissues, mild demyelination and swelling and proliferation of the endothelium of the walls of many of the vessels with a narrowing of the lumens of the vessels.

Sulfamethylthiazole.—All peripheral nerves were damaged. In 2 there occurred mild condensation of myelin and axonal swelling, while in 4 others there appeared either extensive swelling of the myelin or extensive condensation with the formation of geometric figures and beginning fragmentation and vacuolation. The axons often also showed swelling and occasional fraying and fragmentation. In 1 peripheral nerve the damage to the neural elements was extensive. Six spinal cords presented changes which varied from swelling of myelin and axons to demyelination and beginning vacuolation and finally extensive disruption of the neural elements. Four brains showed pyknosis and fragmentation of nerve cells, proliferative endarteritis of the cerebral vessels and the beginning formation of glial nodules.

Sulfanilyl Dimethyl-Sulfanilamide.—The peripheral nerves showed extensive injury. In addition to the milder reactions described previously, each nerve showed mild to extensive fragmentation and vacuolation involving both myelin and axons. Six spinal cords likewise presented extensive injury. In most instances this consisted of demyelination and vacuolation of the white substances and shrinkage of nerve cells. In 1 chicken, the normal structure of the cord was completely destroyed. In 6 instances the brains contained hyperchromatic, pyknotic and swollen nerve cells, a proliferation of the endothelium of the cerebral blood vessels and the formation of small glial nodules.

Sulfaphenylthiazole.—The most extensive injury to peripheral nerves was observed with this drug. Two chickens showed only a mild injury to the myelin with intact axons. Of the remaining 5, 2 presented a patchy, complete destruction of the normal structure while the other 3 showed an almost complete involvement of all the neural elements. In these, the myelin presented extensive condensation, fragmentation and vacuolation, and the axons showed extensive swelling, loss of staining properties, irregularities and fragmentation. Every spinal cord showed some injury, which in the cases of milder involvement consisted of loss of tinctorial properties and beginning demyelination and in cases of severe involvement chromatolysis of nerve cells, swelling and fragmentation of myelin and axons. Some injury was noted in every brain, consisting of pyknosis of nerve cells, extensive proliferative endarteritis with partial or complete occlusion of the smaller vessels and occasional areas of glial proliferation. All these changes will be reported in detail at a later date elsewhere.

Correlation of the pathologic data with symptoms observed in the chickens has been difficult. Although sulfanilamide produced the mildest pathologic injury, all the chickens given this drug showed great weakness, loss of balance and a tendency to squat. The chickens would stand erect if provoked. Apparently these symptoms must be due to some other factor. Similar

symptoms have been noted in other animals and in man. All these chickens lost weight. The chickens receiving sulfapyridine and those receiving sulfathiazole presented few symptoms. Only 1 in each group was lethargic, and 4 receiving the former and 2 receiving the latter drug lost weight. All others gained weight. With sulfamethylthiazole, 3 chickens lost and 4 gained weight. Two presented weakness and a desire to squat. With sulfanilyl dimethyl-sulfanilamide, 2 lost and the others gained weight. Furthermore, 2 chickens were weak and walked with an unsteady gait. All chickens receiving sulfaphenylthiazole showed a great loss in

* Remainder of tissues not studied.

Key: 0 = normal. Damage probably reversible: + = occasional, patchy, slight alteration; ++ = mild, diffuse but reversible changes; +++ = moderate, diffuse injury with preservation of the normal structure but with occasional axonal involvement (sometimes nonreversible). Definitely nonreversible changes: ++++ = moderately severe changes involving all structures with much injury of a permanent nature; +++++ = severe damage to all tissues with complete disruption of the normal structure.

weight. All presented weakness, coma and depression, and 2 were unable to stand even when provoked. These 2 chickens showed the most severe pathologic injury, namely a complete destruction of the normal structure of the sciatic nerve. Thus there was a clearcut correlation between symptoms and pathologic injury in only these 2 chickens. The lack of this correlation in all the other chickens is not particularly disturbing. McKinley¹⁰ has shown that in the sciatic nerve the fasciculi fuse and divide throughout the course of the nerve, so that the peripheral bundles receive fibers from many sources. Thus, unless the sciatic nerve is severely involved—and this occurred in only 2 chickens—the function of the nerve can be carried on by the remaining fibers in the intact fasciculi.

From the standpoint of the experiments on chickens and the available clinical data on peripheral neuritis, it is our belief that any one of the drugs studied may occasionally produce nervous lesions. In support of this possibility, the following case of peripheral neuritis which may be associated with sulfathiazole is briefly described. To our knowledge no other has been reported to date.¹¹

REPORT OF CASE

R. E. C., a white woman aged 37, in December 1935 had a furuncle on her left arm, which was drained. Subsequently, roentgenograms revealed an osteomyelitic involvement of the underlying bone. This process eventually healed, but a few months later a similar condition developed in her right ankle, and since then she has had involvements of the skull, the mandible, the left tibia and the left knee joint. She was treated with multiple injections and drainage.

On admission to the University Hospital in November 1939, the patient's blood showed 32 per cent hemoglobin, 1,550,000 red blood cells, and 8,000 white blood cells. The differential count showed 66 per cent polymorphonuclear leukocytes and 44 per cent mononuclear leukocytes. The patient was given liver and iron therapy, and she received several transfusions. The hemoglobin level eventually rose to 85 per cent.

Within a few days a complete foot-drop developed, with anesthesia over the lateral surface of the right lower limb.

Two weeks after discontinuing the medication she noticed for the first time a return of dorsal flexion of her right foot and improvement in her sensory involvement. Within a week she was able partially to flex her foot dorsad, and she was able to detect superficial sensation in the involved area. Examination of her hearing at this time revealed almost complete deafness, although the patient now had a return of osseous conduction over the involved ear. During and previous to the period during which her foot-drop developed she had had no osteomyelitic involvement in this extremity, all of her trouble being confined to the left lower limb. She did, however, have a large indurated mass on the posterior aspect of the right thigh which at no time broke down or drained.

In searching for a possible explanation for the injury to nervous tissue produced by the drugs, the concentrations of four of the drugs were determined in the various tissues. Similar data for the liver and kidneys were obtained. The chickens used were from the same hatch as those used before but they were from four to ten weeks older. The drugs were given orally as described previously. The dose was either 0.5 Gm. or 0.2 Gm. per kilogram of body weight given every twelve

* Average of four determinations per chicken: two at four hours and two at twelve hours after dosage.

The patient continued to show a mild toxic picture; her temperature ranged between 98 and 100.5 F. In April 1940 cultures of the blood were positive for staphylococci. Because of the positive cultures and the persistence of toxic symptoms, the patient was given sulfathiazole 1 Gm. every four hours. After eleven days the dose was reduced to 1 Gm. three times a day. One week later, it was further reduced to 1 Gm. daily. Five days later it was increased to 1 Gm. three times a day. After seventeen days the dose of sulfathiazole was again increased to 1 Gm. four times a day. This dose was continued until the middle of September. Thus over a period of five and one-half months the patient took a total dose of about 600 Gm. of sulfathiazole. In addition to this medication, she received 2 tablets of extralin four times a day, 100 mg. of ascorbic acid daily, and 5 mg. of thiamine hydrochloride daily. The patient's blood became sterile two weeks after she was given sulfathiazole. Determinations of the levels of the drug in her blood revealed a concentration of from 1.9 to 4.3 mg. of free sulfathiazole per hundred cubic centimeters and from 2.4 to 6.2 mg. of total sulfathiazole per hundred cubic centimeters of blood. Although the patient was discharged from the hospital on August 16, she continued to take sulfathiazole for another month under supervision.

Seven weeks after the sulfathiazole therapy was begun deafness suddenly developed in her left ear. On examination this proved to be deafness of a nervous type. A few days later weakness and numbness began to develop in her right lower extremity, primarily in the distribution of the peroneal nerve.

hours for one week or more. Autopsy was performed on the chickens twelve hours after the last dose was given. The tissues were extracted by a modification of the trichloroacetic acid method described by Marshall and Litchfield.¹² For determinations of the drugs in the blood, liver and kidneys a dilution of 1:30 was used, and for peripheral nerves, spinal cords and brains, the dilution was either 1:50 or 1:100. No corrective factors were employed in the data.^{12a} The number of chickens used for these studies on drug distribution was for sulfanilamide 4, sulfapyridine 7, sulfathiazole 7 and sulfamethylthiazole 4.

The data on these 22 chickens show strikingly that the levels of these drugs in the organs studied show great variations from the average concentrations in the blood. Data are given in table 3 from only a few individual experiments. The highest and lowest concentrations of sulfapyridine and sulfathiazole observed in the periph-

12. Marshall, E. K., Jr., and Litchfield, J. T., Jr.: Some Aspects of the Pharmacology of Sulfapyridine, *J. Pharmacol. & Exper. Therap.* 67: 454-475 (Dec.) 1939.

12a. Control analyses on blood, nervous tissue, liver and kidney have been negative except for an occasional faint trace (too small to read) in blood and liver. Quantitative recoveries, within the limits of the colorimetric method, have been obtained when known amounts of sulfapyridine, sulfathiazole and their acetyl derivatives have been added to blood, nervous tissue and liver. The extraction of acetyl derivatives added to the tissues is complicated by the fact that the concentration of trichloroacetic acid used hydrolyzes a portion of the drugs; for example, in peripheral nerve extractions this amounts to 20 per cent, and in liver to 40 per cent of the added drugs. If these corrections are applied, the trend of the experimental results is not changed.

11. Dr. E. T. Evans, Division of Orthopedics, University of Minnesota General Hospital, gave the authors permission to report this case.

eral nerves of the chicken are illustrated. With the former drug, every level in the peripheral nerves was higher than its respective average concentration in the blood, but the level in the peripheral nerves of only 1 chicken was above 15 mg. per hundred grams of tissue. With sulfathiazole, the level of the drug in the peripheral nerves was below the respective average level in the blood in 3 chickens, whereas in 3 other instances the level of the drug in the peripheral nerves was above 20 mg. per hundred grams of tissue. With sulfanilamide the concentrations in the nervous tissues of 3 chickens were equal to or above the respective

TABLE 4.—Concentrations of Sulfathiazole

Blood		Peripheral Nerve (Sciatic)		Liver		Kidneys	
Free	Total	Free	Total	Free	Total	Free	Total
15.7	39.5	22.8	33.0	34.2	41.8	60.0	109.5

levels in the blood. Except with sulfanilamide the concentrations found in the spinal cord and brain were always much below those in the blood.

A similar type of distribution with sulfathiazole can occur in man, at least in the presence of depressed renal function. Adequate samples of various tissues were obtained from a patient who was operated on for carcinoma of the stomach and died from postoperative pneumonia. This patient had almost total anuria during the last six days of his life. The level of the drug in the blood remained almost constantly at the figure given in table 4 during this period. The concentrations of the drug in milligrams per hundred cubic centimeters of blood or per hundred grams of tissue are shown in table 4.

Whether the observed variations in the concentrations of these drugs in the chicken and in man are due chiefly to a cumulation from repeated doses or whether a decreased glomerular function (glomerular development in the chicken is inferior to that in mammals⁹) is necessary or merely additive is unknown at present. However, with sulfapyridine in the dog even a few hours after single doses slight rises in the concentration of the drug, compared to levels in the blood, can be discerned in various organs and tissues such as the liver, the kidneys and the peripheral nerves.¹³ Possibly a uniform distribution following repeated administration of certain of these drugs is more hypothetical than real.

COMMENT

It can be argued that the patient described here had a sufficiently extensive infection to account for her nervous involvement. This possibility is not denied. However, the occurrence of such localized nervous lesions, the presence of foot-drop (which has also been observed clinically with other drugs in this series,¹⁴ and more especially with sulfamethylthiazole⁶), the sudden improvement after discontinuance of sulfathiazole therapy and the observation of corresponding types of lesions in the chickens all seem to us to be evidence that the drug was at least to some degree responsible for the patient's neural involvement.

On the one hand, it is evident that such a toxic reaction is a hazard. On the other, this hazard at the present time does not appear to be as dangerous for the

patient as that presented by a serious infection which remains untreated.

It is to be emphasized that observations on the damage to nervous tissue produced by the various drugs of the sulfanilamide series studied in the chicken are not to be transferred directly to man. It should be emphasized that the chicken appears to be much more sensitive to the toxic effects of these drugs on the nervous system than is man. Furthermore, differences in species of animals have been noted, for Nelson² observed less injury, in his experiments, in rabbits than in chickens. Undoubtedly a similar type of injury, though much milder, as in the rabbit, can occur in man. The data in the literature seem to indicate that the frequency of peripheral neuritis in man places these drugs in a more or less systematic order similar to the classification determined by experiments in the chicken. It is hoped that with additional experimental and clinical evidence data obtained on the chicken may be of some use for a comparative evaluation of the effects of sulfanilamide and its derivatives on the nervous system.

It is not yet possible to state that any of the five drugs herein described which have been used clinically should not be used in man. There may be possible obscure contraindications, as yet unknown, for all of them. However, the question of the routine use of one or more of those producing the most serious injury is as yet practically answered in the negative. No one knows why these toxic nervous reactions occur, whether a hypersensitivity on the part of the patient is the chief predisposing factor or whether other factors are chiefly important. The tendency of certain of these drugs, at least, to accumulate in the peripheral nerves as compared with what occurs in the brain and spinal cord seems to speak against a simple hypersensitivity. Rather, it appears as direct evidence in favor of the idea of specificity of the drugs for peripheral nervous tissue, which can be correlated with the clinical and pathologic changes. The explanation of the difference in the degree of injury done by the drugs appears most logically to lie in their different chemical structures. It does appear, however, that these toxic manifestations are chronic. For this reason, when any of the drugs of the sulfanilamide series are used, physicians should observe their patients most carefully and institute every precaution to prevent any unnecessary rise in the concentration of the drug in the blood stream and any unnecessarily prolonged use of the drug. In no instance should any of these drugs be used promiscuously or without careful supervision.

ADDITIONAL CASE OF PERIPHERAL NEURITIS

After our manuscript had been submitted for publication another case of possible early peripheral neuritis in man due to sulfathiazole was brought to our attention by Dr. W. W. Spink of the Division of General Medicine, University of Minnesota General Hospitals. He has consented to the following report:

A. K., a white man aged 63, entered the University Hospital for transurethral prostatectomy, which was carried out on Dec. 8 and 20, 1939. A cholecystectomy was performed on Jan. 12, 1940. The patient had a persistent infection of the bladder caused by *Bacillus proteus*. During the period from Jan. 14 to Jan. 18, 1940 he was given 18 Gm. of sulfapyridine. Nausea and vomiting occurred. On February 1 the patient was given sulfathiazole and during five and one-half days received 27 Gm. The therapy was then discontinued because of the onset of nausea and vomiting, oliguria and tingling and numbness of the fingers of both hands. No other neurologic symptoms were observed. The paresthesia of the fingers was interpreted as

13. Chinn, H., and Bellows, J.: The Distribution of Sulfanilyl-2-Aminopyridine in the Body, *J. Lab. & Clin. Med.* 25: 735-738 (April) 1940. Marshall and Litchfield.¹²

14. Long and Bliss.⁸ Bannick, Brown and Foster.⁷

beginning peripheral neuritis. At the end of this five and one-half day period of dosage the level of the drug in the blood had risen from 3.2 mg. of free and 5 mg. of total to 13.7 mg. of free and 22.2 mg. of total sulfathiazole per hundred cubic centimeters. In spite of an adequate intake of fluid the urinary output dropped from 1,200 cc. to 100 cc. a day during this period. A week after discontinuance of therapy the gastrointestinal and nervous symptoms had disappeared, the level of the drug in the blood had dropped to 5.6 mg. of free and 10.3 mg. of total sulfathiazole per hundred cubic centimeters, and the output of urine had risen to 1,300 cc. daily. At this time the patient's blood urea nitrogen was elevated from 16.3 mg. to 34 and 53.5 mg. per hundred cubic centimeters. A week later this had dropped to 19.5 mg. per hundred cubic centimeters. The renal function was normal at this time, and the urine was sterile.

SUMMARY

1. The order of the drugs in the sulfanilamide series studied according to the amount of injury they produce in the nervous system of the chicken, beginning with the least injurious, is sulfanilamide, sulfapyridine, sulfathiazole, sulfamethylthiazole, sulfanilyl dimethyl-sulfanilamide and sulphaphenylthiazole.

2. Under certain conditions unknown at present, and after repeated doses, some cumulation of at least four of these drugs tends to occur in the sciatic nerve.

3. The case of peripheral neuritis in man reported here possibly was due to sulfathiazole.

THE INTERRELATION OF NEUROLOGY, PSYCHIATRY AND PSYCHOANALYSIS

ROY R. GRINKER, M.D.

CHICAGO

The relationship of clinical neurology, psychiatry and psychoanalysis as specialties of medical practice is not clearly understood by the lay public or by the medical profession. These fields are thought of sometimes as sharply isolated, are often confused with one another, or are considered together as one special branch of medicine. I consider that they are intimately interrelated, and my thesis is that the future progress of all three in practice and research is dependent on a diffusion through the artificial boundaries of the fundamental principles, methodologies and recognized facts of each. The integrated neuropsychiatry that results will be a legitimate member of the medical sciences broad enough to include normal and abnormal psychology hitherto largely ignored by medicine.

By accepted definition, clinical neurology is that branch of medicine concerned with the investigation, methods of examination, diagnosis and treatment of organic diseases of the nervous system. Its techniques, although specialized, are similar to those of internal medicine. Psychiatry deals with the investigation, description, diagnosis and therapy of disturbances of mental processes concerned with intelligence and emotion, no matter what their origin, and its techniques are largely psychologic in a descriptive sense, for study is made of verbalisms and behaviorisms. Medical psychoanalysis investigates, diagnoses and treats unconscious dynamic factors which influence emotional expression, behavior and thought processes. Its technic is a highly specialized type of psychology—analysis of behavior, free associations and dreams—adapted to the goal of understanding the unconscious. The overlap and possible

integration of these three fields in clinical practice at once become apparent. Many organic diseases of the nervous system such as dementia paralytica and cerebral neoplasms manifest themselves partially or entirely by mental abnormalities or disorders of behavior. The specific psychiatric syndrome that a patient presents is not explicable by understanding the organic changes alone but in addition by determining the individual unconscious factors in that patient. Furthermore, psychiatric syndromes known as functional neuroses and psychoses, for example the compulsive neuroses, can be understood or treated only by exposing the underlying unconscious emotional basis.

To some it seems hardly necessary to point to such overlap or to discuss interrelations and integration, yet antagonism of the strongest type was still fiercely expressed in 1939 in the utterances of specialists within all three fields. A psychiatrist recently published the results of a questionnaire in which one item asked whether psychoanalysis was completely accepted, as if one could accept a scientific discipline as a divine law. A neurologist pleaded for neuropsychiatrists who have adhered to orthodox doctrines to hold their forces well in hand for an impending battle to keep neuropsychiatry on a sound organic basis. This sounds as if the author anticipated a revolution to which he reacted with fear rather than scientific objectivity. A psychoanalyst stated that pharmacologic shock represented the expression of an ancient trend of conscious and mostly unconscious hostility against the mentally ill. To him drastic methods to alter the cerebral chemistry or cerebral blood flow made the physician employing them sadistic.

I believe that physicians have developed to a degree at which such antagonisms should have become historical and integration of the disciplines of neurology, psychiatry and psychoanalysis feasible, because a rational understanding of the problems of the human mind are possible only by using the scientific and empiric knowledge of all. I hope to demonstrate that the basic principles and clinical methods of interpretation of dynamic neurology and psychiatry are identical—that both neurologic and psychologic phenomena are explicable by the same fundamental biologic laws.

Clinical neurology is most closely allied to internal medicine although, as I shall point out later, there are important basic differences. Its groundwork traditionally is morphology—comparative anatomy, embryology and gross and microscopic anatomy. The structure and interconnections of various parts of the peripheral and central nervous system have been carefully studied and most of the larger fiber tracts described. By no means is the entire, complex anatomy known, since a large portion of the finer systems of unmyelinated fibers are yet to be traced. The first conjectures as to function of separate parts of the nervous system were made from morphologic investigations. Later physiologic studies on experimental animals and at the bedside opened much greater areas of knowledge regarding the nervous system, and recent technical advances such as the oscillograph and the electroencephalograph have facilitated determinations of finer details of function. However, studies of physiology and pathophysiology of the human nervous system have lagged far behind work on experimental animals, which cannot be transposed to man because his higher centers have taken over many functions residing in the lower centers of other mammals (encephalization).

The study of neuropathology received its greatest stimulus from the cellular pathology of Virchow and

the development of special staining technics. Although neuropathology was a great catalyst for the development of clinical neurology, it at the same time hindered the progress of physiology of the nervous system and placed an almost ineradicable bias on generations of neurologists. In the first place anatomic aspects were used as physiologic evidence. Given a clinical syndrome of neurologic defect and at necropsy a damaged structure, then in that structure the function which had been clinically disturbed was supposed to reside. Innumerable mistakes were based on such reasoning because the complexity of functional interrelations within the nervous system was neglected and only morphologic alterations visible under the microscope were relied on. In the second place, the neurohistologists Nissl and Alzheimer, after developing special staining methods to disclose detailed alterations within the nerve cells, believed that specific changes in ganglion cells could be correlated with specific diseases. This has not been confirmed for a single morbid entity. The new neuropathology, which had great scientific appeal because of the use of high power microscope lenses and thus gave an appearance of objectivity, attempted to explain psychiatric as well as neurologic disorders on a purely morphologic basis. The concepts arising therefrom slowly disintegrated and even now tend to flourish for a time among various groups, although the expectation for an organic basis of all nervous disorders has become displaced from microscopically detectable changes to the finer physical chemistry of the cell structure.

Psychiatry has for long been the weak sister of medicine largely because of man's defensive emotional attitude toward his own emotions. It was only one hundred and forty-eight years ago that Pinel's influence lessened the severe hostility displayed against the mentally ill. Only recently have psychiatrists been permitted the privilege of using hospital facilities wherein the full cooperation of the laboratory and clinical sciences could be obtained. Until the last century only a few psychiatric syndromes had been delineated from the chaotic and confusing clinical manifestations of the so-called lunatics. In 1883 Kraepelin inaugurated the first clinical classification in psychiatry based on descriptive life histories; a modified and amplified version of this is still used in the psychiatrist's diagnostic terminology. Under the influence of the then new discoveries in cellular pathology, Kraepelin attempted to link the nosologic entities with specific cellular changes in the brain. Thus the first step of psychiatry toward a scientific etiology was in the direction of pathologic anatomy.

In this country a more holistic concept of etiology was advocated in the early decades of this century by Adolf Meyer, who insisted that all the psychologic effects of environment, conflicts and frustrations were equal in importance to endogenous constitutional factors and pathologic changes in the causation of mental disorders. But even today psychiatry is largely descriptive except when it borrows from biochemistry research technics of precision which have given false promise in solving the problem of etiology in mental illness. The field has become static just as far as psychiatrists have been content to utilize the descriptive methods of academic psychology and kraepelinian psychiatry for their clinical investigations and overlook the dynamisms of human emotions.

Psychoanalysis is the youngest of the three fields under discussion, for Freud's first contributions were published only a little more than forty years ago. His

original works evoked a bitter and emotional controversy, the sense of which has long since been lost, for today medicine has become mature enough to grasp the significance of unconscious emotional factors, and psychoanalysts have begun to understand their own relationship to medicine. The early rejection was strongly tinged with hatred, due probably to the difficulty of even psychiatrists facing their own unconscious drives. The result was a forced isolation of the freudians, who were compelled to form their own groups and societies apart from the universities and other medical contacts, and although these circles have continually widened they have always remained small and relatively inbred. However, of equal importance in this separation from biology was Freud's own dictum that psychoanalysts should concern themselves only with psychologic matters, the biologic origin of which should be left to investigators in other fields. This unfortunate isolation has been rapidly overcome in this country by psychoanalysts less orthodox than the original European groups and by the gradual penetration of psychoanalytic dynamic concepts into static descriptive psychiatry.

Many of the original freudian concepts will be discarded and much will be modified. However, the basic concepts of unconscious mental forces, conflicts and repression will probably persist as fundamental principles in psychology. The theory of instinctual forces in psychology may be abandoned and infantile sexuality reinterpreted as phenomena of gradients of growth, but the general idea that emotional forces within the realm of the unconscious are responsible for the direction of activities in the field of thought and behavior continues to receive confirmation. These drives or forces of biologic origin push man into activities which meet with prohibitions from his social and cultural environment; the result of this is a conflict the solution of which necessitates modification, sublimation or repression. This epitomizes the battle of each individual's lifetime.

As one proceeds from neurology through psychiatry to psychoanalysis one can discern a gradation of increasing deviation from the basic facts of anatomy and physiology susceptible of experimental proof. From a science resting directly on the foundations of biology to the descriptive field of psychiatry concerned with classification, one arrives at more abstract, nevertheless scientific, concepts concerned with dynamic factors involving intangible forces of energy. These are expressed in symbolic language and acts, highly individualized for each person but susceptible of abstraction into common laws. Yet each field deals with identical problems—the functions of the human nervous system. Brain and mind can be understood only by observing the identity of the natural laws which regulate both, the former in terms of space and time, the latter as subjective reflections of the same physiologic processes. Their scientific vocabularies may vary, but to me at least it is obvious that the laws of psychology must be identical with those of physiology, for mind is no epiphenomenon but a concomitant of the function of definite anatomic structures.

In comparing neurology with psychoanalytic psychiatry I do not consider the static pathophysiology of the last century as representative of neurology but speak of the dynamic neurology vigorously developing in this country today on the foundations laid by John Hughlings Jackson. He was the great stimulant of the English school who thought out crucial animal experiments for his younger colleagues to perform in the laboratory but himself remained at the bedside. Jackson conceived of

the nervous system as a gradually developing hierarchy which he roughly divided into three levels corresponding to their evolutionary significance. He stated that the highest nervous centers, the climax of this evolution, are in popular language "the organ of the mind" and insisted that this "organ" functions as much on the basis of reflex activity as the lumbar enlargement of the spinal cord. He believed that the constitution of the highest centers differs vastly in degree from that of the lowest center, for they represent most indirectly all parts of the body in most numerous and more complex combinations.

The highest level of the organ of the mind Jackson located in what is now termed the frontal associative area, but this does not mean a localization of mental processes or consciousness within a specified anatomic area. Since the highest centers represent the whole organism, they are widely detached and protected from the sensory periphery and the muscular system. The highest centers are thus permitted to act without interruption or disturbance and need not participate in lower-most automatic functions. Through such isolation slower, more adaptive symbolic formulation and delay in expression are achieved by the highest levels.

Nervous integration at the lowest levels is represented by varying combinations of reflexes, on the synapses of which many influences exert modifying effects. Recent evidence points to chemical substances, accumulated at the synapses, which are responsible for inhibition and augmentation of reflex activity. This type of inhibition may be termed biologic and, fulfilling certain patterns to a great extent phylogenetic but not clearly understood, is at the basis of shifts of activity within the central nervous system. It is possible that the physico-chemical forces playing on the lowest cellular levels may be compared to and perhaps in the future identified with the forces and drives which Freud postulates as so important in the psychic activity at higher levels and which he too stated conform to reflex activity.

Within the lower levels there proceeds much activity which never reaches consciousness directly or at all. By means of inhibition, incoming stimuli may be prevented from evoking a simple intrasegmental response and diverted by a process of "long-circuiting" to higher levels within the neuraxis so that the simplest, most immediate responses are delayed or modified. There is good evidence to suggest that some long-circuiting is always present, and on its quantity depend the degree of delay and the quantity of extinction of the reflex and the amount of involvement of the higher level resulting in consciousness of the stimulus and awareness of its significance.

As the nervous system became more complicated in the process of evolution, newer cephalic structures developed, toward which representations of lower functions wandered in the process called "encephalization." The development of newer and more adaptable functions was accompanied by alterations in activities of lower structures. Such modifications were in the nature of inhibitions from above. Thus evolution not only brought in new positive factors but held or damped down older functions, often extinguishing them completely. To give an example in the motor sphere: The infant shows little voluntary control but purposeless, random movements, lively deep reflexes and phylogenetically old defense reflexes, including the Babinski response, all evidence of uninhibited activity of the lower level. Maturation of the cortex puts the motor system under voluntary control, abolishes the choreoathetoid, old

movements of the motor system, reduces amplitude of the reflex and converts defense flexion reflexes into extensor stepping responses. The latter evolved level adds fine voluntary individual movements and at the same time inhibits older types of activity. These activities of the lower level reappear only when control by the cortical higher level is disturbed in disease—in the foregoing example, when lesions of the premotor cortex result in the loss of fine voluntary motor control and the reappearance of choreoathetoid movements. Symptoms then manifest themselves within two spheres: The negative factor is the loss of function which resided in the damaged structure; the positive factor is the release of function normally inhibited by the damaged structure. The former is often of lesser importance because of compensations and vicarious functions by other structures; the latter usually dominates the clinical picture. It is this combination of negative, positive and compensatory factors that places the reasoning and rationalizations of neurology on a basis different from that of internal medicine.

Using the epilepsies as examples, Jackson showed that dissolution of the nervous system need not be due to an anatomic lesion. After an attack, the postepileptic phenomena demonstrate both the negative and the positive aspects of dissolution. In the functional fatigue of higher centers following exhausting excitation, all the phenomena of release can be observed temporarily.

Evolution of the nervous system recapitulated by the individual in his process of maturation is accompanied by a corresponding process in behavior and the emotional life. According to the degree of long-circuiting possible and the quantity of encephalization of function, animal species show a degree of inhibition of stereotyped immediate reflex behavior and a more delayed adaptive response to external excitation. The developing infant shows in his behavior evidences of activity of the lower level in stereotyped responses to many stimuli, quantitatively excessive responses and inability to delay activity. He passes through many stages of behavior which can be graded quantitatively according to the aforementioned criteria and in relation to his needs at various chronologic periods of growth. His life in a civilized world, however, demands that he give up long before he is ready the gratifications of behavior prompted by the lower level. As his cerebral cortex develops, his ego may bear deprivation and delay in activity. Excessive responses and immediate behavior are supplanted by delayed adaptive verbal expressions or rational acts. Thus psychologically the older, more directly gratifying activity is inhibited or repressed and the activities of the higher level of the ego become dominant.

The prohibitions of external realities force an inhibition or repression of the direct expression of the drives or forces typical of all animal life. In psychologic repression one meets with a quantitative factor which makes the end result different from neurologic inhibition. The animal or instinctual forces are of tremendous strength and are kept from direct expression with difficulty. Civilization, no matter how it arose, has not yet evolved in man an ego sufficient to repress successfully the old activities, as the present worldwide outbreak of beastlike hostility amply demonstrates. Cultural environment demands repression, instincts demand direct expression and man finds himself not yet biologically adapted to the former, so that a continuous struggle between his levels of neural organization involves him in psychologic dilemmas for

which he attempts many, often disastrously unsuccessful, solutions termed neurotic or psychotic.

One may consider the phenomenon of this great conflict similar in nature to the intense neural excitation which precedes the motor aspect of an epileptic fit. When the extraordinary excitation has passed, consciousness is lost and the discharge passes into lower motor levels. Excessive excitation without adequate discharge results in fatigue and paralysis. In periods of conflict excessive psychologic excitation results which cannot be discharged by the ego. The pressure of emotional drives meets resistance from without, and functions of the ego become fatigued or paralyzed. There result two aspects, as in any neurologic lesion. The negative is evidenced by the fact that the instinctual drives are not expressed through the highest level in highest symbolic expression—words or gestures. The positive aspect finds its expression through lower levels now permitted to act by the release from the higher, inhibiting functions. As in the somatic sphere the positive aspects dominate the picture in the new phenomenon of symptom formation or "return of the repressed." The negative aspect or deficiency is likewise compensated for by other functions, although not influencing the quantity of release. The ego's deficiency and compensations for it are spoken of as "reaction formation."

The psychoanalytic theory of symptom formation depends on the concept that the repressed or undischarged energy escapes elsewhere than through the motor activity of the ego—that it returns modified as a symptom. In neurologic terms Jackson stated that diminished action in one part of the nervous system results in exalted action in another part, but this so-called new action takes place on a lower level. Neurologically, release of lower levels results in a greater preponderance of visceral participation in reflex activity. Psychologically, verbal expressions and direct motor activity of the somatic nervous system are replaced by autoplasmic innervations, what may be roughly stated as "turning one's emotions against oneself," producing disturbances of function of the internal visceral organs innervated by the autonomic nervous system. It seems clear that regression to lower levels of psychologic activity has a particular applicability to the mechanisms of organ neuroses.

Effect of therapy indicates that these functional changes are at least in the early stages reversible. The symptoms can be caused to disappear and regression at least partially removed by reestablishing the functions of expression of the higher levels which are not destroyed but are in a state of functional paralysis. Regression is at an end when the function of the ego in symbolic expression is reestablished, in other words when exteriorization of instinctual drives may take place through the highest level, which when functioning resumes its inhibiting influences on lower levels anew.

In devolution of the nervous system in disease processes, repression has been seen to be synonymous in its effects with release of inhibition, resulting in regression to lower levels of activity. In the various degrees of long-circuiting from lower to higher levels within fairly fixed neural pathways, repression of simple reflex activities has been termed inhibition. Moreover, like repression at higher levels, the results are a negative factor in that activity fails to be a simple response over a securely fixed pathway, and a positive factor in that activity at higher levels is permitted. One can then state that both repression and inhibition indicate a nega-

tive factor, in that a certain level of activity is abandoned, and a positive factor which results from or is permitted by the shift of activity from one portion of the nervous system to another. It is on this basic principle that both clinical neurology and psychoanalysis are able to explain the phenomena of so-called disease entities expressed in the form of either physical or psychologic symptoms.

Two other neurophysiologic phenomena become apparent when the psychoanalytic concepts of conflicts and their therapy are considered. Psychologic conflict originates when the immature nervous system and corresponding weak ego are forced by external agencies into exerting repressing influences on the child's normal instinctual activity. These agents are external and by repetition of their demands cause the phenomenon of repression to become permanent. This is identical with conditioning, for the child unconsciously and automatically perpetuates these early patterns of behavior. Psychoanalysis terms this conditioning or internalization of one time external voices of authority as the creation of a superego. In therapy, possible in adult life when functions of the ego are stronger, removal of conditioned responses or deconditioning the superego by permitting gradual testing of a less prohibitory and strict reality, excitation can again be discharged through the highest levels and neurotic symptoms or activities prompted by the lower level abandoned. This is one of the fundamental principles of psychoanalytic therapy.

Facilitation is a process of gradual lowering of the threshold of excitation by repetitive stimuli. Electrically stimulating the motor cortex may at first produce only a local response, but if it is continued a generalized convulsion ensues. Such facilitation is evidenced psychologically by gradual mounting tensions breaking through to the expression of a violent emotion. The subthreshold stimuli may be entirely unconscious and the final discharge as surprising to the subject as to those around him. Such subthreshold stimuli are reproduced in therapy by psychologic interpretations which gradually build up tensions within local areas of the cortex, finally swelling up to a discharge in behavior or words which permit to enter consciousness activities which were neurotically active at visceral levels. After breaking into consciousness the deconditioning efforts of the therapist permitting and accepting such impulses allow them to be understood and more adequately dealt with.

These dynamic expressions of interplay and shift of activities within levels of the nervous system indicate the identity of the fundamental neurologic and psychoanalytic principles. I have spoken theoretically of interplay among such levels without indicating their concrete existence and without commitment as to localization of emotional and intellectual functions. It is valuable to turn to the hypothalamus and cerebral cortex in considering those functions. Hypothalamic functions are concerned with emotional expression, regulation of endocrine and visceral activity and degree of consciousness. A tremendous amount of work has been done on this structure but little interpretation of the results in furthering our concepts of a dynamic interplay between emotions and intelligence.

The hypothalamus is a small structure lying at the base of the brain under the thalamus between the optic chiasm and the cerebral peduncles. It contains the tuber cinereum, mamillary bodies and infundibulum and forms the base of the third ventricle. Within it are several nuclear masses easily distinguishable and many

other cells not easily demarcated into nuclei. The hypothalamus is closely allied with the old olfactory system through the fornix and mamillothalamic tracts, with the midbrain by descending fibers, with the hypophysis, with the thalamus and indirectly with the neocortex.

The hypothalamus is an effector structure receiving its afferent supply from the thalamus. It regulates and integrates autonomic activity and is thus concerned with sleep, regulation of bodily temperature, metabolism of minerals, carbohydrates, fats and proteins, water metabolism and reproduction. Thus it regulates and integrates conserving autonomic functions. However, at this time I wish only to discuss its position in relation to cortical activity.

It has been shown repeatedly that removal of the structures anterior to the hypothalamus—removal of cortical influences—results in wild, uninhibited activity which has been termed sham rage. Such emotional activity can be reproduced by direct stimulation of the posterior hypothalamus, making it clear that this violent emotional expression is inhibited by the cerebral cortex and that the center for the integration of visceral and somatic components for emotional expression lies in the hypothalamus. Damage to this area causes apathy and a sort of catalepsy with somnolence.

Numerous clinical observations in man indicate that tumors and infections damaging corticohypothalamic connections release hypothalamic activity and cause signs of aggressive destructive ragelike behavior. In development one observes impulsive, uncontrolled emotional expressions in infancy and childhood before the cortex has sufficiently matured to function as an inhibitor of hypothalamic activity. The hypothalamus as a central integrator of the autonomic nervous system has become the cephalic representative of its visceral activities subjectively expressed in emotional drives and forces and is only temporarily permitted free expression.

In psychological language, the child is driven by his instincts, which are held in check only by a process of cortical learning induced by environmental admonitions and prohibitions. Such learning is possible only when the cortex is matured and to a degree dependent on its functional capacity, which is to a large extent innate. This function of adaptation is attributed to the psychologic ego, which is the subjective correlate of activity of the cerebral cortex. Functions of the ego are of many grades of efficiency, from the weak, easily overwhelmed by hypothalamic activity, to the overly strong, which hold down most of the biologic emotional drives and result in a rigid, perfectionistic, supermoral character. This degree of activity is dependent not alone on the quality of the cortical structure but also on the type of conditioning to which it has been exposed from the psychologic influences of the early environment.

The cortex thus inhibits the hypothalamus and releases it in phasic responses for activity in emotional expression initiated by specific internal and external stimuli. Let us examine the influence of the hypothalamus on the cortex itself in order to determine the forces which require modification and expression:

Stimulation of the hypothalamus in the cat and in man causes an excitation of the potentials of cortical action in varying degrees, depending on the strength of the stimulus. Intense stimulation results in the cortical waves becoming faster, gigantic and in synchrony or phase with those of the hypothalamus. Drugs, such as epinephrine or metrazol, having a sympathetic stimulating effect likewise augment cortical activity. Drugs

having a depressing effect on the hypothalamus, like pentobarbital sodium or pilocarpine, have a depressing effect on the cortex. Thus the hypothalamus is like a driver or excitor of the cortex, which is in conformity with the recent experimental work indicating that sleep is an inhibition of the hypothalamic centers for wakefulness.

Psychologically these experiments assume importance, for a patient given an emotionally significant verbal stimulus reacts as if his hypothalamus were electrically stimulated. Furthermore, in both electrical and verbal stimulation bursts of activity reappear from time to time similar to disagreeable ideas convulsively popping up in one's mind despite attempts at forgetting. One may state that in experimental hypothalamic studies there has been shown a neurologic basis for the overwhelming of intellectual processes by emotional activity and that the hypothalamus is a reservoir for prolonged excitation and a chronic effect on the cortex and periphery.

Psychoanalysis has shown that attempts at repression, that is, inhibition of more emotional instinctive behavior, are by necessity characteristic of all mankind. Failure or success is a relative matter, and neurosis is universal, varying in degree, dependent on how repressed or unconscious energies can be dealt with. Experiments demonstrate conclusively that hypothalamic activity in variable degree activates cortical functions and that there is an inhibition of the hypothalamus by the cortex and a driving of the cortex by the hypothalamus. Thus a relationship exists in a dynamic physiologic interplay between these structures identical with the dynamic interplay between ego and unconscious emotional drives, the quantitative and qualitative result of which is evidenced in the severity and type of neurosis.

Where dynamic clinical neurology and psychiatry have reached their closest point of fusion in the present is in psychosomatic medicine. This field has for its object the study of the interrelation of the psychologic and physiologic aspects of normal and abnormal bodily functions with a rational therapy as its ultimate goal. It approaches the problems of etiology and therapy in general medicine from a psychologic point of view. It takes for granted that psychic and somatic phenomena are part of the same biologic system. There can hardly be any doubt that the specific apparatus concerned in the unity of effect portrayed in psychologic and somatic disturbances is the nervous system. One may study the process by the technics of psychology or physiologic methods of internal medicine or neurology, but one is always expressing one side of the problem—both are necessary for an adequate and complete understanding.

The psychoanalytic view of organic neuroses is that emotional tensions require adequate cortical activity of the highest level for their relief; if repressed, they find expression in somatic symptoms which are simply substitute attempts of the lower level at relief of emotional tensions. These symptoms disappear if the repressed emotion is made conscious. When the emotional tensions are not relieved they become chronic and result in bodily changes. These repressed tensions and ultimate bodily changes take place within the sphere of the vegetative nervous system for the reason previously outlined.

In the early days of psychoanalysis interest was largely centered on those aspects of bodily symptoms affecting the voluntary nervous system which are classified as hysteria. Gradually interest veered to those symptoms and signs of disorder of the visceral organs

innervated by the autonomic nervous system. The patient with attacks of anxiety accompanied by tachycardia, hypertension, perspiration, diarrhea, polyuria or dysmenorrhea was readily acknowledged to be suffering from a neurosis. It was only vaguely indicated that emotional factors played some role in the syndromes of diabetes mellitus, peptic ulcer, colitis, migraine, hypertension or bronchial asthma. Emotional factors were believed to act by exaggerating these conditions, or the organic illness reversibly increased the patient's nervous instability. It is only lately that the possibility has been advanced that these syndromes which arise as evidences of disturbed function of visceral organs may be caused by emotional conflicts. It is on this future phase of medicine—psychosomatic medicine—that psychoanalysts such as Alexander and his co-workers are now busy.

The fundamental thesis is this: Intrapsychic conflicts may result, after repression, in activities of the lower level which engaged the activity of the autonomic nervous system. The results are contractions of smooth muscles the chronicity of which leads secondarily to organic changes in the visceral organs. These organic changes are thus terminal events in a causal change whose beginning is a psychologic conflict which forces neural activity to adopt a regressive pathway rather than a direct or verbal higher level expression.

The selective nature of the functional change and secondary organic effect is a problem which requires careful correlation with specific emotional conflict. Such correlations are in the process of study, although some have already been elucidated.

Sufferers from peptic ulcers react from a conflict between their unsolved, passive, dependent attitudes and their self-respecting aggressiveness and independence. The former is not permitted expression of the higher level in verbal longings or behavior, thus necessitating continuous innervation of the upper portion of the gastrointestinal tract, the organ of passive intaking. Long-continued chronic stimulation of the smooth muscle of the stomach and its glands leads to an organic breakdown and the formation of an ulcer.

In certain persons conditioning has resulted in an inhibition of the direct verbal or active expression of rage through the innervation of the voluntary nervous system. The whole emotional process plays itself out within the autonomic nervous system, as evidenced by hypertension. At first this fluctuates as the emotional stimuli impinge on the individual, but the long-continued effect may result in organic changes in structures which perpetuate the hypertension and set up a chain of events which ends in malignant alteration in a whole group of organs. The morphologic alterations evidenced at necropsy are the last events in a whole series of consequences of emotional conflicts incapable of direct expression.

Medicine has valiantly sought to make the greatest use of cellular pathology in an explanation of disease, but it has never been satisfied that the entire story of the so-called degenerative diseases was known. Constitutional and hereditary factors have been too evasive to be permanent concepts. What are dismissed as constitutional are individual factors more dynamically expressed as the result of the interaction of a specific organism with problems and frustrations of life that set into activity, through failure of adaptations of the whole organism, a series of events that ends in disease. Such failures, which are attributed to constitution, allergy and lowered resistance, are but expressions of

a dynamic interplay between the total organism and the environment. Such a concept is not mystic or vague but utilizes the soundest of biologic concepts. It brings disease into relationship with a system of energies valid and dynamic and gives one optimism that the hopeless category of constitution may be replaced by a factor amenable to therapy. Medicine may return its attention to treatment of the spirit of the total organism without fear of losing its scientific attitude and without fear of becoming mystic and returning to demonologic concepts. The study of the patient as a whole—the personality as the expression of the unity of the organism—becomes the right and duty of the medical man.

I could not possibly present the entire interrelation of neurology, psychiatry and psychoanalysis in one brief communication. Therefore I chose to indicate the identity of their basic principles, exemplified by a discussion of the physiology of hypothalamic-cortical or emotional-intellectual dynamic interplay. Finally, I have indicated that the basic neurologic-psychologic concepts have now pervaded medicine in an attempt at furthering the study of the etiology and therapy of many obscure internal diseases. Thus neuropsychiatry expands beyond its limited interest in purely neurologic diseases or purely psychologic disorders and contributes in a practical manner to the field of medical therapeutics.

USE OF DIGITALIS TO PREVENT EXAGGERATED ACCELERATION OF THE HEART

DURING PHYSICAL EXERCISE IN PATIENTS
WITH AURICULAR FIBRILLATION

WALTER MODELL, M.D.

HARRY GOLD, M.D.

AND

HAROLD H. ROTHENDLER, M.D.

NEW YORK

The ventricular rate serves as the chief guide to the degree of digitalization of patients with auricular fibrillation. The customary procedure is to give enough digitalis to reduce the rate of the ventricles to about 70 beats a minute and to maintain it at that level. It is well known, however, that if this result is attained with the patient at complete physical rest the rate in some cases mounts considerably when the patient is up and about. Furthermore, it may show wide fluctuations with moderate effort. Sir Thomas Lewis¹ stated: "Although it is usually possible to control the rate in cases of auricular fibrillation, when the patients are at rest or quietly exercising, it is rarely possible to control the rates adequately in conditions of freer exercise." In a recent report by Weinstein, Plaut and Katz² a contrary observation was made. In a previous study³ it was found that the same resting level of the heart rate can be attained in auricular fibrillation by either of two mechanisms of the action of digitalis, one of these

From the Department of Pharmacology, Cornell University Medical College, and the cardiac clinics of the Hospital for Joint Diseases and of Beth Israel Hospital.

requiring larger doses than the other. When the rate is reduced to about 70 a minute by moderate doses of digitalis atropine abolishes the slowing (chiefly "vagal" action), but when larger doses are used by the same person atropine causes relatively slight acceleration (chiefly "extravagal" action).

It seemed possible that these observations might have a bearing on the practical problem of preventing the extreme fluctuations in heart rate due to physical exercise in patients with auricular fibrillation under the influence of digitalis. They suggested that extravagal digitalization might accomplish this. A related problem was how one might best determine clinically whether

whether the slowing is produced by the "vagal" or the "extravagal" mechanism.

The present study is an endeavor to secure an answer to the foregoing questions. We compared the cardiac acceleration caused by vagal paralysis with that caused by physical exercise to the point of extreme fatigue in patients with auricular fibrillation before administering digitalis, during "vagal" and during "extravagal" stages of the action of digitalis.

METHOD

In all, twenty-seven experiments with atropine and a similar number with physical exercise were carried

TABLE 1.—Condensed Protocols of Cases in This Study

Patient	Sex	Age	Diagnosis *	Daily Dose of Digitalis Preparation	Resting Ventricular Rate	After Atropine		After Exercise	
						Maximum Ventricular Rate	Acceleration, Beats per Minute	Maximum Ventricular Rate	Acceleration, Beats per Minute
A. A.	♂	76	Arteriosclerosis, enlarged heart, sclerosis of aorta, 3D	None.....	100	170	70	170	10

* The diagnoses are made in accordance with the "Nomenclature and Criteria for Diagnosis of Diseases of the Heart" (New York Heart Association, 1939).

the ventricular rate is under "vagal" or extravagal" control after the administration of digitalis. This could be done by means of the atropine test, but it is not always practicable because the necessary dose is 2 mg. of the sulfate by intravenous injection,³ and that dose often causes distressing symptoms.

The question, then, was whether the ventricular acceleration during physical effort is due to decreased vagal tone or to other factors. If the acceleration after exercise in digitalized patients with auricular fibrillation is due only to decreased vagal tone, one would expect that the exaggerated acceleration would not occur in patients digitalized by the "extravagal" mechanism, for in these cases vagal tone plays little part in the slowed rate. If, on the other hand, the acceleration in these patients is due solely or chiefly to some other factor, one would expect it to take place irrespectively of

out on 11 ambulatory patients with auricular fibrillation showing varying degrees of heart failure. These included 3 patients with arteriosclerotic heart disease, 7 with rheumatic heart disease and 1 with syphilitic heart disease. There were 6 men and 5 women, and their ages ranged from 19 to 77. All had been under our treatment at the cardiac clinics for years. Each patient rested lying down until the ventricular rate reached a constant level, which was taken as the control rate. This was followed by the physical exercise, which consisted in walking rapidly up several flights of stairs until the patient complained of extreme fatigue and felt unable to go further. At this point a count of the ventricular rate was made. This was followed by a period of rest of thirty minutes. Then a dose of 2 mg. of atropine sulfate was injected intravenously. This dose is sufficient to block the vagal endings com-

pletely.³ The ventricular rate was counted immediately after the injection and continuously during the next five minutes. The maximum rate was taken as the full effect of the atropine. The ventricular rates were counted by means of the stethoscope at the apex in some cases and in twenty of twenty-seven experiments they were counted from strips of electrocardiogram.

The foregoing procedures were carried out after digitalization in all cases and also before digitalization in 7 of the 11.

In most instances a standardized digitalis leaf was used in the form of compressed tablets. The potency was 80 mg. per cat unit. In 2 cases tablets of lanatoside C were used and in 5 cases tablets of digitoxin.⁴ These

were dispensed in the clinic in suitable numbers, and patients were directed to take them daily in a single dose. The experiments were performed after the patient had received a given daily dose for a period varying from one to three weeks.

RESULTS

In table 1 are assembled the details of the experiments on the 11 patients. It may be noted that the effect of atropine on the ventricular rate, as well as that of exercise, varies in the same patient and in different patients with different degrees of digitalization. However, the average ventricular rate after blocking of the vagus by atropine in the group as a whole was practically identical with that immediately after severe

physical exercise, namely 130 beats a minute after atropine and 128 a minute after the physical exercise.

In table 2 the results have been rearranged in order to compare the effect of atropine with that of exercise during different grades of digitalis action. The experiments are arranged in three groups: (A) before

TABLE 3.—Proof That Physical Exercise Produces the Same Maximum Ventricular Rate as Blocking the Vagi by Atropine

C. Predominantly "extravagal" digitalization	60	105	105

digitalization, (B) during digitalization by the predominantly "vagal" mechanism and (C) during digitalization by the predominantly "extravagal" mechanism. Groups B and C are defined by the effect of atropine. When atropine caused marked acceleration, usually to a rate considerably above 100 beats a minute, the cases were placed in the "vagal" group. When, as after larger doses of digitalis, atropine caused less acceleration, usually to a rate not greatly exceeding 100 a minute, the cases were placed in the "extravagal" group.

When the results are examined in this way it may be noted that the maximum ventricular rate after the administration of atropine is highest when the patient is without digitalis, is somewhat lower after moderate digitalization and is considerably lower after more intense digitalization. Nevertheless, the average maximum ventricular rate after extreme exertion is practically identical with that after blocking of the vagus by atropine in all three stages. These facts are more readily seen in table 3, in which the averages of the results of table 2 are assembled.

In isolated instances the maximum rate reached by blocking the vagi is significantly different from that after exercise. In eleven out of twenty-four experiments listed in table 2 a difference of at least 20 beats

a minute occurred. In 7 cases, or 29 per cent, the acceleration after exercise was from 20 to 30 beats less than would be the case if vagal tone were completely removed. In 4 cases, or 17 per cent, the maximum ventricular rate after exercise was from 20 to 35 beats higher than could be accounted for solely by the removal of vagal tone.

COMMENT

It is well known that patients with heart disease, and especially those with auricular fibrillation, frequently show an exaggerated response to exercise.⁵

4. The lanatoside C (cedilanid) was supplied by Sandoz Chemical Works, Inc., and the digitoxin (Digitaline Nativelle) by Laboratoire Nativelle.

5. Blumgart, H.: The Reaction to Exercise of the Heart Affected by Auricular Fibrillation, *Heart* 11:49 (Jan.) 1924. Lewis.³

But whether this response to exercise by these patients is mediated through decreased vagal tone or through some other factor such as stimulation of the accelerators is not established. The normal mechanism for cardiac acceleration by physical exercise in the dog was shown by Gasser and Meek⁶ to be due to decreased vagal tone, and they suggested that accelerator stimulation participates only in times of great need. Boas⁷ suggested that the accelerators play a role in the rapid and labile ventricular rate of patients with auricular fibrillation who have exophthalmic goiter or autonomic imbalance. Our experiments indicate that in the average patient with auricular fibrillation with or without digitalis the acceleration of the heart with severe physical exercise is due to decreased vagal tone, the normal mechanism seen in the dog.

This deduction is based on the observation that the maximum rate of the heart beat reached when the vagi are blocked by atropine in the patient with auricular fibrillation is the same as that attained during extreme grades of physical effort. When the degree of digitalization has been relatively light ("vagal" slowing), blocking the vagus with atropine as well as physical exertion produces marked acceleration of the ventricular rate to levels of the order of 150 a minute or more. When the doses of digitalis have been relatively larger ("extravagal" slowing), however, neither blocking the vagi by atropine nor physical exertion produces marked ventricular acceleration, usually not much above 100 a minute.

The type of cardiac slowing by digitalis in auricular fibrillation, whether by the "vagal" or by the "extravagal" mechanism, can therefore be ascertained either by blocking the vagus with atropine or by physical exertion. The two generally yield the same results. If a patient has been digitalized at complete rest in bed, and the ventricular rate has been reduced, for instance, to 70 a minute, the observation that 2 mg. of atropine sulfate injected intravenously fails to accelerate the rate appreciably above 100 beats a minute is, in the average case, a satisfactory indication that the exaggerated acceleration usually seen in patients with auricular fibrillation during physical effort will not occur.

While in the average patient with auricular fibrillation acceleration of the ventricular rate during exercise takes place by a decrease of vagal tone, the results of our studies showed some exceptions. In a few instances the level of the ventricular rate after physical exercise was lower than after complete blocking of the vagi. These probably indicate that the patient discontinued the effort before vagal tone was completely lost. In 4 cases, however, the ventricular rate rose to a level higher than could be accounted for by the complete blocking of the vagus. This indicates that under certain conditions the patient with auricular fibrillation may utilize some mechanism for acceleration of the ventricle during physical effort in addition to the decrease of the vagal tone. In one of these the resting rate was 66 a minute during full digitalization. Blocking the vagus accelerated the rate to 103 a minute, but during physical exertion the rate rose to 138 a minute. We do not know what this accessory mechanism is. There are several possibilities, such as direct stimulation of the accelerators or their indirect stimulation through the

effects of asphyxia on the secretion of epinephrine. It may be noted that the 4 patients in whom such an accelerator mechanism operated during effort had the most advanced degree of cardiac damage and failure of the entire group, especially patients D. C. and T. S. They were the only ones of the entire series who required intravenous injection of organic mercurials in addition to digitalis to control their failure sufficiently to enable them to be up and about.

At this point attention should be directed to the fact that the level of the resting ventricular rate in digitalized patients with auricular fibrillation does not reveal whether the slowing is produced by the "vagal" or by the "extravagal" mechanism. Attention was called to this matter in another study⁸ in which the explanation of the phenomenon was discussed. Table 4 shows a case in the present series which illustrates this point. The resting rates after moderate and after large doses of digitalis were practically identical, but after the moderate doses atropine as well as physical exertion produced very marked acceleration, whereas after large doses of digitalis the same factors produced very little acceleration.

SUMMARY AND CONCLUSIONS

1. The average patient with auricular fibrillation has acceleration of the ventricular rate during exercise chiefly, if not entirely, by decrease of the vagal tone. In these cases blocking the vagus by means of atropine accelerates the ventricles to the same maximum level as extreme physical exertion.

2. There is an indication that in some patients, especially those with advanced heart failure, an accessory mechanism for acceleration may also be invoked during extreme physical effort.

3. Exaggerated acceleration of the ventricles caused by physical exercise in patients with auricular fibrillation can be prevented in most cases by "extravagal" digitalization, a state in which the ventricles are slowed chiefly by the direct action of digitalis on auriculoventricular conduction and in which vagal tone has been, for the most part, lost. It is produced by relatively large doses of digitalis. In this state, the ventricular rate rarely exceeds 100 beats a minute after the vagi are blocked by atropine or after severe physical effort.

4. The rate of the ventricles during rest does not disclose whether the digitalis has caused the slowing by the "vagal" or by the "extravagal" mechanism. There are two methods for determining "extravagal" digitalization: (1) the atropine test (the intravenous injection of 2 mg. of atropine sulfate) and (2) physical exercise. After neither of these tests will the ventricular rate rise appreciably above 100 beats a minute if enough digitalis has been given to cause slowing by the extravagal mechanism.

Fatigue.—The most striking effects of fatigue are on the nervous system, where it produces irritability, nervousness, restlessness. Enthusiasm is gone, judgment warped. The world looks drab. Child specialists tell us that many behavior problems in children are due to fatigue. There is evidence that fatigue lowers resistance to disease, and it very definitely interferes with recovery from infections.—Diehl, Harold S.: *Healthful Living*, New York, McGraw-Hill Book Company, Inc., 1941.

THE FORMATION OF RENAL CALCULI IN BEDRIDDEN PATIENTS

MONTAGUE L. BOYD, M.D.
ATLANTA, GA.

My purpose in this paper is to call attention to, and illustrate by the report of cases, the effects of inadequate renal drainage and of phosphaturia in the formation of renal calculi in bedridden patients. In my experience it has been the phosphatic stones (calcium phosphate) which have produced the most serious results, because they can form rapidly and without symptoms, so that they may have already produced a serious condition when they are discovered.

The fact that renal calculi are frequently formed in patients having paralyses which produce disturbances of urination, such for example as fractures of the spine and poliomyelitis, has been so generally recognized and so frequently reported that it is unnecessary to devote any space here to confirming it. The discussions concerning preventive treatment have emphasized the correction of metabolic disturbances, the relief of urinary obstruction, the removal of foci of infection, regulation of the diet and the administration of vitamins and have neglected to stress adequately the importance of obtaining renal drainage by proper posture aided by a large urinary output, the two things which, I think, are perhaps of greatest importance in the prevention of the phosphatic stones.

Of course urinary obstruction, focal infection, hyperparathyroidism, infections of the urinary tract and vitamin deficiencies are important etiologic factors in the formation of renal calculi, and they may well be of considerable importance in some cases, but they are at times not the essential etiologic factors, since phosphaturia and poor drainage with the increased excretion of calcium, which seems to occur in patients with paralyses, may cause and are in themselves capable of producing phosphatic calculi.

Furthermore, there is no doubt but that the processes which are now considered to be the usual etiologic factors in the formation of stones frequently occur in these patients. The past history of some of them shows that the propensity to the formation of stones had already existed before the occurrence of the illnesses or accidents which caused them to be bedridden. In other instances the stone-forming process probably developed afterward. These kinds of stones or beginning stone formations may, of course, cause serious complications which I shall not discuss here.

PHOSPHATIC STONES

I have had 3 patients who had multiple phosphatic renal calculi after poliomyelitis; 1 had both kidneys full of stones and 2 had one kidney full and some stones in the other one. Two of these patients died, and the other one, after many operations, has attained fairly good health.

Last year I had a patient whose condition, when he came to me, was, I feel sure, the early stage of the condition that I found in the other patients—five or six of the minor calices of the left kidney were filled or almost filled with many small stones and sand, and many of the minor calices of the right kidney contained a little sand, so that a faint outline of the calices could be seen in a roentgenogram. There was one stone in the right kidney about 1 by 1 by 0.5 cm. The patient had been

bedridden for about three months because of a fractured femur which refused to unite satisfactorily, and he had been given two tablets a day of dicalcium phosphate for two months; he had phosphaturia when I saw him. A stereoscopic urogram showed that the major and minor calices of the kidneys, especially of the left kidney, ran almost directly dorsal from the pelvis and that the pelvis was probably of the anterior variety. Therefore, drainage free enough to rid the kidneys of the sand and the stone could not occur unless the patient would lie on, or almost on, the ventral surface of the body. He began at once to assume this position for several hours a day, having each time first drunk a large amount of water. He passed all the sand and small stones from the kidneys without much difficulty, except the large stone in the right kidney, which would not pass through the ureter and later on had to be removed at operation.

In reviewing a large number of stereoscopic urograms I have found that it is not unusual to find the calices of one, sometimes of both kidneys, running backward from the pelvis, so that the pelvis lies almost entirely ventral to the major calices, a condition which I had paid little attention to until I found it in this patient.

Fig. 1 (case 4).—Sand and small stones fill the minor calices on the left. One stone is seen in the right pelvis and there is also a little sand in a few of the minor calices of the right kidney which shows in the roentgenogram but not here.

The essential difference between the commonly encountered processes of stone formation and the formation of these phosphatic stones is that the phosphatic stones are usually the result of only three things: (1) a precipitation of the urinary phosphates either as amorphous phosphates or as phosphatic crystals or both; (2) a lack of an adequate drainage of the renal calices and pelvis due to improper posture and to an inadequate intake of fluid, and (3) increased calciuria. I cannot be sure that the increase in the calcium in the urine always occurs or that it is an essential factor.

Phosphaturia is by no means an uncommon occurrence in the bedridden patients I have seen, and it is due to a number of different causes: (1) metabolic disturbances resulting from the disease (trauma, infection, fever and toxemia); (2) disturbances of the gastrointestinal tract caused by being bedridden and by the drugs given to relieve pain and nervousness; (3) too much citrus fruit juice; (4) saline cathartics containing phosphates (particularly those containing sodium bicarbonate), and sodium phosphate used by itself as a purgative or acid sodium phosphate used for

acidifying the urine; (5) sodium bicarbonate and magnesium oxide which are so frequently given to these patients for "indigestion" and "acid stomach," and (6) inappropriate diet.

Of course, the formation of gravel or renal calculi in patients with extensive and more or less permanent paralyses is a more serious matter than it is in patients

fractures, of course, cannot be moved from the dorsal position for several weeks, but it is not likely that during that period extensive formation of stones will occur or serious complications develop if the aforementioned precautions are taken.

REPORT OF CASES

CASE 1.—A married man aged 30, who had had colic in the right kidney fifteen years before and passed some small renal calculi, was admitted to Piedmont Hospital Jan. 1, 1937. He had had poliomyelitis six months before with more or less complete paralysis of the lower limbs. He had been in a cast nine weeks and had urinated by means of a retention catheter for several weeks. He had had fever and malaise a good deal of the time since having the poliomyelitis. Recently he had been worse, and in the past week vomiting had occurred. Examination showed the urine to be alkaline and cloudy and to contain pus and gram-negative bacilli. The pelvis and calices of the right kidney were filled with not very dense stones. Roentgenograms showed a more evident shadow in the region of the pelvis of the left kidney. There was no infection of the left kidney, which was functioning well. There was infection of the right kidney; no function was shown by the phenol-sulphonphthalein test.

Fig. 2.—Ventral position of the pelvis of the left kidney. The ureter, next to the pelvis, can be seen to run a little farther ventrad. The major and minor calices point dorsal—a condition which does not permit good drainage of the minor calices unless the patient lies on the abdomen.

with fractures of bone who usually are kept in bed a comparatively short time and who, therefore, have so much better chance of passing small stones or gravel out of their kidneys and of being cured of their tendency to form stones.

The prevention of complications, which may result from renal calculi in patients with paralyses when the calculi have already formed or begun to form, can usually be accomplished by careful medical and urologic attention. The prevention of the serious condition which may result from extensive formation of phos-

Fig. 4 (case 3).—The pelvis and calices of the right kidney are filled with stones of varying size. A good many stones of various sizes are present in the minor calices of the left kidney.

Fig. 3 (case 2).—Many small stones and sand fill the pelvis and calices of the right kidney, and stones and sand are present in a good many of the minor calices of the left kidney. The stones in the lower part of the left ureter are not shown.

phatic stones can be accomplished by preventing phosphaturia. But for all these patients it seems to me that there is a clear indication for them to lie at least part of the time, perhaps an hour or two a day, on the ventral surface of the body and to drink a large quantity of water before they do so. Some of the patients with

On January 8 nephrectomy was done on the right side. The stones were found to be soft and largely phosphatic. On January 15 a perianal abscess was opened by Dr. Eubanks. On January 30 ureterolithotomy was performed for impacted stone. Phosphatic sand was found in the ureter above the stone. A nephrostomy tube was left in and the patient returned to his home in South Carolina.

On Oct. 1, 1939 the patient died. The remaining kidney had become completely filled with stones many months before death.

CASE 2.—A schoolgirl aged 16, admitted to the hospital Nov. 26, 1937, had had poliomyelitis in July 1937 with resultant paralysis of the lower limbs and some paralysis of the arms. Examination of the urine revealed severe phosphaturia and many gram-negative bacilli and gram-positive cocci. Roentgenograms showed the pelvis and calices of the left kidney to be completely filled with small stones and several small stones in the lower part of the left ureter. There were some small stones in five or six of the minor calices of the right kidney. Gram-negative bacilli and gram-positive cocci were obtained from the left kidney and only a few gram-positive cocci from the right kidney.

The patient was carried home to Lexington, Ky. Dr. Douglas Scott has performed a number of operations on her ureters and kidneys since then and on May 31, 1940 wrote me that she "is now living in a wheel chair and this week completed her high school work and graduated." She is not free of stones.

CASE 3.—A schoolboy aged 16, admitted to the hospital Feb. 21, 1938, had had poliomyelitis six months before with complete paralysis of the lower limbs. Examination showed the urine to be cloudy and alkaline and to contain much pus and many staphylococci. The pelvis and calices of the right kidney were filled with small stones. There were some larger stones in the left kidney.

On March 1 pyelolithotomy was done on the left side, and a nephrostomy tube was left in. Phosphatic stones and sand were removed from the pelvis and calices.

On April 1 pyelolithotomy was done on the right kidney, and a nephrostomy tube was left in.

On April 18 the patient died. Autopsy revealed a perforation of the jejunum and fibrinous peritonitis, the cause of which could not be determined. There were no stones in the kidney.

CASE 4.—A man aged 27, admitted to the hospital Feb. 25, 1940, had broken his right femur three months before admission. Healing was unsatisfactory and he had just been sent to Atlanta to an orthopedic surgeon. For two months he had taken two tablets of dicalcium phosphate daily and smaller doses during the remaining month. Blood had appeared in the urine the day before admission.

Examination of the urine revealed it to be alkaline and marked by phosphaturia and many red blood cells. Roentgenograms showed most of the minor calices of the left kidney outlined as though they were partially filled with stones and those of the right kidney faintly outlined as though they contained a little sediment of sand or gravel. There was one shadow about 0.7 cm. in diameter in the region of the right kidney.

On a suitable diet, taking plenty of water and lying on his abdomen two to three hours a day, the patient passed phosphatic sand and many small stones. All the stones were passed except the large one in the right kidney, which could not go through the ureter and was later removed at ureterolithotomy.

SUMMARY

Of 4 patients with multiple small phosphatic stones and sand in the kidneys, 3 had had poliomyelitis with rather extensive paralyses, and the fourth, a fractured femur which would not unite satisfactorily. The last patient had many small renal calculi, which were all passed by having him drink large quantities of water and lie three or four hours a day on his abdomen. One large stone would not pass through the ureter.

A stereoscopic urogram of patient 4 showed that the minor calices of the left kidney pointed dorsal from the major calices, which in turn pointed back from the pelvis; somewhat the same condition existed in the right side, and it was evident that the stones had accumulated in the kidneys because of this condition and because of his failure to lie on his abdomen. A study of stereoscopic urograms of a large number of patients shows that kidneys with anterior pelves and dorsal-pointing calices occur fairly frequently; I believe that the drainage of sand and small stones from kidneys of that character does not occur unless the patient lies on the ventral surface of his body.

Multiple phosphatic stones can probably form in the kidneys solely as the result of phosphaturia and a lack of proper drainage due to an improper position in bed; perhaps an increased calcariuria is necessary. I do not know.

Naturally all the other known etiologic factors of the formation of stones may exist in bedridden patients and no doubt often do exist, and every precaution to prevent this formation should always be taken, including drainage by changes in posture.

THE IMMEDIATE AND LATE EFFECTS OF THE INTRATHECAL INJECTION OF IODIZED OIL

A. W. MARCOVICH, M.D.

A. EARL WALKER, M.D.

AND

C. M. JESSICO, M.D.

CHICAGO

Although generally recognized as a valuable adjunct in the diagnosis of lesions of the spinal cord, myelography by means of iodized oil¹ has been criticized on three scores, namely that it is irritating to the spinal meninges, that it may not demonstrate early lesions and that occasionally it shows a block where no lesion can be found at operation. The first of these, the irritating effect, has been emphasized more than the other objections.² The majority of reports have stressed the immediate reactions, but a few have mentioned delayed deleterious effects from the injected iodized oil. The increased use of myelography with iodized oil as a diagnostic aid in the sciatic syndrome has made imperative a comprehensive examination of the immediate and late effects of the intrathecal injection of iodized oil.

In order to assess these reactions, we reviewed all the cases at the University of Chicago Clinics in which iodized oil had been used to examine the spinal canal. The histories of the patients were carefully studied with particular attention to any immediate reactions to the injected iodized oil. Letters were sent to the patients who were still living asking them to return for a check-up. At no time was the purpose of the examination mentioned to the patient—none, so far as we know, was aware of our particular interest. On their return a detailed interval history was obtained with particular emphasis on those points which might indicate deleterious effects of the previous injection of iodized oil, such as pain in the extremities, headache, paresthesias, paralyses and gastrointestinal or urinary disturbances. A complete neurologic examination was then made. All but 3 of the patients who returned were placed on the tilting table, and the spine was examined with the fluoroscope, spot films being made for a permanent record of the examination. In the later cases a lateral roentgenogram of the skull was taken.

IMMEDIATE EFFECTS

Between 1928 and 1939, 150 patients were examined with the aid of intrathecal injections of iodized oil. Usually 2 cc. of iodized oil was used, but in a few cases when the fluoroscopic appearance was not sufficiently clear for a definite diagnosis another 2 cc. was introduced into the subarachnoid space. The injection was made into the spinal canal by lumbar puncture in the majority of the cases, but in 14 instances the oil was injected into the cisterna magna. The site of injection did not appear to make an appreciable difference in the resulting symptoms or sequelae.

Clinical Manifestations.—Of the entire group, 46.4 per cent had no subjective reaction of any type and

From the Division of Roentgenology and the Division of Neurosurgery, the University of Chicago.

1. The iodized oil used in this study was 40 per cent iodine in poppy-seed oil, except for a few cases in which the iodine concentration was only 20 per cent.

2. Spurling, R. G., and Grantham, E. G.: Neurologic Picture of Herniations of the Nucleus Pulposus in the Lower Part of the Lumbar Region, *Arch. Surg.* 40: 375-388 (March) 1940. Oldberg, Eric: A Plea for Respect for the Tissues of the Central Nervous System, *Surg., Gynec. & Obst.* 70: 724-725 (March) 1940.

the temperatures did not exceed 99 F. during the three days after the injection. Fever was the most common sequel; 29.6 per cent of the patients had a temperature of 99 to 100 F. and 24 per cent over 100 F. The highest temperature noted was 103 F. The fever lasted only twenty-four to forty-eight hours, and in none of the cases did it persist as long as seventy-two hours. Sex did not seem to play a role in the severity of the reaction. Those patients having a tumor of the spinal cord or a complete block to the iodized oil were less likely to have a febrile reaction to the oil than those who did not have a tumor or a block (table 1).

Other symptoms or signs noted immediately after injection of the iodized oil were headache (23 cases), aggravation of previous symptoms (9 cases), nausea (2 cases), vomiting (2 cases) and stiff neck (1 case).

All these symptoms and signs usually subsided within seventy-two hours after the injection of the iodized oil into the spinal canal.

Many authors have noted some or all of the aforementioned immediate ill effects of intrathecal injections of iodized oil. Fever and headache have been considered the most common complications.³ The other manifestations just noted have been present less fre-

quently. Dizziness was given by Schönbauer⁴ as a rather frequent complaint. Peiper,⁵ Albrecht⁶ and Wartenberg⁷ have reported paralyzes of the cranial nerves, especially of those controlling the eye muscles. Rodriguez de Mata⁸ reported a case of temporary amaurosis after the use of ascendant iodized oil.

The exaggeration of symptoms and signs previously present has been reported by many writers and is not an uncommon occurrence. Root pains, paresthesias and aches are frequent.⁹ An increase in a partial paralysis has been seen occasionally.¹⁰ The severe dyspnea reported by Wartenberg⁷ and Fumarola and Enderle¹¹ should probably be considered an exacerbation of a preexisting condition. Bladder symptoms¹⁰ (retention or incontinence) and constipation are usually of the same category. Messing¹² reported a case of paralytic ileus following an examination with iodized oil. In most instances these exacerbations have been temporary, lasting only a day or two. However, because lumbar puncture alone is not uncommonly followed by an exaggeration of symptoms in cases of tumor of the spinal cord, the foregoing observations are difficult to assess.

Changes in Spinal Fluid.—The changes in the spinal fluid after the injection of iodized oil have been discussed by many authors, but few systematic studies have been made. Immediately after the injection (up to six to eight hours), the spinal fluid remains normal,¹³ but at about twenty-four hours it shows pleocytosis, with as many as 100 cells per cubic millimeter, although occasionally the reaction is more severe and the cells may reach 800 or 1,000 per cubic millimeter.¹⁴ When the total count is below 100 cells per cubic millimeter the aggregation of cells is usually made up equally of polymorphonuclear leukocytes and lymphocytes; when the total count exceeds that number, the polymorphonuclear leukocytes tend to predominate. The height of the reaction is apparently the second, third or fourth day after injection, after which the cell count falls (fig. 1). A slight pleocytosis may persist for some time, rarely as long as six months or a year.¹⁵

The total protein of the spinal fluid also tends to increase after the injection, although it does not reach high concentrations. Ebaugh and Mella¹⁶ stated that in twenty-four hours the protein reaches a peak at about 130 mg. per hundred cubic centimeters and maintains this level for several days. The figures given by Walsh and Love¹⁵ did not show such high levels, although some of their patients had increased protein in the spinal fluid as long as seventeen days after the injection of iodized oil.

Besides the changes in cells and protein, Ebaugh and Mella¹⁶ stressed the fact that many bloody taps occur after the injection of iodized oil, an observation which seems to be borne out by the report of Walsh and Love,¹⁵ in whose series of 24 patients 13 had bloody spinal fluid. Ebaugh and Mella's interpretation of this as indicating a generalized congestion of the spinal vessels seems to be justified, for we have seen hyperemic roots of the cauda equina at operation following myelography with iodized oil but have never observed the spinal fluid to be grossly bloody.

No mention is made in the literature of the pressure of the spinal fluid after the intrathecal injection of iodized oil. In our series the pressure has never been increased, even when several hundred cells were present.

Fatal Reactions.—In none of our cases has a fatal outcome been referable to the injection of iodized oil.

TABLE 1.—Immediate Reactions of Temperature Following Intrathecal Injection of Iodized Oil

	Temperature			Total Percentage
	Under 99 F.	99-100 F.	Over 100 F.	
Total cases (percentage)	46.4	29.6	24.0	100
Male (percentage).....	46.8	28.5	24.7	100
Female (percentage).....	46.0	30.0	24.0	100
Tumor (percentage).....	55.0	30.0	15.0	100
No tumor (percentage).....	38.8	30.6	30.6	100
Canal block (percentage)	55.0	28.3	16.7	100
No canal block (percentage)	40.0	29.2	30.8	100

quently. Dizziness was given by Schönbauer⁴ as a rather frequent complaint. Peiper,⁵ Albrecht⁶ and Wartenberg⁷ have reported paralyzes of the cranial nerves, especially of those controlling the eye muscles. Rodriguez de Mata⁸ reported a case of temporary amaurosis after the use of ascendant iodized oil.

The exaggeration of symptoms and signs previously present has been reported by many writers and is not an uncommon occurrence. Root pains, paresthesias and aches are frequent.⁹ An increase in a partial paralysis has been seen occasionally.¹⁰ The severe dyspnea

Fatal reactions to iodized oil are rare, but a few deaths have been reported which must be considered. Two of the reports¹⁷ are of cases in which no postmortem examination was made, so that they merit little comment. Five cases in which autopsy was done, however, have been reported in some detail. The role of the iodized oil in these cases is not easily determined, for each patient had serious and extensive disease of the spinal cord. In 1 of Albrecht's cases⁶ after a bloody cisternal puncture iodipin¹⁸ was injected into the cisterna magna. At autopsy blood was found in the posterior fossa and over the cerebral hemispheres. Albrecht's conclusion that this bleeding was the result of a drunken brawl before admission to the hospital is certainly open to question. That the cisternal puncture alone was responsible for the bleeding and fatal outcome is not impossible. Albrecht's⁶ second case was no more conclusive. The patient had suffered from tetraplegia for three years and breathed mainly with her accessory respiratory muscles. Twenty-four hours after myelography by means of iodized oil she died of respiratory paralysis; but a few hours before her demise she had been given 0.03 Gm. of pantopon (hydrochlorides of the alkaloids of opium, principally morphine). The postmortem examination showed punctate hemorrhages in the spinal cord, but since the cause of the tetraplegia was not stated the significance of this condition is unknown. The etiologic relationship of the iodized oil to the fatal outcome in the presence of such complicating factors is not at all certain.

In the 3 other reports¹⁹ of patients who died—all with cervical lesions of the spinal cord—there appears to be a more direct connection between the injection of iodized oil and the patients' deaths. All showed acute spinal meningeal reactions and 2 of them similar acute inflammatory changes about the brain stem. In their case, Alajouanine and Horner²⁰ have suggested the ingenious hypothesis that the reaction is due to a disturbance of the cervical vasomotor mechanisms caused by acute compression of the cervical spinal cord resulting solely from the removal of spinal fluid. We are inclined to believe that the iodized oil played a more direct role in the fatality. That such fatal reactions are rare is evident from the fact that only these few cases can be gleaned from the world literature of the past fifteen years, during which time iodized oil has probably been used in thousands of cases.

LATE EFFECTS

Of the 150 patients in whom iodized oil was injected intrathecally, 47 returned and 9 out of town patients wrote us of their condition. The interval between the first and check-up examinations varied from one month to eleven years and one month. The average interval was three years and eight months.

Clinical Effects.—Although about half of the 47 patients who returned for a check-up examination had immediate ill effects from the injection of iodized oil, none, with the possible exception of 1 patient, had any

symptoms at the time of the reexamination which might be referred to the injected oil. Thirty-four of the patients were definitely improved or completely recovered both subjectively and objectively. Thirteen of them showed no significant change in their condition. The latter group was composed largely of patients suffering from inflammatory or degenerative disease of the spinal cord in which improvement could not be expected.

One patient, a woman aged 32, might be considered to have suffered deleterious effects from the iodized oil. She originally entered with the complaint of unilateral sciatic pain. After its demonstration by the use of iodized oil, a herniated intervertebral disk was removed surgically. For about six months her symptoms were relieved, only to recur at the end of that time. A second operation for the identical unilateral symptoms which she had suffered before the first operation showed that the subarachnoid space was obliterated below the second lumbar vertebra and the roots of the cauda equina were matted together. No further protrusion of a disk could be found.

Section of the posterior roots of the lower lumbar nerves on the involved side gave slight relief. It is impossible to be certain that the chronic hyperplastic arachnoiditis was the result of the iodized oil, for the greater part of the oil was found to be extradural at operation. That the arachnoiditis was responsible for the patient's pain is likewise uncertain, for the latter was strictly unilateral, while the arachnoiditis involved equally the roots of the cauda equina on the two sides. To make the case still more difficult to assess, certain psychogenic factors were present which might in themselves have been responsible in a large measure for the return of the patient's symptoms.

Of the patients who wrote to us, 7 stated that they were considerably improved or recovered and only 2 were unimproved. Nothing in the letters suggested that they had experienced any ill effects from the intrathecal injection of the oil.

It must be concluded from this clinical study that no definite, deleterious, permanent clinical ill effects can be ascribed to the introduction of 2 to 4 cc. of iodized oil into the subarachnoid space. It is possible that in the exceptional case, such as mentioned here, the iodized oil may be associated with arachnoiditis, but it is impossible to attribute this complication entirely to the oil, for bleeding at or after the operation might well have been responsible for the disorder. This conclusion

Fig. 1.—Pleocytosis of the spinal fluid following intrathecal injection of iodized oil. The ordinates represent the number of the cells per cubic millimeter of spinal fluid and the abscissa the days after injection. This chart is compiled from data gathered from the literature and our own cases. The two large dots represent the average of 13 cases as given by Ebaugh and Mella. We doubt that this chart gives a true picture of the average cellular reaction to intrathecal injections of iodized oil, for lumbar punctures are not performed in the usual case after the injection of iodized oil. The figures here probably represent the most severe reactions to the iodized oil.

is in harmony with Globus's²¹ study of a somewhat similar series of cases. Selig and Rubert²² stated that even 5 to 6 cc. of iodized oil may be injected into the subarachnoid space without permanent ill effects.

Roentgenologic Effects in the Spinal Cord.—The roentgenographic observations can best be considered by a separate analysis of those patients who did not have laminectomies and of those who had operations on the spinal cord (tables 2 and 3).

In the group in which no operations were performed, with only a few exceptions (table 2), the greater part of the iodized oil was found to be freely movable in the subarachnoid space. In almost every case a few globules of it were fixed in the root sheaths of one or more of the nerves of the lower part of the spine, most frequently the sacral and coccygeal nerves (fig. 2). The

In contrast with the group of cases in which no operations were performed, the iodized oil within the spinal canal in the 24 cases in which an operation was done was usually fixed within the tissues and immobile (table 3). In 5 cases a few droplets flowed in the subarachnoid space, although the greater mass of the oil in these was fixed within the tissues. In only 8 instances did the major part of the oil move freely, and in all but 2 of these instances the dura mater had not been opened at operation. This point, we believe, is a major factor in deciding whether iodized oil will be fixed or not. If the dura mater is widely opened, air and blood may enter the subarachnoid space and meningeal reactions may result in extensive arachnoiditis. This may occur even if iodized oil is not present.

* The term "normal" is used in tables 2 and 3 to denote that most of the iodized oil moved freely in the spinal canal and that no gross lesion of the canal was present. At the second examination a few drops of iodized oil were always found fixed in the sheaths of the nerve roots, as shown in figure 2.

longer the interval between the injection and the reexamination, the greater was the amount of iodized oil fixed along the nerve roots. When iodized oil had been present only three to four years, sufficient oil remained free in the subarachnoid space to form a pointed globule in the caudal sac when the patient was erect. Those patients examined after a longer interval showed only one or more small globules of iodized oil which were freely movable and proportionately more iodized oil fixed about the roots of the spinal nerves and in the caudal sac. In general, it seemed that the total amount of iodized oil in the spinal canal had decreased at the check-up examination as compared with that present at the initial examination. Since different machines with various target-film distances were used, no quantitative measurements could be made. In no case, however, had the oil been completely absorbed.

After operation, if the dura mater has been opened the iodized oil is rapidly encysted by the proliferation of the arachnoid membrane. Within one month of operation we have found the oil completely fixed in the tissues.

In those cases in which the dura mater has been opened, anteroposterior roentgenograms of the spine may give a false impression regarding the site of the fixed iodized oil. Frequently much of the oil is present in the tissues outside the spinal canal and only a small amount enmeshed in the arachnoid membrane. That within the subarachnoid space is usually found in the roots of the spinal nerves and as a globule at the end of the caudal sac.

The presence of iodized oil along the roots of the spinal nerves has been commented on by practically every author who has discussed the subject of myelography with iodized oil (fig. 3). When the oil is injected epidurally, the phenomenon is much more pronounced than when the injection is made in the subarachnoid space. Iodized oil has been found in the popliteal space within a few months after

the former injection,²³ while it rarely extends far into the pelvis when injected intrathecally.

Effect on the Brain.—Since no patient in the present series had any complaint referable to the brain, particular attention was not directed to the examination of the skull in the early part of this study. The report of Garland and Morrissey²⁴ called our attention to the possibility of the presence of encysted iodized oil within the intracranial cavity. To determine the incidence of this occurrence, we have taken lateral roentgenograms of the skulls of the last 21 patients seen. In 7 of these patients small globules of iodized oil were seen within the intracranial cavity. In 1 case one small drop and in another two small globules were

the skull was taken, but the iodized oil was no longer present intracranially. It is thus apparent that temporary introduction of iodized oil into the basal cisterns does not necessarily predicate its persistence there when the patient has resumed the normal upright posture.

It should be emphasized that the patients who had encysted intracranial iodized oil had no symptoms referable to its presence; in fact, 5 of the 7 patients were practically asymptomatic at the time of the examination.

Pathologic Effect.—We have had the privilege of examining the spinal cords of 4 patients who had iodized oil injected intrathecally some time before death. One

* Case referred to in text.

present in the posterior fossa. In the other 5 cases numerous small globules of iodized oil were scattered in the posterior fossa about the brain stem and the sella turcica (fig. 4).

It is noteworthy that in all 12 cases in which the iodized oil was fixed in the tissues in or about the spinal canal no oil was found within the intracranial cavity. The reverse, however, does not hold, for in 2 of the 9 instances in which the iodized oil flowed freely, none was seen in roentgenograms of the skull, and in 2 other cases only one or two small drops were present within the intracranial cavity. In each case in which the iodized oil was freely movable it was made to enter the basal cisterns by tilting the patient under fluoroscopic control. Immediately after having the patient assume the upright position another lateral roentgenogram of

of these instances is of limited value to us in this study because of the widespread disease (von Recklinghausen's neurofibromatosis) from which the patient suffered. The other 3 cases are presented in some detail, since reports of such cases are rare.

REPORT OF CASES

CASE 1.—History.—M. G., an Italian man aged 33, was admitted to the University of Chicago Clinics March 23, 1931 with a history of constant, severe, throbbing, frontal headaches every day and night for the previous two years; vomiting, not accompanied by nausea, almost every day for the previous sixteen months and weakness and dizziness on walking. On examination he was found to have a coarse nystagmus on looking to the left and a finer, quicker nystagmus on looking to the right, a slight right facial weakness and a positive Babinski response on the right side. All other physical and neurologic manifestations were normal. Two lumbar punctures were attempted, and on both occasions the fluid was blood tinged and under low tension. On jugular compression only a slight rise in pressure occurred. A cisternal puncture was made.

23. Pecker, R.: Image radiologique du tronc du sciatique après injection épidurale de lipiodol. Arch. d'électric. méd. 40:91-93 (Feb.) 1932.
24. Garland, L. H., and Morrissey, E. J.: Intracranial Collections of Iodized Oil Following Lumbar Myelography, Surg., Gynec. & Obst. 70: 196-210 (Feb.) 1940.

The pressure was 30 to 40 mm. of spinal fluid, and the fluid contained 130 lymphocytes per cubic millimeter.

An inflammatory process being suspected, encephalography was attempted on March 31, 1931, but when slightly bloody fluid was found under low pressure which did not rise on jugular compression 1 cc. of iodized oil was injected and the encephalography abandoned. The fluid removed contained 650 red blood corpuscles and 44 lymphocytes. Examination of the patient on the tilting table under the fluoroscope revealed an irregular block at the fourth thoracic vertebra.

Four days later ventriculography was performed which showed a deviation of the falx to the left side and an absence of air in the right ventricle. The patient contracted bronchopneumonia and died April 7, 1931, seven days after the intrathecal injection of iodized oil.

A postmortem examination showed a psammomatous meningioma over the right occipital lobe, early lobar pneumonia and acute tracheobronchitis and slight adhesive spinal arachnoiditis.

Examination of the Spinal Cord.—Gross Description: The leptomeninges of the spinal cord were slightly yellow tinged. In the midthoracic region a few adhesions were present between the dura mater and the arachnoid membrane. The vessels on the surface of the spinal cord were injected. Unfortunately no mention was made of the condition of the coverings of the cauda equina or of the presence of iodized oil. The original description of the microscopic changes mentioned congestion of the pial vessels and thickening of the arachnoid membrane. Fortunately three blocks embedded in paraffin from the spinal cord had been stored. The blocks were from the lower cervical, midthoracic and midlumbar segments. New sections were made and stained with hematoxylin and eosin and impregnated by Perdrau's method for reticulin.

Microscopic Description: Examination of these sections confirmed the diagnosis of arachnoiditis. In all three regions the arachnoid membrane was thickened in small areas about the cord. In the subarachnoid space were a considerable number of lymphocytes, frequently arranged about the small blood vessels. The latter were distended with blood. An occasional small calcospherite was seen in the arachnoid membrane.

The neurons of the spinal cord appeared normal in all segments. The white matter also seemed normal, and there was no evidence of gliosis.

The diagnosis was, therefore, mild chronic arachnoiditis and meningitis.

CASE 2.—History.—A. H., a white man aged 36, entered the University of Chicago Clinics July 12, 1929 with the complaint of pain in the left upper quadrant of the abdomen and in the lower thoracic region posteriorly for five months. Roentgen examination elsewhere had been reported as showing a gastric ulcer, but the patient had not improved on ulcer management. General physical examination showed hyperesthesia over the eighth to the twelfth thoracic dermatomes on both sides and increased tendon reflexes in the lower extremities. On July 15 a lumbar puncture was performed. The initial pressure was 20 mm. of spinal fluid and on bilateral jugular compression the pressure rose slowly to 200 mm. The fluid contained 4 cells (type not given) and had a total protein content of 47.6 mg. per hundred cubic centimeters. A tumor of the spinal cord being suspected, 1 cc. of iodized oil was injected and the patient examined on the tilting table under the fluoroscope. No significant abnormality was noted.

Repeated examinations of the gastric contents showed an absence of free hydrochloric acid (except in one sample, in which 5 units was found) and a persistent benzidine reaction strongly positive for blood. Roentgenologic examination of the stomach after a barium meal revealed a gross filling defect and outpocketing of barium in the pyloric region which was interpreted as indicating a neoplasm of the pylorus. On July 24, 1929 an exploratory laparotomy disclosed an inoperable carcinoma of the stomach. The patient grew steadily worse and died August 26, six weeks after the injection of iodized oil.

A postmortem examination revealed a primary carcinoma of the body of the pancreas invading the stomach, duodenum and colon; metastases to the liver, diaphragm, urinary bladder and pelvic lymph nodes; bilateral hypostatic pneumonia, and slight spinal adhesive arachnoiditis.

Examination of the Spinal Cord.—Gross Description: At autopsy no metastases were found in the epidural space or about the spinal cord. Delicate, fine, fibrous adhesions were noted in the middorsal region binding the dura mater to the leptomeninges and occasional similar adhesions at other points along the cord. No other changes were seen.

The spinal cord, almost in its entirety, had been preserved in solution of formaldehyde, so that it was available for inspection at the time this report was prepared. The arachnoid membrane appeared clear and almost transparent. At the level of the fifth thoracic segment several adhesive bands were present between the arachnoid membrane and the dura mater, but these could be easily broken. No other adhesions were noted. The spinal cord and the roots of the cauda equina looked grossly normal. The dura mater also was normal in appearance. A roentgenogram of the preserved specimen showed no trace of iodized oil; probably the caudal sac, which was missing, had contained the greater part of it. Sections were made of the spinal cord through the cauda equina, the lower thoracic portion and the midthoracic portion. These were stained for myelin (Smith-Quigley) cells (Nissl) and reticulin (Perdrau).

Microscopic Examination: Sections stained for myelin showed no definite demyelination in any segment of the spinal cord. The roots of the cauda equina appeared well myelinated. The neurons of the anterior and posterior horns stained well and appeared normal, although a few were dark staining and angular. There was no evidence of gliosis in the gray or in the white matter. The arachnoid membrane was slightly, if at all, thickened. There was no proliferation of the arachnoid membrane about the roots of the cauda equina. Perdrau sections, showing more clearly the distribution of reticulin, confirmed this impression. In none of the sections could globules of iodized oil be identified.

The diagnosis was, therefore, slight chronic arachnoiditis.

CASE 3.—History.—S. B., a white man aged 63, was admitted to the University of Chicago Clinics Oct. 8, 1929 complaining of numbness and paralysis of the legs and a feeling of constriction and intense pain in the lumbosacral region radiating around the lower part of the abdomen. These symptoms had appeared about a month previously and had gradually increased in severity. Physical examination revealed no abnormalities other than those referable to the central nervous system. Both legs were paralyzed and spastic, with increased tendon reflexes and Babinski responses on both sides. From the ninth to the twelfth thoracic segments hypalgesia was present, below which was complete analgesia with slight sacral spacing.

A lumbar puncture was performed October 9. The initial pressure was 110 mm. of spinal fluid and there was no rise on jugular compression. The fluid was slightly yellow and contained 201.0 mg. of protein per hundred cubic centimeters. At this time 1.5 cc. of iodized oil was injected. Fluoroscopic examination of the spinal canal showed a complete block at the eleventh thoracic vertebra.

October 12 a laminectomy of the seventh to the twelfth thoracic vertebra was performed and an epidural mass partially removed. The dura mater was opened for a decompression. The tumor was diagnosed as a small round cell sarcoma. Following roentgen therapy the patient slowly recovered. Although clinical signs of damage to the spinal cord persisted, the patient had no weakness of the legs and walked well.

He felt well until Oct. 18, 1937, at which time he returned because of dysphagia, persistent hoarseness and a productive cough. Fluoroscopic examination during a barium meal revealed constriction of the esophagus at the level of the second to the fourth thoracic vertebra. A biopsy specimen from this area was reported to be normal esophageal epithelium. Biopsy of a lymph node from the right supraclavicular region disclosed the tissue to be "probably of an inflammatory nature." Roentgen therapy relieved the patient's symptoms.

On Aug. 26, 1939 he returned with the complaints of dry cough, loss of weight and dyspnea on exertion. Examination showed enlarged axillary and inguinal lymph nodes, areas of dulness in both pulmonic fields and a hard mass in the left side of the scrotum. Both legs were spastic and the tendon reflexes hyperactive. Extensor plantar responses were present

on both sides. Position and vibratory sensibility were fairly good in the legs. Fluoroscopic examination of the spine showed several globules of iodized oil fixed in the root sheaths of the sacral nerves and the tip of the caudal sac. By thoracentesis 550 cc. of straw-colored fluid was removed from the right pleural cavity. Orchidectomy on the left side revealed metastatic lymphatic tissue around the testis and ductus epididymidis. Biopsy of the inguinal glands revealed a lymphoblastoma. The patient recovered slowly under roentgen therapy.

He returned again December 28 because of pain in the chest and shortness of breath. His condition gradually progressed and he died Jan. 29, 1940.

An autopsy showed lymphoblastoma involving the axillary, inguinal, thoracic and abdominal lymph nodes; fibrinous and fibrous pericarditis; massive, bilateral, widespread, pulmonary fibrosis, bilateral fibrous pleuritis; right encapsulated empyema; lipid pneumonia and terminal bronchopneumonia, and mild arachnoiditis.

Examination of the Spinal Cord.—Gross Description: No gross tumor was seen in the epidural space, nor did the dura mater appear abnormal. Numerous fine adhesions between the dura mater and the arachnoid membrane were found along the spinal cord. The pia-arachnoid membrane of the spinal cord appeared slightly thickened.

Microscopic Description: Sections stained for myelin showed a mild demyelination of the pyramidal tract in the lower

In all segments of the spinal cord the anterior horn cells were well stained and frequently contained small amounts of intracellular lipid. In the sacral region a few anterior horn cells were swollen and a few shrunken and surrounded by glial cells (neuronophagia). The other neurons of the spinal cord were not abnormal. The blood vessels showed mild medial thickening.

Fig. 3.—The spine of a patient the day after intrathecal injection of 20 per cent iodized oil. The light oil has extended farther along the spinal nerves than the usual iodized oil.

Fig. 2.—Appearance of the caudal sac containing iodized oil, the day after its injection (A and B) and four months after (C and D). The iodized oil is movable at the latter period, and the small globules fixed in the sheaths of the lumbar and sacral roots are evident.

thoracic and sacral regions with a corresponding gliosis of the lateral columns. In the cervical region the periphery of the lateral column was slightly pale, but there was no gliosis. There was, however, scattered demyelination of the column of Goll in the cervical region with slight gliosis. Except for these abnormalities, the myelin stains showed no abnormalities.

The arachnoid membrane was definitely thickened at all levels and occasionally contained a calcospherite. In its meshes were occasional lymphocytes. Sections of the second lumbar ganglion showed no abnormality in the cells or capsule of the ganglion.

The diagnosis, then, was mild arachnoiditis and mild myelopathy due to compression of the lower thoracic portion of the spinal cord.

COMMENT

The pathologic conditions in these 3 cases are similar in spite of the fact that they represent distinct temporal stages, the first showing the changes occurring at a week, the second those at six weeks and the third those occurring ten years after the injection of iodized oil. It must be emphasized that in 2 of these cases no operative procedures were carried out on the spinal cord and in the third a laminectomy was performed and the dura mater was opened.

In all 3 cases fine adhesions were present between the dura mater and the arachnoid membrane, but it seems likely that in the first case these changes were present before the injection of the iodized oil. In the second and third cases the iodized oil may have been responsible, although in the third case the presence of an epidural tumor and the operative procedure probably were factors. In the first case definite lymphocytic infiltration was present in the subarachnoid space, but

since there were 44 to 130 lymphocytes per cubic millimeter of spinal fluid before the intrathecal injection of iodized oil it is unlikely that the leptomeningitic infiltration was related to the injection. Only in the third case were significant abnormalities present in the spinal cord. These changes were mild and were compatible with the severe compression of the cord which the patient had suffered ten years previously. It should be noted that this patient had clinical signs of disease of the pyramidal tract—hyperactive reflexes and Babinski's reflex in both feet.

Comparative experimental studies have recorded more severe changes in the spinal cord and its membranes. Peiper and Klose²⁵ found degenerative changes in the myelin and areas of necrosis in the spinal cord when doses greater than 0.1 cc. of iodized oil were injected intrathecally in rabbits. Davis, Haven and Stone²⁶ injected 1.5 cc. of iodized oil cisternally in dogs after an artificial block had been produced in the spinal subarachnoid space, and they found proliferative changes in the leptomeninges and degeneration of the gray matter of the spinal cord. They concluded that the

Fig. 4.—The skull of a patient, showing small globules of iodized oil about the brain stem and sella turcica. Two cc. of iodized oil had been injected nine months previously by lumbar puncture.

changes were due to the iodized oil, for only animals showing no clinical evidence of damage to the spinal cord were used for the injection. No mention was made of the alterations which may have occurred as the result of introducing a soft rubber drain in the extradural space to produce an artificial spinal block. In dogs Bruskin and Propper²⁷ described oil granulomas in the arachnoid membrane after intrathecal injection of iodized oil. Inflammatory vascular changes and degenerative alterations of the ganglion cells were found in the spinal cord. Lindblom²⁸ found evidence of acute leptomeningitis after he injected 1 cc. of iodized oil subdurally in rabbits. The leptomeningitis subsided in two or three weeks. Oljenick²⁹

found no gross changes twenty-four hours after cisternal injection of 1 cc. of iodized oil in the cisterna magna of a rabbit. In each of the preceding animal experiments the amount of iodized oil used was comparably much larger than the usual amount injected in man.³⁰

Lindblom³¹ studied the effect of both animal and vegetable iodized oils on the meninges. Various oils with different degrees of acidity were used, and it was found that the irritating effect decreased as the acidity decreased. Iodized animal oils, such as cod liver oil, were much more irritating than vegetable oils. The animal oil is emulsified by cerebrospinal fluid, and rapid splitting takes place, producing products, chiefly fatty acids and hydrogen iodide, which are irritating to the meninges.

Although the changes in the spinal cord and its membranes in animals after intrathecal injections of iodized oil are fairly severe, the constant pathologic changes—a slight proliferation of the arachnoid membrane with a few fine dural adhesions—in the human spinal cord following the injection of iodized oil are minimal. Constant parenchymal changes are not present. These alterations are in full agreement with the changes noted by Brown and Carr,³² who studied the spinal cord of a patient six months after an injection of iodized oil. Globus³¹ stated that the 3 patients he examined showed no evidence of leptomeningitis. Donat,³³ however, found in 1 case chronic leptomeningitis with iodized oil in a mass of inflammatory tissue.

These slight pathologic changes in the spinal cord and its coverings agree well with the fact that the iodized oil in patients not operated on is usually movable and flows freely up the spinal cord to the basal cisterns. If severe arachnoiditis were present one would expect the iodized oil to show numerous partial or complete obstructions within the spinal canal.

CONCLUSIONS

Intrathecal injection of iodized oil is followed in slightly more than half the cases by a mild fever of short duration, less frequently by headache and aggravation of previous symptoms. The cells and protein content of the spinal fluid are usually increased and may remain so for several days. Fatal reactions, although rare, have been reported.

Definite, permanent, clinical ill effects from the intrathecal injection of 2 to 4 cc. of iodized oil are extremely rare. Although the oil slowly becomes fixed in the sheaths of the spinal nerves and the caudal sac, it usually produces only mild arachnoiditis with fine adhesions between the arachnoid membrane and the dura mater. If, however, after the injection of iodized oil the dura mater is opened at operation, the oil commonly becomes rapidly encysted by proliferation of the arachnoid membrane. Pia-arachnoid reactions would therefore seem to be less likely if the dura is not opened.

Although about one third of the patients in whom iodized oil has been injected intrathecally have a varying number of small globules of it within the intracranial cavity, none has complained of any symptoms which might be referable to the oil.

CHRONIC GRANULOCYTOPENIA CAUSED
BY EXCESSIVE SPLENIC LYSIS
OF GRANULOCYTES

REPORT OF CASE

R. O. MUETHER, M.D.

L. T. MOORE, M.D.; J. W. STEWART, M.D.

AND

G. O. BROUN, M.D.

ST. LOUIS

Since the first report of a case of acute agranulocytosis by Schultz in 1922¹ numerous additional reports have continued to appear in the literature. The syndrome of granulocytopenia may arise under diverse conditions and from varied causes and may run either an acute or a chronic course. Hence it is distinctly neither a clinical nor a pathologic entity.

The various etiologies have been the subject of much investigation. The frequency with which certain drugs and industrial poisons may act as depressants of bone marrow is well known. Nutritional deficiencies,² bacterial toxins³ and hormonal imbalance⁴ have been found capable of producing the disease, at least experimentally. Acute agranulocytosis (which arises spontaneously and not as the obvious secondary effect of a known toxic agent) produces a more or less definite clinical picture and constant pathologic changes in the bone marrow.⁵

In 1939 Wiseman and Doan⁶ reported a new syndrome of acute agranulocytosis caused apparently by excessive lysis of neutrophils by the spleen. This condition is characterized by splenic enlargement, peripheral granulocytopenia and myeloid hyperplasia of the bone marrow. Its mode of production is of a nature radically different from other types of granulocytopenia, in which two characteristic changes in the bone marrow take place. These consist of certain degenerative changes in the myeloid cells and aplasia or a proliferation of myeloblasts and a failure of maturation. Even in the latter condition aplasia is said to occur if the patient has survived the initial phases of the disease.⁷ In the 3 cases reported by Wiseman and Doan there was myeloid hyperplasia of the bone marrow which was obviously compensatory in nature.

An additional case has been reported by Moore⁸ which was accompanied by a thorough study both of the bone marrow and of the peripheral blood. Examination of the spleen clearly revealed large numbers of neutrophils being phagocytized by macrophages. The condition seems analogous to congenital hemolytic icterus and thrombopenic purpura, in which there occurs excessive lysis of red blood cells and platelets respectively.

It is our purpose to report another case. The patient has been under medical care for the past six years. She is alive and well one year after splenectomy. The

pathologic conditions are in conformity with those noted in the 4 previously reported cases. The clinical history is of considerable interest.

REPORT OF CASE

History.—S. M. K., a white woman aged 31, entered the hospital complaining of a dull pain in the left upper quadrant of the abdomen, nausea and fatigue. The history of the present complaint extended back five years, and she had been hospitalized on five previous occasions. The pain, of a dull nature, did not radiate and was almost constantly present. On certain occasions it assumed a sharp, penetrating character, caused prostration and was associated with localized sweating over the splenic regions. These episodes were accompanied by fever, nausea and granulocytopenia. Successive white blood cell counts would reveal a steady drop of the leukocytes and, finally, complete disappearance of granulocytes from the peripheral blood. Remissions would then apparently occur spontaneously and were presaged by increasing numbers of immature forms of granulocytes in the peripheral blood. The average cycle lasted about three weeks. On previous admissions it had been found that the basal metabolic rate was low, averaging about —15 per cent. The patient had been given 3 grains (0.2 Gm.) of thyroid daily. Roentgen examination of the chest, the gastrointestinal tract and the vertebral column gave negative results. Cystoscopic

Fig. 1.—Total leukocyte count and percentage of granulocytes. The patient entered the hospital on the fifteenth day and was discharged on the one hundred and twelfth. There is a close correlation between the total number of leukocytes and the percentage of granulocytes.

examination had revealed low grade pyelitis on the left side on two occasions, which promptly cleared up on the administration of urinary antiseptics.

The initial attack had followed cystoscopic examination, during which the patient had been given a proprietary preparation of phenobarbital and aminopyrine. On two other occasions this preparation was administered before cystoscopic examination, and on both occasions granulocytopenia resulted. The patient, however, had attacks without the administration of drugs, and it is thought that the pain and associated symptoms which were the basis for the cystoscopic examination probably represented the beginning of a granulocytopenic interval and that the drugs were not important from an etiologic standpoint. This is substantiated by the fact that since splenectomy the patient has been given trial doses of both phenobarbital and aminopyrine without a fall in the number of granulocytes.

Physical Examination.—The patient was thin and somewhat anemic looking. The skin was dry and scaly. The pupils were round and equal, and the scleras were clear. Reaction to light and accommodation were both present. The ears, nose and throat were normal. No masses were palpated in the neck. The chest was of the asthenic type and symmetric. Expansion was free and equal, and the breath sounds were vesicular. The pulse rate was 100, and the rhythm was regular. The blood pressure was 100 systolic and 70 diastolic. There were no murmurs or thrills present. The abdomen was scaphoid.

CHRONIC NEUTROPEN A—MUETHER ET AL.

JOUR. A. M. A.
MAY 17, 1941

The liver, kidneys and spleen were not palpable. A definite area of tenderness, which was associated with muscle guard, was found in the left upper quadrant of the abdomen immediately beneath the costal margin. It was most noticeable anteriorly and extended laterally to the midaxillary line. Neurologic, pelvic and rectal examinations gave essentially negative results.

Laboratory Studies.—The blood showed red blood cells 4,120,000, hemoglobin 72 per cent and white blood cells 2,150. The platelet count was 255,440. A Schilling hemogram showed 6 stab cells, 5 segmented forms, 2 large lymphocytes and 87 small lymphocytes. The urine was essentially normal. The level of blood sugar was 85 and the nonprotein nitrogen 30 mg. per hundred cubic centimeters. The Kahn reaction was negative. Examination of the bone marrow showed moderate hyperplasia.

Course in Hospital.—The patient continued to complain of great pain, which was relieved only with narcotics. The temperature ranged between 102 and 104 F. Treatment with blood transfusions, bone marrow extract and pentnucleotide appeared to have small effect on the leukocyte count, which dropped steadily. From the fifth to the ninth day the percentage of granulocytes varied from 0 to 2 per cent, and the total white cell count was 550 to 850 (fig. 1). A reversal then occurred, and there was a progressive rise in the total count and the number of granulocytes in the peripheral blood. On the nineteenth day the leukocyte count had reached 7,500 and the percentage of granulocytes was 61. For the ensuing seven weeks the count remained stabilized within normal limits. As the patient continued to complain of pain in the left upper quadrant an exploratory laparotomy was done with the purpose of removing the spleen if no other pathologic condition was found. The spleen was removed. The patient made an uneventful recovery and was discharged after a period of observation.

Gross examination of the spleen revealed that it was approximately three times the normal size and weighed 325 Gm. At operation there was evidence of old perisplenitis, and there were multiple adhesions to the surrounding structures. The spleen was bright red and firm. On section the normal structure of the spleen was found intact. The malpighian corpuscles were prominent and appeared hyperplastic.

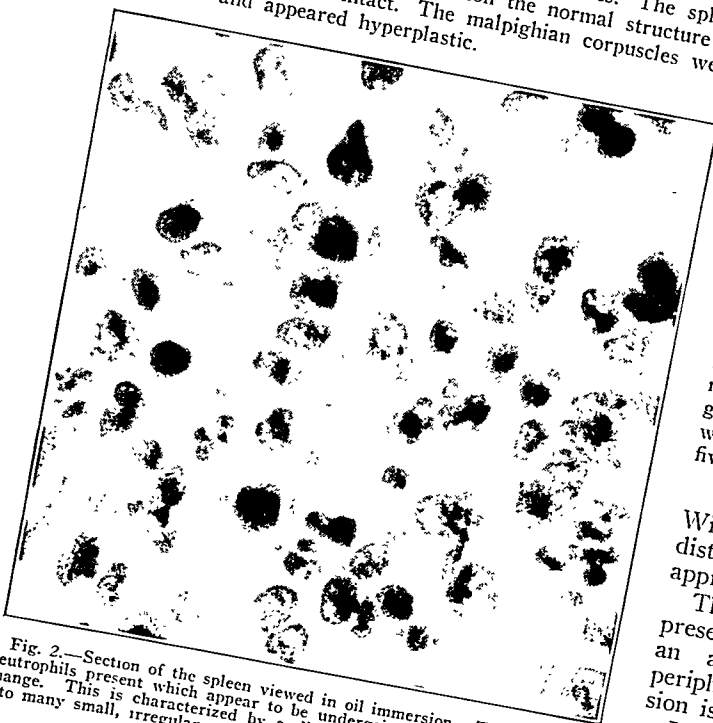

Fig. 2.—Section of the spleen viewed in oil immersion. There are many neutrophils present which appear to be undergoing a peculiar degenerative change. This is characterized by a dispersion of the chromatin material into many small, irregular masses.

Microscopic examination of the spleen revealed advanced congestion and moderate proliferation of the cells lining the sinusoids. These cells were in frequent mitosis. The malpighian corpuscles were large and prominent and occasionally showed accumulations of large, pale cells in their central portions.

The most striking feature was the presence of large numbers of neutrophils in the splenic pulp which were irregularly distributed and tended to be collected in focal accumulations. These averaged about the size of a high power field. In many of the high power fields more than half of the cells present were neutrophils. In some instances the neutrophils appeared

Fig. 3.—Section of spleen viewed in oil immersion. The neutrophils present appear to be well preserved and of the adult type. Many have from five to eight lobulations.

well preserved and of the adult type, having from five to eight lobulations in the nuclei (fig. 3). In other areas the neutrophils appeared to be undergoing a peculiar type of degenerative change characterized by dispersion of the nuclear chromatin into small irregular masses (fig. 2). In such cells the nuclei frequently appeared to have from fifteen to eighteen lobulations and the cytoplasm appeared to be degenerating or completely absent. There was a striking absence of eosinophils, young neutrophils and myelocytes. There was also a striking absence of any evidence of phagocytosis of the degenerating neutrophils, in contrast to the picture described in previously reported cases. Our patient has now survived for fourteen months and has had blood cell counts done at intervals of two weeks. During this period there has been a slight fluctuation in the total leukocyte count, but the ratio of mononuclear cells to polymorphonuclear cells has remained normal. The patient has gained weight and has returned to full time work, something which she had been unable to accomplish for the preceding five years.

We feel that this syndrome, previously described by Wiseman and Doan, as well as by Moore, represents a distinct clinical entity with a rational therapeutic approach.

The diagnosis of this condition seems to rest on the presence of a hyperplastic or normal bone marrow with an abnormal diminution of granulocytes in the peripheral blood. The tendency to spontaneous remission is worthy of emphasis. It must be carefully differentiated from other granulocytopenic states which will not be benefited by splenectomy. Careful study of the bone marrow and the peripheral blood should make the differential diagnosis relatively simple.

COMMENT
In many respects our knowledge of splenic physiology is still elemental. It is known, however, that one function is the destruction of granulocytes whose span

of activity has been served. The syndrome of acute agranulocytosis caused by excessive lysis of neutrophils is characterized by a great disparity between the number of neutrophils in the spleen and that in the peripheral circulation. This may logically be explained by postulating either that there is hyperfunction of the spleen in phagocytizing essentially normal neutrophils or that some error in development of the granulocytes exists and that as a result they are selectively removed by the spleen. The latter condition might be compared to congenital hemolytic icterus in which the more fragile red blood cells are phagocytized in excessive numbers.

The clinical symptoms of pain and fever appear unique and have not been stressed in previous reports of this syndrome. Fever might well arise as the result of cellular destruction. There was a rough correlation between the height of the fever and the degree of the granulocytopenia. Pain might arise as the result of tension within the spleen and pressure on adjacent structures. That this might have occurred on previous occasions is suggested by the number and density of the perisplenic adhesions noted at the time of operation.

Clinical Notes, Suggestions and New Instruments

STOMATITIS VENENATA AND DERMATITIS OF THE ANAL ORIFICE FROM CHEWING POISON IVY LEAVES (RHUS TOXICODENDRON).

SEYMOUR H. SILVERS, M.D., BROOKLYN

The mucous membranes are thought to be less sensitive than the skin to eczematogenous allergens. The skin is often found extremely sensitive to minute doses of a particular allergen while the mucous membrane of the same person remains unaffected by the identical allergen. This fact is responsible for the recent attempts to desensitize sufferers from eruptions caused by poison ivy by giving them drops of the tincture or extract of poison ivy leaves or asking them to chew the leaves. The reason for this profound difference in sensitivity of the skin and mucous membranes is not known. Nor is this difference as common as it is thought to be by many. There are persons whose skin and mucous membranes are equally sensitive to an allergen. A patient demonstrating this dual sensitivity came under my care recently. The following case is an illustration of the fact that the giving of poison ivy preparations by mouth or suggesting the chewing of leaves to a patient may not always be innocuous.

REPORT OF CASE

K. H., a married woman aged 38, consulted me on July 7, 1940 for an intensely pruritic eruption of the face, lips and adjacent areas around the mouth and of the anal region. She had been unable to eat properly for the past two days because of pain involving her tongue and cheeks. For the past seven years she had had cutaneous eruptions from exposure to poison ivy plants. During the summer of 1939 she received injections to prevent these eruptions. These injections did not prevent or diminish an ensuing attack. At the time she received the injections she was told that chewing poison ivy leaves would help prevent these cutaneous outbreaks. The statement was repeated by many of her lay friends, who sympathized with her and suggested the chewing of leaves as a means of preventing the eruptions.

The patient visited the country during the week end of July 4, 1940 and while there thoroughly chewed two leaves of poison ivy (*Rhus toxicodendron*) which she picked with her hand. Two days later her mouth became sore, the lips became swollen and an eruption appeared on the skin about the mouth and on the hands. During the next few days the soreness of the

mouth became worse and extended deep into the pharynx. Eating solids and even semisolids became difficult because of the swelling and pain attending movements of the cheeks and tongue. Two days after the oral soreness was noticed the anal region became sore and itchy. Defecation was painful.

The patient was well developed physically. Examination showed swollen lips and an eruption surrounding the lips. She was in distress because of the pain experienced in trying to move the lips and mouth when talking. Radiating from the lips and decreasing in intensity there were scattered, ill defined, pinhead to lentil size vesicles and some red papules. The skin was somewhat swollen. The lips were swollen and cracked, showing superficial, crusted fissures. Fetor oris was strong. The mucous membrane of the tongue, cheeks, palate and pharynx was tender, grayish and edematous with an irregular surface. The anal area was red, swollen and extremely tender. The redness and edema extended $\frac{1}{2}$ to 1 inch (1.2 to 2.5 cm.) from the anal orifice. The dorsum of the hands showed a few scattered pink and skin-colored vesicles which caused no subjective symptoms.

Burow's solution ointment was applied three times daily to the lips, face, hands and anal region. The mouth was rinsed every two hours with a 0.125 per cent solution of zinc chloride. After three days, the oral lesions cleared sufficiently to enable the patient to eat semisolid foods without experiencing pain. The lesions of the hands, lips and face were much improved. The itching, pain and redness of the anal region persisted the longest.

Loveman¹ reported a case of stomatitis venenata due to oil of anise used in a cream to clean dentures. A positive reaction to a patch test showed that the skin, too, was sensitive to this oil. I² reported a case of stomatitis and dermatitis venenata, of the mucous membrane of the mouth and the skin around the mouth and lips, due to the oils of cloves and cassia present in a tablet used by dentists to clean the teeth. In addition to the usual redness and vesiculation, my patient showed purpuric macules in the affected areas of the skin and mucous membranes. Shelmire³ in his studies of contact dermatitis from weeds made a number of interesting observations. He concluded that sensitivity to plants is apparently general, affecting both the skin and the mucous membranes and that the dermatitis-producing principle of poison ivy is a dialyzable fraction of the oleoresin soluble in both water and urine. Shelmire found pruritus ani et vulvae and gastric disturbances among the 28 ivy-sensitive persons to whom he gave large doses of ivy oleoresins by mouth. The urethral orifices and surrounding areas of the female subjects who complained of pruritus ani et vulvae showed an intense erythema. After the patient had ingested a known quantity of oleoresin in corn oil and the urine and feces were collected for three days, Shelmire found that 30 per cent of the ingested oleoresin was excreted in the urine and the remainder was eliminated in the feces.

SUMMARY

A woman with a known sensitivity to poison ivy (*Rhus toxicodendron*) chewed the leaves on the advice of a physician and of friends. She incurred a severe eruption of the mucous membranes of the mouth and anal orifice in addition to dermatitis of the face, lips, hands and anal region. Apparently the allergens traversed the gastrointestinal tract unchanged. The patient did not complain of any gastrointestinal symptoms, although it is possible that the mucosa was also affected by the poison ivy allergen.

CONCLUSIONS

1. Stomatitis venenata and dermatitis of the anal orifice can result from the chewing of poison ivy leaves.
2. While it is possible to use the oral route for attempted desensitization, it is unwise to suggest the chewing of poison ivy leaves, for the dosage cannot be controlled by this method and untoward reactions may result.

OCCUPATIONAL DERMATITIS DUE TO PARACHLORMETACRESOL

W. H. GUY, M.D., AND F. M. JACOB, M.D., PITTSBURGH

We have observed 12 cases of vesicular dermatitis involving mostly the palm of the left hand of girls employed in labeling and capping whisky bottles. Two kinds of glue, lacquered labels and viscos caps were handled. Patch tests with glue, lacquered labels and washed viscos caps gave negative results. However, the fluid in which the viscos caps were shipped to the distillery produced positive reactions in all cases. The girls held several of the viscos caps wet with the preservative shipping fluid in the palm of the left hand preparatory to capping bottles. The dermatitis ensued in varying lengths of time in different persons and involved to a less extent the right hand and the dorsal surfaces of both hands. The shipping fluid was reported to contain 1 to 1.5 per cent of parachlormetacresol. After repeated attempts to obtain the chemical from the logical sources without avail we obtained parachlormetacresol from Dr. Louis Schwartz of the United States Public Health Service.

Patch tests with a 1.5 per cent aqueous solution of parachlormetacresol gave slightly positive results after twenty-four hours on the upper arm. A patch test on the palm of the left hand of one of us (W. H. G.) with a 1.5 per cent solution of parachlormetacresol produced a pruritic, vesicular dermatitis in four hours which persisted for one week. Washing the viscos caps in water before handling prevented the appearance of new cases.

A SIMPLE HEMOGLOBIN-RED BLOOD CELL RATIO TO REPLACE THE COLOR INDEX

RAPHAEL ISAACS, M.D., CHICAGO

The color index, taken as the ratio of the percentage of hemoglobin (compared to "normal") to the red blood cell count (compared to "normal") has been a useful clinical figure in differentiating iron deficiency from other types of anemia. However, the lack of single "normal" figures for the percentage of hemoglobin and red blood cell counts, as well as the differences in males and females, has always made the number somewhat arbitrary. With the advent of hemoglobinometers in which 100 per cent corresponds to 13.5, 14, 15.6 or 17 Gm., the problem is further complicated by the difference in readings of the percentages. These would give the same person different percentages on the different instruments. The same person could have a "normal" color index with one instrument, a high index with another and a low index with a third.

To avoid these discrepancies and still obtain a figure which would represent the same concept as the color index, the ratio of the number of grams of hemoglobin, multiplied by 3, to the red blood cell count, in hundred thousands per cubic millimeter, has been found useful. The formula is purely empirical and arbitrary, but it has been found that in normal blood 3 times the number of grams of hemoglobin gives a number which is approximately the same as the number of red blood cells in hundred thousands per cubic millimeter. When the number of grams multiplied by 3 is less than the figure for the red blood cells there is an iron deficiency, and when the number is greater the cells are "hyperchromic." As an example, if the number of grams of hemoglobin is 9.3 and the red blood cell count is 2,800,000 per cubic millimeter, the resulting ratio would be $\frac{27.9}{2800}$, or practically 1. If, in this example, the number of grams of hemoglobin had been 7 the ratio would have been $\frac{21}{2800}$, indicating an iron deficiency.

The advantage of this ratio is that comparisons to "normals" (which do not exist) are eliminated, and the figures used are obtained by direct observation. No different standard is needed for men and for women.

SUMMARY

A simple relationship between the hemoglobin content of the blood and the number of red blood cells may be expressed by this formula for "normal": Three times the number of

From the Department of Hematology, Michael Reese Hospital.

grams of hemoglobin per hundred cubic centimeters divided by the number of hundreds of thousands of red blood cells per cubic millimeter equals 1. It is distinctly less than 1 in hypochromic anemias and more than 1 in hyperchromic conditions

THE TYPHOID CARRIER STATE TREATED WITH SULFAGUANIDINE

J. ELLIOT LEVI, M.D., AND ABNER WILLEN, M.D.
BALTIMORE

Reports by Marshall and his associates¹ on the treatment of acute bacillary dysentery and other intestinal infections suggested the use of sulfaguanidine (sulfanilylguanidine) in the typhoid carrier state.

REPORT OF CASE

W. M., a white man aged 38, a chef, was discharged from this hospital on Aug. 15, 1940 after a seven weeks confinement for typhoid. The diagnosis was confirmed by cultures of the blood, urine and stools as well as by the Widal reaction. After discharge, cultures of the stools remained persistently positive for Eberthella typhi. Cultures of the urine and blood were negative for the organism. The patient was readmitted October 13. Cultures of the bile and stools were still positive. The Graham-Cole test revealed poor filling of the gallbladder. On October 27 the patient was started on the therapeutic administration of soluble iodophthalein according to the method of Saphir and Howell.² He was kept on this regimen for one month, and the stools continued to show E. typhi. The patient was again admitted on December 10, and a cholecystectomy and appendectomy were performed two days later. Cultures of material from the gallbladder and the appendix, taken at operation, were positive for E. typhi. After operation, cultures of the stools showed the organism on December 18, 19 and 21, on December 30 and on Jan. 10, 1941. Beginning on January 10, sulfaguanidine was administered for one week (0.05 Gm. per kilogram of body weight every eight hours). Studies on the blood and urine were made during this period, but no evidence was observed of complications associated with the administration of the drug. Cultures of the stools taken on January 19, 20, 21, 23 (two cultures), 25 and 26 were negative for E. typhi. Cultures taken on February 7, 12 and 17 after the use of magnesium sulfate as a cathartic have all been reported negative for E. typhi by the Maryland Department of Health.

COMMENT

According to the data of Coller and Forsbeck,³ Whipple⁴ and Bigelow and Anderson⁵ in their combined series of 44 cases of the typhoid carrier state in which cure was effected by cholecystectomy, cultures of the stools became negative within three weeks after operation if cure was ultimately obtained. In this series there was 1 exception in which the bile was found positive for E. typhi eighteen months and permanently negative in twenty-six months after operation.

In the present case four weeks after operation the stool was still positive for E. typhi at the time sulfaguanidine was administered. The time elapsing since discontinuance of the drug has been brief, but on no occasion have the stools shown the presence of E. typhi. It is felt that this method of therapy is worthy of further trial.

Special Article

SULFATHIAZOLE-WINTHROP CONTAMINATED WITH PHENOBARBITAL

I. INTRODUCTION

MORRIS FISHBEIN, M.D., CHICAGO

On March 26, 1941 the headquarters office of the American Medical Association received a report calling attention to the contamination with phenobarbital of certain lots of sulfathiazole, manufactured by the Winthrop Chemical Company. Immediately, steps were taken to ascertain the seriousness of the situation. As soon as definite evidence was available, on March 28, a general warning was issued to the press and over the radio by the American Medical Association. This was

the first public warning against this hazard. Conforming to the policy of THE JOURNAL and of the Council on Pharmacy and Chemistry to supply information to the medical profession, THE JOURNAL published additional statements¹ to warn of the potential dangers associated with the use of the contaminated material.

Available evidence indicates that the first report suggesting unusual reactions following the use of sulfathiazole - Winthrop originated in Louisville, Ky., late in December 1940. Although the manufacturers began at once their efforts

Food and Drug Administration, has been of inestimable value to the office of the Council on Pharmacy and Chemistry and the Chemical Laboratory of the American Medical Association in the study of this unfortunate incident.) Detailed information now has been received from members of the medical profession about 56 patients. This evidence indicates that at least 47 patients presented symptoms compatible with those observed after the administration of a therapeutic dose or of an overdose of phenobarbital but have made full recovery as far as this office is aware. Histories indicate that 9 of the 56 patients received tablets from the contaminated lots of sulfathiazole and subsequently died. Convincing evidence is not available at this time to indicate clearly the causal relationship between the drug and the deaths that followed in time.^{1a}

Apparently only one batch of the sulfathiazole-Winthrop was heavily contaminated with phenobarbital, this being MP 029. The illustration of the label of Sulfathiazole-Winthrop (fig. 1) shows the method used by this firm in identifying different lots. In this instance the letters GP 252 have been circled by the photographer. This lot of sulfathiazole was satisfactory; the heavily contaminated tablets were marked MP 029. Others which were believed to be contaminated were marked MP 051, MP 076 and MP 118.

In the following articles Dr. A. E. Smith of the office of the Council on Pharmacy and Chemistry has described the symptoms observed in this unusual incident, and Drs. A. E. Sidwell Jr. and A. R. Menotti of the American Medical Association Chemical Laboratory have reported their study of the chemical examination of the contaminated material.

II. CLINICAL ASPECTS

AUSTIN E. SMITH, M.D., CHICAGO

SULFATHIAZOLE

At the request of the Council on Pharmacy and Chemistry, Dr. Perrin H. Long prepared a preliminary report² on the thiazole derivatives of sulfanilamide so that the medical profession might be informed about these new drugs. The report was published in THE JOURNAL before sulfathiazole was released for interstate commerce as a new drug under the Food, Drug and Cosmetic Act. This preliminary report was followed by a statement³ in THE JOURNAL informing the medical profession that certain brands of sulfathiazole had been accepted as conforming to the rules of the Council on Pharmacy and Chemistry for admission to New and Nonofficial Remedies.

In the description of the drug which appears in this Council communication, the toxicity, indications for use and suggested dosage are described. Clinically, the drug has been used primarily in the treatment of pneumococcal pneumonia, infections due to Staphylococcus aureus or Escherichia coli, and in the treatment of gonorrhea in the male; its use in other infections is undergoing extensive investigations.

The toxic manifestations which have been reported following sulfathiazole therapy necessitate daily atten-

Fig. 1.—Label for sulfathiazole-Winthrop, lot GP 252. This particular lot was satisfactory. The grossly contaminated tablets were in bottles marked with the lot number MP 029.

to recall the tablets, the Food and Drug Administration apparently did not receive pertinent information until March 20; this resulted from a report originating in Boston. Immediately thereafter government inspectors were sent throughout the nation to secure all of the contaminated sulfathiazole still in circulation.

As soon as the office of the Council on Pharmacy and Chemistry received reports of the unusual reactions which were occurring following prescription of the remedy, telegrams were sent to physicians requesting details. Replies received at the Council office revealed indicative information which, when followed, resulted in the securing of data on other cases not originally reported to the headquarters office. (Assistance from Mr. J. O. Clarke, Chief of the central division of the

dance by the physician and are similar to those observed in sulfanilamide or sulfapyridine therapy, with the exception that the former drug causes less nausea, vomiting and dizziness than does sulfapyridine. Mental disturbances or psychoses are uncommon, but when they are present it is best to stop administration of the drug and force fluids.⁴ Drug fever is fairly common and may occur at any period but it is usually seen between the fifth and ninth days of treatment. The Council report³ asserts that as far as is now known sulfathiazole can be used concurrently with any other drugs with the possible exception of magnesium sulfate or other saline laxatives. However, more recently Long⁴ stated that there were no contraindications to the concurrent use of other necessary drugs with the possible exception of anesthetic doses of certain barbiturates, but he enlarges his statement by acknowledging that it has been shown that patients who have been receiving sulfanilamide or sulfapyridine "apparently suffer no ill effects from the administration of such anesthetics as sodium pentothal." Dizziness following the use of sulfathiazole is uncommon, and Goodman and Gilman⁵ point out that psychoses or delirium has been reported by several investigators, although central nervous system phenomena are uncommon; Finland and his co-workers observed psychoses in 3 patients in a series of 165, the fever having previously subsided, and Abernathy reported that 4 patients had delirium in a series of 35.

PHENOBARBITAL

The standards for phenobarbital are described in the United States Pharmacopeia, the actions and uses in New and Nonofficial Remedies.⁶ Complete statements on the pharmacology and clinical use of barbituric acid derivatives are well described in a number of textbooks on pharmacology and therapeutics. As is well known, the barbiturates can be used to obtain depression of the central nervous system ranging from slight sedation to deep coma and death. It is sometimes forgotten that these drugs are not analgesics and may not produce sedation if there is present pain which is severe or uncontrolled; in fact, it has been stated⁵ that delirium may follow when used alone in the presence of pain. Emotional disturbances are not infrequent and may be especially prominent in patients showing idiosyncrasy. Sollmann⁷ states that some patients show excitement rather than depression and give the appearance of inebriation.

Recently there have been renewed studies in the physiology of the shock sometimes observed following an overdosage of a barbiturate. When administered intravenously, large doses depress the central vasomotor center, and peripheral vasodilatation and hypotension may follow.⁵ Again, dilatation of the smaller blood vessels may occur as the result of a direct effect on the musculature; if the capillary beds are dilated and injured, shock may ensue. These authors⁵ claim that the fall in blood pressure after oral ingestion is largely due to the anoxia which results from the decreased pulmonary ventilation, respiration being affected early in acute poisoning. Shallow respiration together with

hypotension are favorable to the onset of hypostatic pneumonia, although pulmonary edema or hypostatic pneumonia may result solely from direct depression of the respiratory center.⁵

The most prominent symptoms associated with overdosage of the barbiturates are drowsiness, deep sleep, coma and death if the amount ingested is of sufficient quantity. These may be the only symptoms or they may be preceded by a period of dizziness, excitement or delirium; if recovery ensues, it is not uncommon to observe restlessness, irrationality or excessive activity. It has been stated⁵ that barbiturate poisoning usually occurs when an amount has been ingested which is equivalent to from five to ten times the full hypnotic dose; when fifteen times the hypnotic dose has been absorbed, it is usually difficult to save the life of the patient.

The contraindications to the use of the barbiturates have been the subject of discussion on many occasions and are in general familiar to the medical profession. However, a recent statement⁵ succinctly warns of interesting potential dangers: "Untoward responses attributable to the barbiturates are particularly likely to occur in patients with fever, hyperthyroidism, diabetes mellitus, severe anemia and congestive heart failure."

CASES REPORTED TO BE ASSOCIATED WITH THE PHENOBARBITAL-CONTAMINATED SULFATHIAZOLE

According to the report of the Chemical Laboratory of the American Medical Association, a considerable number of tablets of Sulfathiazole-Winthrop (MP 029) contained approximately 60 per cent (from 330 to 350 mg. of phenobarbital to each tablet) of phenobarbital and negligible amounts of sulfathiazole. Some of the tablets in the other MP series contained traces of phenobarbital (from 5 to 15 mg.) and full amounts of sulfathiazole.

From the clinical point of view there are two important factors to consider in the evaluation of those cases in which heavily contaminated tablets were purported to have been administered. First, the patient was not receiving sulfathiazole in adequate amounts; second, by unknowingly administering such excessive doses of a barbiturate in the pneumonia cases, the physician was adding "insult to injury" by giving a marked respiratory depressant for a condition which was already taxing the respiration. Information forwarded by members of the medical profession indicates that at least 56 patients could have received the contaminated tablets. The total number conceivably may increase, as letters are continuing to arrive at the Council office.

From one physician it was learned that 8 patients became narcosed after receiving some of the tablets; fortunately all eventually recovered on discontinuance of the drug. Another telegraphed: "Pneumonia patient became drowsy and more or less comatose after administration of usual dose of sulfathiazole. Some hours after discontinuance of drug patient regained consciousness. Recovered from pneumonia." From still another source it was reported that a pneumonia patient received four of the tablets and became semicomatose within thirty minutes but was given two more tablets without consultation of the attending physician. On observing the condition of the patient six hours after the initial administration of the drug, the patient was taken to the hospital; the case terminated within ten days in death. A second pneumonia patient received the same amount of

7. Sollmann, Torald: A Manual of Pharmacology, Philadelphia, W. B. Saunders Company, 1936.

drug but recovered after lying in a semiconscious state for five days. Three other cases of complete collapse have been reported, with recovery in all.

Other physicians observed a period of "deep sleep" for four hours in a child of 6 years, continuous "sleep" for forty-eight hours in a male being treated for gonorrhea, profound "sleep" in a boy of 9 years after receiving a second tablet, and coma following the administration of 15 grains (1 Gm.) with recovery in two days but a similar reaction for seven hours when $7\frac{1}{2}$ grains (0.5 Gm.) was administered two weeks later. These reports, together with other statements received at the Council office, indicate that drowsiness, stupor and coma were predominant. However, other symptoms commonly found in patients who have received excessive doses of a barbiturate were frequently noticed.

A woman of 78 years became disoriented, drowsy and complained of diplopia after receiving four tablets given in four doses at four hour intervals. A man after ingesting 60 grains (4 Gm.) over a period of twelve hours had to be relieved of his duties at work and on his way home was unable to distinguish on which side of the road were the people he saw on the highway. A number of patients receiving treatment in a venereal disease clinic complained of "dizziness and intoxication as if from alcohol." Severe reactions were obtained even with moderate doses. A baby of 19 months died thirty-six hours after receiving 2 grains (0.13 Gm.) of the drug; at the inquest a jury of six physicians determined the cause of death to be pneumonia. An elderly woman suffering from pneumonia was sent to a hospital in coma and showing anuria; another had incoherent speech, incoordination and emotional instability.

A physician, reporting 4 cases, mentioned a boy of 13 years who became dizzy, disorientated, hyperexcitable and irritable to the slightest stimulus within twenty minutes after ingesting 2 Gm. of the contaminated sulfathiazole tablets. Over a period of a week in the hospital the delirium lessened with the aid of sedation, although the patient occasionally became excitable and noisy. Significantly enough, the temperature suddenly rose to 104 F. and remained in that neighborhood for several days after being normal for a week. At the same time an extensive maculopapular eruption appeared. Eventually the patient recovered and was discharged from the hospital. A second patient suddenly collapsed after taking sulfathiazole from the contaminated lot of tablets. On examination he was cyanotic and showed Cheyne-Stokes respiration, and the pulse was imperceptible. After stimulants had been administered the patient recovered but remained weak and fatigued. A subsequent course of therapy with sulfapyridine produced no similar reactions. The third patient, also with pneumonia, became drowsy and unable to speak clearly after the ingestion of 30 grains (2 Gm.); several days passed before the speech defect and mental dullness disappeared. The fourth patient, a child of $3\frac{1}{2}$ years, became drowsy and passed into deep coma thirty minutes after she had received 15 grains (1 Gm.) of the material. After several days this patient also recovered. All patients complained of severe headache while recovering. The apathy, mental confusion, delirium and disorientation in some instances led physicians to question whether the patients might have encephalitis. In three cases the reports of examination of spinal fluid were negative, however.

One of the deaths reported occurred within twelve hours after the administration of sulfathiazole from the contaminated lot of tablets to a patient with pneumonia and neurosyphilis. Two deaths reported by one physician dealt with a man aged 74 with bronchial pneumonia and myocarditis and a man with a streptococcic infection of the throat. The former "went to sleep and never woke up," the latter was shown to have a streptococcic bacteremia. Another death, as reported by the physician, occurred in an elderly woman with pneumonia and marked emaciation; the physician did not consider that medication may have contributed to the death. Four other cases terminating in death included a man with acute retention and a possible brain abscess, who was moribund when the drug was administered; a man with progressive congestive heart failure, syphilitic cardiovascular disease and terminal pneumonitis, who was restless and slept at short intervals but showed no evidence of coma or stupor; and 2 surgical cases in which, according to the attending physician, signs of stupor were not evident up to the time of death.

COMMENT AND SUMMARY

All of the 52 patients reported to have received the contaminated Sulfathiazole-Winthrop, but who recovered, presented some of the signs and symptoms similar to those observed in patients under the influence of therapeutic or excessive doses of a barbiturate. These symptoms included drowsiness, stupor, coma, restlessness, irrationality and delirium, eye disturbances, decreased rate and depth of respiration, and hypotension accompanied by signs of shock or collapse. None of these reactions are commonly noticed during sulfathiazole therapy. It has been stated that reactions are particularly liable to occur in patients with fever, diabetes mellitus or congestive heart failure; significantly enough, histories of some of the patients indicated that they were suffering from fever, diabetes mellitus and congestive heart failure.

While sufficient evidence is not at hand to establish definitely a causal relationship between the ingestion of the drug and the reported deaths, sufficient evidence exists in the statements forwarded to the Council office to indicate that the contaminated tablets may have contributed to the deaths in some cases. The amount of phenobarbital which any patient may have received is difficult to estimate accurately, as some of the sulfathiazole tablets were contaminated whereas others were comparatively free of contamination. It may be noted, however, that the ingestion of only one of the heavily contaminated tablets could provide the patient with 5 grains of phenobarbital. Fortunately many recovered after presenting evidence of severe reactions.

REPORT OF CHEMICAL EXAMINATION OF SULFATHIAZOLE-WINTHROP, CONTAMINATED WITH PHENOBARBITAL

A. E. SIDWELL JR., PH.D., AND A. R. MENOTTI, PH.D.
CHICAGO

To obtain information about the nature and extent of contamination with phenobarbital of certain specimens of tablets sulfathiazole-Winthrop, it was considered desirable to subject some of the tablets to chemical examination. Through the courtesy of the Winthrop Chemical Company, Inc., a number of samples

were obtained from the specific lots of tablets, MP series, in which contamination was believed to have occurred. Samples were provided from every container in which these tablets were stored in the factory under "quarantine." In addition, two samples of the tablets from lot MP 029 were obtained from the Food and Drug Administration. A method of examining these tablets to detect and determine phenobarbital was devised, and the results of the examination are here reported. For comparison, specimens of sulfathiazole-Winthrop from lots known to be uncontaminated, and a specimen of tablets of luminal-Winthrop, a brand of phenobarbital, were examined concurrently.

Sulfathiazole-Winthrop is marketed in the form of tablets containing 0.25 Gm. and 0.5 Gm. of that substance. For the purpose of tableting, sulfathiazole is mixed with an excipient consisting essentially of cornstarch. Small amounts of stearic acid and talc are added to obtain desirable physical properties. The finished tablets have the form of short cylindric rods

for an increased amount of ash, presumably from the addition of talc, there is no essential difference in composition of these tablets manufactured at different times. The active ingredient in each amounted to about 84 per cent of the total weight. The average weight for each tablet was determined by weighing from twenty

TABLE 1.—Analysis of Tablets of Sulfathiazole-Winthrop

	Lot GP 252	Uncontaminated MP Series	Lot BR 252
Average weight.....	0.603 Gm.	0.597 Gm.	0.605 Gm.

Ash.....	0.05 per cent	2.2 per cent	2.0 per cent

to thirty tablets. Sulfathiazole was determined by the method described in New and Nonofficial Remedies in the section dealing with that substance.³ Stearic acid was extracted completely with petroleum ether of low boiling point and weighed after removal of the solvent. It was identified by its melting point and neutral equivalent. The starch present was identified as cornstarch by microscopic comparison with known specimens. Talc, when present, was identified by the appearance of the ash.

EXAMINATION OF CONTAMINATED TABLETS

Method.—Each tablet was analyzed separately. After some preliminary tests the following procedure was found to be satisfactory for the detection of pheno-

barbital in mixtures containing sulfathiazole, cornstarch, stearic acid and other excipients present in the tablet:

A single tablet is placed in a 50 cc. beaker containing approximately 10 cc. of freshly distilled, residue-free ether. The tablet is crushed to a powder; the mixture is stirred and then allowed to stand for about five minutes. The ether solution is decanted into another 50 cc. beaker and evaporated to dryness on a steam bath, after which the residue is cooled

Fig. 2.—Crystals of phenobarbital as seen with the polarizing microscope.

with convex ends which form the tablet faces. Each of the 0.5 Gm. tablets is about 10.5 mm. in diameter and 6.5 mm. in length through the center of the faces. The tablets bear an impressed W on one face. The reverse face is scored to facilitate division into halves and one eighth of a tablet.

EXAMINATION OF UNCONTAMINATED TABLETS

Chemical examination of a number of uncontaminated tablets of sulfathiazole-Winthrop of the MP series yielded results provided in table 1. There also are listed in the table data obtained on chemical examination of tablets of sulfathiazole-Winthrop from lots identified as GP 252 and BR 252. The tablets from lot GP 252 were said to have been manufactured prior to those of the MP series, and tablets of BR 252 were manufactured later. Lot GP 252 was the source of samples originally submitted by the company to the Council on Pharmacy and Chemistry. The composition of these tablets having been found satisfactory and the other requirements of the rules of the Council having been met, sulfathiazole-Winthrop was declared accepted for inclusion in New and Nonofficial Remedies.³ Except

and examined. Stearic acid appears as a slight film, with perhaps some crystalline structure apparent in the residue from the ether extract. Considerable amounts of crystalline residue indicate the presence of phenobarbital, which may be identified by its crystalline structure, melting point and other characteristics.

To detect traces of phenobarbital, small residues from the ether extracts are examined under a polarizing microscope fitted with a heating stage. The contents of the beaker are brought to a temperature above the melting point of stearic acid and below that of phenobarbital. This procedure obviates any possibility of interference of stearic acid with the appearance of phenobarbital. By this means the presence of small amounts of phenobarbital is indicated by characteristic crystals such as those illustrated in figure 2. The phenobarbital may be further identified by various means.

The melting point of crystals of phenobarbital, isolated from contaminated tablets, was found to be 172 to 175 C. Control experiments on uncontaminated tablets to which were added varying amounts of phenobarbital showed that as little as 1 mg. of phenobarbital could be detected by the method described.

When phenobarbital was not found the material from ten tablets was combined, extracted with ether and subjected to reexamination for traces of phenobarbital. When tablets contained phenobarbital in amounts estimated to be larger than 5 mg., the material was assayed for phenobarbital according to the Alternative Method-Official described in "Methods of Analysis of the Association of Official Agricultural Chemists."⁸ Because of its low solubility in a mixture of chloroform-ether, sulfathiazole was found not to interfere in this determination.

Results.—The results of examination of tablets of sulfathiazole-Winthrop for contamination with phenobarbital are provided in table 2. The specimens designated by numbers 1 and 2 were tablets supplied through the courtesy of the Food and Drug Administration. The specimens identified by numbers 3 to 21 inclusive were those supplied by the manufacturer. Except for the physically imperfect tablets there were no significant differences in the appearance of the various tablets of the lots of sulfathiazole-Winthrop designated by the letters MP. Slight differences in weight, fragility, color and design of the scribing apparently had no relation to the question of whether or not the tablets were contaminated with phenobarbital.

The results show that not all of the tablets in the MP 029 series were contaminated, but those which were contaminated contained practically 60 per cent of phenobarbital. In two specimens, 1 and 3, about 10 per cent of the tablets contained phenobarbital. In another sample of tablets (number 4) nearly all were uncontaminated; and in another (number 2), only one tablet out of twelve was uncontaminated.

Lot numbers identified by the firm as MP 051, MP 076 and MP 118, according to the manufacturer were made later than lot MP 029. Relatively few of the tablets examined from those made later were found to be contaminated, and in these the amount of phenobarbital was small. These observations bear out the report that the original contamination occurred in lot MP 029 and that the subsequent lots became involved because some tablets from the MP 029 series were ground up and added to the mixture of material for other lots in the MP series.

It may be noted from the table that the tablets in the MP 029 series which contained phenobarbital had slightly less than 60 per cent. As shown in table 1, the active ingredient in uncontaminated tablets of sulfathiazole-Winthrop amounted to 84 per cent. Further examinations of the heavily contaminated tablets were made and, for comparison, examination also was made of tablets of luminal-Winthrop, a brand of phenobarbital, purchased on the market. The results of chemical examination of a specimen of tablets luminal-Winthrop, 1½ grains, lot LP 215, are shown in table 3, together with results obtained on further examination of heavily contaminated sulfathiazole tablets of the MP 029 series and uncontaminated specimens of lot GP 252.

It may be noted that the compositions reported in table 3 for grossly contaminated tablets sulfathiazole-Winthrop and for tablets luminal-Winthrop, 1½ grains, appear to be identical. This fact may be of significance in attempts to trace the origin of contamination. The contaminated tablets of sulfathiazole-Winthrop, lot MP 029, which caused the difficulty, had a percentage composition essentially similar in all respects to that of

TABLE 3.—Tablets Luminal-Winthrop and Sulfathiazole-Winthrop

tablets luminal-Winthrop except for negligible quantities of sulfathiazole.

SUMMARY AND CONCLUSIONS

Tablets of sulfathiazole-Winthrop, reported to have been contaminated with phenobarbital, were examined. Tablets from lot MP 029 were found to be either uncontaminated or to contain about 60 per cent of phenobarbital, which is the relative amount of phenobarbital found in tablets of luminal-Winthrop. Likewise the inert ingredients of these contaminated sulfathiazole tablets and of luminal tablets were similar. Of the different samples of sulfathiazole provided by the firm for the purpose of examination, the highest incidence of contamination was about 10 per cent, the average incidence being much less. Except by chemical methods it was not possible to tell from examination of the tablets whether or not they might be satisfactory tablets of sulfathiazole or tablets containing about 5½ grains of phenobarbital. The incidence of contamination of other tablets in the MP series provided by the firm was small and the extent was slight.

The Feeling of Good Health.—One may be not definitely sick and yet lack the feeling of good health. This is expressed at times as not being up to "par." Health is not only a condition of freedom from disease but also a quality of life, and it is to our advantage to keep ourselves at the highest and best level of health attainable.—Williams, Jesse Feiring: *Healthful Living*, New York, Macmillan Company, 1941.

Therapeutics

THERAPY OF THE COOK COUNTY HOSPITAL

EDITED BY DR. LEROY H. SLOAN

THE THERAPY OF INFLUENZA

GEORGE W. SCUPHAM, M.D.
CHICAGO

Influenza has been essentially an epidemic disease, appearing in all parts of the world at variable intervals though exhibiting a certain periodicity and seasonal incidence. In addition to epidemic occurrence there have been a number of major pandemics in which the disease has spread with extraordinary rapidity and with a high incidence of morbidity and mortality. The last of these major pandemics was in 1918-1920. Preceding this there was a worldwide occurrence in 1889-1890 and also in 1847. The clinical and pathologic manifestations in all were of sufficient similarity to make certain that in each instance the same disease existed even though the cause was obscure. Epidemics appearing in 1769 and 1737 were probably identical.

Following the pandemic of 1918-1920 the disease recurred, and it has continued to make its appearance in minor epidemic forms in various parts of the world and for limited periods. These subsequent outbreaks, while showing the essential characteristics of the disease as it appeared in pandemic form, have been of milder type, with fairly high morbidity but distinctly lower mortality, displaying an absence rather than a presence of complications.

In sporadic outbreaks it is often difficult to identify the disease as influenza. In fact, respiratory diseases of all types, and even some nonrespiratory diseases, have been loosely called influenza (commonly the "flu"). This term covers a wide variety of clinical forms including the common cold both of epidemic and of sporadic variety. Respiratory infections caused by the hemolytic streptococcus, and pneumococcal infections too, are loosely included in this terminology, besides a variety of infections by other organisms commonly found in the respiratory tract. Likewise virus diseases not infrequently have been reported by careful observers under such terms as "influenza-like" infections.¹

Jordan² in his monograph on influenza stated that the loose use of the term influenza had been the subject of comment by both physicians and patients. He referred to Humbolt's statement in which he designated influenza as "that senseless definition of a pathologic X." Mrs. Carlyle also was quoted: It appears that she had been subject to a number of attacks which her physician diagnosed as influenza. She expressed doubt in one of her letters by stating "Medical men all over the world have merely entered into tacit agreement to call all sorts of maladies people are liable to in cold weather by one name, so that one sort of treatment may serve for all, and their practice is thereby greatly simplified."

As the term "grip" and "intestinal grip" followed for many years the epidemic of 1889-1890, so the term "flu" and "intestinal flu" has covered a multitude of minor infections since that of 1918.

2. Jordan, E. O.: Epidemic Influenza: A Survey, Chicago, American Medical Association, 1927.

At the present time doubt as to the cause of the disease can no longer exist and etiologic diagnosis is now possible.³ The relation of a specific filtrable virus seems clearly established for at least one form. The virus can be isolated by spraying washings of the nasopharynx into the nares of ferrets, from which the true strain can then be obtained. It has been possible also to culture the virus on the chorioallantoic membrane of the chick embryo, which also serves for its primary isolation. It is thus different from the virus of the common cold, which apparently will not develop under these conditions.⁴ The effects of the virus can be neutralized by the serum of animals or of persons who have recently recovered from the disease. The antigenic properties of the virus aid in diagnosis by a complement fixation test of the serum infected persons or animals. A flocculation reaction has also been demonstrated when the serums of patients who have recovered from the disease have been mixed with suspensions of lung tissue of mice infected with the specific virus.⁵ By methods such as these it is possible to differentiate this virus from other similar ones. A close relationship between human influenza and that of swine has been suggested by such observations.⁶ The results strongly suggest the identity or close relationship of the two diseases.

Magill and Francis⁷ showed that there were both decided differences and many similarities in the antigenic characteristics of twenty-four strains of epidemic influenza virus. The differences were not great enough to separate them into distinct types. The multiplicity of strains may account for repeated attacks to which certain persons seem to be susceptible. The duration of immunity is relatively short.

Thus it can be said that, while much has been learned of the etiology of the disease, further studies are necessary to clarify important factors. The prevalent epidemic may offer the opportunity to clear up some of the gaps present at this time. The relationship of *Haemophilus influenzae* to the disease is now established as that of a secondary invader. The same is true of other organisms, various types of pneumococci and streptococci, all of which were found and considered possible causal factors in the last and previous pandemics. Reimann⁸ stated that three forms of pulmonary infection have been called influenzal pneumonia. The first is caused by the virus itself, the second by *Haemophilus influenzae* and the third represents an infection by a variety of bacteria, as either single or multiple infections resulting from the effect of the virus on the lungs, thereby sensitizing them, or by the general systemic shocklike effect of a severe influenza.

The clinical manifestations of the disease are variable. During pandemics all variations present themselves in individual cases. Subsequent outbreaks have, on the whole, been mild in comparison to the severity of the disease and the number and frequency of complications in the 1918 version. These variations include subclinical infection with few or no symptoms as well as the most violent and rapidly progressing pneumonia.

The incubation period is about two days. The onset of the disease is sudden and the first symptoms are usually constitutional. Chilly sensations, general aching pains and headache with the rapid appearance of fever are characteristic. Respiratory symptoms appear later, usually a short cough, sore throat, coryza and epistaxis. A tracheobronchitis usually dominates the picture. The patient is drowsy, and the face shows a peculiar livid cyanosis. Conjunctivitis is common. The pharyngitis is characteristic with definite redness of the posterior wall and soft palate, while the hard palate is strikingly pallid. The manifestations in the chest are variable from complete absence of abnormalities to a "wet" pneumonia with rapid pleural effusion and frothy bloody sputum. The intermediate changes are those of a coarse bronchitis or bronchiolitis. The latter is characteristic. During the epidemic of 1918 relative bradycardia was common. Leukopenia was the rule until secondary infection made its appearance. (Even then it often persisted.) Convalescence was prolonged and mental and physical depression striking even in milder cases. The mortality was very high in pregnant women, and abortion was the rule. These features have not been consistent in the recurrent waves of the disease.⁸ The duration of the disease was variable according to its severity. The average patient who recovered had an active stage of seven to ten days, with slow convalescence. At the present time the average duration is less (three or four days) with relatively rapid convalescence.

While it is not possible to make an arbitrary diagnosis without virus studies, the clinical appearance is often sufficiently characteristic so that the diagnosis is not much in doubt. The sporadic case or cases occurring in limited epidemics present greater difficulties, as the observations of Reimann and others indicate.

THERAPY

Prophylactic.—Influenza is a highly contagious disease during periods of severe epidemics. Either immunity is lost after a period or new strains are responsible for the high incidence and apparent lack of immunity. The disease gains entry into the body through the respiratory tract. It is transferred from one infected person to another by direct contact or by discharges from the nose and throat. Droplet infection² results from discharge of small particles from the mouth, nose and throat as the result of sneezing, coughing or even talking. Such small particles may remain suspended in the atmosphere in either the moist or the dried state, with a capacity for transference of infection. It can readily be understood how and why the disease can be rapidly and widely disseminated under the crowded conditions of barrack life. The same applies to contacts in schools, churches, movies and all other gatherings of people. Let the healthy protect themselves from the sick and the sick shun those not afflicted. Robertson, Biggs, Miller and Baker of the University of Chicago have just announced a method of sterilizing the air by a propylene glycol mist which may be applicable to the prevention of influenza. It would seem that this method could be put to practical use in the present wave of influenza.

Natural immunity or acquired active immunity is thought to exist in some persons. It has not been possible to predict with certainty whether or not the degree of immunity is sufficient to give complete protection. Neutralization of a known virus by the serum of a

convalescent person is presumptive evidence.⁹ The secretions of the nose seem to have some inhibiting effect on the growth of the virus.⁸

A number of virus preparations have been employed in an attempt to produce active immunity. None have been entirely successful, unless the new vaccine of Horsfall and Lenette¹⁰ can be so regarded. The discovery of this procedure seems to have been accidental. A vaccine prepared from ferrets, in which ferret distemper occurred simultaneously with experimental infection by human influenza, was injected into animals to immunize them. These animals were found to be immune to three antigenically different strains of human influenza. Subsequently it was found that animals inoculated with a mixture of canine distemper virus and human influenza virus produced a vaccine which would immunize animals to massive doses of all the strains of influenza virus available. The vaccines thus produced have been tested on human beings. The serum of volunteers thus immunized has been found to show a decided increase in the virus antibodies against all strains of influenza virus obtainable. These experiments indicate a probable highly effective method for the prevention of influenza which may be available for general use when the investigative work has been completed.

Unfortunately, the contagious period is probably during the stage of invasion before the presence of illness becomes well defined. At any rate, the patient should be isolated and visitors excluded. The room should be relatively bare, with no more furniture than is required. In past epidemics the disease has been transmitted particularly to the attendants. The morbidity among physicians and nurses has been high. Because of this, it has been customary for attendants to wear masks over the nose and mouth whenever contact with the patient is made. Although this may reduce the liability of infection, it is not a certain means of escape. In fact, only the complete isolation of the case has been entirely successful. Contamination of hands and dishes are other means of transmission. The measures to be employed are obvious. Dishes should be sterilized by boiling, and soap and water used liberally on the hands after contact. Discharges from the nose and sputum should be collected in tissues and disposed of in the usual paper bag attached to the bedside. These should be collected frequently and destroyed by burning. The safe period of quarantine is variable and probably should be continued until all discharges have ceased. Vaccination of physicians, nurses and attendants may shortly be possible. Methods now in use to prevent the common cold may protect against influenza (pooled cold vaccines by hypodermic or by mouth protect to a certain degree).

Active.—Much of the treatment depends on the facts discussed. The individual severity as well as the general intensity of the epidemic will determine the program. While recurrent waves since 1920 have been mild, it is reasonable to believe that subsequent epidemics will again increase in severity.

Since influenza is largely a self-limited disease, the treatment of the average patient without complications is symptomatic. The patient should be put to bed and kept there. Bed rest should be enforced until three to

9. Stokes, Joseph; Chenoweth, Alice D.; Waltz, A. D.; Gladen, R. G., and Shaw, Dorothy: Results of Immunization by Means of Active Virus of Human Influenza, *J. Clin. Investigation* 16: 237 (March) 1937.

10. Horsfall, F. L., Jr., and Lenette, E. H.: A Complex Vaccine Effective Against Different Strains of Influenza Virus, *Science* 91: 422 (May 24) 1940.

five days after all fever has disappeared if no complications have arisen. If these procedures are rigidly maintained, the possibility of complications is unlikely. The exceptions are those attacks of increased virulence such as were seen in the last pandemic. The patient should not be allowed to leave his bed under any circumstances. Bed pans and urinals should be used. Changes of clothing and bed linen should be accomplished without removing the patient from the bed. The bed covering should be light and of sufficient warmth to keep the patient comfortable. Approximately 68 F. is the optimum room temperature, neither too warm nor too cool. Sudden changes in room temperature or too cool an environment result in increased tracheal irritation and excessive coughing. The habit of placing patients out "in the open," on "side porches" or in open "sun parlors" is to be condemned.

The patient with a severe attack of influenza is apprehensive. In the stage of convalescence he is depressed mentally and physically out of proportion to the severity of his illness. He should be reassured as to his condition, and his surroundings should be made as cheerful as possible. Mental tranquillity is more important than in other acute illnesses. Tepid sponges for high fever (102-104 F.) followed by warm alcohol rubs and light massage help achieve both physical comfort and mental relaxation.

The fluid intake should be adequate and may consist of water, sweetened fruit juices and palatable carbonated beverages. The patient frequently is nauseated, and this together with drowsiness may interfere with the intake of both food and fluid. If not possible to achieve an intake of 3,000 to 4,000 cc. by mouth, the balance may be made up by parenteral administration of physiologic solution of sodium chloride or 5 per cent dextrose in physiologic solution of sodium chloride. If a real effort is made, the needed amount can usually be given by mouth.

The diet can be left partly to the desires of the patient. Solid food is distasteful, and the chances of overindulgence are negligible. Because of the relatively short duration of the disease, a bland, relatively high carbohydrate diet is satisfactory. If the patient refuses food, the caloric intake may be increased in liquid form with fruit juices, sugar, milk, eggnog, lactose and the like. It is desirable to maintain the nutrition of the patient by an adequate food intake. Convalescent weakness may thus be minimized. Flatulence may be avoided by judicious use of fruit juices and well cooked vegetables and fruits. At times adding solids and reducing the liquid intake will control such flatulence. Any of the mild laxatives may be necessary. No advantage is gained by repeated catharsis. It is to be condemned. A glycerin suppository may suffice, or a small saline enema.

Throat irritation and soreness can be controlled to some extent by mild alkaline gargles. Isotonic solutions of sodium chloride or sodium bicarbonate are highly satisfactory when used warm. Compound solution of sodium borate is still very useful, and but little improvement can be made on it. Nasal obstruction is often of such severity that it becomes a distressing symptom which requires relief. This can often be accomplished by the use of 2 per cent ephedrine sulfate in physiologic solution of sodium chloride. Amphetamine inhalers used with caution give much relief. Inhalations of steam are grateful not only for nasal irritation but for the distressing cough which accompanies acute tracheitis. A humidifier is serviceable also

in such conditions. A few drops of 10 per cent menthol in alcohol added frequently to the water can be used. Ice collars, oily sprays and nose drops (such as liquid petrolatum) are to be used with care.

The headache and general aching pains are relieved by acetylsalicylic acid or acetophenetidin. Ten grains (0.6 Gm.) of the former or 5 grains (0.3 Gm.) of each every four hours is effective. If codeine sulfate or phosphate in $\frac{1}{4}$ to $\frac{1}{2}$ grain (0.015 to 0.030 Gm.) doses is added, not only is the analgesic effect increased but the irritative tracheal cough is well controlled. Restlessness and insomnia are usually the result of discomfort. In the case of extreme discomfort and restlessness, morphine early in small doses is often necessary to secure adequate rest. The importance of rest cannot be overestimated. Barbituric acid drugs in the form of phenobarbital, $\frac{1}{2}$ to $1\frac{1}{2}$ grains (0.03 to 0.10 Gm.) in average dosage are usually adequate.¹¹ In some cases better results are achieved by smaller doses ($\frac{1}{2}$ grain) repeated three or four times a day.

The results of chemotherapy with the sulfonamide group of drugs in the treatment of influenza have not been established. The cases in which this type of treatment has been used are those relatively mild ones which have occurred in more localized waves of the disease in the past two years. Since these are of short duration and recovery is prompt under any conditions, adequate evaluation has not been possible as far as the virus phase of the disease is concerned. The leukopenia of severe influenza might be considered a theoretical contraindication. Should a complicating secondary infection develop, the use of such drugs will depend on the type of organism present and the nature and severity of the infection. It seems reasonable to feel that failure of the fever to subside in two to three days, except in cases of very severe involvement, may be an indication for the use of a sulfonamide combined with type-specific serum if a specific type of pneumococcus is isolated. Sulfanilamide is probably the drug of choice in streptococcal infections. For the various types of pneumococcus and for *Haemophilus influenzae*, sulfapyridine or sulfathiazole should be used. Recent reports of successful management of meningitis due to *Haemophilus influenzae* infection are encouraging.¹² Perhaps sulfathiazole will have the widest field of usefulness under the circumstances. The present wave of the disease should provide an opportunity for the evaluation of these drugs and of their effectiveness. It is unnecessary to emphasize the need for caution. It would seem unwise to administer any of these compounds in the average case of mild involvement, especially if the patient is treated in the home, unless adequate precautions are taken to avoid the serious toxic effects which may appear (granulocytopenia, anemia, purpura).¹³

No specific measures for the control of the disease have been discovered. The use of convalescent serum has been described a number of times. It was employed by McGuire and Redden¹⁴ in the pandemic of 1918. Five hundred cc. of blood from ten day convalescent patients is obtained under strictly sterile technic, incu-

11. Aminopyrine should be avoided with barbitals.

bated for one hour, cooled in a refrigerator for twelve hours, and the serum removed by slowly decanting or by centrifuging; it is used in dose of approximately 120 cc. More recent work on the immunology of the disease shows that specific antibodies tend to disappear from the blood of convalescents rather rapidly,³ so that after a year they have effectively disappeared. In the event of the occurrence of a severe epidemic or of sporadic cases of severe pneumonia, pooled convalescent serum should be, and no doubt will be, extensively employed. Although no definite results can be predicted, it seems reasonable to believe that good results, when adequate amounts of serum are used, may be expected.

The more effective methods for the administration of oxygen developed in the last decade have resulted in a wide application of this form of therapy. Instead of being confined as a gesture to the terminal stage of the disease, it is now generally employed with great therapeutic effectiveness. This is true particularly of pulmonary and cardiac diseases. The need for oxygen in influenza will be recognized in each individual case as the necessity for it arises. Indications are no different than in other varieties of pneumonia. Increasing toxemia, cyanosis, dyspnea and restlessness and apprehension are symptoms which suggest its use. Early employment in cases of very severe involvement may be of great value in carrying the patient through until natural immunity develops or until improvement by means of serum or chemotherapy can be obtained. The cyanosis and dyspnea produced by a rapidly developing pleural effusion of serohemorrhagic, hemorrhagic or even seropurulent character must not be treated by oxygen to the disregard of the relief of the effusion. Early aspiration is indicated, and repeated aspiration may be necessary.

The complications of epidemic influenza are many. Pneumonia is usually regarded as part of the disease pattern rather than as a complication. This appeared to be the situation in the pandemic of 1918 and in early recurrent waves. Since then, in the milder epidemic appearances, pneumonitis has not been a striking or a frequent finding; rather the exception. The character of such pulmonary involvement was a liquid hemorrhagic pneumonia. The rapid progress, severe cyanosis and early fatal termination in such cases was striking evidence of the virulence of the infective agent and the extent of pulmonary involvement. The conditions found on physical examination varied from those of bronchiolitis with localized patches of fine rales to extensive consolidation and profuse moist rales (confluent bronchopneumonia).

In the event of the appearance of these manifestations, a special effort should be made to determine the type of secondary infecting agent. If it should prove to be of the pneumococcus group, further efforts to differentiate a specific type should be made and adequate chemotherapy instituted at once. If the hemolytic streptococcus is found, sulfanilamide is the drug of choice although sulfathiazole may later prove to be more effective.

Pleurisy was exceedingly common in the last great epidemic. If it manifests itself merely as pleuritic pain, the application of local heat and strapping of the chest with adhesive tape or with one of the elastic chest bandages, or even a plaster of paris support, are usually sufficient. Sometimes morphine is indicated early in the course of the disease. Pleural exudates appear with

extraordinary rapidity. It was not uncommon to find massive exudates developing over night.

These exudates were a common cause of death and early overlooked. This was at times because intense bronchial breathing could be heard over such an area, and the exudate was mistaken for consolidation. Aspiration of the contents of the pleural cavity under such conditions may be a life saving measure. Even the suspicion of the presence of fluid in the chest is an indication for a diagnostic tap. Physical examination of the chest should be repeated at least twice a day; even under such careful observation exudates may be overlooked: "bronchial breathing and no rales → Aspirate at once."

Such exudates were often serous or serohemorrhagic, sometimes seropurulent. It was common for an exudate to begin as a serous type and later become purulent. Treatment of the condition as one of empyema became necessary. The closed method, without rib resection, was found to be effective. Difficulty was encountered because of the frequency with which intralobar empyema occurred. The diagnosis is difficult. Roentgen examination is usually necessary for confirmation. In any case in which complete recovery does not occur in the expected length of time, and in which no adequate explanation for continued illness can be found, such an exudate must be immediately considered.

The most startling complication encountered in 1918 in this disease was the sudden appearance of subcutaneous emphysema at the base of the neck extending down over the chest. It is the result of bronchial or peripheral alveolar rupture into the mediastinum or peripleural space. Sometimes the emphysema was limited to the mediastinum, in which case peculiar crackling sounds could be heard with each heart beat. Sometimes it extended up into the neck as well as over the chest or, in extreme cases, over the entire body except for the soles of the feet and palms of the hands. Spontaneous pneumothorax occurred often. These phenomena are the result of an interstitial emphysema occurring within the alveolar structure with rupture of a peripheral alveolus. Cough must be controlled when this occurs, because with each paroxysm air is forced out of the lungs. Other measures are seldom necessary, but release of air by insertion of a large needle into the pleural cavity may be required.

Conjunctivitis, while often quite severe, usually does not require specific treatment. Warm or cold moist boric acid compresses applied over the eyes give symptomatic relief. The appearance of otitis media may be regarded as an indication for the use of one of the sulfonamide group of drugs in addition to the usual measures employed in the treatment of this condition. The same may be said of acute sinusitis, a rather common complication.

Because convalescence is apt to be slow, allowance is made for at least a two week period in cases of severe involvement. During this time a continued rest program with gradual increase in motor activity is important (graduated exercise—walking on the level → walking on graduated slope, cool baths and so on).

Fatigue is a striking complaint during convalescence and quite characteristic. It is often associated with mental depression. Apparently with fatigue there is an associated loss of resistance to secondary infection, and complications are likely to occur. In 1918 many of the most virulent attacks of pneumonia developed after apparent recovery and convalescence. Avoidance of exposure to cold and chilling of the body surface is

equally important. Apparently all the factors which may be responsible for the development of the common cold are also factors in the recurrence of influenza. Of these fatigue is the most important, and fatigue in convalescence develops very quickly.

One of the most unfortunate late complications of pandemic influenza has been epidemic encephalitis or encephalomyelitis. The clinical picture resulting is that of the familiar Parkinson state. For this reason one is tempted to suggest that maximum doses of the vitamin B group may well be indicated accompanied by the use of thiamine hydrochloride 15 mg. a day by hypodermic and the vitamin B complex containing perhaps 5 mg. of riboflavin and from 150 to 300 mg. of nicotinic acid. At the present time one should not be too constrained to scoff at a possible relationship of a vitamin E deficiency, and it would bear trial to give a patient in this condition early a minimum if not a maximum dose of the concentrate of vitamin E (ephynal). It is possible that in this field may be found a prophylactic for the well known muscular weakness both peripheral and central (cardiac) which so often complicates or is a sequela to its effects.

PRESCRIPTIONS

Laxatives: Liquid petrolatum 4 drachms (15 cc.) at night, fluidextract or aromatic fluidextract of cascara sagrada 1 or 2 drachms (4 to 8 cc.) in the early morning, heavy magnesium oxide 20 grains (1.3 Gm.) at night, glycerin suppository in morning, saline enema.

Flatulence: Bland diet, well cooked low starch vegetables and fruits; avoid excess of total liquid, substitute solid food relatively early. Heat to the abdomen, regular bowel habit. Tincture of belladonna 7 to 10 minims (0.4 to 0.6 cc.) three to four times daily. Substitute hot fluids for cold.

Gargles: Alkaline aromatic solution. Warm physiologic solution of sodium chloride. Physiologic solution of sodium chloride with sodium bicarbonate roughly 2 drachms (8 cc.) of sodium chloride and 1 drachm of sodium bicarbonate to 1,000 cc. Sodium bicarbonate 1.2 Gm. in 120 cc. of antiseptic solution N. F. used half strength. Sodium bicarbonate and sodium baborate 1.2 Gm. of each in cinnamon water to make 120 cc.

Additions to steam vapors: Spirit of menthol (10 per cent menthol in alcohol) from 15 to 30 drops in boiling water frequently as inhalant. Compound tincture of benzoin 1 drachm to 1 pint of boiling water every hour.

Sedatives: Powder of ipecac and opium 0.65 Gm. (10 grains) taken with hot lemonade for diaphoresis and sedation.

General aching; joint pains: Acetylsalicylic acid 0.3 Gm. (5 grains), acetophenetidin 0.3 Gm. (5 grains); mix and put in capsules, one to be given every six hours. Or mix and make a total dose of acetylsalicylic acid 0.24 Gm. (4 grains), codeine sulfate 0.015 Gm. ($\frac{1}{4}$ grain), citrated caffeine 0.03 Gm. ($\frac{1}{2}$ grain), phenobarbital 0.015 Gm. ($\frac{1}{4}$ grain). Acetylsalicylic acid compound, one every four hours.

Stimulating cough mixtures:

1. Ammonium carbonate 5 Gm., anise water 12 cc., syrup of acacia to make 60 cc.; 4 cc. (1 drachm) every two hours.

2. Ammonium chloride 5 Gm. (1 drachm), syrup of ipecac 15 cc. (4 drachms), syrup of glycyrrhiza to make 60 cc. (2 ounces); teaspoon in water every two hours.

3. Ammonium chloride 10 Gm. (2 drachms), syrup of cherry (Dr. Fantus has already called attention to the wisdom of using syrup of cherry rather than the syrup of wild cherry) to make 120 cc. (4 ounces); teaspoon in cup of water every two hours.

4. Syrup of hydriodic acid 15 cc. (3 drachms), syrup of cherry to make 60 cc. (2 ounces); two teaspoons in cup of water every four hours.

Sedative cough mixtures:

1. Codeine sulfate 0.25 Gm., syrup of cherry to make 60 cc.; teaspoon in water every three hours.

2. Codeine sulfate 0.5 Gm., syrup of tolu balsam 60 cc., syrup of wild cherry to make 120 cc.; one teaspoon in water every three to four hours.

3. Codeine phosphate or sulfate directly in $\frac{1}{4}$ to $\frac{1}{2}$ grain dose (0.015 or 0.030 Gm.).

4. Elixir of terpin hydrate with codeine, one teaspoon every two to three hours for severe cough.

5. Codeine phosphate 0.5 Gm., aromatic syrup of eriodictyon to make 60 cc.; 4 cc. (1 drachm) in water every two to four hours.

A capsule prepared of papaverine hydrochloride 0.016 Gm. ($\frac{1}{4}$ grain) and codeine phosphate 0.016 Gm. ($\frac{1}{4}$ grain) has been used in the treatment of the common cold. It should be useful in the early stages of exudative influenza.

Council on Physical Therapy

THE COUNCIL ON PHYSICAL THERAPY HAS AUTHORIZED PUBLICATION OF THE FOLLOWING REPORTS.

HOWARD A. CARTER, Secretary.

INTERMEDIATE BOVIE ELECTRO-SURGICAL UNIT ACCEPTABLE

Manufacturer: The Liebel-Flarsheim Company, 303 West Third Street, Cincinnati.

The Intermediate Bovie Electro-Surgical Unit is said by the manufacturer to be essentially the same as the Council accepted Universal Bovie except for a difference in the construction of the cabinet. The cutting and coagulation currents of the two units are said to be similar in power and characteristics; the

power output controls have been placed in a different position on the Intermediate and are of a slightly different type.

Intermediate Bovie Electro-Surgical Unit.

The apparatus is of a semiportable type, the unit proper being encased in a steel cabinet which is mounted on a subcabinet (optional) also of steel construction. The unit proper weighs 70 pounds and is 16 inches high by 15 inches deep; when mounted on the subcabinet it is 41½ inches high. The subcabinet provides storage space for the accessories.

The control panel is located on top of the apparatus and this position is said to be easily accessible to the operator, who may stand in front of, behind or on either side of the unit.

In the Council's clinical investigation of the apparatus it was found to give efficient service in all operative procedures. The control of intensity in cutting desiccation is satisfactory, and hemorrhage control was efficient when the proper loop electrodes were used in underwater cutting.

The Council voted to accept the Intermediate Bovie Electro-Surgical Unit for inclusion on the Council's list of accepted devices.

HOMOZONE

(Ozone Generator)

NOT ACCEPTABLE

Manufacturer: The Automatic Electric Devices Company, 324 East Third Street, Cincinnati.

Because of many inquiries coming to the Council for information on the Homozone apparatus, the Council regarded the preparation of a report advisable. This report is based on an examination of the advertising for Homozone.

"Nature's Own Health-Restoring and Air Purifying Agent . . . Now . . . Man Made and Controlled!" is the manner in which the Homozone is described in the advertising literature. The copy makes it very clear that the advertiser considers the apparatus necessary to an individual's well-being, as indicated in the following: "Without it (oxygen), we would die within a few minutes. Contaminate our supply of Oxygen, with smoke or foul, disease laden impurities . . . and headaches develop . . . we become easily fatigued . . . our resistance to disease is decreased, and if continued, our Health

is eventually endangered. Ordinary OXYGEN (O_2) consists of two atoms of oxygen to the molecule . . . OZONE (O_3) contains ONE additional atom of Oxygen or THREE atoms of OXYGEN altogether. No chemical, vapor, nor anything else is added . . . it's just 3 atoms of Nature's own pure Oxygen combined together, instead of but 2 atoms as Oxygen exists in its usual state."

In presenting evidence to the public as to the usefulness of the device it is stated: "So while some might question the efficacy of ozone, it should be remembered that even experts have been and still can be wrong. And as the old saying, 'the proof of the pudding lies in the eating thereof,' the practical value of ozone is best proven by what it has done for others—a story which we feel can be better written by its actual users." Then are listed ". . . a few of the many letters which we have received from Homozone users." These letters of recommendation include one from a man in Detroit who purchased a Homozone and states he cured his wife's tuberculosis and sinus condition when physicians had done nothing to help her; a professor in a barber college finds that his students have had no headaches or colds since the installation of the device; a man who had been deafened in one ear by a severe cold found that in a few days his hearing was restored by the use of the Homozone. There are also included many other letters from persons who state that the use of the Homozone relieved or cured their bronchitis, colds and sinus conditions.

The Council has on several occasions in the past declared certain ozone generators to be not acceptable for inclusion on its list of accepted devices. This action has been taken because of the manner in which the devices were promoted and because, contrary to aiding well-being, exposure to ozone may result in irritation of the mucous membranes of the nose, throat and lungs, headaches, drowsiness, fatigue and a burning sensation in the eyes. The firm's evidence presented in the form of testimonial letters is not regarded as critical and, in the opinion of the Council, does not substantiate the claims made by the manufacturer that the Homozone is useful for "General Health Building," "Respiratory Ailments," and that it is ". . . a most valuable aid in the relief of many and diversified ailments." Recent investigations have confirmed earlier observations that for ozone to be even slightly effective as a bactericidal agent it must be present in such concentrations as are distinctly harmful to the delicate membranes of the nose, throat and lungs of a human being.¹ Regardless of where or how it is generated, ozone has little effect on bacteria except in strong concentrations which are harmful to the human being as well.

A section of an advertising booklet describes the "Hom-Ozone-Izer, Electro-Chemical Vaporizer," an accessory used with the Homozone for the purpose of dispensing a medicament as vapor. This medicament is called "Mist-O-Zone" said to "contain several proven medicaments of the Gymnospermae and Pinales groups." In presenting evidence for the usefulness of the device, it is stated, "For as pointed out in Vol. 90, No. 15, April 14, 1928 issue, (pages 1197-1198) of the Official Journal of the American Medical Association, and as attested to by many prominent physicians, investigators, clinics, institutions, etc., therein apparently marked relief and assistance was obtained through inhalations of ozone combined with certain products of the Pinales group, which form, in combination with ozone, an entirely new and different compound, easily inhaled, soothing, cooling, and above all, beneficial, as the statements therein definitely indicate." THE JOURNAL report referred to was a report by the Council on Pharmacy and Chemistry on a similar device which was found to be unacceptable to that Council. The report was highly unfavorable and by no means endorsed the foregoing advertising statements. The reference as it is used by the firm in its advertising is misleading because it indicates a favorable report.

In addition to the health claims made for the Homozone unit it is also claimed that it is effective as a deodorizer. The firm states: "The Homozone Actually DESTROYS Odors, . . . It Does Not Merely MASK Them!" The Council has, in earlier reports, expressed the opinion that

ozone is ineffective as a deodorant—that it merely masks the original odor with a substitute odor. As an oxidizer for fumes, odors or gases, ozone has been found to be ineffective.² Ozone tends to fatigue the sensory nerve endings which govern the sense of smell so that an individual can no longer smell the odors.

The firm reproduces in the advertising many letters from funeral parlors, theaters, chicken hatcheries, animal hospitals and kennels, which state that the Homozone has been useful as a deodorizing agent. The Council does not regard this as critical evidence to substantiate the firm's claim that the device destroys odors.

The Council voted to declare the Homozone unacceptable for inclusion on its list of accepted devices because of the objectionable advertising used in promoting the device to the public, and because the claims made by the manufacturer are unsubstantiated by critical evidence.

Council on Pharmacy and Chemistry

BACTERIOPHAGE THERAPY: II.

IN 1934 THERE WAS PUBLISHED IN THE JOURNAL UNDER THE AUSPICES OF THE COUNCIL A SERIES OF ARTICLES ON THE STATUS OF BACTERIOPHAGE THERAPY, BY DRs. EATON AND BAYNE-JONES. RECENTLY THE COUNCIL FELT THAT SUBSEQUENT DEVELOPMENTS IN THIS FIELD MIGHT WARRANT A RESTUDY OF THIS SUBJECT. DR. A. P. KRUEGER, PROFESSOR OF BACTERIOLOGY AT THE UNIVERSITY OF CALIFORNIA, AND HIS COLLEAGUE, DR. E. JANE SCRIBNER, KINDLY AGREED TO MAKE THE NECESSARY STUDY AND TO WRITE A REPORT. THEIR REPORT, WHICH FOLLOWS, HAS BEEN ADOPTED BY THE COUNCIL AND AUTHORIZED FOR PUBLICATION. IN AUTHORIZING THE PUBLICATION, THE COUNCIL EXPRESSES ITS GRATITUDE TO DRs. KRUEGER AND SCRIBNER FOR THEIR EXCELLENT STATUS REPORT.

OFFICE OF THE COUNCIL.

THE BACTERIOPHAGE

ITS NATURE AND ITS THERAPEUTIC USE

ALBERT PAUL KRUEGER, M.D.

AND

E. JANE SCRIBNER, PH.D.

BERKELEY, CALIF.

(Concluded from page 2167)

3. CLINICAL EVIDENCE REGARDING USEFULNESS OF PHAGE IN TREATING INFECTIOUS DISEASES

In concluding their extensive and critical review of the earlier literature on the phage treatment of human infections, Eaton and Bayne-Jones¹ stated that in their judgment the evidence for the therapeutic value of phage was largely contradictory. They granted the existence of convincing data in only two fields, namely the treatment of localized staphylococcal infections and cystitis. Since 1934 many more clinical reports have accumulated and we have attempted to summarize in the following section the relevant facts pro and con gleaned from these recent publications.

The evaluation of practically any therapeutic modality is admittedly difficult, and an analysis of the clinical application of phage presents no exception to the general rule. Many of the papers are based on inadequate clinical series or are frankly polemical. Even when these objections are met it is no easy matter to arrive at a fair picture of the effectiveness of phage therapy, for few diseases have the uniformity of duration, severity and mortality conducive to the attainment of statistically valid conclusions. One is left to wonder what the patient's progress would have been if no treatment, or some entirely different treatment, had been instituted. In other words, for reasons apparent to any one who has practiced medicine, strictly scientific control groups are hard to obtain and most studies are free from their

salutary influence. This is not peculiar to phage investigations, of course, but it is of such common occurrence among them that it is hard to find in the majority of accounts anything more than the authors' opinions of results accomplished with phage as compared to the results which their experience has accustomed them to expect when other measures are employed. Usually the art of medicine is exercised in the choice of therapy particularly suited to the case in hand and the task confronting the reviewer of phage literature is to weigh the evidence establishing the position of phage in the practitioner's armamentarium; is it a method of choice, one of occasional application or should it be omitted altogether? These are the essential questions, and their answers should reflect not only the data laboratory experience affords but, more decisive still, the all important consideration "Does it work clinically?"

1. *Enteric Diseases.*—These diseases comprise one of the most favorable groups for evaluation of phage therapy. In some of them (dysentery and cholera) the organisms are restricted to the bowel and do not invade the blood stream or other tissues of the body. Since the bowel contents normally contain some sort of phage, and since they can at times support active growth of pathogenic organisms, one may assume that there exist here relatively propitious circumstances for phage production, provided the appropriate phage is introduced. As has been pointed out in section 2, this applies only to the intestinal lumen, for in the deeper tissues there is little likelihood of extensive phage formation taking place. Another limiting factor is the difficulty encountered in getting phage past the inactivating effects of the gastric juice and bile.⁵⁹ Both secretions can take a heavy toll of phage activity, although in practice the administration of phage on an empty stomach, after preliminary alkalization with sodium bicarbonate, seems to assist its passage in the active form. For the same reason some workers (Seidlmayer,⁶⁰ Vaill and Morton⁶¹ and others) give phage retention enemas daily.

The natural occurrence of antidysentery phage in the stools at times during the course of bacillary dysentery has been recommended as a diagnostic aid. During the outbreak of institutional dysentery due to the Hiss-Y strain Feemster⁶² was able to isolate the causal organism from 23 per cent of patients in the first week of illness and from 13 per cent in the second week. The homologous phage was found in 33 per cent of cases in the first week, 80 per cent in the second and 45 per cent in the third. A further test of this diagnostic aid was conducted by Mackie⁶³ in connection with a group of patients presenting the clinical picture of chronic bacillary dysentery. In only 29 per cent could he detect a phage active against the dysentery bacillus, while 13 per cent of a noninfected control group gave positive tests for such a phage. He concludes that the presence of dysentery phage in chronic intestinal infections has little diagnostic significance and that the term "diagnostic bacteriophage" is a misnomer.

At the time of the Eaton-Bayne-Jones survey the results obtained in the phage treatment of bacillary dysentery were highly controversial. Numerous enthusi-

astic accounts were quoted but few of them could be accepted as offering conclusive evidence in favor of phage therapy. In a small number of well controlled series no difference in the course of the disease or in the mortality between treated and control groups was observed. The same situation obtains today. Some authors, e. g. Compton⁶⁴ and Murray,⁶⁵ recommend phage therapy without reservation and feel that 90 per cent of patients with bacillary dysentery benefit from it. Others have used it with good success in prophylaxis against dysentery. For example, Melnik, Nikhinson and Khastovitch⁶⁶ report their experience with three large groups of children. Group 1 received 1 cc. of dysentery phage at ten day intervals for seven doses, group 2 the identical amount of phage plus ox bile and group 3 nothing at all. The dysentery morbidity rates subsequently observed were group 1, 1.44 per hundred; group 2, 0.15, and group 3, 6.38. Haler⁶⁷ used phage to control an institutional dysentery epidemic due to infection with the Sonne type of bacillus. The data suggest that one patient served as the "shedder" of organisms and eleven other children received their infection from him. The twelve sick patients, twenty-one unaffected children and the institution staff members were given phage. Within two days one more child became ill; then the epidemic halted abruptly.

Careful observations of phage therapy in five patients infected with the Flexner type of dysentery bacillus were made by Vaill and Morton.⁶¹ They also obtained considerable data from a larger group of patients in a neighboring community for whom they supplied phage. In their judgment the early persistent administration of phage in large doses by mouth and by rectum is a useful procedure.

Seidlmayer⁶⁰ has had an interesting experience with the phage treatment of bacillary dysentery in children coming to a Munich pediatric clinic during the three year period 1936-1938. As far as was possible, alternate cases were selected for the treated and control groups. Most of the patients had Kruse-Sonne infections and those to whom phage was administered received from 8 to 12 cc. by mouth; the rectal route was employed only occasionally. For thirty-one phage-treated cases the average period elapsing before normal stools were obtained was nine days; among forty controls the corresponding figure was 19.1 days. The phage-treated patients were bacteria free in some 7.6 days, while the controls averaged 12.5 days. Phage treatment appeared to have no influence on the duration of the febrile period. Seidlmayer concludes that phage therapy is well worth while and that it should be used along with dietetic measures in treating bacillary dysentery. Mikeladze and his co-workers⁶⁸ observed the effects of orally administered phage on the course of bacillary dysentery. In a group of twenty-one patients 13 per cent had complications and there was a mortality of 4.8 per cent as compared with 56 per cent of complications and a 15.6 per cent mortality in a control group numbering sixty-three patients, all of whom received symptomatic treatment. These authors feel that the early use of phage in bacillary dysentery

aborts the disease and that when it is used late one still can expect amelioration of symptoms and reduced mortality.

Even if the best of statistics are accepted, the long period of time elapsing before improvement is noted would indicate that actual lytic destruction of bacteria by phage plays no role in recovery from bacillary dysentery. If it did, one might reasonably expect prompt extinction of the incitant and an early restitutio ad integrum. As it is, an average of from nine to fifteen days is required to render the patients symptom free. This would coincide better with the time element involved in certain of the host immune reactions already considered (fig. 3).

Phage therapy in typhoid or paratyphoid fever has not been an unequivocal success. To quote the earlier experience as analyzed by Eaton and Bayne-Jones,¹ "This brief summary of some of the literature on the treatment of typhoid with bacteriophage indicates that this agent has, apparently, no striking effect on the course of the disease except perhaps on the production of reactions followed by temporary relief. Especially is this the case in patients treated by injection of the lytic agent." We have not found anything in the recent literature to suggest that this is an understatement of the case for phage. Peragallo and Scuti,⁶⁹ for example, noted that the appearance of antityphoid phage in the natural course of typhoid is most irregular and has no direct bearing on the patient's recovery. However, phage therapy in their hands usually lessened the duration of the illness and reduced the temperature. They gave 2 cc. amounts of phage intramuscularly and 10 cc. by mouth to seven patients and report that with two exceptions they showed general improvement when compared with four untreated controls. One of the patients to whom phage was given died, and another failed to respond objectively or subjectively. These data do not furnish a particularly weighty argument for the value of phage therapy especially when compared with some of the results reported following the use of typhoid vaccine. In the series of Gay and Chickering⁷⁰ fifty-three patients suffering from typhoid were given intravenous injections of a sensitized typhoid vaccine. Approximately one third of these patients experienced a precipitate fall of temperature and a striking remission of symptoms; to all intents and purposes the disease was aborted. Another third of the patients showed distinct improvement after each of several injections, but the benefits were not permanent; the rest remained completely unaffected by the treatment. The careful use of ordinary unsensitized typhoid vaccine will accomplish just as much (Fairley⁷¹). While individual case reports in some of the phage studies are very impressive, so are the records of many of the vaccine treated patients, and, in our opinion, the statistical evidence in the latter group is considerably better than that collected for phage therapy.

Much of the earlier activity in the field of phage therapy was stimulated by d'Herelle's report⁷² of the dramatic results obtained in the treatment and prophylaxis

of cholera. He stated that the simple administration of phage by mouth to patients who had the disease reduced the mortality from 62 per cent to 8 per cent, while the addition of phage to wells in cholera areas served effectively as a prophylactic measure and sufficed to terminate the epidemics. These therapeutic and prophylactic procedures are corollaries to d'Herelle's major thesis, namely that all natural recovery from disease is brought about either by the adaptation of ubiquitous phages to the pathogen in question or by the acquisition of an active phage from the external environment. In cholera the theory dictates that the convalescent patient already has effected the necessary adaptation and henceforth, under the primitive sanitary conditions obtaining in cholera areas, serves as a disseminator of the means of recovery.

There is reason to doubt that the major factor in the natural history of epidemics, cholera or other diseases, is the spontaneous appearance and spread of active phages in the population at risk. Both the previously summarized data on bacillary dysentery and numerous reports on cholera point in this direction, e. g. the work of Taylor, Greval and Thant.⁷³ These authors were able to recover anticholera phage only occasionally from the stools of cholera convalescents; they consider, therefore, that recovery is independent of phage action. Doorenbos⁷⁴ quotes some interesting figures on the reduction of the case mortality rates during epidemics in several areas. He concludes that the waning of an epidemic is contingent on at least two other factors besides distribution of phage; first, the gradual immunization of the population by natural vaccination and, second, the diminution in the virulence and toxogenicity of *Vibrio comma*. Morison and his co-workers⁷⁵ attach more importance to phage distribution. In Indian locations studied by them while epidemics were in progress it was observed that the usual drop in case mortality occurred in one zone where conditions promoted the natural spread of phage but not in another where existing circumstances were unfavorable to phage distribution. This may be termed suggestive evidence but is hardly more than that. As far as we have been able to determine, the literature to date contains no scientifically acceptable proof that the recovery of the individual or the decline of an epidemic is dependent on the appearance and distribution of an anticholera phage.

Morison⁷⁶ and his co-workers have conducted careful and extensive field studies in India on the prophylactic and therapeutic value of phage in cholera. Only an outline of their most significant experiments, supervised from the Pasteur Institute at Shillong, Assam, can be presented here. The Nowgong district of 3,898 square miles with a population of some 563,000 had been subject to regular epidemics of cholera. The triennial death rate from the disease for the period 1919 to 1929 was 39.2 per 10,000. In 1929, during an outbreak, phage was distributed and within twenty-four hours a decided change for the better in the course of the epidemic was noted. Subsequently dysentery-cholera phage was made available for all cases of diarrhea with the result that the area has been cholera

free for five years (ten epidemic seasons) although severe cholera has developed in three adjacent districts. In one of these, the southern control district of Habiganj, phage was dispensed during 1932 while the surrounding territories were supplied with cholera vaccine. In September 1932 severe cholera flared up in the latter district but not in Habiganj. At a later date three small Habiganj village outbreaks appeared, all of which lasted a very short time.

These observations are certainly suggestive and warrant continuation of the prophylactic program despite objections based on less favorable results and on the notorious capriciousness of cholera. Raynal⁷⁷ has reviewed the Indian cholera experience and concludes that the prophylactic value of phage remains to be demonstrated. Omar⁷⁸ is not overenthusiastic about phage prophylaxis but believes that it has a tendency to reduce the case mortality rate.

The application of phage to the treatment of cholera has been undertaken on a large scale. Here again Morison and his colleagues⁷⁹ have accumulated data that cannot be lightly dismissed. Two extensive epidemics in the Assam Valley district of India were studied. In the first, 1,032 phage-treated patients had a mortality rate of 22.6 per cent as compared with a rate of 56.6 per cent among 2,411 controls. In the second, the corresponding figures were 21 per cent mortality for the phage-treated patients, 70 per cent for 958 untreated controls. In Morison's opinion the patients receiving phage were definitely less infective. He states that under ordinary circumstances 100 households of six persons each having one case per house can be expected to provide fifty-eight secondary cases. If phage is given in the primary cases, the secondary cases will be reduced to eighteen.

Pasricha and his co-workers⁸⁰ have conducted a careful experimental inquiry into the value of phage therapy. Of 1,369 cholera patients admitted to hospital during the year ending July 1935, 684 were given phage in addition to the usual hospital routine and 685 received the latter treatment alone. The two groups were made up of alternate admissions with no selection as to age, severity or other factors. Taken as a whole, the phage-treated patients, who were given 2.0 cc. of cholera phage every four hours, had a slightly lower gross mortality rate than the control patients, but the difference was not statistically significant. When the data are analyzed, a somewhat more encouraging picture is presented. Of 398 bacteriologically positive phage-treated patients, 85 per cent passed agglutinable organisms. The mortality in this selected group was only 8.3 per cent in contrast to a mortality rate of 20.6 per cent among 369 patients who passed agglutinable vibrios but received no phage. For some unknown reason the phage treatment of patients infected within inagglutinable strains of *Vibrio comma* gave unfavorable results. Of sixty-one such cases phage therapy was attended by a mortality rate of 8.2 per cent as compared with a figure of 4.7 per cent among seventy-four controls. The authors state that the phage-treated patients have less toxemia, are not as dehydrated, show a lower incidence of complications and shed vibrios for a shorter period than the untreated controls.

In the light of the data accruing from the work of Morison and his assistants under field conditions in the villages of Assam, and from the hospital observations of Pasricha and his collaborators, it is apparent that the use of anticholera phage prophylactically and therapeutically deserves further trial. Certainly the earlier negative results of Taylor, Greval and Thant,⁷³ Souchard⁸¹ and others should not be permitted to stand in the way of thoroughgoing clinical tests, and just as certainly the work should be carried out under the most rigorously controlled conditions.

2. Pyodermias, Bacteremias and Other Suppurative Conditions.—(a) *Pyodermias*: The treatment of the pyodermias constitutes one of the early extensions of phage theory to actual clinical practice, and the medical periodicals from 1921 up to the present time contain numerous accounts of the successes observed (Bruynoghe and Maisin,⁸² Gratia,⁸³ Gougerot and Peyre⁸⁴ and others). American authors as well as French have reported favorably on the use of phage in treating boils, general furunculosis and carbuncles. For example, Stout⁸⁵ summarizes the results in some 1,500 cases as follows:

- A. In simple boils, 85 per cent of successes.
- B. In generalized furunculosis, 75 per cent of successes.
- C. In chronic furunculosis, 60 per cent of successes.
- D. In carbuncles, irregular results.

Cipollaro and Sheplar⁸⁶ found phage therapy satisfactory in forty-eight (78 per cent) of sixty-two patients suffering from furunculosis and in all of five cases of carbuncles. Rice⁸⁷ has collected data on sixty-six patients with boils and carbuncles to whom phage was administered; excellent results followed in fifty-five (83 per cent). In connection with staphylococcus phage preparations released through the Michigan Department of Health for the treatment of furunculosis, Larkum⁸⁸ reports on a total of 208 cases. In 78 per cent no further lesions developed up to a minimum of six months after treatment was completed and definite recurrences were noted in 19 per cent, although more than half of them were classified as mild. The results of another series⁸⁹ reported by several physicians are given in table 1.

More recent work reveals the same trend. Freund⁹⁰ considers phage of great value in aborting furuncles of the external auditory canal when applied early enough. He states that 98 per cent of these lesions can be resolved by either topical application or hypodermic injection of phage. Lampert, Boyce and McFetridge⁹¹ conclude that a large factor in the efficacious

use of phage is the daily application of generous amounts directly to the infected tissues. They obtained good end results in more than 90 per cent of 1,000 cases. Marion⁹² believes that a primary indication for the use of phage is the existence of large carbuncles and facial pyodermias and that, properly applied, phage therapy is the best measure available for their treatment. Steinmann⁹³ has successfully treated two cases of nasal furunculosis, complicated by extension toward the cavernous sinuses, with partially purified phage which he injected into the carotid arteries. The amounts used for each injection varied from 3 to 20 cc.; rapid cures were obtained in both cases. Eisfelder⁹⁴ used injections of phage and direct application of phage-soaked packs in treating furunculosis. He reports his observations in 378 cases, of which 134 were classified as multiple furunculosis. In his experience phage therapy can be relied on to clear up sties and simple boils within one to three days, often after a single application. Thirteen of his patients who had carbuncles of the upper lip recovered. Raiga⁹⁵ holds that phage therapy of staphylococcal infections is to be preferred to other means at our disposal because it represents the way nature effects a cure. He cites 2,759 cases of staphylococcal infection including 685 facial lesions, 1,968 boils and carbuncles elsewhere in the body and 106 instances of septicemia and osteomyelitis. While there is a lack of detailed information in his paper, it is interesting that the gross mortality rate for the entire group was 1.3 per cent and for the patients with facial lesions only 1.4 per cent.

Montant and Guinchard⁹⁶ have injected partially purified phage solutions directly into the brachial artery for the treatment of fourteen patients with hand lesions. They noted prompt alleviation of pain, improvement of lymphangitis and adenitis and a notable reduction in the duration of illness.

While some observers⁹⁷ have been well satisfied with the phage therapy of acne, others⁹⁸ have reported unfavorably. In one series⁹⁹ only fifteen of twenty-nine patients with acne received benefit (52 per cent). The same difference of opinion obtains with respect to sycosis. Stout⁹⁵ rarely noted improvement following the use of phage in treating this condition, and Cipollaro and Sheplar⁸⁶ report indifferent results in twenty-eight cases. On the other hand, Bruynoghe and Maisin⁸² and Gougerot and Peyre⁸⁴ were gratified with the results they have obtained following the repeated application of phage directly to the sycotic areas.

Despite the admitted difficulty of setting up adequate control groups, it is regrettable that this has not been attempted in the studies summarized. The great majority of staphylococcal lesions are self limited, and for this reason it is hard to determine an exact measure of efficiency for any therapeutic agent employed. It must be kept in mind that fully as good and in some instances better results with vaccines and toxoids have been recorded. As a case in point there follow the data

of Whitby,⁹⁸ who used injections of staphylococcus toxoid in treating patients suffering from various types of staphylococcal infections. Of 183 patients with boils, sties and carbuncles 133 (73 per cent) were cured and subsequently had no recurrences. Twenty per cent of the entire group were improved initially but later had recurrences, while only 7 per cent failed to respond. The same sort of results have been reported in work with staphylococcus vaccines.⁹⁹

It seems probable that the host response evoked by the injection of staphylococcus phage can be attributed to the specific and nonspecific immunizing fractions of the crude lysate (see section 2) and on this basis one might anticipate precisely what the available evidence indicates, namely that phage possesses no measurable degree of therapeutic superiority over properly prepared vaccines and toxoid. Its value when applied topically to pyodermias, infected wounds and so on is almost certainly not due to direct lytic destruction of bacteria but resides in the stimulus supplied to the local immune mechanism by the complex materials of the lysed cell suspension. As a matter of fact, a certain amount of this action is independent of either phage itself or bacterial derivatives, for it is known that broth alone can produce a pronounced rise in local tissue resistance (Gratia⁵⁶).

In connection with the general problem of phage administration there is reason to invoke the old dictum

TABLE 1.—Results in a Series Reported by Several Physicians

No. of Cases	Type of Infection	Benefited	
		Number	Per Cent
63.....	Furunculosis	44	70
16.....	Carbuncle	14	88

"primum non nocere." Although it is commonly believed that if phage sometimes does no good it at least can do no harm, reactions ranging from mild to severe were observed in 43 per cent of Larkum's patients receiving injections of phage⁸⁸ and in the majority of patients seen by Cipollaro and Sheplar⁸⁶ and by Bagley and Keller.¹⁰⁰ Very marked local reactions at times follow the use of phage instillations or wet dressings (Bruynoghe and Maisin,⁸² McKinley,¹⁰¹ Gougerot and Peyre⁸⁴) and distressing systemic upsets have been noted after oral ingestion of phage (Violle and Roure¹⁰²). Gowen³⁶ feels that phage applications in the treatment of facial furunculosis are responsible for exacerbations which eventually terminate favorably. Well controlled experimental studies suggest that a fair percentage of the reactions are due to the elaboration of either toxin (King, Boyd and Conlin⁵¹) or the Reynal spreading factor in the course of lysate preparation.

Altogether one gains the impression from the literature to date that staphylococcus phage preparations carefully prepared and intelligently used for systemic or local immunization in the conditions mentioned are

useful therapeutic agents with about the same indications for clinical application as staphylococcus vaccines and toxoid.

(b) Bacteremias: Invasion of the blood stream by staphylococci is recognized as a grave condition carrying a general mortality variously estimated at between 60 and 80 per cent. In the treatment of this condition by means of phage injections there have been several interesting clinical series. Dutton¹⁰³ had a case mortality of only 8.3 per cent in a group of twelve patients, although five of them may not have had true septicemia. If these five questionable cases are disregarded the mortality still is low (14.3 per cent). MacNeal and Frisbee¹⁰⁴ lost eight of fifteen patients (53 per cent) who were given intravenous injections of specially prepared phage at short intervals. Since then MacNeal and several of his colleagues¹⁰⁵ have had a more extensive experience. He uses an intensive dosage program, injecting phage around any local lesions every twenty-four to forty-eight hours and giving from 100 to 300 cc. of phage intravenously in divided doses until a shock reaction is produced. For from two to three days after the shock smaller intravenous doses are given twice a day. In a series of 100 cases the resultant case mortality was 75 per cent. MacNeal and Frisbee feel that intravenous administration of phage definitely benefits cases of staphylococcal septicemia chiefly through promoting phagocytosis and not by direct lytic action. Longacre, Jern and Meleney¹⁰⁶ have recently reported their results with the phage treatment of thirty-six cases of *Staphylococcus aureus* septicemia. Fifteen of their earlier patients were not given large amounts of phage and the mortality in this group was 73.3 per cent. The last twenty-one patients received what the authors consider to be adequate dosage and as a consequence the case fatality rate dropped to 28.5 per cent. For the whole group of thirty-six phage-treated patients the mortality was 47.2 per cent, while among fifty-four controls 81.4 per cent died. Longacre and his co-workers recommend the use of large amounts of phage as early as possible in the course of the disease. Others have observed as good results in smaller clinical series (Bréhant,¹⁰⁷ Sauvé¹⁰⁸ and Gilbert¹⁰⁹).

It is difficult to reconcile the enormous variation in phage dosage recommended by different investigators with the remarkably uniform end results. American investigators are practically unanimous in counseling the intravenous injection of from twenty to thirty times the amounts used by the French. The one element common to the two schools appears to be the regular induction of shock, and it may well be that this reaction coupled with stimulation of phagocytosis (see section 2) constitutes the essential mechanism at work here. Certainly it is not lysis of blood borne bacteria.

The best of the phage statistics relating to staphylococcal bacteremia are not superior to those obtained

with other therapeutic measures. During the past two years nine patients with proved staphylococcus invasion of the blood stream were seen in the service of Dr. Robert Sutherland at Cowell Memorial Hospital, University of California. They were treated with intravenous injection of large amounts of staphylococcus antitoxin and the intramuscular injection of citrated whole blood obtained from donors previously subjected to intensive immunization with staphylococcus undenatured bacterial antigen (Krueger and Fuendeling¹¹⁰). The mortality was 11 per cent. In another similar group occurring in the practice of several different physicians and comprising sixty-one cases, immune whole blood alone or immune blood plus antitoxin was employed with 18 per cent mortality. The chemotherapeutic approach to the problem likewise has been fruitful, as is evidenced by a reduction in the general mortality from an expected average of 70 per cent to less than 30 (Herrell and Brown¹¹¹).

As we see it, the acceptance of phage therapy as a routine procedure in the treatment of staphylococcal bacteremia should wait on the establishment of a greater body of adequate data. The completely negative results attending the use of phage in experimental septicemia under the most favorable conditions and the uncertain rationale as compared with that demonstrated for each of several other procedures (e. g. administration of antitoxin, blood from immunized donors, chemotherapeutic agents) warrant the conclusion that, as yet, phage therapy is not a method of choice.

(c) Various Suppurative Conditions: Reports on the application of phage therapy to the treatment of various suppurative conditions besides those already considered are numerous, but the great body of this material consists of isolated observations and small clinical series from which conclusions have been drawn without the benefit of either control groups or sufficient bacteriologic data. Although the general tone of the published results is favorable and occasionally enthusiastic, it is not sufficient to offset a serious lack of acceptable scientific evidence. In submitting the following summaries of some of these papers, it is our conviction that they represent interesting clinical experiences rather than rigorous proof establishing phage therapy as a chosen procedure; they indicate clearly the direction future work should take if satisfactory data are to be accumulated.

Boyce, Lampert and McFetridge¹¹² have used phage in the treatment of approximately 1,000 patients with wound infections, abscesses, cellulitis, furuncles and carbuncles. Their record of 90 per cent of successes, they believe, is due to the continuous application of large amounts of phage directly to the infected tissues. Schultz⁸⁹ noted that 47 per cent of seventeen wound infections were improved by phage, while Rice⁸⁷ obtained excellent results in 91 per cent of forty-four cases. Dutton,¹⁰³ McKinley¹⁰¹ and MacNeal¹¹³ report much the same sort of experience.

Rice,⁸⁷ Rixford¹¹⁴ and Ruddell, Sicks and Loomis¹¹⁵ employed phage for the treatment of peritonitis and

appendical abscess. In the series of Ruddell and his co-workers the phage was placed in the peritoneal cavity at the time of operation with a resultant mortality among twenty-seven patients of only 11 per cent. Tsouloukidzé¹¹⁶ hails phage therapy as "the greatest medical discovery." In five years' experience he observed the clinical courses of forty-seven patients who were operated on for intestinal perforation during typhoid. Of twenty-seven patients treated with surgery alone twenty-four died (mortality 89 per cent); of twenty to whom phage was administered after operation seven died (mortality 35 per cent). King¹¹⁷ describes a small series of phage-treated cases of peritonitis arising as complications of acute appendicitis. He believes that phage has possibilities in this condition and urges its further investigation.

Morrison and Gardner¹¹⁸ have reported careful observations on the use of phage in the treatment of a patient with lung abscess following peritonitis. The abscess developed from an infected embolus and was associated with massive collapse of the left lung and empyema. Surgical measures and repeated irrigations with physiologic solution of sodium chloride for five days failed to control the suppurative process. Within twenty-four hours after the instillation of 30 cc. of phage the necrotic character of the infected area was gone and the patient made an uneventful recovery. Moore¹¹⁹ recommends phage as an adjunct to the general therapy of pulmonary suppuration. Five cc. of mixed staphylococcus-streptococcus phage is instilled into the abscess. Bronchoscopic treatments, vaccine and phage are administered over a long period of time, usually about five months. Thirteen of twenty-three patients were definitely improved by this regimen but it is not possible to evaluate clearly the role played by phage.

Albee¹²⁰ subscribes to d'Herelle's concept that the appearance of phage in infected tissues is a major element in the normal process of host recovery. He has found active phages in some 94 per cent of exudates from acute and chronic cases of osteomyelitis and it is his belief that the efficacy of the Orr closed treatment of osteomyelitis resides in the exceptionally favorable conditions afforded for the spontaneous development of phage. The general routine of immobilization and dressing employed by Albee is in keeping with the best of modern nonintervention teaching, but it does not follow that the results observed are due to native phage. We have not been able to isolate phages from the exudates in cases of osteomyelitis with anything like the frequency reported by Albee, nor when phages have occurred could we relate them to the patient's clinical progress. Albee recommends the paraffin-petrolatum tampon in which a catheter is incorporated for the periodic introduction of phage. He also reports the successful use of phage in clearing up a carrier of *Eberthella typhi* who had positive urine, blood, bile and bone abscess cultures.¹²¹

While similar favorable results following the use of phage in osteomyelitis have been observed by Larkum,⁸⁸ MacNeal¹²² and Raiga,¹²³ other investigators have not received such a good impression. For example, Boyce, Lampert and McFetridge¹²⁴ could not discern any striking effect due to phage which had been administered to ten patients with osteomyelitis. Bagley and Keller¹⁰⁰ found that no improvement ensued when phage dressings were applied to three of their patients with bone lesions caused by organisms other than the staphylococcus. Despite the local and systemic administration of phage to three other patients who presented septicemic complications, two died. Of four patients with uncomplicated staphylococcal osteomyelitis three recovered and one died. Rice⁸⁷ obtained excellent results in four of eleven cases of osteomyelitis treated with phage but he is not enthusiastic about its use in this field.

Stout⁸⁵ records the recovery of two patients suffering from staphylococcal meningitis after the use of phage. Schless¹²⁵ gives a more detailed account of a similar case in which staphylococci were isolated from the spinal fluid on three successive days; during this time the blood culture remained negative. Within twenty-four hours after the intrathecal injection of phage the spinal fluid became sterile and the clinical picture improved. Frank¹²⁶ used phage intravenously early in the treatment of a case of staphylococcal

TABLE 2.—Schreuder's Results

	Definitely Improved	Slightly Improved	Unimproved
29 phage-treated cases..	34.5%	31.0%	34.5%
31 saline-treated cases..	52.0%	32.0%	16.0%

meningitis complicated by septicemia. Later in the course of the disease the phage was given intraspinally but the patient failed to respond and finally died.

Although phage has been used on a fairly large scale in the treatment of acute respiratory infections there is no evidence to show that it has any real influence on their clinical course. In 1933 Schreuder¹²⁷ gave injections of phage to 169 patients presenting symptoms of the common cold. All had acquired the infection within a forty-eight hour period prior to treatment and each patient received injections of phage on three successive days. Thirty-nine per cent were definitely improved, 38 per cent noted slight benefit and 23 per cent were unimproved. In order to extend these observations, Schreuder conducted a similar experiment during the winter of 1934-1935 but this time included a control group, the members of which received injections of saline solution instead of phage. The results are summarized in table 2. Schreuder concludes that the subcutaneous injection of phage is of no demonstrable value in acute colds.

Ruskin¹²⁸ states that he has found phage therapy helpful in cases of recurrent acute nasal infection, but practically continuous treatment was required to produce any benefit. For the phage treatment of sinusitis he stresses the necessity of avoiding chemical antiseptics and recommends the topical use of large amounts of phage. Hosen and Signorelli¹²⁹ believe that the administration of phage-lysed suspensions of the common respiratory invaders during the early stages of the common cold will serve to prevent many of the complications such as chronic sinusitis or bronchitis. Halphen¹³⁰ has not obtained good results with phage in treating chronic maxillary sinusitis, otitis media or chronic mastoiditis but considers it valuable for furunculosis of the ear canal, ozena and tonsillar phlegmon.

Dechaume¹³¹ has developed a technic for the application of phage in cases of maxillary osteitis. He states that the results in his hands have been both good and remarkably rapid, but one cannot tell from his paper on what clinical background this opinion is based nor is there evidence of critical comparison with other modes of treatment. Raiga¹³² cites fifty-two cases of odontopathic phlegmon in which phage therapy was found to be helpful.

3. Urinary Tract Infections.—Theoretically, uncomplicated infections of the urinary tract should offer potentialities for the application of phage therapy. They are usually well localized processes and the tissues involved are readily accessible, so that almost any desired amount of phage can be brought into contact with them. Nevertheless there is little in the published results to suggest that phage therapy has any significant superiority over the common chemotherapeutic approaches (mandelic acid, sulfanilamide and so on).

The optimal procedure for administering phage to patients with urinary tract infections seems to comprise a combination of subcutaneous or intramuscular injection and instillation directly into the bladder or kidney pelves. Zdansky¹³³ obtained 30 per cent of cures among a total of twenty cases of cystitis in which he administered bladder instillations. Approximately the same percentage of favorable results is reported by Munter and Boenheim¹³⁴ following intramuscular injection of phage into thirteen children with cystitis. Cowie¹³⁵ used subcutaneous injections alone in treating eleven cases of urinary tract infection. Six acute cases were cured in from three to five days, but only one patient of five with chronic infections showed permanent benefit. Cline¹³⁶ successfully treated twelve of fourteen children suffering from pyelitis by means of phage administered subcutaneously.

Dalsace¹³⁷ gave phage by the oral, subcutaneous and intramuscular routes to nine patients with staphylococcal

infections of the urinary tract and to twelve who had *Bacillus coli* infections. In the former group six were cured, in the latter only two, although eight others showed some improvement. Wehrbein¹³⁸ has found phage helpful in treating superficial genito-urinary infections but of no value in cases of kidney abscess, vesiculitis or prostatitis. Among a group of ten patients who had acute pyelitis seven were cured by a single topical application. The results in chronic pyelitis were less impressive, there being only five cures (21 per cent) among twenty-four cases. This coincides well with the observations of Krueger, Faber and Schultz,¹³⁹ who combined bladder instillations and subcutaneous injections for administering phage to thirty-five selected patients with chronic uncomplicated urinary tract infections. Four (11 per cent) were promptly cured; of twenty-five patients (72 per cent) who gradually recovered, the response was not clearly attributable to the phage. Christiansen¹⁴⁰ has reported the same sort of data. Schultz¹⁴¹ supplied phage to physicians for treatment of urinary tract infections and has analyzed the reports submitted to him. Including both cured and improved patients in one group there were seventy-two favorable responses (48 per cent) out of 151 patients treated. Seventeen of the seventy-two subsequently had recurrences and, if this is allowed for, the favorable results are reduced to fifty-five cases (36 per cent).

While some authors claim to have had considerably better results with phage therapy in chronic urinary tract infections (Frisch,¹⁴² Voss,¹⁴³ Michon¹⁴⁴), the collected statistics in general do not afford convincing evidence of its value. There are several fundamental factors operating against attainment of bacteriophage in the bladders or kidney pelves of these patients. Under ordinary conditions, phage introduced into the urinary tract is subject to constant dilution, with the result that it may be completely washed out inside of twenty-four hours (Larkum,¹⁴⁵ Zdansky¹³³). The diluting menstium, urine, contains materials such as dead bacteria and tissue debris which actually bind phage and prevent its participation in the reaction with living organisms (see section 2). At times the phage may persist in the urinary tract for months without, however, exerting any appreciable effect on the clinical course of the infection (Caldwell¹⁴⁶). This is due to the fact that certain strains of bacteria are lysogenic and act as phage carriers but do not themselves undergo massive cellular lysis. In pyelitis or cystitis secondary to kidney abscess, renal tuberculosis, hydronephrosis, ureteral stricture, and so on, there is practically universal agreement that phage therapy is of no permanent value (Hinman,¹⁴⁷ Ravina,¹⁴⁸ Wehrbein¹³⁸). The uncompli-

cated acute cases which respond best of all to the administration of phage are equally responsive to other therapeutic measures.

Relatively little work has been done with the phage treatment of gonorrhea. In fact it appears that investigators reporting clinical series under this heading have not utilized a true phage. For example, Pelouze and Schofield¹⁴⁹ observed in filtered aqueous extracts made from old cultures of gonococci an agent capable of killing gonococci within five to twenty-four hours. This so-called "gono-phage" failed to produce plaques in agar cultures of gonococci and did not induce the characteristic clearing of gonococcus suspensions. Since its reported properties do not fulfil the criteria established for bacteriophages, the use of the term "gono-phage" does not seem justified. Schmidt-La Baume and Fonrobert¹⁵⁰ as well as Balozet and Lepinay¹⁵¹ have been unable to demonstrate a true phage active against the gonococcus. They found, however, that filtrates of gonococcus cultures regularly contained a growth inhibitor for this organism.

Regardless of the nature of the material studied by Pelouze and Schofield, it was employed in the treatment of forty patients with acute gonorrhea. Some suggestive results were obtained but there was no definite evidence that the course or duration of the disease was influenced. In fact, Pelouze and Schofield have taken pains to point out the very definite limitations of gonophage therapy. More recently Burnet and Salberg¹⁵² have described a disappointing experience with the topical use of gonococcus lysate incorporated in a jelly. Among a group of eighty-eight women suffering from gonorrhea, all of whom received treatments with the lysate, extension of the infection to the pelvic organs occurred in 35 per cent. This represented three times the expected incidence. In 75 per cent of the patients who had such complications the pelvic involvement took place within three weeks, i. e. much earlier than would normally be anticipated. The authors conclude that the lysate somehow altered the local tissue response and thus contributed to upward dissemination of organisms. They are convinced that severe peritoneal irritation is a common accompaniment of the lysate treatment and therefore condemn its use.

SUMMARY AND CONCLUSIONS

1. The nature of bacteriophage is no longer in question. It is a protein of high molecular weight and appears to be formed from a precursor originating within the bacterium. There is evidence that the precursor likewise is a protein and that it is synthesized by the cell during a phase of accelerated metabolic activity. The process by which the inactive precursor is transformed into active phage is catalyzed by phage; i. e., the primary reaction is:

Inactive Phage precursor + Phage \longrightarrow Phage

2. For all practical purposes phage production proceeds at a significant rate only when the environment permits bacterial growth and concomitant synthesis of precursor. The most prominent phase of bacteriophagy,

massive dissolution of the susceptible bacteria, takes place when enough phage has accumulated to raise the phage/bacteria ratio to the critical lytic threshold.

While phage action in vitro is spectacularly effective in bringing about bacterial destruction, bacteriophagy in vivo operates on a much less efficient scale and plays a negligible part in the clinical application of phage. There is no substantial evidence that the spontaneous development of phage in the infected host has any bearing on the process of recovery.

Four alternative mechanisms by means of which lysates conceivably may exert a beneficial therapeutic effect include:

(a) Phage-induced dissociation of less virulent variants from the original pathogenic invader.

(b) Augmentation of phagocytic efficiency through phage action.

(c) Stimulation of specific antibacterial immunity in the host by antigenic fractions of lysed organisms.

(d) Activation of specific or nonspecific immune mechanisms of the host by entirely nonspecific elements in the lysate.

The first of these is of little more than possible significance but the last three are unquestionably important and completely outweigh the long overstressed theory that lysis of bacteria in vivo is responsible for the clinical successes of phage therapy.

3. The reported data on the use of phage in various diseases caused by bacteria are for the most part insufficient to establish phage therapy as a method of choice. Only rarely have these studies included an adequate bacteriologic background, control groups or careful comparison with accepted therapeutic procedures. There is evidence, however, that a properly prepared lysate can serve satisfactorily as:

(a) A vaccine for the treatment of certain diseases, e. g. some types of staphylococcal lesions.

(b) An agent for the induction of nonspecific protein shock in syndromes in which at times such shock may be used to good purpose, e. g. typhoid.

(c) A measure for enhancing the general resistance of an infected area when applied topically. This depends on its nonspecific action in mobilizing macrophages and microphages.

It is equally evident that phage solutions possess no measurable degree of superiority over well known and accepted preparations employed for the same purposes; for example, bacterial vaccine and toxoid in carbuncles and furunculosis or typhoid vaccine in nonspecific protein shock therapy. Modern chemotherapeutic approaches to the treatment of a variety of conditions for which phage has been recommended (cystitis, pyelitis, gonorrhea, certain bacteremias) offer more chances of success than does phage.

While it has become almost axiomatic to state that the use of phage is entirely innocuous, we have not found this to be the case. The literature provides numerous accounts of reactions ranging from mild to severe following the injection, local application or ingestion of phage, and animal experimental work has shown that lysates may contain enough soluble toxin or Reynal's spreading factor to be actually dangerous.

4. Although it is admittedly very difficult to arrive at definite conclusions regarding the efficacy of any therapeutic agent used for the treatment of certain diseases, the accumulated clinical data on phage are in some instances highly suggestive and warrant the continuation of further studies under thoroughly controlled conditions. This is particularly true of cholera.

THE DIET OF THE AMERICAN SOLDIER

Food is one of the most important single factors in maintaining good morale among soldiers. The rigors of military life, particularly during warfare, tax to the utmost the physical and mental stamina. Recently Lieut. Col. Paul P. Logan,¹ chief of the Subsistence Branch of the Office of the Quartermaster General, has answered fully the query as to how the American soldier is fed.

The composition of the ration, or food which is provided for each soldier daily, may vary considerably depending on circumstances. Thus the diet of men in the field during warfare may be quite different from that of those in garrisons far from the scenes of conflict. The ration of the garrison provides all the constituents of a properly balanced diet and includes among other items a variety of meats, vegetables, fruits and beverages. The rations issued in the field are, of course, influenced by the fact that the food supply lines may be disturbed or interrupted. For this reason extra quantities of nonperishable materials are carried on truck trains which accompany the troops. Each man has, moreover, a reserve of food which he carries as part of his personal equipment. Among field rations there are a number of types. Field ration A, for example, which is issued whenever circumstances permit, conforms closely to the garrison ration and includes such items as fresh meats, bread, butter and possibly fresh fruit and vegetables. Field ration B includes canned meats, evaporated milk, hard bread and similar relatively nonperishable provisions which do not require refrigeration. This ration is intended for use when circumstances, such as failure of transportation, make it impossible to issue the more desirable type A. Type C ration, consisting of six cans of prepared food, is also available for use when conditions prevent the issuance of types A or B. The cans contain different combinations of meat and vegetables, whole milk crackers, cube sugar and a chocolate wafer. This ration may be eaten hot or cold

and is carried by the soldier as part of his equipment. A comparatively simple emergency ration, consisting merely of sweetened chocolate bars containing oat flour, has also been designed and is intended for use when all other food supplies are lacking.

While the garrison diet of soldiers may be excellent, the food of men in the field may at times be deficient both in quantity and in quality. Fortunately, as pointed out by Logan, fighting units do not generally remain in the combat zone for a long time. Although it may be difficult to insure a well balanced diet to men in the zone of combat, everything possible is done to feed them adequately under all conditions. Many problems relating to the nutritional adequacy of the diet of the military forces are being intensively studied. No doubt these and the problems relating to certain diets will be considered in the National Nutrition Conference for Defense announced for May 26.

CASE FINDING IN TUBERCULOSIS

Basic in the success of public health efforts for the control of tuberculosis is the widespread application of adequate methods for finding active and infectious cases. Important developments in this field promise still further inroads on the morbidity and mortality from this condition, the diminishing death rate of which has been one of the spectacular phenomena of the past generation. Probably tuberculosis, as a major public health menace, could be brought under control by the use of knowledge and technics now at hand.

The methods now in use for detecting tuberculosis are varied. The procedure may start with a complete physical examination, followed by a tuberculin test. If any indication of the disease is found, a roentgenogram of the chest is made. In some places mass examinations are conducted which include the taking of a full sized roentgenogram of every person examined. Sometimes all other procedures are omitted on the first examination.¹ Such extremes in technic are under attack, the first as being cumbersome and ineffective and the second as unnecessarily expensive.

Early tuberculosis rarely causes symptoms and in most cases is not detectable by physical examination. However, physical examination, accompanied by the usual laboratory procedures, must always be made in the evaluation of the disease process, once found or suspected. Case finding involves recognition of the disease among large groups of people with the greatest possible speed and efficiency.

Present day effort centers on a compromise between the extremes of procedure, with the development of effective but relatively inexpensive methods for "screening" large numbers of persons, followed by complete

1. Edwards, Herbert R.: Tuberculosis Case Finding: Studies in Mass Surveys, Am. Rev. Tuberc. (supp.) 41: 3 (June) 1940.

examination of those found to be positive or suggestive by the screening method used. The time honored screening method is the tuberculin test, which can be applied either with or without physical examination.² There seems to be a tendency away from this test,³ although it is still vigorously defended. For the most part, the modern approach to case finding is by adaptations of the roentgen ray technic to avoid the expense of material and processing for full sized film in every case.

First is application of the fluoroscope.⁴ In competent hands this is both highly effective and relatively inexpensive as a means of finding suggestive and positive cases for further examination, and of eliminating negative cases. Second is the miniature roentgenogram,⁵ which depends on photographing the fluoroscopic image on a small film. For this purpose both the 35 mm. motion picture film and the 4 by 5 inch film have been used. The former has the advantage of lower cost for material and processing, and the disadvantage that it must be enlarged, ordinarily by projection, for interpretation. The relative merits of the various methods proposed are technical and economic questions to be decided on the basis of further experience.

Efficacy of any case finding program in tuberculosis depends only in part on the technics employed in examination. Behind this is the broader question of the selection of groups for examination and of bringing them under observation. With the change in technics there is a corresponding shift from a passive attitude in case finding, which leaves the initiative in seeking examination to the individual, perhaps encouraged by health education efforts, to more aggressive programs which provide machinery to look for cases where they are presumed to exist. This has led to mass examinations in industries, in schools and colleges, in prisons, among some occupational and racial groups and among pregnant women, and even house to house canvasses. The success of such efforts may be expected to influence to a considerable degree the management of the tuberculosis problems which will arise under recruiting for the defense program.

Bloch and his collaborators⁴ have recently made a strong case for centering case finding efforts in out-

patient clinics. In their words, "a clinic offers the opportunity to conduct a routine roentgenologic search of the populace without the necessity of solicitation." As a result of their experience they suggest that roentgenologic examination of the chest, which they carried out by means of the fluoroscope, should become a routine procedure in all medical institutions. They draw the analogy with the Wassermann reaction and point out that the returns from routine fluoroscopy, in persons not under suspicion, are at least as great as those from routine serologic tests. A by-product of these examinations, and one which adds weight to the argument in their favor, has been the finding of an unexpected number of cases of disorders in the chest other than tuberculosis.

With the development of new technics in examination and with a more aggressive attitude in the search for active cases of tuberculosis the public health aspects of this disease enter a new phase. One of the first results of the new approach, where it has been applied extensively, is an increase in the incidence of reported cases and in the number of deaths recognized as due to tuberculosis. Another initial effect of efficient case finding is the reversal of the relative proportions of minimal and advanced tuberculosis, the latter having always been predominant among institutionalized patients. The bringing of a larger proportion of the active cases in a community under observation and control will tend, in the long run, to a decrease in the actual incidence and death rate.

Current Comment

IMPAIRED JUDGMENT FROM SULFANILAMIDE

Many therapeutically effective drugs influence the physiologic mechanisms, psychomotor reactions or judgment of persons who take them. When given to patients at rest in bed such drugs have been established as beneficial to the patient and of course harmless to other persons. Under some circumstances, however, drugs may have effects potentially dangerous to both patient and community. Not long ago a locomotive engineer who was taking sulfanilamide for an infection of the bladder was involved in an accident in which considerable property damage was done and a number of people were injured. He described the event as follows:

Approaching the station where the accident occurred, a feeling of lassitude seems to have crept over me unawares and to the extent that I do not have much recollection of what went on for the last two or three miles. I was sitting on my seat, looking out and feeling that I was on the alert. . . . Actually I was not on the job with all my faculties. I passed landmarks customarily used to locate position without seeing them, even to the station board; and it was only when the hazard became imminent that I was aroused out of it and became efficient.

Already physicians have ruled that airplane pilots must not fly until four days have elapsed after they have received any of the sulfonamide group. Patients engaged in mechanical work of any kind should not take sulfanilamide except when relieved from their responsibilities. Physicians thus have a definite obligation when prescribing sulfanilamide. Patients should be cautioned preferably to stay at home and at rest while taking the drug and not to drive an automobile, make any important decision or sign any papers while the drug is being administered. Such recommendations seem especially advisable in view of the insidiously developing reactions of sulfanilamide when compared with such drugs as the bromides and the barbiturates.

U. S. GOVERNMENT VS. AMERICAN MEDICAL ASSOCIATION ET AL.

In this issue of *THE JOURNAL* appears the final instalment of the proceedings of the trial of the U. S. Government versus the American Medical Association and other defendants. In this instalment are included the final arguments presented to the jury by attorneys Lewin and Kelleher representing the government and William E. Leahy representing the American Medical Association. A careful reading of these arguments will provide a general résumé of the evidence as presented by each side and the interpretations placed on the evidence by the attorneys who spoke. As was published previously, the jury brought in a verdict which found the American Medical Association and the District of Columbia Medical Society guilty but all of the individual defendants not guilty. On May 2 attorneys for the American Medical Association and the other defendants appeared before the court and offered three motions which asked that the verdict of guilty be set aside and a judgment entered in favor of the two corporate defendants, another motion that there be an arrest of judgment, and a third motion that there be granted a new trial. At that time the court offered opportunity to attorneys for the defense and for the government to present additional briefs in support of this motion and opposed thereto on May 10, after which date the court would take the matter under advisement. At this time the court has not yet rendered a decision. No doubt the Board of Trustees and the House of Delegates of the Association at the session to be held in Cleveland, June 2 to 6, will give this matter further consideration as to the procedure to be followed in the future in the conduct of this case.

HEREDITARY TUBERCULOUS DIATHESIS

The establishment of six inbred strains of rabbits with different hereditary resistance to tuberculosis is reported by Lurie¹ of the Henry Phipps Institute, Philadelphia. Two of these families are hereditarily hypersusceptible to tuberculosis, one is hereditarily immune and three are of intermediate susceptibility. The fundamental difference between these family groups is in the degree to which the infection is limited to the port of entry. In tuberculosis naturally acquired by respiratory contagion the most resistant family confines

the disease to the lungs, with little or no dissemination to other parts of the body. In the two hypersusceptible families there is a rapid spread by lymph and blood stream. When members of the resistant family are injected intracutaneously with killed tubercle bacilli there is a rapid development of tuberculin sensitivity, with prompt appearance of high titer specific agglutinins. On control vaccination the hypersusceptible family groups develop little or no allergic sensitivity, with almost no formation of specific agglutinins. If these two contrasting groups are afterward injected intracutaneously with living virulent tubercle bacilli, the resistant family develops local lesions which rapidly heal. They quickly develop a local tissue immunity, the local mononuclear cells acquiring the capacity of inhibiting the growth of ingested tubercle bacilli. In the hypersusceptible groups the local lesions show almost no tendency to heal, and the local macrophages do not develop intracellular bacteriostatic properties. The ingested tubercle bacilli multiply rapidly in the cytoplasm of these hypersusceptible cells. An intermediate degree of local macrophagic immunity is shown by families of intermediate resistance. Breeding experiments between resistance and susceptible family groups are now in progress.

MIXTURES CONTAINING ACETANILID

Three articles on health hazards in acetanilid-containing nostrums and mixtures appeared in the September, October and November issues of the *Journal of the American Dental Association*. The author, Dr. Paul J. Hanzlik, professor of pharmacology at Stanford University School of Medicine, points out how frequently the medical profession and the public may come in contact with acetanilid mixtures. Often the name under which the product is marketed is so misleading that a true concept of the ingredients must be gained from other information. The pharmaceutical industry "boasts" of disposing of "tons" of acetanilid in the United States. Hence it is not surprising that the problem of chronic and acute intoxication should arise. Hanzlik's three papers delve into the problem of chronic intoxication, discuss chronic effects, which include such symptoms as anorexia, impaired nutrition, loss of body weight, anemia, diminished resistance to intercurrent infections, lassitude, dizziness, headaches and apathy; review the question of cyanosis and hemoglobin changes as sulfhemoglobinemia; pass on to an evaluation of addiction and abstinence symptoms and a comparison of the acute fatal and tolerated doses of acetanilid in animals and man, and end with a discussion of the nature of acetanilid analgesia and the analgesia and symptomatic relief by rational procedures other than the use of analgesic drugs. *THE JOURNAL* has repeatedly carried reports by the Council on Pharmacy and Chemistry and the Bureau of Investigation of the American Medical Association on the possible injurious effects of certain preparations containing acetanilid or other coal tar derivatives proposed for similar pharmacologic effects. The reports by Hanzlik offer an up to date and complete review on the dangers of acetanilid when subjected to promiscuous use.

MEDICAL PREPAREDNESS

In this section of The Journal each week will appear official notices by the Committee on Medical Preparedness of the American Medical Association, announcements by the Surgeon Generals of the Army, Navy and Public Health Service, and other governmental agencies dealing with medical preparedness, and such other information and announcements as will be useful to the medical profession.

ARMY RESERVE OFFICERS ORDERED TO ACTIVE DUTY

FIRST CORPS AREA

The following additional medical reserve corps officers have been ordered to extended active duty by the Commanding General, First Corps Area, which comprises the states of Maine, Vermont, New Hampshire, Rhode Island, Massachusetts and Connecticut:

CARY, Francis F., 1st Lieut., Springfield, Mass., Camp Edwards, Mass.
DENHOFF, Eric, 1st Lieut., Taunton, Mass., Fort Devens, Mass.

SECOND CORPS AREA

The following additional medical reserve corps officers have been ordered to active duty by the Commanding General, Second Corps Area, which comprises the states of New York, New Jersey and Delaware:

BAXT, Sydney J., 1st Lieut., Brooklyn, Headquarters 2d Military Area, New York.
BEACH, Philip A., 1st Lieut., New York, Camp Livingston, La.
BEIN, Morris, 1st Lieut., Brooklyn, Headquarters 2d Military Area, New York.
BELGOROD, Samuel H., 1st Lieut., New York, Camp Livingston, La.
BENENSON, William, 1st Lieut., Flushing, L. I., N. Y., Fort Benning, Ga.
BENSON, Murray, 1st Lieut., New York, Camp Lee, Va.
BOCKAR, Arnold, 1st Lieut., Warwick, N. Y., Headquarters 2d Military Area, N. Y.
BRESCHIA, James J., 1st Lieut., Montgomery, N. Y., Headquarters 2d Military Area, New York.
BROWN, Robert E., Captain, Mount Vernon, N. Y., Camp Livingston, La.
CAGAN, Aaron, 1st Lieut., Brooklyn, Fort Benning, Ga.
CANAAAN, Robert, 1st Lieut., Forest Hills, N. Y., Carlisle Barracks, Pa.
CAVUOTI, Michael A., 1st Lieut., Greenvale, L. I., N. Y., Camp Lee, Va.
CHARTERS, Raphael R., 1st Lieut., Brooklyn, New York Port of Embarkment (Army Base), Brooklyn.
CHIRICO, Dominic F., 1st Lieut., Brooklyn, Fort Dix, N. J.
COCKERILL, Thomas J., 1st Lieut., New York, New York Port of Embarkment (Army Base), Brooklyn.
COLEMAN, Robert R., 1st Lieut., Queens Village, N. Y., Alabama Institute of Aeronautics, Tuscaloosa, Ala.
COSGROVE, Joseph V., 1st Lieut., New York, Carlisle Barracks, Pa.
DENEFF, Carl, 1st Lieut., Brooklyn, Fort Jackson, S. C.
DIAMOND, Joseph L., Captain, New York, Camp Stewart, Ga.
FARBER, Harry, 1st Lieut., Brooklyn, Fort Jackson, S. C.
FINE, Sydney G., 1st Lieut., Trenton, N. J., Camp Livingston, La.
FRANCO, Biagio, 1st Lieut., New York, Fort Bragg, N. C.
GIARDINA, Anthony L., Captain, Brooklyn, Fort Niagara, N. Y.
GLASS, Burt A., 1st Lieut., New York, Camp Blanding, Fla.
GLUCK, Roland, 1st Lieut., Brooklyn, Fort Totten, N. Y.
GRANGER, James R., 1st Lieut., New York, Headquarters 2d Military Area, New York.
GRAY, Philip, 1st Lieut., Brooklyn, Camp Lee, Va.
GREENBERG, Avrom M., 1st Lieut., Whitesville, N. Y., Camp Lee, Va.
GREENBERG, Samuel I., 1st Lieut., Brooklyn, Camp Croft, S. C.
HABER, Mordecai, 1st Lieut., New York, Fort Bragg, N. C.
HAIGHT, Julius R., 1st Lieut., Wingdale, N. Y., Fort Jackson, S. C.
HEAD, Arthur E., 1st Lieut., Gouverneur, N. Y., Fort DuPont, Del.
HOCH, Samuel, 1st Lieut., Lynbrook, L. I., N. Y., Camp Lee, Va.
HOROWITZ, Albert W., 1st Lieut., Brooklyn, Camp Lee, Va.
ISRAEL, Murray, 1st Lieut., Williston Park N. Y., Carlisle Barracks, Pa.
JASPIN, George, 1st Lieut., Rockville Center, N. Y., Fort DuPont, Del.
KABACK, Harry, 1st Lieut., New York, Camp Lee, Va.
KATZ, Sidney, 1st Lieut., New York, Fort Bragg, N. C.
KAUFMAN, Samuel S., 1st Lieut., New York, Carlisle Barracks, Pa.
KAUNITZ, Paul E., 1st Lieut., Brooklyn, Carlisle Barracks, Pa.
KELLY, William M., 1st Lieut., White Plains, N. Y., New York Port of Embarkment (Army Base), Brooklyn.
KIDDER, James H., 1st Lieut., Fort Dix, N. J., Carlisle Barracks, Pa.
LANDMANN, Heinz R., 1st Lieut., New York, Fort Benning, Ga.
LEADLEY, Jerome H., 1st Lieut., Rochester, N. Y., Fort Slocum, N. Y.
LEDERMAN, Solomon J., 1st Lieut., New York, Carlstrom Field, Fla.
LEE, Arthur B., 1st Lieut., Brooklyn, Fort Bragg, N. C.
LEVINE, Abraham I., 1st Lieut., Brooklyn, Graham Aviation Company, Americus, Ga.
LEVINE, Morris J., 1st Lieut., Atlantic City, N. J., Camp Claiborne, La.

HADFIELD, Jonathan P., Major, Fall River, Mass., Fort H. G. Wright, N. Y.
LEVIN, Robert M., 1st Lieut., Hartford, Conn., Camp Edwards, Mass.
MULHAIRE, Victor J., 1st Lieut., Hooksett, N. H., Camp Langdon, N. H.
NICHOLS, Arthur A., 1st Lieut., Newtonville, Mass., Camp Edwards, Mass.
PERKINS, George E., Lieut.-Col., Boston, Providence, R. I.
POLLOCK, Henry M., Jr., 1st Lieut., West Medford, Mass., Fort Devens, Mass.
WALKER, Robert, 1st Lieut., Cornwall, Conn., Fort Adams, R. I.

LEVINSON, Leonard J., 1st Lieut., Brooklyn, Fort DuPont, Del.
LOCASCIO, John, 1st Lieut., New York, Camp Lee, Va.
LONG, Hugh K., 1st Lieut., New York, Carlisle Barracks, Pa.
LYNCH, Vincent A., 1st Lieut., Rosedale, L. I., N. Y., Fort Bragg, N. C.
MACCA, Joseph A., 1st Lieut., Forest Hills, N. Y., Camp Blanding, Fla.
MALACH, Robert R., 1st Lieut., New York, Camp Forrest, Tenn.

NATIONAL NUTRITION CONFERENCE FOR DEFENSE

Five hundred persons interested in nutrition have been invited by Federal Security Administrator Paul V. McNutt to attend a National Nutrition Conference for Defense called by the President to be held at the Hotel Mayflower, Washington, D. C., May 26-28. The purpose of the conference is to assist in the formulation of a national nutrition policy and in the organization of a program of action. General sessions will be held each morning, and section meetings in the afternoons and evenings. Among speakers who are expected to address the conference are Vice President Henry A. Wallace, Secretary of Agriculture Claude R. Wickard, Assistant Secretary of State Adolf A. Berle Jr., Surgeon General Thomas Parran of the U. S. Public Health Service and Mr. McNutt.

EXAMINATIONS FOR APPOINTMENTS IN MEDICAL CORPS OF NAVY

The next examination for appointments as assistant surgeon, U. S. Navy (lieutenant [junior grade], Medical Corps, U. S. Navy) will be held at all major Medical Department activities on August 11 to 15 inclusive. Applications for this examination must be in the Bureau of Medicine and Surgery not later than July 15.

Applicants for appointment as assistant surgeon must be citizens of the United States, more than 21 but less than 32 years of age at the time of acceptance of appointment, and graduates of a class A medical school who have completed at least one year of intern training in a hospital accredited for intern training by the Council on Medical Education and Hospitals of the American Medical Association.

A circular of information listing physical and other requirements for appointment, subjects in which applicants are examined, application forms and other data pertaining to salary, allowances and so on may be obtained from the Bureau of Medicine and Surgery, Navy Department, Washington, D. C., on request.

An examination for appointment as acting assistant surgeon for intern training in naval hospitals accredited for intern training by the Council on Medical Education and Hospitals will be held at all major Medical Department activities on June 23 to 26 inclusive. Students in class A medical schools who will complete their medical education this year are eligible to apply for these appointments.

Students in class A medical schools who will have completed their third year of medical education this year are eligible to take this examination and, if successful, will receive their

appointments on or about July 1, 1942, after they have completed their medical education.

Applicants for appointment as acting assistant surgeon for intern training must be citizens of the United States, more than 21 but less than 32 years of age at the time of acceptance of appointment. Acting assistant surgeons are appointed for a period of eighteen months. After the appointee has served as an intern in a naval hospital for twelve months he is eligible for and may take the examination for appointment as assistant surgeon, U. S. Navy.

A circular of information listing physical and other requirements for appointment as acting assistant surgeon, subjects in which applicants are examined, application forms and so on may be obtained from the Bureau of Medicine and Surgery, Navy Department, Washington, D. C., on request.

Assistant surgeons and acting assistant surgeons for intern training are appointed in the rank of lieutenant (junior grade), Medical Corps, U. S. Navy. The pay and allowances for an officer of this rank total \$2,699 a year if he has no dependents and \$3,158 a year if he is married or has dependents.

GUARDING THE SUPPLY OF HELIUM

The U. S. government's helium plant in Texas is the world's sole producer of helium. About 15 per cent of the output of the plant is sold for medical, scientific and commercial use, the other 85 per cent of the output being supplied directly to the government. At the current rate of production this plant will produce by the end of the fiscal year about 14,000,000 cubic feet of helium. The plant has produced more than 110,000,000 cubic feet of helium since it began operations about twelve years ago. There are proposals now in Congress to increase both the well and the plant capacity. Measures are being taken to insure that no interruption in operation shall occur. Dr. R. R. Sayers, director of the Bureau of Mines, reported to the Secretary of the Interior that steel guard towers are being constructed at strategic points. A tower is being erected also in the gas field from which a general view of the government's helium properties can be obtained.

REGULAR MEETING AT NAVAL SCHOOL

At the regular monthly meeting of the medical officers of the navy in the District of Columbia at the Navy Medical School, April 7, Dr. Henry L. Bockus, Philadelphia, spoke on "Liver Function Tests in the Diagnosis and Management of Jaundice."

APRIL 2—MORNING

OPENING ARGUMENT TO THE JURY ON BEHALF OF THE UNITED STATES

MR. JOHN H. LEWIN

Mr. Lewin:—May it please the Court, and ladies and gentlemen of the jury: The time has now come when you must listen to what is known as the summing up of the evidence from counsel on both sides of the case, and after a long two months trial I don't know how to be more helpful to you at the start than to state what I believe is the issue, the narrow issue of fact which you are called on to decide; and I conceive that issue to be: Did the defendants, the two corporations and the eighteen individuals, plan together or plan to take action together to restrain and hinder the activities of this cooperative medical group association by:

1. Enforcing rules and regulations designed to prevent doctors, including members of the defendant societies from joining Group Health, or from consulting with Group Health, or having anything to do with it, and

2. By inducing the private independent hospitals, otherwise independent institutions, to join with them in preventing Group Health Association from having a chance even to get courtesy staff privileges at those independent hospitals.

Now, I think I can further emphasize that narrow issue of fact, as to which there can be only one answer beyond a reasonable doubt, by stating what issues are not before the jury. Group Health Association is not on trial, and whatever faults it may have had, of its own making or by reason of the restraints imposed on it, are not to be criticized here or questioned. This is not a private suit between Group Health Association, on the one hand, and these doctors on the other; and the comparative merits of the two, and their two methods of distributing medical service, are not in issue. This is a case between the United States of America on the one hand and the defendants on the other, brought not because of an offense against Group Health but because of an offense against the Federal law: The Federal law that prescribes the conduct that anybody must live up to, high or low, who engages in a controversy with his competitors. Ladies and gentlemen of the jury, this is not a case—whatever insinuations may be made to the contrary—against all doctors, or against the medical profession as a whole. The Grand Jury, after deliberation, indicted these doctors, not all doctors, and two corporations whose members happen to be doctors, and these individuals who happen to be doctors, not because they were doctors but because it is charged that they entered into specific conduct and took specific action. This is not a case to vindicate or sponsor any particular form of medical care or the distribution of medical care. It is simply to vindicate the natural law that any citizen has, unhampered by boycotts and oppression, to find that form of distribution of medical care that suits him.

And you need not, I say, assume the responsibility which the Government has not assumed, to attempt to determine the merits or the demerits of any particular form of medical care. The issue here is that whatever that form, the people who adopted it were entitled to pursue it without boycotts and restraint against it.

And this is not a case to force anybody to like Group Health Association. All of us, including the doctors, have a perfect right to like or dislike it, as they please; and the only point is that their animosity, and their dislike, must not be carried to the extent where they put into operation something which restrains the normal right of people and organizations which they dislike. And, so they may disapprove, so anybody may disapprove Group Health Association, provided that disapproval does not bring into effect a rule which forbids, or which requires a course of conduct which oppresses the persons disapproved. And so, I return again to the narrow issue, with these false issues brushed aside: Did the defendants do more than disapprove Group Health Association? Did they attempt a plan to obstruct its successful operation, by preventing doctors, including their own eight hundred thirty doctors, from having anything to do with Group Health Association, whether they wanted to or not; and by inducing these private hospitals, who otherwise would have made up their minds independently, perhaps with advice, but who would have taken independent action, with that plan to induce these hospitals, not to exercise their own, independent judgment; not to require adherence to reasonable regulations, but the behest of the defendants imposed on them; and I submit, ladies and gentlemen, in all fairness, that that issue of fact can be answered in only one way, and that is in the affirmative. And why do I say that? I say that because the evidence in this case answers that question over and over again, and it is the best evidence that could be produced, unimpeached and unimpeachable evidence; documentary evidence, contemporaneously written with the happening of the event, as a record of it; evidence contained in minutes and records proceeding from the mouths of the defendants themselves, written and recorded when their conduct was not drawn in question in any regard, and not qualified here in any substantial degree because you, I am sure, will remember defense witness after defense witness took that stand and simply reaffirmed the Government's evidence by saying that the document was written, and it meant what it said.

Now, let us come to Group Health Association for a moment. What was it? It was a nonprofit, mutually beneficial, cooperative, launched by its well meaning, altruistic sponsors, with no profit or gain to themselves, to do two reasonable things: to give their members medical care at less cost by the advantages of group practice, as to which there certainly could be no objection, and the chance to budget their family expenses for medical care by small prepayments of dues, so they could spread that cost over a period of time and over a group of people; and if those things aren't unreasonable, how could they be unreasonable in combination? And that is what it was, and it was nothing more than a plan to do that sort of thing throughout most of '37, and throughout '38, down to the very fall, it was simply trying to get started. It had no organization, no personnel, no activities. There could be no question of the quality of its medical care, because it was giving none,

no medical care; and yet during that time this boycott was conceived and plotted against it, plotted against it because of those two ideals it had—the group practice idea and the prepayment budget idea.

Now, it needed a chance to get in the hospitals. It had no right to demand of any hospital that it be taken in, and this case is not to force the demand of any person to insist that the hospital take them in; rather it is to vindicate the free independence of a hospital to make that decision for itself, on the advice, if you please, of its medical staff, but advice that should be confined to the medical standpoint of the applicant.

What was the hospital situation? There were twelve private hospitals, and only twelve, Group Health could turn to. It wanted a chance to state its case and negotiate with these hospitals freely and independently, and get the hospitals' own determination, but the medical staffs—the attending or regular staffs of those hospitals—were almost entirely composed of members of the defendant's society, so you start with that measure of control. They sought application to the courtesy staffs and it is true that a great many of the courtesy staffs were members of the District Medical Society, but up to that time ten of them had no rule that in order to become a member of the courtesy staff you must be a member of the District Medical Society, and the A. M. A. You will see later how that rule came about, and the purposes for which it was adopted, but ten of them had no such rule. Casualty had a rule that you must be qualified for membership in the District Medical Society, and Emergency, the only one that had the rule prior to this conspiracy, had not enforced it; and you will see it took steps to enforce it strictly against Group Health Association. You will see later how, through the activities of the A. M. A., acting through the defendant Cutter, and the activities of the defendant Warfield and his committee, operating under authority from the District Medical Society, all of those hospitals during this conspiracy, and for the purpose of preventing Group Health doctors—not simply Selders, but any of them—from getting into the hospitals, adopted that rule which was known as the Mundt Resolution, that their courtesy staffs must be confined to members of the District Medical Society, and I will discuss that later.

Now, what was the machinery that the defendants had at hand? Well, they had this resolution; they had this part of their constitution:

"Members shall not accept appointment to, or otherwise continue to serve upon medical staffs of any hospital which is not approved by the Society."

Now, what did that mean? It meant that if they denied approval to any hospital, for any capricious reason they pleased, stated or unstated, disclosed or undisclosed, not one of its eight hundred thirty doctors could have anything to do with that hospital. It gave them a power, for any reason they pleased, practically to unstaff and ruin any hospital they chose. This is not fanciful, because you will see in the evidence it is not theoretical, but it was resorted to.

And then they had another way. Section 5, amended March 3, 1937. Before that time it applied to private organizations. Now, they made it apply to Group Health.

"No member of the Society shall engage in any professional capacity with any organization, group, or individual, by whatever name called or however organized, engaged in the practice of medicine within the District of Columbia or within ten miles thereof, which has not been approved by the Society."

There again. Withdraw or withhold approval for any reason they pleased, stated or unstated, disclosed or undisclosed; and, presto, eight hundred thirty must quit. Is that boycott? And they left that approval, not simply to the District Medical Society, but to its executive committee so that the executive committee had the power, by simply putting the finger on any one it chose to withdraw this entire group of professional men from having anything whatsoever to do with it. And on June 1, 1937 Group Health Association had no activities, and no medical personnel, but one medical director. A prominent member of the executive committee of the defendant corporation suggested the use of that machinery. He said they had two weapons at hand, and I am quoting.

"One, forbid consultation, and

"Two, withhold approval of any hospital that would take any cases or assist the movement in any way."

Weapons: Does that sound like affirmative opposition being planned as early as June 1, 1937? And he repeats it more strongly to the executive committee on June 21. He says there are two ways. Two ways of doing what? Of persuading

that Group Health is a bad idea? Two ways of combating, combating Group Health Association:

"One, discipline our own members who undertook to participate, and
"Two, the possibility of doing something to recalcitrant hospitals through pressure of their staffs."

Does this throw any light on that narrow issue? "On their staffs." "Through pressure on their staffs." And how was this done? You will remember the witness Macatee. This is one of the little bits of significant evidence. He did not deny making those suggestions. Here is what he said, and I quote:

"The record would have to be clarified by my conviction that so far as the Medical Society itself could proceed in this or any similar circumstances it would have to be limited by its own constitution and by-laws, and what it could do under the constitution and by-laws in disciplining its members if they should become involved adversely with any provisions of the constitution and by-laws, and that so far as hospitals were concerned, we should only exert an influence through our own members so far as that might go."

His own members. His own members dominating the staffs of the hospitals; and doesn't that qualification leave those two suggestions exactly where we found them in the first instance, with the minutes, unchallenged, through June and July, showing particular interest on the part of a number of the defendants as to how Group Health would get hospital privileges?

Hooe pointedly asks Brown—he was the medical director of Group Health—if Group Health could function with hospitals and hospitalization left out.

Bennett pointed out that some hospitals require courtesy staffs to be A. M. A. members and suggested that Brown's cooperation with the Medical Society would be important, and he suggested that these facts be brought to the attention of the rest of the board.

Willson and McGovern discussed the same subject July 29. On July 12, the first day action was taken on this approved list, after its adoption, which omitted G. H. A., and that approved list was amended so that there would be no doubt that it didn't carry approval of G. H. A., because one of the categories approved were doctors connected with the Government, and the argument might have been made that Group Health, under their contention, Group Health doctors were connected with the Government—they changed it so there could be no doubt that Group Health would be left off. At that very meeting action was taken for the first time under this machinery of section 5, amended in March, with a committee headed by McGovern, and with Hooe, reported to the executive committee, and this report is adopted by this committee, given to the executive committee, and the executive committee tables it for further consideration, and you will see it received it. This language appears:

"The doctors of Group Health Association"—I am quoting now—"will probably surely fail to be put on the courtesy list of the hospitals for one reason or another without the fact of his connection with the cooperative being even mentioned. In fact, any combative method would necessarily have to be camouflaged to the nth degree."

Ladies and gentlemen, will you bear that in mind when you hear these far fetched excuses for the rejection of all the Group Health doctors, some of which there isn't any question as to their qualifications, and when you hear these excuses bear in mind the suggestion of the committee, "Hold for further consideration," and that they

"could easily fail to be put on the courtesy list of the hospitals for one reason or another without the fact of his connection with a cooperative even being mentioned. In fact, any combative methods would necessarily have to be camouflaged to the nth degree."

And on July 26 when the committee met with representatives of Group Health their spokesman points out again their so-called principles of ethics, intending people to believe that they were principles of morals but really principles of economic conduct gotten up to condemn a competitive system of distributing medical care; gotten up by that branch of the A. M. A., which is nothing but a business protective association. And he points out those economic rules and, significantly, calls their attention to the fact that they would make them unethical, and that the same would hold true—and I quote:

"As regards the necessary contacts in the local hospitals, for your hospitalization would have to be cared for,"

and they then tried to persuade Group Health not to go on. And then on July 29 this approved list, this white list, omitting G. H. A.—the first one ever issued—is issued by the Society and with it go two letters of the defendant Conklin, and it is authorized to go not only to their own members but to these independent hospitals as a suggestion as to what they

must do, and one of the letters says, calls attention to "organization or organizations interested in gaining medical personnel." Macatee, on that stand, corroborated these facts, which is all too apparent, that that organization was Group Health Association, interested in gaining medical personnel; and here was a word to the wise, that they must not get personnel and not have a chance even to deal with the local private hospitals on a fair, man-to-man, honorable basis.

And there is evidence that the hospitals took it to heart. In August the president of Sibley Memorial Hospital replies to this letter, acknowledging its receipt, that is of the white list, and says:

"Its provisions will be carried out by this institution."

Now, what was the A. M. A., the parent body, doing all this time? Just as soon as they heard of it, they condemned it as unethical; they used this horrible word which a normal man might suppose was a charge of immorality. As their past president defined it, the conduct of a gentleman, observing the golden rule, the Ten Commandments. Certainly there was nothing like that involved here, and they sent posthaste from Chicago to Washington their three big men, their full salaried men, their doctor general manager West, their Dr. Cutter, and their doctor lawyer. What to do? Simply to get information? The resolution under which they came showed they were to advise the District Medical Society, and the evidence shows that they did so. And then the Trustees of the American Medical Association, alarmed by this competition, instructs the defendants Fishbein and West, their doctor journalist and doctor general manager, to bring the situation to the attention of the entire medical profession, and an article is to be written, to be published in *THE JOURNAL* and distributed among their one hundred and ten thousand doctors.

That article was more than informative. It was a dynamic thing. It was intended to carry, and it did carry, a message to shape their conduct. I quote from it. And it was being prepared all through the summer of 1937:

"As the members of the salaried staff of the Association are likely to be looked on by the profession generally in the community as on the outer verge of ethical practice, if not altogether beyond the pale, it is not clear how they are to obtain qualified consultants or procure hospital service for their patients.

"In any event, medical service under the Association would be likely to be handicapped by difficulty likely to be experienced in obtaining the best consultant service and hospital accommodations. Physicians who sell their services to an organization like Group Health Association for resale to patients are likely to lose professional status."

Not only were those suggestions expressed perfectly clear, but the implications were clear too and they were:

1. Regard G. H. A. as unethical and hope people will believe that is a dirty charge of immorality; that it is conduct unbecoming a gentleman, in violation of the Ten Commandments and golden rule; but really the economic object of these people, unchallenged by free thought and free action.

2. Put its doctors beyond the pale. Qualified and unqualified, men like Scandifio and Hurlbut and Lee, and all the others as to whom there is no question concerning their abilities.

3. Refuse to deal or consult with them, and refuse to let them treat their Group Health patients in hospitals.

Those are the implications and the authors so intended them. They sent it not only here to Washington but to Maryland and Virginia for action by those societies, and the letter accompanying urges them to take an active part in the contest, and it refers to the article as "useful in any cooperative work you may undertake"; nor was the purpose of those suggestions lost on the District Medical Society, or its members. On September 27 a resolution was offered that the District Medical Society be admonished to read the entire article for their information and guidance. Nor were these implications lost on the parties they were intended to impress. On October 6 a resolution was adopted by the executive committee reciting that the District Medical Society is in full accord with the contents of said reports, both as to the established facts set forth therein—and they were very few—as you will remember, the author said: "and the implications drawn therefrom"; and then resolved that the Society

"cause a copy of said report to be sent to each of its members as an indication of its future policies with respect to combating the activities of said Group Health Association."

And that resolution was offered by one of the persons named defendant, seconded by Dr. McGovern, and adopted by the full Society. And that the implications that I have suggested were then intended is shown by the fact that the author of that resolution, when he stated that the implications were clear, pointed to those very excerpts from that article which I have

read this morning. Now, the white list had gone out in July, and its purpose and its intent and effect perfectly clear, but so exercised were the defendants they wanted assurances doubly sure, so in the fall of 1937 the defendants were afraid that its meaning might not be sufficiently clear to the hospitals, or that the hospitals might disregard it, and the defendant Hooe suggests on Oct. 11, 1937, that a letter be sent to the directors of each of these hospitals warning them—get that word "warning" them—I quote:

"that if they failed to cooperate in every way they might not be on the approved list."

And at that meeting of the executive committee, a letter, prepared by the defendant Sprigg, was recommended to go to each of the hospitals, and it recited the provision of the constitution that I have read to you: that no member could have anything to do with a hospital not approved, and no member could have anything to do with any organization practicing medicine not approved by them, reciting both those sections; and then it called on those hospitals for cooperation.

The evidence is perfectly clear that that suggested letter was aimed at Group Health Association. There can be no doubt about it, and now I read this excerpt from the minutes as to the effect that letter was intended to have:

"One member would inquire if it was meant that members of the Society would not be permitted to practice in a hospital that did not subscribe to any approved list; in other words, if they attempt to practice in a hospital not approved by the Society the members of the Society would be duty bound to keep clear of that hospital,"

and the defendant Sprigg, the chairman of the executive committee, the man who had prepared the letter, answered that that interpretation was correct.

It is a threat to unstaff unless "you do what we tell you to do." The high point, I think, in all this plotting, was reached when this defendant then said that the Society requires—and I quote—

"merely that a man to practice in the District of Columbia must be approved by the Society."

What has happened to the law? What has happened to licensure? Because it is clear that they recognize that a man cannot practice his profession if he is barred from consultation if the epithet "unethical" is hurled at him, and if he cannot even get a chance to get in the hospitals on his own merits. No, he cannot practice in the District of Columbia, cut off absolutely from a chance to make a living unless he is approved by this private corporation. Haven't things come to a sorry pass?

He then referred to the doctors on the approved list and said, and I quote:

"This letter doesn't keep those men out of the hospitals."

Those that get on these lists: they can get in the hospitals. All right, don't keep them out. They must contend with all the powers of tyranny, when Scandifio, Lee and Hurlbut and the rest cannot practice their profession in the District of Columbia.

And then on November 6 a committee of the District of Columbia goes out to Chicago and gets further aid and comfort. When they get there it is Dr. McGovern and Dr. Hooe telling West and Woodward what they came for, and they quote the very resolution in pursuance of which they come, the Stanton Resolution, and they recite from that resolution that it is the duty of the American Medical Association—what to do? Argue, persuade, debate? Oh, no. To oppose immediately with all its might—and I tell you they are calling on great might—Group Health Association, and then, quoting again from that resolution:

"It is the opinion of the Medical Society of the District of Columbia that it is the duty of the A. M. A.—"

what to do? To gather information? To disseminate it to people who inquire for it?

"—to combat vigorously Group Health Association."

At this meeting West assures them that the Trustees of the A. M. A. have given certain instructions. And what were they? "Instructions to oppose it." He says the A. M. A. has not exhausted all its means and it has no idea of quitting, and I quote again:

"It will continue fighting it every way we can."

It was not necessary for the defendants to go to Chicago and have this talk, because the A. M. A., as it boasted itself, had already been in this plan of oppression even before the

District Medical Society got very active, because West wrote to Poling on December 4:

"The A. M. A. has done everything that it could do to oppose the organization and the operation of the Group Health Association in the District of Columbia. The A. M. A. became active in this matter before the Medical Society of the District of Columbia began its efforts in opposition."

And in that letter is given other reasons as to whether this evidence had anything to do with the conduct of gentlemen who observed the golden rule and the Ten Commandments, and it is this:

"That if Group Health is successful." That is what they feared. Not that it will be unsuccessful. "—the private practice of medicine in the city of Washington will be largely destroyed."

And at this same meeting the delegates from Washington bring to the A. M. A.'s attention this hospital situation. They tell them that the executive committee has recommended that a letter be addressed to the medical boards of the various hospitals calling attention to H. O. L. C., and insisting that the hospitals take notice of it and, among other things, calling attention to the fact that physicians employed by such groups are not acceptable to the Medical Society of the District of Columbia; and in reply to Dr. McGovern's question as to whether they might control the hospitals West merely expresses his opinion that there is some doubt about it, and he is recorded as saying, "It is reasonable that they should do it."

Now, I ask you, ladies and gentlemen, if those statements of the defendant West which I have read, and there are other statements like it in the record, are consistent or compatible with his testimony on the stand that all he in the American Medical Association was interested in doing was simply acting as a collector of facts which they would disseminate to interested people. If that is all they were doing, don't you agree that he used very strange language indeed?

The defendant Willson, you will remember, testified that he never cared for section 5. He objected to sending the Sprigg letter. Now, what were his objections? His testimony tells you, and I quote:

"My own personal feeling was that this method of approach to the hospitals in connection with G. H. A. was inexpedient and calculated to engender friction rather than any real assistance in the problem."

He didn't like the letter because he didn't think it would work, because of the method. He preferred another, which you will see, and another member said he thought this letter would cause a lot of uncomplimentary comment against the Medical Society and the profession generally by the lay boards. He felt that this information should be conveyed to them orally when they would have nothing to fight back with. And that is the reason the letter was abandoned for the November 3 resolution of Willson, seconded by Christie, and passed by the Society itself.

And let me go back to that resolution one moment, because do you need anything more?

"WHEREAS, The Medical Society of the District of Columbia has an apparent means of hindering the successful operation of Group Health Association, if it can prevent patients of physicians in its employ being received in the local private hospitals; and

"WHEREAS, The Medical Society of the District of Columbia has no direct control over the policies of such hospitals as determined by their lay boards of directors, except through its control of its own members serving on their medical staffs"—

and believe me that is plenty. You see, the approach is to be made through the medical staffs, because they can turn a doctor down and pretend it is on his qualifications. They can camouflage to the nth degree, without even anybody knowing, perhaps, that he is connected with Group Health. And then he points to this Section 5; and then the resolution adopted by the Society is:

"Resolved, That the Hospital Committee be"

—and that is omitted by the defendant Warfield—

"and is hereby directed to give careful study and consideration to all phases of this subject and report back to the Society, at the earliest practicable date, its recommendations as to the best way of bringing this question to the attention of the medical boards and boards of directors of the various local hospitals in such a manner as to insure the maximum amount of practical accomplishment with the minimum amount of friction and conflict."

Why is it referred to the hospital committee? Because the hospital committee is composed of one member from each one of the local hospitals and they can get to the medical boards, and the medical boards can advise the directors. But at this

early date, at that very meeting, one of the members of the executive committee reported that every hospital in the city was cooperating with the medical profession against Group Health Association, with one exception. Bear in mind there was no question of qualifications of doctors then. And on November 11, at a meeting attended by one of these defendants from the A. M. A., this hospital committee brings in its report, and its report is innocuous; it is useless, it doesn't reach the problem. His report is Group Health patients should be admitted but they should be treated only by members of the courtesy staffs of the hospitals. Why, of course, no one could ever pretend otherwise, except in an emergency, but the point was that there was no assurance that Group Health doctors would not be on the courtesy staffs, unless something else was done; and Yater, the defendant Yater, pointed that out, and he moved to recommit that as not going far enough because it didn't give assurances that the members of Group Health staff were not on the courtesy staffs, and then and there the president, Neill, reported that there were at least two doctors who were members of the Society, Lee and Scandifio, on G. H. A.'s staff.

You will remember that just about that time the proceedings got under way for the expulsion of Lee and Scandifio, but if they could get through a rule like the rule of the Mundt Resolution that confined the courtesy staffs to their own members, then all they had to do is see that no Group Health doctors got in their Society, and those in got out; and then they have something; and just at this time you will remember the hospitals want definite instructions as to how to proceed. They know that Lee and Scandifio are still members of the Society; they have them on the courtesy staffs of some of these hospitals. On November 10 the superintendent of Homeopathic sent, as an expression of its attitude, to the Society, as the attitude of that hospital against Group Health Association, the letter the defendant Custis, their chief of staff, wrote to Penniman on November 9, saying that until approved by the District Medical Society, the Homeopathic Hospital could not enter into any arrangement with it. And the secretary of the Medical Board of Georgetown, on November 18, writes to the Society:

"What is the opinion of the Society concerning the members who are now engaged with Group Health Association as regards to consultations by the hospital staff members, and admissions to the hospital for their patients?"

And the answer is forthcoming on Dec. 1, 1937, when the Warfield committee comes back with a report that does mean something, and it is the rule of the Mundt Resolution, and it says it shall be recommended to the hospitals, and a "word to the wise is sufficient," and that their entire staffs shall be confined to members of the District Medical Society, or the other local societies of the A. M. A.

Now, then, they have something. All they have to do is to see that Lee and Scandifio get out, and none of the staff get in.

Let us see what the A. M. A.—let's catch up on the A. M. A. Let me show you that from August 1937 to November 1937, while this conspiracy I have described was at its height, the defendant Cutter, the secretary of the Council on Hospitals of the A. M. A., was hard at work on five of the Washington hospitals that had not been inspected for years previously, to make them adopt this same rule of the Mundt Resolution; and he succeeded in every instance, and he did it by courteous phrases in the first instance, because that was all that was necessary. If they didn't come along he could withdraw their registration, their approval for intern training; he could bring down a dire catastrophe on any hospital that resisted. So, in wielding the big stick, all he had to do was speak softly, and he employed a formula that had worked well in other places, and which he boasted had worked well. He wrote:

"What possibility, if any, exists for the observance of this recommendation in the Washington Sanitarium and Hospital?"

They write back:

"Each application for staff appointments calls for the Medical Society to which the applicant belongs. Would this meet the requirement of the resolution?"

They are not in doubt as to whether it is a requirement. And Cutter writes back:

"The intention remains that of hospitals stipulating membership as the basis for the assignment of hospital privileges."

Well, here is one, and he was not invited down here by the Washington Sanitarium to inspect it.

He writes the same formula to Georgetown, and gets back:

"The executive staff ruled at its last meeting that no physician shall be nominated or elected to any staff of the hospital unless he is a member

of his local Medical Society or the A. M. A. Members who are already on the staffs specified by you as not meeting these requirements will be notified to qualify within the year."

Here is another one.

Providence, another hospital, the same formula—and he gets another. You will remember Providence. He says:

"As matters stand now, we believe quite likely that when this statement is submitted to the Council at its regular meeting early in November, intership approval will be withdrawn."

And the Providence superintendent writes back that:

"No words can express my distress at the possibility of losing the A. M. A.'s approbation of our intern training school. Nothing will be omitted either by the staff, the hospital, or the superintendent to prevent what would prove to be a dire catastrophe to Providence Hospital, the loss of its accreditation for intern training."

And then he is told:

"Members of the staffs who do not belong to the Medical Society of the District of Columbia have been contacted, and at the present time, all non-members have submitted their applications for membership, so that now, with those exceptions, all members of our staff are members of the A. M. A. or affiliated with its constituent societies."

The same thing at George Washington Hospital:

"The problem then is reduced to three members of the clinical staff, and I feel that this number will be reduced very shortly."

Now, Columbia Hospital. The same formula. No response. He follows it up. It is not simply a suggestion; he follows it up. Eventually, back on November 5, we have the following:

"As for the demand that 'physicians on the staffs . . . should be limited to members in good standing in their local county medical societies,' it meets with the approval of the Medical Board as regards future appointments. So far as known, all present members of the staff of this hospital, except one, are members of the District Medical Society."

There is no doubt but what that formula and that follow-up was a demand and a requirement and was very effective, whatever anybody may say.

Cutter himself had said—and this is in connection with the use of the formula elsewhere—

"It has not been necessary to take drastic action against any hospitals on the basis of the membership resolution of the House of Delegates since prompt results have usually been obtained by less formidable action on the part of the Council."

Cutter himself had said that the purpose of the Mundt Resolution was—and I quote:

"to smoke out from the staffs of some hospitals certain men who were regarded as objectionable but whom the hospital felt a delicacy in removing."

Cutter himself had said—and I quote him:

"The Council on Medical Education and Hospitals will, without question, adhere to the instructions of the House of Delegates in requiring that hospitals . . . have on the staff only physicians that are members of the County Medical Society."

Cutter himself had said:

"We have used this same method with respect to quite a number of hospitals and the response has, in almost all instances, been completely satisfactory."

You, I am sure, will recall how Dr. Cutter finally admitted on the stand, under cross examination, that after those doctors out in Chicago had been expelled because they had a prepayment clinic, which was objected to on the ground that it was contrary to sound public policy, whatever that may mean—I ask you, who in the world ever entrusted to any private corporation the power to affect public policy without ever bothering to define it or to set up standards to guide anybody in observing it?

You will recall that after that happened he admitted on the stand that he wrote to every one of the private hospitals in Milwaukee in turn, first letters, and then follow-up letters, until those doctors who had been expelled were no longer members of the staffs of any of those hospitals. I asked him:

"Q.—And you don't attribute that result in the slightest degree to your efforts?"

"A.—I do not say that. I think it may have affected it."

He gets this letter in July 1938 from the last hospital that held out, Mount Sinai:

"Drs. A. L. Curtin and H. F. Wolters were removed from the active staff of Mount Sinai Hospital and courtesy privileges were withdrawn from these two men, as well as from Drs. Sullivan, Reuth and Dahlgren, in accord with your letter dated July 14, 1938 and telephone conversation held with you on Friday, July 15, 1938."

And in the light of that evidence of his activities and what he said as to the results he accomplished, can you believe for one moment that Cutter did not intend to hang over the heads of the Washington hospitals a threat of ruination if these hospitals should open their staffs to G. H. A. doctors—unless they subordinated themselves and violated their trust and made themselves the slaves and the followers of the behest of these organizations?

And the Warfield committee which, on Dec. 1, 1937 embarked on the same program of achieving compliance with the Mundt Resolution in the other hospitals in Washington, achieved similar success.

The Hospital Committee went to work, and I will show you its favorable report on the results of its activities; and when the December 1 resolution came to Garfield Hospital the defendant McGovern, secretary of the Medical Staff, responded, and he told the District Medical Society in January 1938 that the "present policy in force at Garfield is in conformity with the provisions of" the December 1 resolution.

By "present policy" he means the present policy, Macatee to the contrary notwithstanding, because the questionnaire for Garfield, with Warfield himself on the staff of that hospital, reported that at that time there were only 75 per cent of the membership of the courtesy staff who were members of the District Medical Society, but that this requirement was exacted of "all recent appointments."

So there is no doubt but what Garfield fell into line because of this resolution.

President Taylor of Sibley Hospital, who had responded favorably to the White List, responded equally favorably to the December 1 resolution. He writes—and I quote:

"There are no changes in the Council's personnel in contemplation at present, but should such contingency arise, you will know that proper regard will be paid to the wishes expressed in the aforementioned resolution."

So that when the Group Health Doctors come up, Sibley is ready for them.

With respect to Children's Hospital, on Dec. 6, 1937, four days after the receipt of the December 1 resolution, it amended its by-laws to require courtesy staff members be members of the District Medical Society.

Emergency Hospital. You remember the testimony, that that was the one that had a rule from April 1936. You will also remember the testimony of Sandidge, and also from Mitchell, that it had not been strictly enforced.

In June 1938, after receipt of the resolution and after these activities of the Hospital Committee it began a policy of strict enforcement, resolving—

"That the Courtesy Committee carefully check the list of doctors who have been given courtesy privileges at Emergency and who are not members of the D. M. S., (or their local medical society in the case of physicians who are nonresidents of the District), and that these members be notified that they must join the Medical Society or the hospital will be obliged to revoke their privileges."

That was after those activities. Although it was not strictly enforced, it was very strictly enforced with regard to Group Health Association.

You remember that Lee, when he joined Group Health Association, tendered his resignation from the District Medical Society. I think that was on October 31. And will you believe it!—he received from Emergency notification that his privileges were withdrawn on the very next day.

Oh, yes; there was strict enough enforcement for the Group Health Association doctors.

THE COURT:—If it is agreeable to you, Mr. Lewin, we will take a short recess.

Mr. Lewin:—Will that be counted against my time?

THE COURT:—I do not think so.

Mr. Lewin:—I am agreeable. I would love to have a recess.

(A brief informal recess was taken, at the conclusion of which the following proceedings took place:)

Mr. Lewin:—When we recessed I was calling the jury's attention to the documentary evidence which shows the success that the Hospital Committee had with respect to the enforcement of the Mundt Resolution, that courtesy staff privileges were to be confined to members of the defendant corporations. I told you about Garfield's response, about Sibley's response, about Children's Hospital's amendment four days after they got the resolution, and Emergency Hospital's response.

On Dec. 21, 1937, on a motion of the same defendant Custis, who had written that letter to Group Health Association that they could have nothing to do with them because they were not approved by the District Medical Society, Homeopathic Hospital for the first time adopted this rule. And I caution

you that the questionnaire makes a mistake as to that and says that the rule started on Jan. 1, 1937, when it clearly means Jan. 1, 1938. It is the usual mistake in the entry of the year, because there was a resolution adopted for the first time in December of 1937, confining their staffs to members of the defendant corporation, pursuant to the behest of the defendant corporation.

So you will see that Cutter's activities accounted for five hospitals, Columbia, George Washington, Providence, Georgetown and Washington Sanitarium. There is documentary evidence as to Emergency, Homeopathic, Sibley and Children's hospitals; and I will show you later the report of Warfield on his check-up, that he had them all except three. He was wrong about it, because he meant Columbia, George Washington, and Sibley; and here they are (indicating). He said he found them all cooperating against Group Health Association. And so they were.

What difference does it make with regard to the qualifications of a Group Health doctor in his application to any of these hospitals? He could have had the qualifications of an Osler, and he would run his head up against this stone wall; he would be denied membership on the hospital staffs, would be denied courtesy privileges at the hospitals regardless of his qualifications.

Does that not make all these insinuations about Dr. Selders' qualifications totally beside the point?

Just as the Society was concerned in the fall of 1937 as to whether the White List had taken effect, just so we find them in the early part of 1938 still demanding that assurance be made doubly sure, because the defendant Yater comes back and says, at the meeting in the early part of February, that Georgetown, among others, has some doubts as to what to do with members of the G. H. A. staff who were formerly members of the District Medical Society; that they were in a dilemma as to how to proceed.

And the defendant Hooe, chairman of the Disciplinary Committee, was quick with his suggestion that a letter be prepared warning them if they did not observe the White List, and he now suggests

"that a committee of the Society should go around among the hospitals and attempt to get them to outline a policy of disapproval of the G. H. A."

And then the defendant Mattingly presents a resolution; and he is the defendant, you will remember, who wrote to the Grand Jury boasting of what he had done, and you remember that he said in that letter—and can you want any more than this on the issue of fact that I have suggested?

"I frankly admit the following acts of professional leadership, successfully accomplished."

Professional leadership?

"I personally raised the question and forced the issue of compelling wavering or undecided hospitals"

Compelling, mind you!

"to deny courtesy privileges to staff members of G. H. A. . . . I successfully used my position as a member of the Medical Council to prevent Dr. Raymond Selders from receiving courtesy privileges at Sibley Hospital."

Not only did he use his influence at Sibley on the Medical Council against one man, but he raised the question and forced the issue—by reasonable persuasion and debate? By "compelling wavering or undecided hospitals to deny courtesy privileges to staff members"—to unqualified men?—"to staff members of G. H. A."

And this was his resolution. This was in February 1938:

"That the proper agency of the Medical Society be instructed to present at our next stated meeting the facts relating to the present status of Group Health physicians at the various Washington Hospitals preliminary to appropriate disciplinary action, in event any hospital has ignored the Medical Society's wishes in the premises."

Preliminary to appropriate disciplinary action against these independent hospitals, if they had ignored the wishes of the defendant.

And that resolution is not to be lightly brushed aside as some man's blundering overstatement. Oh, no. It is taken seriously by the Executive Committee and is referred to what committee? The Hospital Committee—the same committee headed by the defendant Warfield and a member of which was on the staff of each one of the hospitals. A questionnaire was sent out by Warfield to every member of that committee to report, and those questionnaires are in evidence.

They start off with a question about Group Health Association, and they ask, "What is the policy of the hospital? Is it favorable to the policy of the District of Columbia Medical Society?"

And every one of them replied in the affirmative.

The whole questionnaire was addressed to the Group Health Association problem; and when those hospitals were reporting as in favor of the policy of the District Medical Society they were in favor of the policy that I have described to you, ladies and gentlemen.

Only two of them reported on those questionnaires that there were members of Group Health Association on the Hospital Staff at that time. Sibley Hospital reported that Dr. Scandiffio was then on the Courtesy Staff, and you will see from Warfield's report, in a moment, how that institution had assured the chairman of the Hospital Committee of the District Medical Society that steps would be taken to deny that doctor his privileges.

The Homeopathic Hospital questionnaire was made out by the Hospital Committee representative, Dr. Birdsall, and signed by the Superintendent of that hospital, reporting that Lee and Scandiffio had privileges. They were under the misapprehension that Lee was still a member of Group Health Association, but he had resigned under circumstances that you will remember. This questionnaire was signed by the superintendent and reported that—

"future action regarding them awaits the action taken by D. C. Medical Society."

And then—I quote:

"The hospital wants to cooperate with D. C. Medical Society. Would like advice about course to pursue regarding applications from patients holding Group Health Association. Also regarding consultations in such cases."

And so, on March 28, 1938 the Hospital Committee of the defendant Society, through the defendant Warfield, was enabled triumphantly to report complete success:

"that at this time, the majority of local private hospitals contain in their by-laws a provision that a physician in order to practice in the hospital must be a member or qualified for membership in his or her local medical society. All of the local private hospitals are cooperating fully with the Medical Society in respect to Group Health Association, Inc. At the present time only one of the local hospitals has on its staff list the name of a physician connected with Group Health Association, Inc."

He must have been referring to Sibley, or it might have been Homeopathic Hospital. The tabulation that was offered in evidence showed Sibley having Dr. Scandiffio there.

"This hospital does not revise its staff list annually, as do the other hospitals, but it has assured the chairman of the Hospital Committee that steps have been taken to deny this physician hospital privileges."

Ladies and gentlemen of the jury, this (indicating) was shown you before, and I am not going to burden you with it again, but it is a photostatic copy of the report from which I have just read and it recites these resolutions that I recited to you this morning, beginning with the November 3 resolution which started the action with the hospitals, and the resolution that Mattingly had offered, referring to appropriate disciplinary proceedings against any hospital which should ignore their wishes; and when it was written, you remember that in the second paragraph we find this:

"In an effort to hinder the operation of Group Health Association, Inc., in the local private hospitals the Medical Society adopted a resolution."

That is stricken, and in the handwriting of Warfield—that is was offered against Warfield alone—appear, instead of "hinder the operations of Group Health Association," which were the words of the resolution, the following sanctimonious words:

"To maintain the high standards of practice."

When it comes to the first paragraph on the second page he strikes out these words:

"preliminary and appropriate disciplinary action in event any hospital had ignored the Medical Society's wishes."

Those sanctimonious changes from what he really meant were made in the Executive Committee when he made his report, because the minutes of the Executive Committee show that this resolution was adopted "with slight changes which pertain to paragraph 2 and paragraph 3." And here they are (indicating).

It was adopted by the Executive Committee on March 28 and was reported to the Society on April 6, and it was adopted by formal vote of the Society on April 6, when a representative of the A. M. A., one of the defendants, was present when the action was taken.

In the light of that evidence, unimpeached and unimpeachable, proceeding from the mouths of the defendants themselves, and written down to be preserved contemporaneously and currently with the event, could there be any reasonable doubt on the narrow issue that here was a plan to take concerted action to hinder the successful operation of Group Health Association—I use their own words—"by preventing patients of physicians in its employ being received in the local private hospitals"?

Just for a moment or two I would like to turn to the evidence that corroborates everything that I have said, proceeding from the hospitals themselves. Bear in mind, ladies and gentlemen, the hospitals are not defendants in this case. They were in a hot spot. Whatever their independent wishes may have been, they certainly were unavailing, in the face of this kind of pressure backed up by real power.

When we turn to the hospital records themselves what do we find? Was Dr. Selders kicked out of the hospital because of his qualifications? I wish I had time to recite to you what the record shows as to his qualifications.

He had five degrees from higher institutions of learning. I would like to refresh your recollection as to his practice for seven long years in Houston as a surgeon; as to his postgraduate work in the postgraduate school of the University of Pennsylvania; the receipt of his Master's degree in Surgery; as to his splendid record at the Worcester City Hospital—Mr. Castle's gossipy letter, based upon hearsay on hearsay, to the contrary notwithstanding; as to the fine things that were said about him, including that which was said about him by the secretary of the Harris County Society, in the same letter that said they were going to bring disciplinary proceedings against him; as to his fine qualifications as a general surgeon, as Dr. Brown reported to Mr. Penniman when he was employed.

But time is limited, and let me pass now for a moment to the kind of evidence that they put into the record regarding Dr. Selders. This writing of Castle's based on what somebody named Higgins, whom nobody knows, says that somebody at Worcester City Hospital said that one of the Sisters said about him.

Just contrast that kind of miserable muckraking, uncorroborated, hearsay on hearsay, with the evidence which we have put into the record, and I ask you whether a doctor who is impressed with that kind of thing comes nearer than the Group Health Association doctors to violating true ethics. The conduct of a gentleman, regard for the Ten Commandments and the Golden Rule? Oh, no. All these facts we have gathered together in his favor were brushed aside and they content themselves with hiding behind the Castle letter, which comes some months after the hospital had acted against him, and the report from the Washington Academy of Surgery and the Washington Gynecological Society—organizations with high-sounding names—reports that could not have been written, as the evidence shows, following the tenets of Hippocrates, but the tenets of hypocrites, basing their recommendation on no interview with him, no chance for a hearing. No one had seen him operate; not even bothering to read his references in the hospitals; based, in the Washington Academy of Surgery, on this documentary evidence, a letter which they thought so damned him with faint praise that they did not consider his other references.

They call attention to the fact that Dr. Moore had not responded, when they must have known that he could not respond, when he was addressed at Hugo, Oklahoma, and was in Houston, Texas.

And the decision was reached, ladies and gentlemen, in a resolution by the Washington Academy of Surgery on December 10, as shown by the minutes, a resolution presented by Dr. Sager who was on the Hospital Committee of the District Medical Society, which said that they should consider his ethics, the ethics of the applicant—again, this same old word—as defined by the American Medical Association.

The Washington Gynecological Society was worse. No references were written to. No references read; no interviews; no seeing him in operation. Merely two miserable gossipy letters that any of us would be ashamed of—a letter from Berry to Bullard. There is no evidence that the committee even knew who Berry was. He was reporting some gossip he had heard about him in Worcester. And then there was the letter in which they place most of their reliance, which is the letter from Johnson which betrays on its face that it is nothing but hearsay, that Johnson does not know this gentleman; and the worst thing he can say about him is that he is the kind of fellow who is likely to get in most anybody's hair.

Have we not come to a sorry pass when all these high-sounding tenets are directed to the preventing of any chance of a man for a livelihood? And yet that is what this high-sounding society puts out as the basis of its recommendation against these gentlemen. Nothing more.

But the true situation was the treatment of the patients.

You have heard about the qualifications of Dr. Selders. I told you about Dr. Scandiffo, the Homeopathic and Sibley staffs and the fate that awaited him, without any whisper about his qualifications. You remember Dr. Price, a defense witness, who criticized Group Health Association after he left it and was confronted with his prior inconsistent statement when he was with it, and how he had applied to Homeopathic Hospital and had not received even an answer. He applied in the spring of 1938 and got no answer at all, and he was not admitted to any hospital in Washington during the whole period of the conspiracy; but on the day before the indictment was returned the Medical Staff of Garfield approved him for membership—one day before this indictment came down.

I told you about Dr. Lee and the report on the questionnaire from Homeopathic Hospital with regard to him—

"Future action regarding him awaits the action taken by the D. C. Medical Society."

You will recall Dr. Hulburt. He was not a member of the District Medical Society, but he had privileges at Georgetown. He was called in by the superintendent while he was down there, while he was connected with Group Health, and was told that he could no longer come into the hospital or have any cases there. Then he resigned from Group Health. It is a wonder they all did not. How Group Health Association managed to survey this kind of an attack I do not know. But he resigned in April 1938 and in May he was reinstated. Free of Group Health he now becomes a qualified doctor, I suppose, in the Georgetown Hospital.

He applied to Columbia Hospital, while he was a member of Group Health, for normal obstetrics, which means the ordinary delivery of babies without any complications at all. His application was tabled there, as the minutes show, so long as he was a member of Group Health Association; but after he resigned it became all right for him to deliver babies, and he was admitted into Columbia in June.

And that fine, upstanding-looking professional man, Dr. Halstead—was there a breath against his qualifications? He told you on the stand that he applied in the summer of 1938 to Georgetown, Sibley, Providence, Emergency and George Washington and, in the fall of 1938, to Garfield, but he was not admitted to any of them. Does it take from August until December to find out that Dr. Halstead is worthy to practice his profession in a hospital?

You will remember Dr. Richardson who testified that he resigned from Group Health Association for fear of losing his hospital privileges.

When you consider all those doctors who suffered the same fate, I ask you whether all this attempt to rest this case on some gossipy letters with regard to Dr. Selders being able to play musical instruments, and things of that kind, account for this unanimity. I wish I could quote to you, even at the risk of boring you a little more, minute after minute of those hospitals showing the real reasons regarding Group Health Association. I wish I had time to recall to your minds the effect this kind of thing has on patients, upon private citizens, upon ladies like Miss Sarah Abbott, knocked down on the street, taken to a hospital, nervous, suffering pain, wanting a doctor in whom she had confidence, and being told, "You can have our doctors." Or the case of Miss Stuart, sick enough to be hospitalized for three weeks at Garfield, and only permitted to have Dr. Selders there because they had not had time to get his revocation notice to him.

I wish I could recall to your minds Mr. Hardin, taken with an emergency case of appendicitis in the middle of the night and denied his doctor, told that he could not have his doctor in any of the hospitals. He is rushed there, and what is he confronted with? By a memorandum from the admitting office of Sibley Hospital, prepared by its admitting staff pursuant to directions, listing the names of every one of the doctors, including Dr. Brown, associated with Group Health Association. These doctors are not to be allowed in at any time.

I wish I could recall to your minds that dear old lady, Mrs. Austin, who was knocked down on the street and hurried to one of these hospitals receiving the same denial of free choice. And all this is based on ethics. One of them is that Group Health Association denies the free choice of physicians. I will ask you whether these patients' free choice of physicians was not seriously impaired.

I wish I had the power to bring to your minds the feelings that Miss Tew must have suffered when her doctor diagnosed a pain in the abdomen as an emergency case and was permitted to admit her. She was taken to her room and given morphine. Then, after she has gotten the morphine and the pain has subsided, a young resident or assistant resident who has been

practicing a year, I think it was, pressed on her abdomen, paying no attention to her blood count, which is indicative of infection and which read 14,500, which is double the normal, and paying no attention to her fever, and none of the other doctors bothering to come to see her—callers who called on the phone were told these things and her doctor in whom she had confidence was told it was not an emergency case. He had a right to bring her there if it was an emergency case. Oh, no. You can have these doctors and only these doctors. When she insisted on her free choice she must rise from her bed with the morphine effects still on her, nauseated and nervous, having nerved herself up to an operation, and she is permitted to leave the hospital in a half-fainting, nauseated condition.

Ladies and gentlemen, you have heard this evidence. You have heard the defense, whatever defense it has. I ask you, in the light of the evidence which I have not over-stated—I have stuck to these notes so that you might have confidence in me—I ask you, when you come to your deliberations, that you can conscientiously say that whatever may be your personal feelings, you can do but one thing; that this evidence convinces you beyond a reasonable doubt that the narrow issue—not the red herrings—of a concerted attempt and a plan to oppress by the means that I have stated was engaged in beyond a reasonable doubt.

ARGUMENT ON BEHALF OF THE UNITED STATES

GRANT W. KELLEHER

Mr. Kelleher:—May it please the court, and ladies and gentlemen of the jury: when I stood before you in my opening statement many weeks ago I told you that the Government would establish beyond a reasonable doubt that there is in this country today a large body of American people which either does not receive adequate medical care or which is oppressed by the heavy financial burden of the care which it does receive; and I can now stand before you and tell you ladies and gentlemen that not only has the Government established that fact, but it stands undisputed in the record in this case, and you must accept the fact as proved and undisputed that people with substantial incomes receive two and a half times as many physicians' calls a year, spend twice as many days in the hospital, as people earning less than \$2,000 a year; that only 14 per cent of the more fortunate receive no medical care as compared with 50 per cent of those in the low-income groups, despite the fact that it is well established and well recognized that the low-income groups are far more susceptible to sickness and disease.

And so far as the uneven incidence of illness is concerned, you must accept as an undisputed fact that one tenth of the American people bear over 40 per cent of the total medical bill, while six times as many bear less than 18 per cent.

Those are the facts. Those facts rest on the doorstep of the organized practice of medicine; rest there because not only is there no evidence disputing the facts to which I have referred, but there is nothing to show that the private practice of medicine under the fee-for-service system has been able to cope with this serious social problem.

There is evidence in the record, however, that there are some 150 organizations throughout the country today making a sincere and conscientious effort to meet this problem. You have heard of some of them. You have heard of the Ross-Loos clinic, of the Endicott-Johnson plan, the Stancola in Louisiana, of the plans of the Northern and Southern Pacific railroads; and from the mouths of the defendants themselves, either in their correspondence or from that stand, you have heard it admitted that some of these plans are manned by competent doctors; that some of these plans have given good medical service.

What these plans are and what their purposes are you already know. Briefly, they seek to meet this social problem, which is very serious, first, by improving the quality of medical care and reducing the cost to the patient by combining the care in group practice, by both general practitioners and specialists, the effect of which is to give the patient the advantage of the joint knowledge of the group and, at the same time, to reduce the cost of the care by eliminating the unnecessary duplication of equipment and facilities which would inevitably result, as we know, if these doctors were engaged in private practice. It seeks to eliminate the heavy financial burden caused by the unpredictability of illness, by its system of periodic prepayment which entitles each member to complete and adequate medical

care, within limits, irrespective of the amount of care he needs. It is group practice on a prepayment basis. Whether it will succeed or whether it is the answer to the problem with which we are faced today is not for me to argue or for you to decide. Suffice it to say that on the record in this case the intents and purposes of this plan cannot be disputed, and on the record in this case it is also true that there is nothing revolutionary, nothing radical, no new ideology involved in these plans. Prepaid medicine is over a century old; and the practical common sense appeal of group practice, the economies reached, the good sense of it, destroy any argument that there is anything extreme or radical about it at all. It has been indorsed by hard-headed business men, such as those men must be who run the Standard Oil Company of Louisiana and the Endicott-Johnson Shoe Company.

We have heard it said in this case that the medical profession alone is able to judge what is adequate medical care for you and me. On the record here I question whether the degree of Doctor of Medicine bestows any such ability with it. But assuming that it does, what is the answer of some of these far-seeing and progressive members of the profession?

We showed you the report of the American College of Surgeons, that body composed of eleven thousand of the leading surgeons in the country. What was their answer? They say prepayment plans furnish a reasonable expectation for providing more adequate medical care to the American people and that experimentation with such plans should be continued.

We showed you the results of a committee on the costs of medical care. Fifty leaders in economics, sociology, public welfare and medicine, twenty-five of them from the medical profession. What was the answer? Seventeen of those doctors endorsed the majority report which recommended experimentation with these plans. There is an answer from the profession itself to any claims that these plans seek to destroy the private practice of medicine.

We have in evidence Exhibit 104 for the Government which has been referred to as the prospectus for Group Health Association. There is no evidence to show that it directly ties up into the G. H. A., but it is sufficient to say that G. H. A. is a small scale model of what is described in this prospectus.

This prospectus contemplated a plan which would involve seventy-five thousand of the population of Washington. As you know, Group Health Association is far more modest than that. But suffice it to say that in this prospectus are detailed the objectives and the methods by which those objectives can be achieved by Group Health Association.

Let me refer for just a minute to the foreword in this prospectus, because here is what Group Health Association was seeking to accomplish and here is all that the defendants knew that it was seeking to accomplish when they first decided to oppose it:

"The aim of this plan is to make available to Federal employees in Washington and to their families adequate medical care, both preventive and curative, to provide this care at moderate cost and to place that cost on a regular budgetable basis within the means of the group to be served."

There is the outline of the purposes of Group Health Association.

To achieve that purpose Group Health Association adopted the successful plans detailed in this prospectus and followed them—the plans of the Ross-Loos clinic, of Endicott-Johnson and of Stanocola. In so doing it decided that it would be necessary in order to achieve the economies which such plans contemplated to have a full-time salaried staff; and here is the plausible explanation of the reasons set forth in this prospectus which is in evidence:

"The pros and cons of provision of service by a staff of salaried physicians have been carefully considered. The disadvantage of salaried service is that it does not permit the patient to go to any physician he may select, but limits his choice to the physicians who are members of the staff. It is believed that this disadvantage is at a minimum in the case of the population of Federal employees, since many, being new-comers in the city, have no affiliations of long standing with physicians. In any case the disadvantage is more apparent than real. Actually the average layman generally chooses his physician on the basis of hearsay and is not qualified to judge competence. With a salaried staff the patient receives care from a selected group of physicians chosen by a chief of staff on the basis of their professional qualifications and competence. Furthermore, only in salaried group practice is it possible to have a desirable degree of professional supervision of service and ready consultation of one physician with another. Finally, only on this basis can the economies flowing from organization be achieved."

It is plausible and reasonable; something about which reasonable men might disagree, certainly, but certainly nothing irrational or unreasonable about it.

So Group Health Association decided to incorporate in its prepayment plans the idea of a salaried staff of doctors.

Group Health Association was intended merely to give to the employees of an agency of the Federal Government the benefits which businesses like the Standard Oil Company of Louisiana, the Endicott-Johnson Shoe Company, the Northern Pacific Railroad Company and the Southern Pacific Railroad Company had achieved through similar plans—to give to the Government employees the same benefits that were given in the railroad yards and shoe factories of the country.

What was the attitude of the American Medical Association concerning these plans? I say to you that on the basis of the record in this case the conclusion which you must draw is inescapable: the American Medical Association opposed these plans as far back as 1932 and fought them with everything at its command. It did so because it had to do so. It did so because the governing body of the American Medical Association had declared that it must.

We proved to you that in 1933 the House of Delegates in formal assembly adopted, as expressive in principle of the views of the A. M. A., the minority report of the Committee on Costs of Medical Care, the report which opposed and violently criticized these plans. The American Medical Association violently excoriated the American College of Surgeons one year later through its House of Delegates for the report which that body issued endorsing such a plan; and in 1934 the same governing body of the American Medical Association adopted ten fundamental principles. They were called that by the Board of Trustees. That was done to control any experiment to supply more adequate medical care to people with limited means. One of those principles categorically prohibited group practice because it required that any plan embrace within it all of the physicians in the locality to be served. It unequivocally forbade contract practice in these plans; and it is undisputed in the record at this time.

How, then, could the American Medical Association do anything different than oppose Group Health Association? And it did oppose it from 1932 throughout the period of the indictment to 1938. Doctors were expelled in Texas, California and Wisconsin. They were threatened with expulsion in Cincinnati, Ohio, for participating in these plans. Trinity Hospital lost its registration. The Milwaukee hospitals were compelled to exclude from their staffs members of the Milwaukee Medical Center.

There can be no real issue on the question of the attitude of the American Medical Association concerning these plans. As one of the doctors is quoted in the minutes, the American Medical Association and organized medicine have fought these plans tooth and toe-nail.

Ladies and gentlemen, do not believe for a moment that these constituent and component bodies of the American Medical Association were free to decide for themselves what was ethical or unethical. The House of Delegates had spoken; the Judicial Council of the A. M. A. had spoken and declared these plans unethical. The constitution and by-laws of the A. M. A. provide that the Judicial Council shall be the final arbiter on matters of ethics; and Dr. West told you that every constituent body of the A. M. A. except one, and every component body, had agreed to abide by those principles of ethics in the constitution of the Medical Society; and the Medical Society of the District of Columbia adopts those principles of medical ethics. The House of Delegates is the body which lays down the principles which shall control; and with the Judicial Council interpreting those principles of ethics it is as absurd to say that the Medical Society of the District of Columbia is free to interpret those principles, independently of the A. M. A., as it is to say that this court here may ignore the interpretation placed upon a statute by the Court of Appeals of the District of Columbia.

Now, let me come to the attitude toward G. H. A. I think the evidence shows beyond question—and I am going to try to demonstrate it to you now—that the American Medical Association and the Medical Society of the District of Columbia opposed this plan of G. H. A. from the moment they had the first inkling of it. The first evidence of knowledge is the letter from Dr. Ireland to Dr. Cutter in which he told of the H. O. L. C. scheme and said:

"The local doctors are going to be wised up."

And the evidence shows that they were. In the month of May there was a series of conferences between Dr. Glenn I. Jones and the defendants Christie, McGovern, and two others, and before May 16 when Dr. Glenn I. Jones had merely explained that this plan involved prepayment, with a salaried staff, these doctors had taken the position that they were opposed to it and that the Medical Society was opposed to it;

that no doctor could take a position on the salaried staff of that organization and still remain a member of the society, and that the organization could not expect members of the Society to consult.

That, ladies and gentlemen, was as early as May 16, 1937, before there had even been a formal meeting of the Medical Society with reference to it; and the minutes of those meetings further tend to substantiate the position of the Government in this case, that the opposition to G. H. A. occurred from the start, and that the circumstances which were later developed and the facts which were later developed had no influence on the decision of these gentlemen to oppose this plan.

You will recall the minutes of the first meeting. At that meeting, which was specially called to consider G. H. A., Dr. Verbrycke got up and read this prospectus, and that was the knowledge which these defendants had.

After he had read the prospectus Dr. Mattingly got to his feet and said, "We have two weapons at hand: one, to forbid consultation, and two, to deal with the hospitals by failure to put them on the approved list if they cooperate with G. H. A."

Then a committee was appointed, a committee of six, including the defendants Hooe and McGovern, with the defendant McGovern as chairman, to consider this plan in cooperation with Dr. Verbrycke's committee, the Committee on Medical Economics.

Bear in mind that here is what they had (indicating)—this prospectus describing Group Health Association. That committee reported through Dr. Verbrycke, three weeks later. What was its report? This was before they had ever seen, so far as this record goes, any of the representatives of Group Health Association. The report was this, that it involves prepayment; it involves a salaried staff. Therefore it is not ethical, and no member of the Society may have anything to do with it as at present constituted.

That was the report, as early as June 21, 1937. At the same meeting Dr. Mattingly rose again to his feet and got his suggestion across again, that the two ways of combating this plan were, one, by disciplining members, and, two, by dealing with the hospitals.

At this meeting it was also decided that Group Health Association should be invited to the next meeting of the Executive Committee. Mr. Penniman and Mr. Zimmerman came. The plan was laid before them. It involved prepayment; it had a salaried staff. They were told they were going to rely on the Medical Society for consultants. They were told how it was financed; and the H. O. L. C. had made an appropriation for two years to get it started. That is in the minutes of the first meeting with G. H. A.

What did the Medical Society members do? What could they do? They had prejudged that plan. G. H. A. did not know it, but the evidence now shows that they came over there to talk with the Executive Committee when that committee had already adopted the Verbrycke report as the policy of the Executive Committee, and had already decided that G. H. A. was unethical and that they were going to deal with it as "at present constituted." What more could they do than what McGovern did?—and that was to intimate that G. H. A. would not be acceptable, by calling their attention to the fact that it did not permit free choice of physicians.

At that same meeting the evidence shows it was decided to have another meeting between representatives of the Society and Group Health Association; that is, the board of trustees of Group Health Association. G. H. A. willingly agreed.

After Zimmerman and Penniman had left, the minutes show that in discussing the function of this committee that was to confer with G. H. A. it was explained that all that the committee should do would be to go over and feel them out—and those are the very words—feel them out and see if they would adopt a different plan, a plan which would involve the use of Medical Society doctors, drawn through a panel of those doctors. That was the purpose of that meeting. No question of cooperating with G. H. A. as it was. That was settled in June. Now the sole and only purpose was to see whether they could not change the plan, to take the heart out of it, and save for themselves the business which they feared G. H. A. would take away from them.

I think I have reached a point now, your Honor, where a recess might be taken.

THE COURT:—Very well. We will take a recess at this time until 1:20, ladies and gentlemen of the jury. Please take note of that.

(Whereupon, at 12:20 p. m. a recess was taken until 1:20 p. m. of the same day.)

APRIL 2—AFTER RECESS

The proceedings were resumed at 1:20 p. m., at the expiration of the recess.

Mr. Kelleher:—Ladies and gentlemen, when we recessed at noon, I had just completed discussing the fact that the District Medical Society, through its executive committee, had decided as early as June 21 to oppose G. H. A. unless it changed its plan of having a salaried staff, and that they came to the meeting of June 24 with their minds already committed to this policy. After the meeting of June 24 the next meeting of the executive committee was on July 12, and, as you probably know because it has been repeated so much, at that meeting of the committee Dr. McGovern submitted the second report of his subcommittee, the report in the form of a letter from Verbycke to McGovern, and in that report were analyzed four alternatives of policy:

1. Approval.
2. A *laissez faire* attitude of let alone, see what happens.
3. Disapproval and active combat with every measure at our command.
4. Disapproval and the sponsoring, possibly, of our own plan.

Those were the alternatives of policy, and this is the way the report concluded:

"Approval is manifestly impossible. Disapproval and active combat is possible. Whether it is desirable without our own plan is another matter. Group Health Association could easily fail to be put on the approved list and lose consultation.

"The members of the staff of Group Health could fail to be put on the courtesy staff of the hospitals without the reason even being known. In fact, any of the above methods must be camouflaged to the nth degree."

And then the report goes on to point out that, in addition to this disapproval, perhaps some more desirable thing for the Society to do would be to formulate its own plan. McGovern at that meeting told the executive committee that his committee was nonplussed because it didn't know whether to fight G. H. A. with the weapons at hand or to adopt a plan of its own to combat the organization. Hooe told the meeting that as G. H. A. was then organized it would not be countenanced by the Society. Then Macatee said—Macatee, who is chairman of this committee to meet with the board of trustees of G. H. A., presumably to work out some form of cooperation—here is what he said at the meeting of July 12:

"I am going before those gentlemen and ask them whether they realize the threat to the success of the plan if it doesn't permit free choice of physicians. I am going to them and ask them whether they will accept the Society as the means for supplying this medical care."

Attached to those minutes is a so-called agenda for the conference with the board of trustees, and what other matters were to be discussed:

1. Whether the H. O. L. C. will accept the District Medical Society as the source for its doctors.
2. Whether it will consider abandoning its plan entirely if the Medical Society will adopt a plan of its own.

That is what the purpose of this conference with the board of trustees was. What they wanted G. H. A. to do was to abandon its plan because they had already committed themselves to the policy of opposing it if it went through as planned. That conference was held on July 26. At that conference Dr. Macatee called attention to the principles of medical ethics affecting contract practice, and he intimated most clearly that the Society would never approve of a plan as then organized. He asked them if they would not be willing to convert G. H. A. merely into a financial organization to collect dues and then to pay those dues to the doctors in the Society.

Verbycke said the trouble with this plan is, "No free choice of physicians." There is the rub. "Will you consider using the Society, all the Society's doctors in your plan?"

And naturally Group Health Association politely ignored their request; ignored it because to eliminate this salaried staff would be to take the heart out of the plan.

A special meeting of the executive committee was called on July 27, and again Dr. Macatee arose and said:

"This organization as planned violates free choice of physicians. No member of the Society may have anything to do with it."

Does that sound like cooperation? And at the same time McGovern submitted four possible causes of action, and they were:

1. To fight the organization through the constitution and by-laws of the Society.
2. To have our own plan with our own doctors; or
3. To fight it in the courts.

Every alternative submitted an alternative of opposition. At the first meeting of the Society had with reference to this plan on July 29, Dr. Macatee and Dr. McGovern reported on the conversations they had been having with the board of trustees. What occurred at that meeting? Conklin tells us in a letter which he wrote to Woodward; the recommendations at that meeting, he said, ranged all the way from various conciliatory measures—and he obviously meant the adoption of some plan by the Society—from various conciliatory measures to drastic boycotts.

At that meeting another subcommittee was appointed to consider G. H. A. and report back to the Society as to the policy which the Society should adopt. That subcommittee reported to the executive committee on September 8 and September 27, and both times it reported that G. H. A. was unethical, and at one of the two meetings it reported that no member of the Society can have anything to do with this organization.

Does that sound like cooperation?

In between the meeting of the executive committee on September 27, and the second meeting of the Society concerning this matter on October 6, an event occurred which galvanized the Society into action; and that was the publication of *THE JOURNAL* article of October 2; the article in which the defendant Woodward, acting with the authority of West and Fishbein, wrote that the salaried staff of this organization would no doubt be on the outer verge of ethical practice, if not beyond the pale; that members of the staff of that organization would certainly lose professional status. That was the spark that set the Society off. Four days later Groover came in with his resolution, which the Society adopted, and in which the Society stated that it was in full accord with *THE JOURNAL* article, both as to its facts and implications therein, and that it approved the report as representative not only of the methods to be used in combating G. H. A., but as to the ethical responsibilities of the Society's own doctors.

On October 6, then, the Society, after months of opposition, months when the only question was how they would oppose this plan, on October 6 at the suggestion of the A. M. A., this Society adopted as final the policy which resulted in these proceedings here in Court today.

Now, Mr. Lewin already has explained the hospital boycott, and I should now like to devote what time I have left to a consideration of what we term the consultation and staff boycott by the Society. In order to clarify this I think I must explain something about the so-called white list issued by the Society on July 29. There is no dispute in this case that on July 12 the executive committee of the Society approved this list of organizations contained in Exhibit 45 for the Government; nor is there any dispute that that list went to every member of the local Society and to every hospital in the city of Washington; and, of course, there is no dispute that Group Health Association's name was conspicuously omitted. This white list supplied the cornerstone for the boycott of the organization of Group Health Association. It furnished the method, the means, by which every result automatically flowed from the issuance of this. From the stand here Dr. Macatee denied that this white list in any way had anything whatsoever to do with G. H. A. I say that the combination of circumstances in this case, when weighed with that denial, completely refutes it. Before I point that out let me give you a little history behind this thing. It involved what you have already heard referred to as chapter 9, article 4, section 5 of the constitution. Section 5 was originally adopted in January 1936. It provided that no member of the Society could have any professional relationship whatever with any organization the profits from which did not inure to the benefit of the medical profession. That, I say, is section 5 as adopted in January 1936; and before I come to the amendment of that constitutional provision in March 1937 let me dispose of one false issue which counsel has attempted to project into this case. Counsel had witness take the stand after witness and deny that that constitutional provision was adopted for G. H. A. and thus attempted to make it appear that some substantial issue of the Government was refuted by these denials. I tell you ladies and gentlemen now that the Government at no time in this case, either in the indictment, in the opening statement to you, or at any time in the trial, took the position that that constitutional amendment, or the original constitutional provision, was adopted for G. H. A. specifically. The position which the Government did take is this: that the amendment to the constitution substantially changed the original provision and it did, for that reason, because the original provision was limited to profit-making organizations. The constitution as amended provided that no member shall have any professional relationships with any organization unless approved by the society, by the executive committee of the society.

Thus, in March 1937, one month after G. H. A. was incorporated, that constitutional provision was changed so that it was possible for the Society to control its members with respect to nonprofit organizations as well as profit-making organizations. And, bear in mind, G. H. A. was a nonprofit organization.

Now, let us see what the evidence shows as to whether this approved list had anything to do with G. H. A. First, the events and facts preceding the adoption and approval of the list. The evidence shows that the subcommittee of the executive committee appointed to approve this list consisted of three doctors, two of whom were the defendants Hooe and McGovern, with McGovern as chairman. The evidence also shows that prior to July 12, when this list was approved, there had been three meetings of the Society and numerous informal discussions concerning G. H. A. It shows that the defendant McGovern was chairman of the subcommittee which was appointed to study G. H. A.; was chairman of the subcommittee which on June 21 reported that G. H. A. was unethical and he, serving in this dual capacity as chairman of the subcommittee studying G. H. A. and chairman of the subcommittee to prepare and approve this list of organizations. The evidence also shows that, at two of these meetings preceding the adoption of this list, Macatee made those statements now so familiar to us. The two methods to combat G. H. A.; the two weapons which might be used by the Society, and one of those weapons was to discipline members; to prevent consultation—the very thing which failure to place the name of an organization on the approved list would inevitably result in. Those are the facts preceding the adoption of this list. This list, as I say, was adopted on July 12, 1937. Before the discussion concerning this, there was an elaborate discussion concerning G. H. A., because it was at that meeting that McGovern submitted his second report, his second report in which he outlined the four alternatives of policy, and in which he said this failure to place G. H. A. on the approved list—and there was no approved list at the time—failure to place it on the approved list would automatically prevent consultation; that, at the same meeting at which this was adopted.

After the discussion of G. H. A., McGovern was called on to report as chairman of the subcommittee to prepare this list. He explained how the list had been arranged. He explained the effort which he had made to obtain the names of those organizations and doctors on that list, and then he submitted the list for the approval of the executive committee. The list was identical with that attached to Exhibit 45 for the Government, except in one important respect; item No. 10 read, as submitted by McGovern:

"All medical personnel connected with the Federal Government."

The minutes show that Macatee moved to strike the words "connected with" and substitute the words "employed by." With that amendment the list was approved. His amendment was obviously designed to remove any question that might arise from the use of the words "connected with"; that G. H. A., or its doctors, were approved by this list, and then in the same discussion concerning this list we find that one of the members of the Executive Committee inquired about the medical personnel of G. H. A., and Dr. Hooe replied:

"It is a corporation; it must be approved as a single unit."

This is at the very time that list was being approved.

But it has been said that the reason G. H. A. was not on this list was because they had not asked for approval. There are two answers to that. Nobody was asking for approval. The minutes show that McGovern was going out making inquiries himself to determine who should be approved. He stated that he had contacted in writing the local medical societies in Virginia and Maryland; that he had not heard from them and, therefore, was going to make further efforts to approach them. That is the best answer. The second is that Dr. Brown had asked for approval. He told the members of the Medical Society on June 24—fifteen days before this list was approved—that G. H. A. wanted to go along with the Society; that he wanted to become a member; that he thought the other doctors would.

What more could this Society want than that? We have also heard it said that G. H. A. wasn't on this approved list because it was not yet in existence. The facts are that G. H. A. had been incorporated on February 24; it was looking for a medical staff, and what better time could there be to approve this organization than now, when the members were being approached to join the organization? What was the purpose of that if it wasn't to advise the organization with which they could have professional relation. Certainly if there ever was an appropriate time to deal with G. H. A. it was then; and, we say, therefore,

that when they left G. H. A. off that list they intended to deal with it; they intended to leave it off; they intended to do so because by that action they were able to prevent the members of the medical profession from having professional relations with G. H. A.

I think those circumstances are conclusive. But let me go a little further. At the meeting of July 29 Macatee addressed the entire Society concerning G. H. A., and there is a long paragraph in the minutes in which he outlined the plan of G. H. A., discusses it at length, points out that he considers the men who founded it honest, responsible, public-spirited men, who were trying to do something for their associates in the office; and immediately after this, and as part of his remarks, Macatee says this:

"The private list is now in the office of the secretary. I advise the membership to examine it carefully and familiarize themselves with its contents."

And he testified that the list he was referring to was Exhibit 45 of the Government. There is one other circumstance which completely repudiates any argument that could be made that this was not connected with G. H. A. In Exhibit 45 are three documents, two of which are letters addressed over the signature of Conklin to "Dear Doctor." The second of these letters merely calls attention to the fact that the executive committee had approved a list of organizations and quoted the section of the constitution dealing with that. That, one would think, would be adequate if the only purpose of this list was to call attention to the organizations on that list, but look at this first line:

"Also it may come to your attention that there is an organization or organizations interested in gaining medical personnel. Your attention is called to Chapter 9, Article 4, Section of the constitution,"

quoted in full; and Macatee, on cross examination, admitted finally that that letter referred, among other things, to Group Health Association, and he admitted that if the approved list was not adopted on July 12 as against G. H. A., it was directed against G. H. A. when it went out.

One other very interesting bit of testimony in this case. Woodward testified that he had been in Chicago at this time, the time this letter was mailed, and that he received this at his home, and then he said this: He said, "I took it to the office with me in the event that if I received inquiries about Group Health Association." How did he know this was directed against Group Health Association? He was here in Washington on July 14, two days after this was adopted.

As I say, the adoption and issuance of that list automatically prevented members of the Society from joining G. H. A., or from having any consultations with them or with that organization. It did so for the reasons I have stated, and it was intended to have that effect for the purpose of forcing G. H. A. to the wall. That is clearly demonstrated by Macatee's statement at the first meeting, that by preventing consultations the Society could combat G. H. A. He even went further. He realized what it would mean to G. H. A. if it was disapproved by a constituent body of the A. M. A., because he told the board of trustees of G. H. A., "You must remember that the A. M. A. includes one hundred and six thousand of the one hundred and sixty thousand doctors in the United States. All of those doctors are bound by the principles of ethics." And he said, "That leaves sixty thousand doctors, and even that field is narrowed because many of those doctors are inactive and unavailable." He knew what it meant to withdraw from G. H. A. every member of the American Medical Association by the simple process of omitting that organization from that list issued on July 29.

The evidence shows, ladies and gentlemen, that there were seven doctors, seven doctors at least, who either refused to join G. H. A. because it was disapproved by the Society, or who resigned from G. H. A. for the same reason. The first is Dr. Glen I. Jones, contacted by Penniman and Zimmerman late in the spring of 1937. He was interested in this plan, but he decided to scout around among the members of the Society to learn the attitude concerning G. H. A. He came to two of the defendants in this case, McGovern and Christie. They told him that they disapproved; they told him that the Society disapproved; that any doctor—that no doctor could take a position on the staff of G. H. A. and still retain his membership; that the Society could and would refuse to consult, and he turned the post down because, as he testified here, he was afraid the organization could not succeed if the Medical Society disapproved it.

The evidence shows that Dr. Tribble refused even to give advice or assistance to Dr. Brown because the organization of G. H. A. was disapproved. Dr. J. Keith Cromwell refused to take a position as obstetrician because the organization was

not approved; and the defendant Neill was also approached by G. H. A. It seems a little ironic now, but Penniman, Zimmerman, and Russell went to him some time before the clinic opened. There is a dispute in the evidence as to what position was offered Dr. Neill, but Zimmerman and Penniman testified they offered him the medical directorship; Brown denied it; and the minutes show that Neill reported to a meeting of the Society that he had been offered the post as surgeon. It is immaterial whether it was the directorship or whether he was asked to be the surgeon of this organization. The important fact is that he was interested at first, wanted the post because it was the sort of thing he was doing for a utility company here in the city, but said he had to consult the Society because he was a member. What is important is that he refused the post and addressed the meeting of the Society, telling them that he had refused. Why, he even went so far as to decline to go to the banquet of G. H. A. on October 29. He even was so discourteous as to refuse personally to acknowledge the invitation and instead, at the direction of the Society, had his secretary acknowledge the invitation and decline in the third person.

Francis Richardson was employed by G. H. A. in December 1937 to take house calls on a part-time basis. He worked for four or five months. Then when one day he met Mann and McNulty at Sibley and had a conversation with them, he resigned from G. H. A. and testified from that stand that he did so because he was afraid he would lose his hospital privileges. That is No. 4.

No. 5, Fred Hammerly, a doctor in New York, was negotiated with in New York concerning G. H. A. He wrote to West and Fishbein for advice as to whether he should take it. West replied G. H. A. was disapproved by the local Medical Society, and then he went on to point out that the United States Attorney and the Corporation Counsel had held it was illegal, despite the fact that his letter showed that he knew Mr. Justice Bailey had held that the organization was lawful, and that in July, Fred Hammerly didn't come with G. H. A.; and I saved the best for the last: Drs. Lee and Scandiffo.

Ladies and gentlemen, I tell you that it is a remarkable thing that these facts which I am about to recite, some of the most essential facts in the indictment of this case, stand substantially uncontradicted and undenied. There is no dispute in this case as to the following:

On November 29, Mr. Hayes, the local representative of the A. M. A. here in the District of Columbia, wired Woodward in Chicago the names of the staff of G. H. A. just announced; wires him that on that staff were Drs. Lee and Scandiffo. Dr. Woodward turned that wire over to Dr. West. West wrote Conklin on the same day, stating Lee and Scandiffo are members in good standing of the D. M. S.

October 29-November 3, the C. C. and I. N. Committee cites those two doctors before it.

December 6. The first hearing of the executive committee. December 16. Lee resigns before the second hearing.

March 16. Scandiffo expelled. No dispute about that.

You may take those facts to the jury room undisputed. Why, it is urged on you, and you are asked to believe that all that was intended in those proceedings was to discipline those doctors.

In his opening statement to you, Mr. Leahy said Dr. Scandiffo knew the rules of this organization. If he didn't want to comply with them, why didn't he resign, and the answer to that is this: that D. M. S. was out for bigger game than Lee and Scandiffo. The fact of the matter is that on Oct. 29, 1930 both Lee and Scandiffo did resign. They resigned on the advice of Brown, and because they feared disciplinary proceedings would be instituted against them, and the evidence in this case shows beyond peradventure that the Medical Society intended to deny them their right to resign from that organization. Why? In order to force them out of G. H. A.

As I have said, on November 3 Dr. Hooe cited Lee and Scandiffo to come before the C. C. and I. N. Committee.

On November 6 he and McGovern were in Chicago conferring with Drs. West, Woodward, Leland; and in the course of those proceedings, in the course of that conference, Dr. Hooe said this, in substance:

Two of the G. H. A. doctors are members of the D. M. S. They sent in their resignations. He knew it. He had the resignations then, as of November 3. They sent in their resignations, he said. The C. C. and I. N. Committee cited them to appear before it; they didn't appear, but one of them wrote and said that he had resigned, and then he said, "The C. C. and I. N. Committee unanimously recommend to the executive committee that disciplinary action be taken." That is on November 6—four days before they had withdrawn their resignations; resignations which that Society was obligated to

accept if all they were interested in was in eliminating members who refused to comply with the rules and regulations. He added one other thing at that Chicago meeting. He said a third member of G. H. A., a third member of G. H. A., applied for membership in the Society but withdrew his application; that nothing could be done about him "at this time."

That is the answer to any contention that all these defendants were interested in was to clear the Society of people who would not comply with their rules and regulations. All know that what they were after was bigger game, as I have said. They wanted by threat, the threat that by these proceedings these doctors would become professional outcasts; they wanted to threaten Lee and Scandiffo with that in order to induce them to leave G. H. A. and unstaff that organization. The very arbitrariness of the hearing shows it. Even while that resignation was pending Hooe's committee recommended that the executive committee take action. One of the charges against these doctors was that they had failed to file their G. H. A. contract with the C. C. and I. N. Committee. On December 3 that contract was sent to Hooe by both Lee and Scandiffo. It was ignored, and that hearing proceeded. Lee's resignation is such a conclusive answer that it is hard for me to believe that anybody can make any serious contention that this expulsion proceeding was not directed at G. H. A. The first hearing was held on December 6. Lee testified at the hearing. The next hearing was scheduled for December 10. In between that time Lee received a telephone call from R. Arthur Hooe. He was told by Hooe that if he would resign from G. H. A. the proceedings would be dropped and his membership unaffected. On December 6 Lee appeared before the C. C. and I. N. Committee. He submitted his letter of resignation, or a copy of it, addressed to Dr. Brown. In that letter he wrote:

"Because of the circumstances I am forced to resign from Group Health."

The C. C. and I. N. Committee was meeting in one room of the Society building, the executive committee in another room. At the meeting Dr. Hooe addressed a letter to the executive committee stating that the C. C. and I. N. Committee had just been advised that Dr. Lee had resigned from Group Health and that, inasmuch as the charges against him were based on the fact that he had a contract with Group Health, the C. C. and I. N. Committee recommended that the charges be dropped. The letter was taken from the room in which the committee was sitting to the room in which the executive committee was meeting. It was read to the executive committee in full, and then the minutes show this:

"When it was definitely ascertained that Dr. Lee was no longer with G. H. A., Dr. McGovern moved that the charges against him be dropped. Seconded, passed."

That disposes of Dr. Lee.

The proceedings continued against Dr. Scandiffo three nights, I think, with the defendant Reeves presiding as chairman, and a few days after those proceedings concluded, Conklin wrote a doctor by the name of Hale:

"Dr. Lee has resigned from Group Health; Dr. Scandiffo has continued with Group Health. He no doubt will lose his membership."

He did, on March 16, 1938.

Let me now touch briefly on the boycott against consultation. The principles of medical ethics provide that in serious illnesses doctors should request consultation. The Medical Society knew that Group Health Association would depend on outside consultations. In the October 2 article of THE JOURNAL Woodward wrote that G. H. A. would be handicapped by the difficulty rightly to be experienced in obtaining qualified consultants; and was it handicapped?

Mr. Penniman, late in November, came to the defendant Neill and said this: Mary Frances Stewart, our technician, became seriously ill one morning and was taken to one of the local hospitals. Dr. Schoenfeld was called in to operate. Dr. Schoenfeld, a member of your Society, refused to operate at first until he had learned that this patient was entered by Dr. Lee as his own private patient. Penniman was shocked. There was a warning to Neill of the seriousness of this consultation boycott. There was a warning that the risk involved was far too great to justify enforcement of the provisions of this Society's rule. Did Dr. Neill observe that warning? Let's see. In March of 1938 Dr. Price had a patient seriously ill with coronary thrombosis, and on March 24 that patient became so ill they decided to call in Dr. Thomas S. Lee, one of the prominent heart specialists in the city, and what was the result? Dr. Lee instructed him, "I can't consult with you; I can't see that patient in your presence because you are G. H. A." That was Lee's response.

Kirkpatrick wrote a letter to Lee inquiring whether Lee had stated the fact correctly to Price, and received a response, in substance, substantially to that effect but saying that the specialist had seen the patient in the absence of Price. Now, what is the value of such a consultation when face to face contact and exchange of ideas between the doctors is the purpose of the consultation? It is true that the patient got well, but no thanks to the Medical Society.

Dr. Price took the stand, and although he denied on direct examination that there had been any interference with him with respect to consultation, he admitted in substance, on cross examination, the facts which I have related concerning Dr. Thomas S. Lee. He also testified that a few weeks after this incident he had in G. H. A. clinic a woman, an elderly woman so ill with heart disease he was afraid she would die in the office of the clinic. He called Dr. Thomas S. Lee and received the same response. Price further testified that after that, after that there were probably other instances when he would have liked to call somebody into consultation, except for the experience he had had.

Those are the instances in this record. They show how effective, how ruthless, the enforcement was of this consultation boycott. They show that the cardinal principle of ethics, that the welfare of the patient shall be the paramount consideration, was thrown to the winds, was scrapped to enforce the other provisions of the constitution.

Early in 1938 there were various rumblings in the Society because there were circumstances that indicated that some of the members of the Society were secretly and surreptitiously cooperating with G. H. A. Mattingly, on February 2, sought to put a stop to it by introducing a resolution which required the appropriate agency of the Society to take immediate steps to ascertain whether members of the Society were parties to any secret understanding with G. H. A. This resolution was referred to the detective bureau of the Society, the C. C. and I. N., chairmaned by the defendant Hooe; and then the witch hunt among the membership started. Hooe did everything except put on a false beard and dark glasses. Secret telephone calls, in which he warned members that they were suspected and would be cited before the C. C. and I. N. His telephone rang incessantly with calls that Dr. So and So was helping G. H. A. Neill helped him on it by giving him a signed statement which I think said implicated two of the members. He was so zealous that he even had the Society pass a resolution prohibiting members from accepting checks from G. H. A., but finally after he urged members time and again to get evidence, get evidence, "hearsay evidence won't do, I must have positive evidence of the violations," he reported to the Society that he was unable to get reliable evidence, and the Mattingly resolution was tabled, but Mattingly wrote that this threat of action had corrected this clandestine operation by members "of our suspected body," and the tabling of that resolution didn't stop Hooe. He worked on; and then he got his man. He got him just as Lee and Scandifio, and that doctor was none other than Dr. George B. Tribble, whom you saw on the stand.

What did Hooe find? In May 1935 he found that six months before Dr. Tribble had operated on Louie Gilstrop, the son of a member of G. H. A.; had operated on him for an acute mastoiditis. Dr. Scandifio, the charge was, had been permitted to be present for a few minutes during the operation and, in addition, after the operation, Tribble had written to Dr. Brown concerning the facts of the operation. That was the charge. Tribble appeared before the C. C. and I. N. Committee. Hooe told him that constituted collaboration with G. H. A. Think how far they had gone by 1938. The mere writing of a letter to the medical director was prohibited by the C. C. and I. N. Committee. The C. C. and I. N. Committee found him guilty, perhaps unwittingly, and recommended disciplinary proceedings.

Then Tribble got busy because he was scared. He got affidavits from everybody and they confirmed his statement that it was a private case; that he had not helped G. H. A., and the executive committee let him off with a warning from Sprigg that he must never do that thing again, and on his promise that he would not collaborate with G. H. A.

Ladies and gentlemen, do you wonder that such is the fact, that G. H. A. was having difficulty in operating? Neill, in the winter of 1937, December to be exact, had stated, "I think we can break this organization entirely," and he was speaking of G. H. A.

McGovern in April stated in the Society meeting, "G. H. A. is licked. It is nothing but a bubble."

Why, ladies and gentlemen, it is a miracle that the doors of that clinic were even kept open. Doctors denied hospital privileges, refused consultation, beset by resignations. How

could any organization possibly give adequate medical care under circumstances like that, and when these gentlemen stand here now and try to defend this case with the contention that the care is inadequate, that merely proves that they accomplished what they set out to do. That was their aim and they had achieved it partially. Hurlbut, of course, and another member of the staff came there as assistants. Lee was overworked. He became discouraged and left. Who wouldn't? That that organization was able to keep a single member of its staff is hard for us to understand.

One other matter. Let me come to one other matter before I close. An excerpt from some of the minutes. The first is the very significant report of Verbrycke, or rather of McGovern, on June 12, 1937. Let me read to you a few paragraphs from that report, which demonstrate that what the defendants were seeking to do was to drive out this threat, this competitive threat to private practice here in the District of Columbia, and that is all they were interested in, and that accounts for every move that was made; and here is a document which reveals it to you:

"The present H. O. L. C. corporation is only a minor consideration. (a) Either innumerable others will follow, or (b) a large, all embracing organization will succeed all the smaller enterprises.

"The first eventually, innumerable others, is not of great concern to us. Competition will kill them, and since they can't be large enough to supply a proper quality of medical care and hospitalization on their own account, subscribers will withdraw."

In other words, we can compete with these small organizations; we do not have to worry about them. We do not have to worry about the quality of medical care; subscribers will come to us. Those plans need not be considered, but listen to this:

"However, if the second eventually should occur and one single, large cooperative to take in all Government employees should be formed, the considerations are entirely different and we must be prepared to admit the following:

"1. With size and a single large cooperative, its financial success is assured.

"2. It can secure enough personnel of good quality, even if not the best, either locally or imported, to assure its success from the patients' standpoint.

"3. Its own medical center and hospital can be obtained.

"The Medical Society must therefore adopt a definite policy toward the cooperative problem as a whole."

That is what they feared. They feared the success of this organization. They feared its quality of medical care would be adequate. They feared it would have the funds to go on. So they feared that if this organization got large enough and succeeded, it might withdraw from private practice Government employees who had been going to the defendants, and that is why Woodward wrote. And that is what he wrote on September 1 in his report to the board of trustees. He said, after calling attention to the fact that Government employees constituted a large proportion of the population of Washington, that G. H. A. might, according to its certificate of incorporation, seek to withdraw from the ordinary practice of medicine and cover into a group health insurance or group practice scheme and treat them through physicians hired for that purpose. He said:

"The effect of the withdrawal from private practice of even one half that number of persons, all of whom are able to pay for medical service, would materially diminish the incomes of the physicians in private practice in the District of Columbia and render it necessary for them to increase their charges or sacrifice the practices they have built up and go elsewhere."

And so, ladies and gentlemen, when you heard various remarks in the minutes by the speakers on the floor of the Society, you can attach to those remarks the significance which they really deserve. When you hear these matters, give them the significance which the Verbrycke report of July 12, and THE JOURNAL article, require.

Dr. Thompson, chairman of the executive committee in the Society, says:

"We must look to the future. These plans all threaten the coming generation of physicians."

McGovern:

"I look upon this G. H. A. plan as coming in and interfering with my business. I expect to be in private practice for another twenty-five years, and I do not propose, if it can be helped at all, to have this organization interfere with my work and income. What are you fellows going to do about it?"

There is the answer. There is the answer to free choice of physicians; to public policy; to the rest of the principles of medical ethics.

Ladies and gentlemen: Let your verdict be the answer to these defendants who would hide those purposes in the shelter of the Hippocratic Oath. I thank you.

(Thereon there was a brief, informal recess, at the conclusion of which the proceedings were resumed as follows:)

ARGUMENT ON BEHALF OF THE DEFENDANTS

WILLIAM E. LEAHY

Mr. Leahy:—If your Honor please, and you ladies and gentlemen of the jury, before I begin to sum up for the defense may I take this opportunity to say a word of thanks to you. You have been very kind. You have sat here with patience and attention and you have listened for two months to perhaps the most boring, tiresome testimony that any jury was ever called on to listen to. Necessarily, from the type of the case as it was presented by the prosecution—so many papers, so many documents, so many minutes, so much of what somebody said ten years ago, eight years ago, five years ago, and three years ago, with nothing but reading—I dare say you hoped that some day there might come an end to it.

Now it is necessary for me to stand here and bore you further with a repetition, perhaps, of what you have listened to for two months; and I dare say that sometimes your minds were in a delightful state of confusion where you wondered just where all these documents happened to fit into this particular picture that you were called on to look on, and then, as jurors, to decide.

You have just heard the oldest profession in the world castigated as though its members were common criminals. You have just heard every motive which has actuated a doctor in the practice of the ideals of his profession dragged down into the common mud and mire of cheap commercialism. You have just listened to a castigation of men who have been drawn into this court room as defendants, the like of whom no jury has ever been called on before to sit face to face with for two months.

You have heard two organizations of professional men which have had for their ideals the protection of your health and mine, the protection of the health and the welfare of the United States, condemned as if they all ought to spend the rest of their lives in disgrace.

There must be some reason for such a thing; there must be some reason why men are thus accused. We are all human, after all. We all have known the medical profession. The medical profession stood by every one of us when we came into this world, and some one of them will be standing beside our deathbed when we leave it. We know that doctors are only human, and we know that sometimes they are actuated by motives which we do not approve of, just as lawyers are, and no one regrets that more than the practitioner, because, after all, the profession of medicine has been inspired by the highest ideals under heaven, next to the ideals of those who attend your sick souls.

Why was it, therefore, that this heat was put into the argument in order to arouse you so that you could not review this testimony as jurors with calm deliberation?

I will tell you the reason. It is a reason which every lawyer uses when he cannot talk facts. It is the reason which every lawyer employs when he knows he has not a good case. It is the reason which every advocate employs to try to inflame the jury and get it away from the issues, in order that it may draw you into an unjust and an unfair verdict.

We do not need to employ the anger that counsel employed. We do not need to talk about honest men as lawbreakers. We do not have to employ language which says that every one who disagrees with us is a crook. We can stand here and sit here, as we have for two months, and look all this evidence calmly in the face and arrive at a verdict which we know is fair and honest and just.

An analysis of this testimony, ladies and gentlemen, will show you that the cause of your being here for two months was given you by the first witness on the witness stand, two months ago, and the answer to these charges was given by the last witness who appeared on the witness stand the last day we took testimony in this case.

I want you to go back with me for just a few moments in your minds and try to recollect with me the testimony of the old gentleman who came down here as the expert from Boston—Dr. Hugh Cabot.

Why, those men—and I am including now the defendants—those fine officers of the American Medical Association, these doctors who are members of the District of Columbia Medical Society, know more about the practice of medicine in five minutes than these lawyers could tell you about in five years. It has been their life work. They spent ten years to prepare for their practice, and then they pursued that practice; and for us lawyers to stand up here and talk to you ladies and gentlemen about the cost of medical care and the distribution of medical care is nothing but nonsense. Those men, including Dr. Hugh Cabot, could sit on that witness stand and tell you more about the theory and practice from actual experience—not from the standpoint, now, of one of the experts whom they produced, who has never done a day's work in a hospital from the practical standpoint and who, since 1920, has always lived off the income handed to him by some fund engaged in theoretical studies.

Those men know the practical side of life. They know what the actual practice of medicine means. They know whether you can get good medical care one way or another way—not from a theory, not out of a book, not out of a class of individuals who are drawn together to study. They know it from cold, hard facts. They have seen examples of the lack of good medical care. They have nursed back from illness to health those who have not had proper medical care. They know the reasons why. And in endeavoring to lay a foundation back there, when I asked you to go with me in your recollection, the question was asked of Dr. Hugh Cabot, laying a foundation for this G. H. A.—

"Doctor, is there any danger in these groups from the interference of a lay board?"

The answer was a rather unexpected one. He said, "Yes; there is."

It was the interference of the lay board of G. H. A. which put you ladies and gentlemen in this jury box. If G. H. A. had left this matter to that grand old man sitting right there now in this court room—Dr. Brown—you would not be here. But it was due entirely to the fact that Zimmerman, Penniman and Kirkpatrick had determined in their minds that they were going to do something. And then Zimmerman spent about two days, if you recall, down at Stanocola, in New Orleans, and he came back with all the knowledge in the world about group medical practice.

Penniman told you on the witness stand that he became connected with this matter as early as January 1937. Kirkpatrick came in a little later as the second president, but was on the first board of trustees. Those three men, the lay board of trustees of G. H. A., have brought you into this jury box when, if they had followed the advice of Dr. Brown, the Medical Director, there would have been no trouble whatsoever with G. H. A. and none of the squawking complaints that you have listened to here that remind you in retrospect more like children crying than as men who were honestly trying to seek and practice a lofty ideal and ambition.

Dr. Cabot warned them. He said, "Yes; the interference of lay boards of trustees is extremely liable to happen in groups of this kind." It did happen.

Now, let us grow up with the baby for a while. Zimmerman had been down to Stanocola. Before he came to work for the H. O. L. C. he had been with some oil company out in the West. And, ladies and gentlemen, let us not have our minds confused about this group practice or these industrial groups.

Do you remember Mr. Laux when he was on the witness stand, who worked in the department headed up by Dr. Leland? Do you remember that he told you that he personally had studied four thousand such plans. You might think G. H. A. was the only plan that had ever been put on foot; you might think nobody had ever heard of such a plan before. Mr. Laux, their own witness, said that in the four and a half years while he was studying plans under Dr. Leland's supervision, he had probably written from eight thousand to ten thousand letters.

They went through Mr. Laux' files from A to Z. You saw on the corner of some of the letters which were read here, and perhaps you may have forgotten it, a numeral. I tried to bring it to your attention. I said, "What does that stamped numeral mean on the corner—705, 1,006?"

"That is the number of the documents which the F. B. I. withdrew."

This case has been combed from the start out of documents; and I want to ask you this, as a man talking to you, the jury, if it was not left for the defense to produce the facts. They produced minutes and letters, all one sided; not the letter written in the first instance, but the reply, so that they could draw from that letter any interpretation which they wanted to put on it; and it was left to us to go out and comb Wash-

ington, find nurses, find young interns to tell you properly what had taken place about Miss Abbott and the rest. But we will discuss that later.

We had to go and bring their own doctors to the witness stand. They would not even bring a doctor from their own clinic on that witness stand, and we had to do it for you.

In other words, the facts in the case were developed from the defense; and that is exactly what your attention was being drawn to when Mr. Laux was here, because he had examined four thousand plans similar to this, and yet they have the temerity to stand up here in front of you and tell you that the American Medical Association was opposed to group practice from the beginnings.

Why, Dr. Cabot is a member of the American Medical Association this very day. Dr. Cabot told you he had his own clinic in Boston. The President of the American Medical Association has his clinic in Boston. The Mayos were presidents of the American Medical Association, and they have perhaps one of the best known clinics in the world.

Yet the prosecution tries to persuade you that over this period of time the American Medical Association was opposed to group practice. Bosh! Nonsense! And they know it. They know it is not true.

Dr. Cabot had been on the stand hardly an hour and a half before they shifted the whole picture of the prosecution. In their opening statement they tried to make you think that we were opposed to the Mayo clinic, that we would have nothing to do with the Mayo clinic; that the G. H. A. was formed like and similar to the Mayo Clinic, because they knew that practically every person in the United States has heard of the Mayo clinic, and that if they could persuade you that we were opposed to something like the Mayo Clinic, then they knew they were talking about something about which you knew and it would be very effective.

You were told in the opening statement that group practice such as G. H. A., had come up in the last ten years. Dr. Cabot described to you that group practice extended back over a hundred years. Of course it has. Nobody denies that. There have been groups of doctors operating; but this particular kind of group practice, Dr. Cabot said, was known only in the last decade; it was still in its experimental stage. In fact, he said that he had himself collected together a committee of doctors to study the principles under which this particular kind of group practice should operate. I asked him the question, if you will recall, "Who were on that committee, Doctor? Did you have only doctors?"

"Oh, yes. There was only one who was not a medical doctor, and that was a Ph. D."

He appeared on the witness stand. He was not a medical doctor. He was the one who was acting as secretary of the committee. But when that old gentleman from Boston wanted to collect together a group of doctors to study how to formulate a group practice plan, did he get three gentlemen working in H. O. L. C., or did he get five doctors who knew something about the distribution of medical care and what it should be?

On his own clinic in Boston does he have a lay board interfering between the patient and the physician? It is all doctors, and they are doctors who have qualifications in the hospitals. Every one is qualified for hospital practice.

They asked him, "Oh, but didn't you have some difficulty with your local medical society?"

"Oh, no; none whatsoever."

There is not any reason why this case should have been here in this court. The whole thing is so unnecessary, to bring doctors to the humiliation of a trial as criminals when it is all due to the interference of the lay board of G. H. A.

And I am bringing you back to the point, now, where we started, in order to show you just exactly how that interference came about.

The argument was just made to you that the District of Columbia Medical Society, back in June, in an executive committee meeting, came to a position of determined opposition to G. H. A. I will tell you that the testimony is that as early as January 1937 G. H. A. came to the determined opposition of the Medical Society.

Why do I say that? You remember, probably, one of the doctors who they said was drawn away from G. H. A.—Col. Glenn I. Jones. You remember when Colonel Jones was on the witness stand. He is the first doctor who was approached to take the position of Medical Director of G. H. A. You remember that Mr. Penniman and Mr. Zimmerman went to see Surgeon General Reynolds of the United States Army, and Surgeon General Reynolds referred them to Colonel Jones, because Colonel Jones was retired; he had the proper qualifications, and Surgeon General Reynolds thought that he would make an excellent director. At that time Mr. Penniman and Mr. Zimmerman

asked Colonel Jones to draft a plan of organization, and Colonel Jones said that the first thought that hit him right between the eyes was that no plan of distribution of medical service to anybody can possibly succeed unless we have the best doctors in the community.

Now, it just happens that the best doctors belong to the District of Columbia Medical Society. We do not apologize for that. If all of the best people collected together into an association in order to advance the interests of medicine—and you will remember that the first article in the constitution of the American Medical Association was and is only to promote the art and science of medicine and the general public welfare. That has been there since 1847. I wonder if they accused us in 1847 of having put that article in there because in 1937 Group Health Association was to be formed. In the District Medical Society we have the same purpose, to promote the art and science of medicine and the general public welfare.

But they say, no, that is not our purpose. It is cheap commercialism. We are afraid of competition. We are afraid of a dollar that somebody may take away from us. We are afraid of a group that might get together and that would not have our rent to pay.

We adopted those constitutions, one in 1819 and the other in 1846, operating as the sole guide as to ethics, and their morals and their standing have now been accused before you of being cheap commercialism, or being in cheap competition as if they were selling tobacco or cigarettes off a shelf, as if they had no thought in mind that when they are sitting at your bedside, after all maybe they are interested in seeing you get better. Maybe they are willing to miss a baseball game or theater if they can sit beside you and maybe bring you back to health.

No; they want to wash that out of the picture. The true picture, the true purpose for which these men are organized covers every act they did in this case, as you will come to see.

To return to Dr. Glenn I. Jones. I do not know anything more about the practice of medicine than you do, not one whit or one bit, and I would not propose to stand here and tell you that I knew anything more about the practice of medicine than you know yourselves. But as men and women we know that if someone is going to distribute medical care, I don't care whether it is an experiment or an accomplished fact, it has got to be done by good experienced men. It is a pretty dangerous experiment, toying around with human life. Wait to see whether the experiment succeeds. The success of the experiment probably is buried over in the grave yard. We never know. But we do know this, that when people are ill, when they need professional care, then in the words of Dr. Glenn I. Jones, we need the best in the community to back up and head such an organization.

What did he do? He did just what you would do if you were called on, if you were a doctor, to head an organization. Would you not go around and talk with some of your friends whom you had known for a long time, who were young practitioners when you were? Would you not go and say to them, "Well, Bill, what do you think about this?" Or "Jack, do you think we can make it go? Is it sound?"

He did just that thing. He went to see Dr. Christie. He had known Dr. Christie twenty-five years. He went to see Dr. Groover. He had known him for twenty-five years. He went to see Dr. Charles Stanley White. He had known him for thirty-five years. Not a single one of those gentlemen was talking for the District Medical Society or for any purpose except sitting down there with Col. Glenn I. Jones, their old friend of twenty-five and thirty years' standing; and they talked the matter over, as he said, for about an hour, and all three of those men said they did not think that the scheme as outlined would receive the support of the District Medical Society because they did not think it would work. And to repeat Col. Glenn I. Jones' statement, "Right then and there my participation in that scheme began to cease."

What did Jones do? Jones went back and told Penniman and told Zimmerman.

Now, let me ask you this. After all, we all want to be fair. We do not have to indulge in exhortation of anybody. We do not have to call names. But you can sit there and I can stand here, and be fair about this matter.

Don't you think that if Penniman and Zimmerman wanted to start a medical organization in the District of Columbia they ought to have talked with some doctors? Am I asking something that is unreasonable? Don't you think that an organization which is going to give medical care to the people of the District of Columbia ought to have the advice and information of the doctors of the District of Columbia? Dr. Cabot said so.

What does he do? Immediately following the information which Colonel Jones brought to Zimmerman, he calls for a

meeting. And where? In his apartment. With whom? He has Admiral Rossiter from the Navy; he has Reynolds, Surgeon General of the Army; he has Cummings, of the Public Health Service, and he has our own Dr. Ruhland, our own District Health Officer—the same office that Dr. Woodward once held here. They met in the apartment and Jones again discussed it with them and he again told them it was absolutely necessary, in order for this scheme to succeed, to have the very best doctors, and that anybody who dared to start an organization to administer to the public health without the very best doctors they could get would be perpetrating an imposition and a fraud and ought to be opposed and stopped in the public interest.

What happened? From that meeting Colonel Jones dropped the entire organization.

Surgeon General Ireland, on the 27th day of March, wrote to Dr. Cutter and said that they had discussed this matter and concluded that it was an entering wedge to state medicine.

I said, "Colonel Jones, do you think state medicine is in the public interest?" And he said, "Absolutely not."

Major General Ireland used the phrase, "They dropped it like a hot cake."

Colonel Jones said, "No; I didn't use that phrase."

But he did drop it like a hot cake.

Is it not strange that out of this great idea, this thing that exploded spontaneously, you never have seen Admiral Rossiter on that stand; you have never seen Surgeon General Cummings on the stand, you have never seen Dr. Ruhland on the stand? But you have never seen a man in a responsible position who, as early as March 1937, knew the inside of G. H. A., who connected himself with it whatsoever.

Even after Colonel Jones had told Penniman and Zimmerman that he had information that these finest of our surgeons and doctors in the District of Columbia could not agree with the scheme did they even then go to the District of Columbia Medical Society? Did they call up a single District Medical Society doctor? Did they have a conference with a single soul? Not one. They went ahead, determined to put that scheme through, because Zimmerman had spent a couple of days down in New Orleans—can you imagine that? Supposing all of us right now walked over to the Endicott-Johnson shoe factory, or went over to the Ross-Loos Clinic, or even walked over to a hospital and saw it in operation. Do you think any one of us would know how to run that institution? Every last one of us has been in a hospital at some time. What do you know about its running?

But Zimmerman came back, and he knew it. But in March, down to the time that Dr. Brown was employed, not a single man in the District of Columbia was approached to become the Medical Director. Not a single word of advice was sought. Not a single bit of information was given until in June Dr. Brown was appointed the Medical Director.

There was not a single one of these defendants, not one of these organizations that as an organization or as a defendant knew a single thing about Glenn I. Jones until about the 26th day of May, when Jones himself, I presume, feeling as a medical man, having spent most of his life in the United States Army, having been an experienced surgeon and physician—I suppose he felt that somebody in the District of Columbia who knew something about the practice of medicine ought to be advised of what was going on.

Now, they sneer at Surgeon General Ireland who said he was going to wise up some of the local doctors.

Every little word, every sentence in letters between old friends, is given another meaning. Ireland had been on the committee out there with Dr. Cutter for years and was writing as one friend to another, and then four or five years later they pick up his letter and they want to put a sneer where none was meant. You know what Surgeon General Ireland referred to. He referred to the visit of Glenn I. Jones to Dr. Gerry Morgan's office on May 26, 1937, when Colonel Jones told Dr. Gerry Morgan, Dr. Macatee, Dr. Christie and Dr. Groover what was going on in the city of Washington, and about these men inspired with a lofty ideal to do humanitarian good to a large group of citizens, but who refused to tell.

I want to ask you now, in all fairness, don't you think that all of the doctors of the District of Columbia are rightly interested in a group which is going to take care of thousands or hundreds of thousands of people in the District of Columbia?

I think it was one of the saddest bits of testimony in this whole case when Dr. Groover was referred to, and it was difficult to restrain your honest indignation when you heard the motives of that man dragged across the floor of this court room as cheap commercialism. He sat down there on July 26

and told them, "I am through. I have not more than four or five years to live. Therefore I have no personal interest in what you do. I want to tell you that the medical profession of the District of Columbia will not be threatened if you know that the quality of medical care will be assured."

He was a prophet of his own passing; and even though he could not testify or talk to anybody, nevertheless those words of that dead man stand out here as the answer of an attorney who would come before you and try to degrade the entire profession of the District of Columbia and its practice by saying that such men as these, men who have been our honored citizens in this city ever since you and I have been here—most of these men on whom you are sitting in judgment now have practiced medicine more years than you have lived. There has not been a finger pointed at these men until this G. H. A. finger was pointed in scorn and condemnation. These men have taken care of more people, perhaps, in the District of Columbia than all the G. H. A. membership put together.

But we will return to that meeting of July 26 before the board of trustees of G. H. A. The meeting on the 26th day of May, when Dr. Glenn I. Jones made up his mind months before to have nothing to do with the project, was the first information which any one in the District of Columbia, in the District Medical Society, had heard, with the exception of Drs. Christie, White and Groover, when Glenn I. Jones first asked their advice about the matter.

Can we not differ in our opinions? Has it come to this, that because G. H. A. is involved we cannot have a difference of opinion about it? You know that somewhere, written into the Constitution of the United States, is the fact that our citizens shall enjoy freedom of speech and freedom of the press. Under our form of government we still have a right to think; we have a right to express our thoughts; we still have a right to write and print. Newspapers still write as they think they should. Magazines still publish articles. You and I read them. There are disagreements among them, but we still do not go to a concentration camp or back up to a wall because we happen to disagree with someone else; and unless in our speech or unless in our writing we are violating the law, unless we are doing something which we ought not to do in violation of the law, then we have the right to talk, thank God!—because that is a right for which men died in order that you might be sitting here in this box as twelve citizens, jurors, to find a verdict in this case.

These men are criticized because they wrote letters saying, "We don't agree with G. H. A.," and counsel say that they ought to be condemned as criminals, that they should be pronounced guilty. Guilty of what? Guilty of exercising a higher right than the anti-trust law gives anybody. They are exercising a right for which men fought for years, and this today, perhaps, is the only country in which we have that right in the freedom of its full exercise and its full enjoyment.

What is the next thing we see after May 26? Dr. Macatee comes before an Executive Committee meeting of the District Medical Society.

Some of you men, I suppose, belong to some organization; I don't know. But if you do, you know that the organization has committees, and you know that the committees are given jurisdiction, as we call it, or given authority to go out and make an investigation here and make an investigation there and make a report. That is what their right is and that is what their duty is. Their duty is to make an investigation and to make a report; but they cannot bind the organization. Not until the organization to which you belong votes to adopt the report and to bind itself by the report, does the report become of any importance whatsoever in so far as the organization itself is concerned.

Dr. Macatee made a report, and Dr. Verbrycke produced what was the first information which the Executive Committee of the District Medical Society had about Group Health Association. This, now, is the Group Health Association which has been represented to you as wanting the cooperation of the District of Columbia doctors, and this document has marked on it "Confidential. For private use only." Here is a copy of it (indicating) which was introduced in evidence. This is what Dr. Verbrycke produced. There is no use holding back these things with any air of mystery about it. There is not anything in this case that we cannot explain.

Is it not strange, if all of these men over here (indicating defendants), honored citizens of this community, were engaged in the commission of a crime? Is it not strange that if they were you would find all these letters? They would have been in the mouth of a furnace, or they would not have been written in the first instance. Men engaged in the commission

of crimes do not leave a stack of documentary evidence as high as this railing, that it took, I think, two weeks to read to you.

Did you find any documents that Penniman or Zimmerman had written—or Kirkpatrick? I am going to contrast that with you before we get through. I want to show you the difference between honest, straightforward men who are honestly trying to find out what to do in a situation which suddenly confronted them in this fashion, and the situation of men who built up a record for themselves and who did not write, because if they should write somebody might find what they had written.

This document is marked "Confidential; for private circulation only." Why? Why should it be confidential if it is something in the public interest? If they are now engaged in performing this experiment which, as Mr. Kelleher said, was a further advance in medicine where the fee-for-service practice—I think that is what they like to call it—had fallen down, what in the world are they circulating it so confidentially for? Wouldn't you be interested in knowing about it? I would, if I could get my doctors' bills paid for \$3 a month; I would be there in a minute, and I think most everybody else would. I would like to know about it; I would be only too glad to know about it.

But that is what was produced, and the Executive Committee sat down and looked this over. No one had seen it before. It contained some very interesting matter. I am not going to read it to you; it would take too long to do so. It states that the smallest number of enrolled persons employed, supporting a medical clinic or group, should be approximately ten thousand. But they started right out with nine hundred. They had all these things in here to look at. They sat down and discussed the matter, and then they say that Dr. Macatee said, "We have two weapons." Oh, how they like to seize on that language! It was contained in an abstract of minutes of that meeting. But they entirely forgot something.

Dr. Macatee appeared here before you. He is one who perhaps had more to do with Group Health and the attitude of the District Medical Society toward it, up until the 6th day of October 1937 than any other single person.

I showed him the words in the report. He said, "No; I didn't use that language."

And you remember the young lady who took down the minutes of the meeting of the Society. She told you that it was almost impossible for her to get all that was said; the best she could do was to transcribe what she thought was stated, and then Dr. Conklin came along and he corrected it. If it did not jibe with what his recollection of it was, then it was corrected. In the Executive Committee Dr. Conklin alone acted, and he was writing down what he thought someone else said.

Dr. Macatee told you what he did say, and he said he did not say any such thing.

Counsel handed the minutes of the June 1st meeting to Colonel Glenn Jones, and with a great deal of expectancy and assurance they pointed out what the minutes said, and they said, "Colonel Jones, will you kindly look at this place here and tell us about that?"

Colonel Jones looked at it and said "I don't know what it means. Who is supposed to have said it?"

And yet he is the man who is supposed to have said it.

There is a danger in the type of testimony upon which they ask you for a conviction in this case, because they are minutes which were written back three years ago, some of them almost four years ago. Not what people said, but what people thought was said. But right then and there Mr. Kelleher told you that the Executive Committee of the District Medical Society took a firm, determined purpose that it was going to restrain G. H. A.

Let us see what happened. What did it do? Did it appoint a committee to try to find ways and means of keeping G. H. A. from coming into existence? Did they appoint a committee to go around with black glasses and a beard and try to find out what G. H. A. was doing, in order to stop it before it started?

If they wanted to restrain G. H. A., the time to have done it was then. That is when they ought to have worn black glasses and beards. The whole Executive Committee should have had them and played detective—such as Dr. Hooe was painted to you, when his telephone was so busy that he was almost out of breath and the phone was hiccupping call after call.

They appointed a committee to investigate and report back, and the committee made its investigation. And then these men who wanted to restrain and to destroy G. H. A., these men who

did not want this group to come into existence, these men who did not want a doctor on the staff, these men who had refused to consult with the doctors after they were appointed, these men who wanted to shut the hospital doors to all G. H. A. patients and doctors alike—what did they do? They invited G. H. A. to come up and talk to them.

Conspirators? Is that the way conspiracy starts? Is that the way opposition is conceived and then put into practice?

They invited those men to come over, and they said, "All we know about you is what we have heard from Glenn I. Jones and from the document marked 'Confidential; for private circulation only.' Come over and tell us what your scheme is, will you?" And they accepted that invitation. Penniman, Zimmerman and Dr. Brown came over to the District Medical Society. And here comes the first disagreement in the testimony in this case. Dr. Brown, the first Medical Director, a gentleman who has already lived as many years as I hope each one of you will live, who has spent one of the most useful lives in the practice of his profession that any doctor could possibly spend, who, when he goes down to his final reward will go down with a life well spent back of him—he told you that he believed in the group practice of medicine on a prepayment plan, and he said, "I still believe in it."

And then I asked him as the first medical director, the man who opened their clinic, the man who purchased their equipment, the man who was formulating their staff, getting their nurses together, seeing that the clinic was properly laid out—I asked him if he remembered the occasion when those three men went to the District Medical Society.

Up to this time the District Medical Society had done nothing, because it had no information upon which it could act in any way. Those men were honestly seeking a bit of information about which they might advise the District Medical Society. And Dr. Brown said, "Yes. We all met for a dinner at the Mayflower Hotel, and it was agreed among us that we would tell them nothing, and just before we went into that meeting the admonition was repeated—'Now, remember: tell them nothing.' In other words, let them do the talking, but don't tell them anything."

Mr. Penniman and Mr. Zimmerman say that that was never said. The fact of the matter is that they told them nothing. In the broadest kind of language they answered questions.

Why a meeting at all? Why should the three of them go to dinner just before they went up to the District Medical Society? Why didn't they do what you or I would have done—go up there and meet with the District Medical Society and go in? Why should they all meet to prepare and map out a course of conduct at this meeting over at the Mayflower Hotel before they walked over to the District Medical Society office? Why should they then say, "We will tell them nothing"? And that is just what they told them—nothing.

Mr. Penniman told you on the witness stand—and don't let anybody think that Mr. Penniman is not about the smartest witness you have ever seen on the witness stand. He has a magnificent presence; he is a fine looking gentleman, and he is well schooled in experience. He used to sell investments for Blythe & Company at 120 Broadway. He knows how to weigh his language. He is a good salesman and he knows how to make a sale. He told you that he was particularly interested in getting Dr. Neill as the Medical Director. Dr. Neill was the president of the District of Columbia Medical Society, and he said that he and Zimmerman and Russell went up to Mr. Childress' house; that Mr. Childress was the liaison officer between H. O. L. C. and Congress; that Childress was a close personal friend of Dr. Neill, of long years' standing, and there they asked Dr. Neill to become Medical Director.

They never asked him any such thing. When we called Dr. Brown, Dr. Brown said, "Why, I was already the Medical Director."

They would have you believe that Dr. Neill refused to become the Medical Director of G. H. A. because it was along this line of restraint of G. H. A., when the Medical Director already appointed was sitting right in the group with them; and they never denied it.

You know, there is not so much in this case as there is out of it. There is not so much evidence brought to you ladies and gentlemen as there is that which has been restrained and pulled back. It is not the restraint of G. H. A.; it is the restraint of testimony, because where the testimony is not in, then you can argue inferences. That is the danger of circumstantial evidence, because with only circumstantial evidence before you, then the one who can draw inferences the most convincingly from what is in is the one who is liable to convince you that his interpretation is correct.

We could have found out whether he was there or not. They could have found it out in the easiest way in the world. We called Dr. Brown. We were not afraid to produce anybody on their staff, and everybody that we could get from their staff we brought in. They did not. Where is Mr. Childress? That is the man who can settle that difference in the testimony. There is the man who could tell you, the liaison officer between H. O. L. C. and Congress, the first assistant to John H. Fahey, the man who proposed the conference. If Dr. Brown is not accurate in his memory, why have we not had Mr. Childress here to tell us about it?

Now Mr. Kelleher says that it makes no difference, because he did not become surgeon. It makes all the difference in the world, because they ask you to rely upon the recollection of Penniman and Zimmerman over against the recollection of Dr. Brown, and you know that if Dr. Brown was the Medical Director and was sitting there in the conference as Medical Director, they never asked Dr. Neill to become Medical Director, and he never refused, because he was never asked.

They say it was a long, extended meeting, and they were told that H. O. L. C. had financed it for a couple of years. How much? For what purpose? What was the amount?

You remember that on cross examination I asked the witness if he did not remember sitting there with his pencil and paper figuring out the number he had in the clinic and how economically they could give the service which they said they were going to give, and what they were charging, and he said, "Yes; I do remember that."

What were those men trying honestly to find out? A way to restrain G. H. A.? Or were they trying to find a way of killing it off before it started? Almost the last thing that was said at that meeting was, "If we can get together on this proposition I think we will have attained a great social service."

And then these men who wanted to restrain G. H. A. and to destroy it, said, "Won't you entertain a committee from us so that we can talk it over once more? Won't you let us come down and sit down with you and discuss this matter further? Let us see if we cannot do something."

Finally they said yes. The committee which had been appointed was still functioning. One of the arch conspirators, Dr. McGovern, was on that committee; and Dr. McGovern wrote on July 15 to Mr. Penniman and said, "Mr. Penniman, won't you supply us with a copy of the by-laws? Won't you supply us with the contract under which your proposition is being financed?—because if it is not being properly financed it cannot do what it promises to do. Won't you give us the contract between your members and your association?"

Dr. McGovern wrote that letter and it is here in evidence. Did Penniman write a reply? Not much. He was too smart. He called Dr. McGovern, because we do not trace telephone messages except in our memories, and one man's memory is as good as another's when he comes to the witness stand.

Then they arranged a luncheon. He said, "Come on down and we will talk it over at lunch." And McGovern went down. When he went down did he meet Penniman? No. He met Penniman and Zimmerman—so there could be two who could remember against McGovern, who would be alone. Did they supply him with a copy of the by-laws? Did they give him a copy of the contract? Did they supply a copy of the contract between the subscribers and the association?

They supplied him with absolutely nothing.

And yet he had the audacity on July 26 to suavely state to the committee when it came down there honestly seeking to obtain information, "We laid all our cards on the table."

All but three that he held up his sleeve, the three important ones.

And then I asked him on cross examination, with reference to when Dr. Macatee was talking to him down there as one of the committee, "Don't you remember that he raised the question of the legality of G. H. A.? Didn't he say that in most of the states of the Union it had been held that a corporation could not practice medicine because a corporation cannot take a license out to practice medicine?"

And I asked him, "Don't you remember Dr. Macatee said, 'Give us some help on this, will you?—because there never has been a decision in the District of Columbia upon it.'"

He said, "Yes; I remember. We had the idea that you wanted the contract and you wanted the by-laws and you wanted this other information so you could test the legality of G. H. A."

And he positively and absolutely and purposely refused to give that information or any assistance or cooperation to that committee of reputable, honest, decent men here in the District of Columbia, just as positively as it was possible to give

a refusal, with those honeyed and mellifluous words; and when the meeting was over he thanked them for having been down there. But what did they get?

Dr. McGovern reported back that he could not get the contract; he could not get a copy of the by-laws.

Mr. Penniman was on this witness stand before you—and I wonder if he thinks that you cannot see through these things—and he said, "I knew they could get a copy of the by-laws, because we had several hundred of them printed and they were distributed to the members of G. H. A." I said, "Did you supply a list of the members to the Medical Society so that they could go to somebody and get it?"

"Oh, no."

His excuse for the nonproduction of the contract was that he would have to get the H. O. L. C. board's approval to surrender it. And then ten minutes later he told us that it was in connection with Dr. Macatee's statement, that they figured that perhaps Dr. Macatee was down there trying to trick them, trying to find some excuse to get something on them.

Now, ladies and gentlemen, this business of restraint has been the bugbear of G. H. A. in the minds of Penniman and Zimmerman ever since the beginning. That is all they have talked about. They said, "Oh, you are trying to restrain G. H. A." And as far back as July 26 Penniman is so suspicious that he won't give a copy of the contract or of the by-laws to Dr. Macatee.

You saw Dr. Macatee on the witness stand. He was there two days. Do you think he is a crook or a trickster or a conspirator? Or is he a man who is practicing his profession here in the District of Columbia and has for forty years, who has held the highest office which his own District Society could confer upon him, who is a delegate to the House of Delegates of the American Medical Association for the District Society, who has high office in the hospitals of this city? If that is the kind of man they say they thought was trying to trick them, I wonder if what Dr. Tribble said is not apropos: "Evil to him who evil thinks."

Those men went down there trying to get a bit of information in order to report back to the District Medical Society. All that the District Medical Society had done was to appoint a committee to try to get information.

In the talks back and forth in some of these committee meetings you will find that A said this and B said that. They had a right to discuss it among themselves, just as you in your jury room will discuss this matter, and finally the only effect of it all will be a verdict. It will not be what you said or the other one said, if someone wants to attack the verdict and say, "Oh, you said this" or "You said that."

They bring in the minutes and say, "Oh, the Doctor frankly said 'We have two weapons which we can use.'"

Can they show that he repeated that on July 27 when he reported what had occurred at the meeting on July 26?

They had no more information. They did not know what to do. So they called a special meeting of the District Medical Society. This is the first time the District Medical Society had met, because it was summer. Nobody sits around in meetings in Washington in the hot summer time. And they met in a special meeting in the latter part of July and they reported to that meeting, and here were the conspirators, McGovern and Macatee, and Dr. Macatee said that he thought they were high-minded, civic minded men and that they really believed that what they were trying to do was right. McGovern made the same kind of statement.

And those are the men who are charged as conspirators, trying to restrain G. H. A.

Dr. Macatee said that these men perhaps had heard of other cases in which some medical society had taken action against them, and maybe that was the reason why they did not want to give the Medical Society the information requested. Of course he did not know what Penniman had told you. If you sought the world over you could not find a more honest, fair statement than Dr. Macatee made or Dr. McGovern made.

Does that show ill will? Does that show a purpose to destroy? Let Mr. Kelleher answer it now. He says that away back in March or April they had formed the idea of trying to restrain and destroy G. H. A. But the chairman of the committee, the man who was appointed as the spokesman for the committee, reported back that he thought these men were high-minded and fair minded. Now these doctors sit over here as defendants charged with a conspiracy to destroy G. H. A.

If Dr. Brown had been let alone, if Dr. Brown had been given the right to go among the hospitals, as he started to do; if Mr. Penniman and Mr. Zimmerman did not think they knew more about medicine and its practice than Dr. Brown did, who had been in charge of Government hospitals for twenty

years, under the Veterans Administration, who knew more about hospitals in five minutes than Penniman and Zimmerman will ever know; if they had let Dr. Brown alone there would not be any such difficulty as this.

Don't you think I am reasonable in asking you this question? If a group of men wanted to start a clinic, if they wanted to hire a staff of doctors—they must have known that somebody was going to be sick, because nobody would come to a clinic unless he was sick, and some of those in the clinic would need hospitalization—do you not think it would be reasonable that the first thing they would do would be, as Dr. Cabot did when he started his clinic, to get members connected with various hospitals, so that they would have hospitalization? There is not a word about trying to arrange with the hospitals for G. H. A. They have been talking about it since January and they refused to go to the only people who know what practicing medicine means. They refused to go to the hospitals in the District of Columbia and ask the hospitals, "How do you feel about this? What can you do about it? What are your rules with regard to practice in the hospitals?"

And then when they found that out they could go ahead and open up their clinic in accordance with rules that had been in effect in the hospitals, some of them for fifty years.

You will see that every hospital in the District of Columbia is named in the indictment as a conspirator, every one. There is nobody in the United States who ever said anything about Group Health Association who is not a conspirator.

Here are these hospitals in the District of Columbia who are manned by an administrative board composed of the ablest and best known and most civic-minded men in the District of Columbia, who give of their time freely in trying to keep the hospitals going. The staffs of those hospitals are manned by the most experienced surgeons, who do not get a farthing for what they do for the poor that come in there and on whom they operate and for whom they care. As Mr. Kelleher says, that is all they are there for. They have been doing that all these years, every single hospital. A hospital cannot talk; it cannot write; it cannot speak. It only acts and speaks and writes through its administrative board. Yet every one of those fine business men and civic-minded men are all conspirators. Of course they tried to excuse them by saying they were in a tough spot. I would like to see them try to put that group of men in a tough spot, and see how far they would get. I would like to see them go to those boards and try to impose and coerce and put pressure upon them about something which they did not think was for the best interests of the hospital. What would they get? The answer that Mr. Drayton gave, who has been a member of the bar of this court for thirty years. He gave you the answer on the witness stand last Friday:

"We didn't care about G. H. A. We were thinking of what was best for the hospital."

They don't want you to believe that. That is "with degree camouflage." They want you to believe that Charlie Drayton didn't mean that when he said that. He is on the board of Children's Hospital, and he said when he took action he took action because it was for the best interests of the hospital. The administrative boards are the final boards to approve or disapprove. But to weave in this conspiracy, to try to put into the frame this agreement, combination, confederation among those societies and defendants, they have got to put in the hospitals, because if the hospitals are not conspirators there is no conspiracy, because all they say about the staff members cannot be true unless the hospitals wilfully said, "We won't do it because we are going to restrain G. H. A."

Now I have brought you down to July 29, so far as the District of Columbia Medical Society is concerned. Macatee, McGovern, Groover and Verbyrck have all come back and reported. They came back empty-handed.

What happened then, after this report? Did the District Medical Society become aroused? Did it fulminate in its rage and say, "Now we will go after these men; now we will ruin this Group Health Association; they refused to give us this information. Therefore we are suspicious; therefore we will destroy them and restrain them?"

What did they do? They still kept the committee on and said, "We will ask them if they won't try to get some information so they can bring it back to the District Society, so the District Society may know something about G. H. A."

That is the conspiracy. That is the confederation among this group of doctors who have forgotten every ideal they ever tried to measure up to, who have debased every motive which prompted and motivated them in the practice of their profession. Now they come down to this cheap commercialism based upon the dollar and their fear of losing a dollar that is inspiring everything they do!

What did they do? They said, "Well, boys, stick it out. See if you can find something and bring it back."

And the special meeting adjourned.

What did each one of the committee do? They stayed on and finally they had another Executive Committee meeting, the result of which was read to you from the minutes, because official action was taken there. They reported for the approval of the Executive Committee and for its action, and the Executive Committee, in substance, moved that the report, after adoption, should be presented to the District Medical Society at its next regular meeting, which was Oct. 6, 1937. Dr. Macatee presented his report and the report was that they would still wait to see if they could get some information about G. H. A.

Now, that is everything which the District Medical Society did up until Oct. 6, 1937. They could have done a lot. I will tell you how they could have restrained G. H. A. They could have gone around and tried to persuade people from becoming members of G. H. A. They could have gone through the Government departments and tried to persuade membership away. They could have gone down and tried to frighten them away. They could have gone to those who were members of the staff and tried to frighten them. Was there any threat made against Dr. Brown when he was at the meeting on July 26?

What is it that they are trying to do? They are asking you to convict on suspicion. If there was any purpose or intention on the part of the District Medical Society or the American Medical Association to destroy G. H. A., they could have done everything which these 850 members here in the District of Columbia could have conceived could have been done.

Did they ever go to a single doctor and say, "Don't join that staff"? Did they ever go to a member of the G. H. A. and say, "Resign"? Did they ever do a single thing to Dr. Brown when he appeared before them as the Medical Director? Don't you think that if that old gentleman had been restrained they would have brought it out when he was on the witness stand?

Let us speak of the facts, the facts upon which we know that men do things. I told you that I wanted you to weigh the words which were spoken down there in that meeting of July 26. But before I come to that, may I give this answer to Mr. Kelleher's argument. He told you that the American Medical Association had been opposed to group practice. I will discuss this Milwaukee situation and the Ross-Loos clinic. But just look at this (indicating). Here are the minutes back in 1932, and this is Dr. Leland's committee, and Dr. Leland is one of the arch-conspirators. What is he reporting to the House of Delegates?

"In many phases of medical economics physicians must act as an organized group in order to accomplish the most worthy ends. Individual action along these lines will not be as effective or as free from error as collective organized action."

What does he say back there in 1932?

"The profession has for its prime object the service it can render to humanity. Reward or financial gain should be a subordinate consideration. The practice of medicine is a profession. Although business methods and economic principles are essential to the orderly conduct of the financial phases of the practice of medicine, all such methods and principles must serve rather than dominate the profession, must be secondary to the primary object of the profession and must conform to the accepted principles of medical ethics."

They don't like that phrase "medical ethics." They don't like a profession to have standards of practice. They don't like to have those principles promulgated and have it said that if there is any doctor who wants to become a member of the Society he must comport himself as a gentleman.

One of the finest doctors who appeared in this case, a former president of the American Medical Association and who is not, I hope, construed to be a conspirator except as he is still a member of the American Medical Association, told you that the principles of ethics were, after all, only the application of the Golden Rule in the practice of the medical profession.

But now sport is made of those ethics. They are called the Ten Commandments, because back as far as 1934, in complete refutation of the argument made by Mr. Kelleher to you, the American Medical Association declared that the practice of medicine under contract is not unethical per se, but it laid down ten principles—not ten commandments—and one of them was with reference to solicitation.

Do you like your door being knocked on in the morning, and when you answer it you have some one there say "We will take care of you for \$1.50 if you become sick"? You say

"What do I get?" You do not know that the salesman is getting perhaps 75 cents of the \$1.50; and he will paint just as pretty a picture to you as a Hoover salesman ever painted in your life, and before you knew whether you wanted the Hoover or not, you got it.

The Medical Society does not like advertising. It does not like you to pick up the morning *Post* or the *Evening Star* and see an advertisement in it saying, "Bladder removed, Ten Dollars today. Appendix Removed, \$5."

They say, "No; we don't like that." Those are two of the most important. Do you think they are unreasonable? Or do you think that doctors, after all, should give the profession a reputation such that people will seek them out, and not have them try to peddle their wares on the street like doughnuts or like oranges?

A man who has practiced his profession as he should, who has been a gentleman and who has preserved the standards and the ethics and the moral principles which guide him in the profession, does not need a newspaper advertisement. He does not need any solicitor. They say that if it is wrong for one man to do it you cannot make it right by having five try to do it.

Those are the principles which were laid down on contract practice of medicine in 1934. I suppose the American Medical Association foresaw that today, in this good hour in 1941, some one would be making sport of those principles because the A. M. A. was accused of trying to restrain G. H. A.

THE COURT:—We will stop when you are ready, Mr. Leahy.

Mr. Leahy:—Very well, your honor.

THE COURT:—The jury will be excused until tomorrow at the regular time.

(Whereupon, at 4 o'clock p. m., the court adjourned until Thursday, April 3, 1941, at 10 o'clock a. m.)

APRIL 3—MORNING

Mr. Leahy:—If your Honor please, and you ladies and gentlemen of the jury, may I say that I am going to try to be just as speedy as I can in closing up the few remaining points that are to be discussed with you and which were advanced by the prosecution in their summation.

I think yesterday at the close we had been over a great portion of the facts in the case, which had led us up to about Oct. 6, 1937. You will recall that we had discussed the beginning of G. H. A.; how it was conceived; how it was put into effect. I had gone over with you the discussion which was held in Mr. Zell's apartment, where the four high officials representing the Public Health Service and the Army and Navy were present, and I had remarked to you that it seemed extremely peculiar, in fact incomprehensible, why it was that when a medical association was being formed not a single advised man of the Medical Society of the District of Columbia had been called in to that discussion. I think perhaps I had omitted to call to your attention that at that time Colonel Jones said that there seemed to be a difference of opinion, but he thought that gap might be bridged by a discussion with members of the District Medical Society. But still not one member was called in, and the strange part of it all is that the only person other than those representing the Army, Navy and Public Health Service was a member of the Twentieth Century Fund; and then, after that we discussed what had taken place, and you will recall from Dr. Macatee's testimony that from the first day of June, when the Executive Committee of the District of Columbia Medical Society first learned of G. H. A., down to the sixth day of October all that the District Medical Society had done was to appoint a committee to meet with the members of G. H. A., and then after the meeting of July 26, and report of that committee on July 29, to continue that committee in existence and to file its report, requesting the District Medical Society to continue an attitude of investigation of G. H. A. when, on October 6, the resolution which we will come to discuss in a few minutes, was passed by the District Medical Society.

Inasmuch as that resolution was based to a large extent on a publication in the American Medical Journal let me now just for a few moments discuss what the American Medical Association had done up to that point. You will recall in the opening statement I told you what the American Medical Association was. I told you that you would learn about it from the testimony in this case and you have.

You found it is an incorporated, nonprofit organization. Its membership is made up of the members in the county societies, in the state societies; that its organization depends for its legislation on the meetings of the House of Delegates. That House is composed of representatives from these societies and also representatives from the Army, Navy and Public Health Ser-

vices in the United States. For all the world, the American Medical Association is a reconstruction of our own national form of government. Everything which is done is done to prime and probe the medical opinion of the United States in order to accomplish the purposes and objects of the Association, to wit: to advance the art and science of medicine and protect the public health. Those meetings, as you were told, occur yearly at the different places where they meet in convention. Some of the minutes of the meetings of the House of Delegates were read to you at the trial. There was one which was read going back several years ago, with particular emphasis on the question of the power of the American Medical Association, and that read to you was the report of the financial condition of the American Medical Association; and, perhaps, it may still be argued that this was a corporation which was making a million dollars a year, and, therefore, it had tremendous power based, as it was, on a membership of a hundred and ten thousand in the United States. The remarkable thing about it is this. If there is one cornerstone on which our government is based it is the will of the majority, and one hundred and ten thousand out of one hundred and sixty thousand have agreed on a course of conduct as proper to guide them in the standards of practice of their profession. Isn't that something persuasive for you to think about? If that great army of men who have selected as their life work the care of the public health and of the individual citizen think that the health can be advanced, protected and secured by a given course of conduct, isn't it a bit persuasive that perhaps one hundred and ten thousand men can't all be mistaken? And it is those one hundred and ten thousand men who have declared themselves in those principles of ethics, and you have heard them questioned—I won't say ridiculed, but certainly not honored in argument—that the ethics were moral principles. They are moral principles only as every decent, honest standard of living is a moral standard and principle; and if we do not have those in our hearts no matter what we do,—whether we are the most humble mechanics, the most capable lawyer, the most learned physician—if we do not have the desire to do a good job of our work; if, in our heart and soul we do not have the desire to do what we are called on to do in accordance with the highest standards of honesty and decency, then we are not worthy of a place in that calling, whatever it may be.

There is no question of morals. The argument was made that when such and such was considered to be unethical it was, therefore, immoral. Not in the sense it is a violation of the ten commandments with respect to the principles of medical ethics any more than a violation of the ten commandments is condemned in relation to whatever we do. They are simply the standards which a hundred and ten thousand physicians have said over the centuries should guide them; and if practically the universal voice of medicine has said those principles shall be its guide then who are we to say it shall not be.

What do they do with this million dollars? The million dollars is spent on what? That organization, for the first time to you, as it was to me, has been put under the light so that you may know what its activities are and have been in the past.

That report showed they employ approximately six hundred forty-one young ladies, clerks and specialists. I think you saw about twenty-five of them here on the witness stand. They are secretaries, each man here indicted as a defendant having three or four. For what? To answer inquiries written to them from the people all over the United States asking and wanting to know what is best to do. Then they have bureaus. They have bureaus which protect the public health in accordance with the purpose of their organization; every last one of them headed up by a Christian gentleman and an experienced doctor. Not a doctor manager; not a doctor lawyer; not a doctor economist, but a doctor each one of them who has spent his life for the public good, most of them in the public health service of their state or else in charge of medical schools; men who know the theory and the practice of their profession, and who have come there, not on their own solicitation, but chosen by their fellows because they thought they had within them those qualities of leadership to guide them and that dependence on which the profession could rely.

I told you they answered inquiries. I made that statement from the testimony. Did you hear Mr. Laux, when he stated that within the four years he alone, as one member in Dr. Leland's bureau, had answered about ten thousand letters. Mr. Simons said that they answered two or three or four almost every day; that is almost a thousand a year. And they pick eleven letters out of ten thousand written by Laux, and they don't pick eight out of about an equal number of Mr. Simons. Don't you think that if there had been this tremendous conspiracy, with all the searching of the files of the American Medical

Association, they would have found more than eleven letters written by Laux, or eight letters written by Simons which they could select as replies written—and everyone of those replies were written in response to an inquiry from a member of the public—and, as Mr. Laux told you, were answered after investigation with the advantage of time and knowledge and experience gained, not of one case visited and investigated by Mr. Simons, but of four thousand such cases.

Let me impress on you this, ladies and gentlemen. The statement was made from this witness stand, in reply to the argument which is made by the prosecution to you that this body of men who have no other interest in life than to see to it that the public health of this Nation is preserved and protected against the quack and charlatan; the man who would sell us all down the river by his representations that he can cure, and to whom the sick man would give his last dollar if he thought he could be cured of an affliction which he knows leads only to the grave,—those men with that only purpose, will be happy and will open with outstretched arms and welcome any system, any method of the practice of medicine which can give to the entire people adequate medical care at the cheapest cost available.

Why, to bring it down to our doctors, our own home town folks, the first letter which Dr. Verbrycke wrote to the Group Health Association said:

"I have just heard about this scheme. We have set up our medical-dental service; we have set up our group hospitalization service to take care of the people in the District of Columbia who need medical care and are having difficulty in obtaining it because they can't pay the price of doctors' bills."

And, none of us like to pay doctors' bills. I don't like to; you don't like to any more than we like to pay lawyers' fees. Nobody likes to pay a lawyer or a doctor. Why? Because the man who receives this service doesn't know what goes into it, just as I don't know what goes into it when a doctor feels my pulse, examines my heart or lungs and suddenly he says I have something wrong with me, and I must go to the hospital. He has come into my room; he has looked at me; tested my wrist, felt my pulse, and I had to go to the hospital; and if I didn't go to a hospital I would die; but all I recall is he came to the house once and then he was right. But here is what is hard, as Dr. Groover said down here in that meeting on July 26. He said "I know it is hard to persuade a layman," and we are all laymen, "that the doctor is interested in the quality of medical care. That his interest is to see to it that people are protected by decent, hard work of an experienced and trained surgeon or doctor. That is difficult to persuade the ordinary layman, but," he said, "That is the only thing in which we are interested, and we give up almost everything else for that." Now, he was only one, expressing the opinion of a hundred and ten thousand doctors in the United States whose sole interest has been and, I think,—if you get nothing out of this case but that, you have learned what the American medical profession has been doing for the past century almost of its existence.

For instance, take the Bureau of Investigation which Dr. West told you about. Did you know that there was any bureau of doctors, for which we don't contribute any money, that are watching the drugs you buy in the drug store to see that they are standard? Did you know they are watching the food you eat, to see that it is not polluted? Did you know that when you went to the hospital, or your son, your mother, father, sister or your baby, that that hospital was being investigated by the American Medical Association to see that it was up to standard; to see to it that when you were operated on you would not be infected?

Did you know they were checking the staffs of the hospitals to see that a drunken surgeon, for instance, was not operating on you when you were sound asleep under the anesthetic?

Did you know that the medical schools of the District of Columbia, and of the complete United States, were being so investigated that in the past forty years they have reduced the cheap diploma mills from one hundred fifty; they have cleaned that up until today we have sixty-six medical schools; and Dr. Cabot told you that they were of that high standard of curriculum and training that the young doctor of today, when he graduated from that school and went into training and internship was perhaps better able to take care of the health of the people than the trained doctor of experience of fifty years ago?

Every single bureau that is being administered and maintained at the cost alone of the American Medical Association is being maintained in the public interest, a watchful, careful eye for you and for me, and an eye we never knew was awake; an eye we never knew never slept.

That is the work which the American Medical Association has been doing for the public. And what has it been doing for the profession? It has been publishing what Dr. Cabot said was the finest medical journal in the world to keep every doctor abreast of the times. Every article therein which might be instructive; everything which was new, for the betterment of the profession, all set out there in the weekly magazine; and from that weekly magazine, and from the advertising contained therein come the funds from which you and I, and the prosecution, and all of us, have been protected.

Now, they say "We admit that. We admit they have done a great many fine things; a large amount of good; that the medical profession is not on trial; that neither is G. H. A. on trial here."

We know G. H. A. is not on trial, but I am not too sure of the sincerity of the statement that the American Medical Association and its professional members are not on trial.

If the American Medical Association has done anything it has done it at the behest and instruction of the House of Delegates, just as when the President of the United States signs a bill, he does it after it has been passed by the House of Representatives and the Senate; and, therefore, the representatives of the entire medical profession have at stake their reputation; their bona fides of action; the sincerity of the purposes for which they were incorporated. Every one of those things are at stake when they assault and attack the American Medical Association as a conspirator to restrain Group Health Association in the District of Columbia.

This organization, which is looking over four or five thousand schemes all over the United States—and they say it stopped the machinery of all that nationwide activity just to restrain G. H. A. here in Washington. And how do they say it did it? They have offered in evidence here an article written by Dr. Woodward. We put Dr. Woodward on the stand. He is a man over 70 years of age. He has spent his life in the public service. For forty years he took care of the Public Health Service of the City of Washington. He had rendered that service so well they called him to the City of Boston where he took care of the public health of that great city. And he was called from there by the American Medical Association to head the medical legal department. Why?

Because having taught over forty-five years in the universities. Having taught here in Georgetown Law School for over forty years, he had at the same time studied law, and he holds a degree of LL.M. He is a member of the bar of this court; of the courts of Massachusetts, of Illinois, and he it was who could see the legal significance of medical problems as they presented themselves in state legislatures or in the practice of the profession generally throughout the United States.

The first he heard of G. H. A. was when Dr. Verbrycke wrote him a letter when he came to Washington. Now you will recall that they harp, with a great deal of repetition and strength, on the fact that the Board of Trustees of the American Medical Association authorized an investigation into the facts surrounding G. H. A., and the publication thereof to the profession. Isn't that too bad?

Who is the American Medical Association: part of its duty has been to see to it that any association which crops up to take care of the health of the people should be investigated in the public interest, so that they, in turn, can keep their members abreast of the times; reporting to them fully what a full and complete investigation discloses.

Mark you, they didn't say "write an article at once." They didn't say "write something: we don't care what it is; whether it is true or false." That is what they would have done if they wanted to restrain Group Health. Do you think Dr. Woodward would have been here three months trying to get the facts if it was recklessly determined to restrain Group Health? What did he do? He came down here and went to the source of what should have been information, Mr. Zimmerman. Now, we know Mr. Zimmerman had started this whole organization. We know that he had been with it from the beginning. Why wouldn't Zimmerman tell the facts to Dr. Woodward? Why did Group Health take the position that it would tell the American Medical Association and the District Medical Society nothing? Why did it refuse to give anybody any information?

That is what I cannot understand from the testimony in this case. They may say "Oh, we were afraid you were going to attack us." Why? The American Medical Association sponsors schemes for the prepayment of medical care.

Why, we brought to you as a witness the president of the American Hospital Association and put him on the stand so you might hear him, the man who received this letter concerning which you have heard so much about. This smoking

out letter. We brought him here so that you might know how that letter affected him. Why? We did that for this reason: You can take a letter like that and all you see on the face of it are the words; it can't explain anything to you; and then you can put any interpretation you want on those words; it can't answer back. And then you argue from that letter that it was a threat. "The man who received that knew he was under pressure. The man who received that knew that unless he knuckled down and did what you told him in that letter to do, was going to suffer"; so we brought him down here, and said "Let them cross-examine him as long as they wish. Let the man who received the letter tell you. He can talk; the letter can't."

He told you of the group payment plans that were up there in New York State, there in the locality where his own hospital is; and he told you that there were others on his staff than members of the American Medical Association. That there was never any threat or coercion or pressure exerted against his hospital. Why, now, then, was it—to return to Mr. Zimmerman's refusal to tell Dr. Woodward anything about Group Health?

Woodward told him who he was; that he was from the American Medical Association. Dr. Woodward was asking him about the \$40,000 which he had heard had been received. No information. Mr. Zimmerman slips out of the room for a moment; comes back; Dr. Woodward says "Won't you show me the contract under which the \$40,000 was paid?" Dr. Woodward told you he said "Brown will be at Atlantic City, at the convention next week; he will have the contract."

Dr. Woodward left Washington with no information and went to Atlantic City. He was there for three or four days. He was registered; his name was on the list. Anybody could have found Dr. Woodward but nobody presented any copy of the contract and Dr. Woodward went back.

Oh, but they say, the resolution under which he acted stated that he and Leland were to return to the City of Washington, and there to advise the District Medical Society. And there is the terrible thing; they were to advise the District Medical Society and, therefore, if they advised the District Medical Society they are in confederation, combination and agreement. But they don't follow it up. They cut off at the important point. You probably didn't quite catch the significance of it, and I don't blame you with all those documents read and reread. It would be humanly impossible for anybody to recognize what some of them were about and remember it, but I took up for you the minutes of July 12 of the District Medical Society. They were abstracted, and what advice did Dr. Woodward give?

They recorded that he talked about bringing quo warranto proceedings because he had been right across the street in the Recorder of Deeds' office and found out that G. H. A. was incorporated to practice medicine, and he, as a lawyer, he who had been at the head of the legal medical department, had known that in various states of the Union the courts had declared a corporation could not practice medicine; and, therefore, he was advising the District Medical Society then, as he did consistently and which is the only advice he ever gave, "Hire a lawyer; employ a lawyer. Follow his advice."

And what did Dr. Leland advise them about trying to in any way restrain G. H. A.? He was talking about a prepayment plan for the distribution of medical care. Now, why do they argue to you, ladies and gentlemen, that this advice necessarily is the point of beginning of this conspiracy when we have in the case the evidence as to what the advice was? I will tell you why. Because the entire case is built on circumstances; circumstances like that. A visit from Dr. Woodward and Dr. Leland to the District Medical Society. They are careful not to produce facts because you and I can understand facts, can't we? But when circumstances come along, and you hear one side argue this circumstance, and another side that circumstance, it gets your mind in confusion. You want to do the right thing. You are trying hard to find out the truth of the matter. You have one fellow appealing to you with one set of circumstances and another with others; and you want to know what the facts are, and they haven't produced them and, therefore, if they leave circumstances in this confused mass before your minds then they feel as though they can argue to you that out of these circumstances came a conspiracy when, as a matter of fact, none, not only came but was never conceived.

Yes, they came down to advise. And there is an old adage in the law: that one charged with an offense is presumed to be innocent.

There is another principle: that conduct is presumed to be fair and honest.

Now, why is that? Because most men are decent. You will find some crooks, yes. Our Lord found one among the twelve, but by and large people are fair and honest in their dealings with their fellow men; and so the law says we have to take into consideration what we know to be the general rule and not fasten on somebody's conduct a suspicious motive.

If that were not true none of us would have much reputation because there isn't anything we can do that is not considered one or two ways by people who have the construction of our conduct under their investigation for either discussion or determination. Therefore, when we find that Dr. Woodward came down here, he came down here as he said on that witness stand. He was trying to find out facts.

Was the article a reckless one? He sat there on the witness stand with the original article he wrote, and on the margin of that were his sources of information; and I asked him "When you made that statement in this article, where did you get it?" And he turned to page so and so of the Congressional Record. And I asked him again "When you made that statement, upon what did you base that; what was the source of your information?" And he said from such and such a case in the Supreme Court, or State Court—and they dared not cross-examine him.

The article was a carefully written article by a man who had spent his life in his professions. He had spent practically the summer in trying to get material and finally all he could get was the certificates of incorporation which was there and is a public record across the street, which you and I may have a copy of upon payment of the price of the certification—and a copy of the by-laws.

But why should the American Medical Association be interested in writing an article for the entire membership throughout the United States on a clinic in the City of Washington? The answer, gentlemen, is given to you by Dr. Woodward. He said he was not interested in G. H. A. when he read the letter of Major General Ireland of March 27, 1937. You will remember that letter went to Dr. Cutter and he sent a copy to Dr. Woodward, and also to Dr. Leland, Dr. Leland because it concerned his department as a new method of the economic distribution of medical care; and Dr. Woodward because he said he knew Dr. Woodward was born and raised in Washington. He said he was not interested when he read that letter because it referred only to the District of Columbia, but when he came here and inspected G. H. A.'s certificate of incorporation and learned that it had qualified to deal not only in the District of Columbia but throughout the United States, wherever there were employees of the Government of the United States, then, when he knew that it was to operate wherever in the United States it could find those employees, it ceased to be a local clinic and became a national issue, for which all of the doctors of the American Medical Association had the right to be informed. Hence he wrote the article.

Well, hadn't newspapers been writing articles about G. H. A.? The testimony is full of references to publicity. Now, it was perfectly all right for a newspaper to write it, but if Dr. Woodward wrote an article on the medical profession to the members of the profession throughout the United States then he is pronounced an arch conspirator. The Court will tell you what the law on that matter is, and the Court will tell you that Dr. Woodward had the right to publish the article and that anybody in the United States still has the right to use legitimate persuasion and argument, just as I am trying to argue to you now—and I would have the right to make the same kind of an argument out there in the park now on a soap box if I wanted to, just as long as I don't conspire, confederate, or agree with other people for an unlawful purpose and to violate the law. Because that is of the right of which I spoke to you yesterday: the right of free speech and the right of freedom of the press.

Now, there isn't a single thing that the American Medical Association did in that case other than authorize the preparation of and the publication to the members of the American Medical Association throughout the United States of this article. And this article, as I have told you, and on the danger of repetition I am going to say again, was carefully prepared by an honest, decent man, who had spent his life in the honorable practice of his professions for longer years than perhaps you will find any other witness has ever spent in the practice of their profession, testifying in any case.

Oh, but they say "November 6." The American medical profession was then again appealed to. You remember that in this discussion of November 3, in the District Medical Society, the members said "The American Medical Association has not done anything for us. Let's send a committee out there and see if they won't do something." They didn't know what to do,

so they sent out Dr. McGovern and Dr. Hooe, and you remember there they sat down with Dr. West and Dr. Leland and Dr. Woodward. There, the five of them were together.

Well, hasn't a doctor who is a member of a committee of a local society the right to go to the national association to talk over with the officials of the national association his or their problems; discuss with such officials who are in contact with the entire country and who are at least supposed to have a larger, and wider knowledge, and wider experience with such things? So they went out there; and what was the result of that conference?

Do you remember I took the minutes of that conference while I think Dr. Woodward was on the stand, and I said "Find me a suggestion made in that conference for action by the District Medical Society other than Dr. Woodward's statement 'Go back and employ a lawyer.'" You can't find it.

That is all that the American Medical Association did to those two men when they came out there. They said "It is your local problem. We have done everything we could do. We investigated the facts as best we could. We published what we found; and that is the end of everything here that we can do. Go back and employ counsel and follow his advice."

That is everything the American Medical Association has done. And that organization, which has spent around a century in the service of the medical profession and the public generally, which is composed of the finest type of men in the United States, is now condemned as a conspirator, and they want you to hold them as violators of the law by your verdict, saying that they are guilty of conspiracy. And they didn't raise one finger against G. H. A.

Have you heard where they did a single thing other than publish the article which 'hey had a right to do? It was not only their right; it was their duty to acquaint the medical profession, and the public, with everything it told them.

But they say "Dr. West wrote some letters." He did. Again, those letters in the minutes of the District Medical Society are the only evidence in the case. It was all documentary evidence. We had Dr. West go on the witness stand and say "Yes. That is another letter asking for information." And he said again and again in those letters "I can't understand how an agency of the United States would be set up as a corporation to practice medicine when the courts of most of the states before whom that question has come have pronounced such an organization illegal." Again he said, "I know that the district attorney of the District of Columbia and the Corporation Counsel of the District of Columbia have pronounced them illegal." And "We have done everything we could to oppose Group Health."

Now they say "Ah": they say "Now we have Dr. West. He is the general manager of the American Medical Association. Now, we have him admitting on paper 'We have done everything we could to oppose G. H. A.'"

Yes, they have. They said the same thing to the committee of the District Medical Society on November 6. What could they do? As Dr. West said "I tried every way I could to find out facts about this organization." He had even gone to United States Senators. Now, you would think a Senator at least could pry loose a little information. He ran right up against a stone wall. Dr. Copeland sought information. They wouldn't even give the Representatives of our National Government the information. He said "I tried to get the information, and we published the information which we had and that is all that we could do," and that is all they did.

Now, remember, these men had a right to talk just as any of you being members of any society or organization have a right to speak therein. I have a right in my society to discuss the questions which are of interest to the members and the society, and so have you; they had a similar right. You would be poor members if you didn't take enough interest in your organization to discuss its problems. And suppose some one was checking you every word you said, and three years later you were confronted with an abstract, not of what you said, but of what others thought you said? And when you have an astute gentleman for the prosecution pulling a letter on you that you wrote three or four years ago, and he is trying to distort everything in there to meet the view which he has, and is examining you along that view—try it some time. And then you stood up there with a jury looking at you, a courtroom full of people looking at you, counsel all looking at you and asking you questions, and a copy of a letter is produced and you say "No, I didn't write that letter. I didn't mean that in the way you say it." And then the next thing you hear "Did you expect him to admit it? Of course, he would deny it; he is afraid to tell the truth." Try it some day. Try it when you know in your heart that you didn't mean what somebody else has said you meant when you wrote the letter. And try

to stand up against the questioning under such circumstances. "Let me hear you explain this." And it is three or four years old. That is the way of this case. We even had Dr. Parnell, I think that is his name; it is close enough to it—we even had him look through his file to see if he could possibly locate that correspondence on "smoke out," and fortunately he found it, and he brought down to you three letters and we passed those letters around, and on the three letters there were three different signatures of Dr. Cutter. One secretary had written a letter; another secretary another letter. His name was on it, and he did sign the letter, the smoke out; he didn't sign the other letters. And he told you that he hadn't dictated the smoke-out letter, but these letters come on his desk from three or four stenographers, twenty-five to fifty a day, and he signed them: perhaps some of you have to do the same thing. You say to the stenographer "Have you written up this letter," and upon that assurance it is signed. And those letters were brought down just to show you that what Dr. Cutter told you was the fact, because there was the argument to be made that, of course, he denied that letter because he was afraid of it. Afraid of what? Why should he be afraid of the letter? Here was the man who received it right here on the witness stand, but it is the same argument that I told you would be directed against any witness who had written letters or signed forty-five or fifty of them a day, necessarily having to parcel out to those working in the office this work, because no single man could do it.

Now, that is the connection of the American Medical Association with this case. There is a statement having been made there that Dr. West wrote to Dr. Hanley; wrote to a young man up in Long Island, I think, on Oct. 12, 1938. May I have that exhibit? It is not a very good photostat, as you can see; and they say that Dr. Fred Hanley of the Long Island Hospital had written down here and that Dr. West reported the situation here regarding G. H. A., and that he did it with the intention and for the purpose of restraining G. H. A. See the length to which they have gone to try to persuade you. It is a little bit sometimes more than I can understand. In order to persuade you that the American Medical Association was trying to keep Dr. Hanley from becoming a member of the staff of G. H. A. they say Dr. West wrote that letter. Well, what does he do? He states the absolute facts: "It is my understanding that the ruling of the United States Attorney and of the Corporation Counsel were made the subject of an application to United States District Court, that is the trial court, not the Appellate Court—and one of the Judges of that court held that Group Health was not violating any law."

And in the argument yesterday you heard it said to you that he knew when he wrote that letter that Judge Bailey had just decided the case.

Why did he say that? Did he give any advice to Dr. Hanley? Now, let me show you the difference between fact and suspicion. If Dr. West wanted to persuade Dr. Hanley not to become a member of the staff of Group Health, wouldn't he have said something there? Wouldn't he have said "Don't join that Group Health outfit. It is a bad group and I don't think as a young man you should possibly join this group."

Does he make any statement like that? He tells cold facts in response to an inquiry. The young man can do as he pleases. He gives no other advice or makes any other suggestion. Now, if he was a conspirator with all the influence Dr. West has as general manager of the American Medical Association he would have said to Dr. Hanley "Don't have anything to do with Group Health," but all he does is supply him with the facts, and we have just as much right to assume that it was a letter of inquiry, although the letter is *not* here, similar to that all the doctors in the United States write to the American Medical Association to be advised about medical affairs; just as every one of the inquiries written to Laux and Simons and Leland—and they have combed thousands upon thousands of letters, a few of which mentioned the Ross-Loos Clinic or some other clinic, in which was a statement that organizations of this kind usually are unethical or deemed unethical by the American Medical Association. And do you remember when Dr. Leland was on the stand and I took one of those letters and I said, "Doctor, what were you referring to when you said this?" I wanted this jury to know the fact. I didn't want you ladies and gentlemen to be sitting here trying to guess. I didn't want your minds when you went to the jury room in there to determine the truth about this matter, to have them pulling this way and that way; wondering what the fact was. I didn't want it left to your imagination just what Dr. Leland meant when he wrote that, and when Laux and Simons wrote similarly; and I said "What were you referring to in that letter?" He said, "I was referring to practically one hundred fifty organizations

in the State of California that had been closed." By whom? The American Medical Association? Oh, no. By the State of California.

Ladies and gentlemen, these men are in the office every day watching these things all over the United States. They are the ones whose business it is to know about them. They have a Bureau of Investigation. They are not running it for personal gain. They are operating it so that you and I and all the citizens of this country, all over the United States, may be protected.

Did you know that a hundred and fifty institutions in California had been closed up by the state? Did you know from that letter he had that in mind when he was writing it? No. They leave it for you to guess, so that you wouldn't know what the facts were.

What did Dr. Leland do throughout all this case? Let's take him. We have Dr. West. Dr. West didn't do anything but answer correspondence, as he had a right to do. If a man writes to you you have a right to make an honest, straightforward reply. Your opinion might differ from his or some one else's opinion, but that is what made this country; the right to do that thing; and out of the clash of beliefs and opinions, so that we may come to a form of government and enactment of laws which have been more in the public interest than in any civilization known in the history of the world. Dr. West wrote letters. He had a right to, and unless, of course, he was in some conspiracy to write the letter, if when he wrote all these letters—and they stretch back to 1935 and 1936—letters in which he expressed what he pleased with reference to certain clinics about which inquiries had been made, and also with reference to what the man was inquiring about G. H. A. being illegal. Dr. Woodward wrote the letter. Dr. Woodward was in Washington twice at meetings of the District Medical Society and, gentlemen, I don't know how it is that men can find in their minds the amount of suspicion with which to place on the honest acts of other men that has been found in this case with reference to these men from the American Medical Association. You knew when you saw Dr. Woodward on that witness stand he had no criminality in his heart, mind or soul. You know a man who is now approaching the last time before the sun sets that he will not do such things; you know that at that period of life he is not suddenly transformed into one who will conspire to crush down and destroy G. H. A., or any other decent thing. You knew that before he ever opened his mouth in response to his oath as a witness. He came down here, he tells us, to attend the meetings of the District Medical Society and, as a man of judgment, experience and training, he always left the same words. It was repeated so often it was like a litany. They asked him the question "What shall we do?" They didn't know. His answer invariably was "Hire an attorney and follow his advice." And now he is dragged through this courtroom as a conspirator, because he gave the same advice to the society that one of you ladies or gentlemen would give to a good personal friend of yours in some difficulty or trouble. You would say "Go down and see a lawyer; follow his advice." And because you did that you wouldn't want to be dragged in here and indicted if later on some question arose with reference to that advice which you had given.

What did Leland do? He came here and advised the District Medical Society with reference to a prepayment plan. That is his business. That is what he is there for. He is head of the Economic Bureau. He makes an examination of these various plans throughout the United States. He gives advice. Did he come east and say "Let's find some way of wrecking G. H. A.?" Did he come here and leave advice as to how to restrain them or kill them off? He came down here on that single occasion and the minutes show he advised them with reference to a prepayment plan. And then he wrote some letters just as Dr. West had written with reference to information inquired about, concerning certain clinics throughout the United States; and you have heard this Ross-Loos Clinic so many times that let's get rid of it now. Dr. West on that witness stand showed a letter in which he said—and we are criticized now for the action of the American Medical Association against Ross-Loos. Get this, please. This is important. This shows you how far they have gone in order to build up this case against these people. I told you, and it has been testified to beyond doubt, that with reference to purely local affairs, and the administration of the local society, the county society was a unit self-sufficient to itself, just as Montgomery County is in the State of Maryland; just as Arlington County is in the State of Virginia.

Do you find the Governor of Maryland: Do you find the Governor of Maryland going to the local officials at Rockville and telling them what they may or may not do? Do you

find the Governor of Virginia going to Arlington County people and deciding for them what they shall do; whether they want to put in a sewer, or street, or what not? Doesn't the county go ahead and do it?

Somewhere out in California the county society had a clash with the Ross-Loos Clinic. Now, under the constitution of the American Medical Society if a man is accused of unethical conduct he first has the trial in his county society. They had a trial in the county. Then, in the further protection of his interests, if he is dissatisfied with the result of that trial he has the right to appeal that up to the constituent state society, and if that goes against him then he has a right to proceed up to the American Medical Association, to what they call the Judicial Council. The Judicial Council has nothing whatsoever to do with the facts of the case. It looks the record over and sees if a man had a fair trial in accordance with the constitution and by-laws.

Now, remember, the American Medical Association is charged with having done everything it could to frustrate, restrain and destroy the Ross-Loos; it was told you so yesterday. The Ross-Loos Clinic is held up before you as a prepayment clinic which was the guide, and model of G. H. A., and you are told that the American Medical Association sought to destroy it and, following the same course of conduct, sought to destroy G. H. A. Now, let's get the facts. Now once and forever straight. If the American Medical Association wanted to destroy Ross-Loos, it could have done it. All it had to do was affirm that decision, wasn't it? What did it do? Sent it back; reversed it; shot it back from whence it came, and on what? On a pure matter of procedure. Now, if the American Medical Association is such a crooked institution; if it is so determined to destroy things that it will crush under camouflage to the nth degree, would the Judicial Council of the American Medical Association not have said "We consider these people have had a fair trial, and the decision is affirmed."

They shot it back, and Dr. Ross is a member of the American Medical Association; Dr. Loos is a member of the American Medical Association. Not one word has ever been uttered against Ross-Loos by the American Medical Association.

Dr. West, in his letter, stated "I understand Ross-Loos is giving a good sort of medical care."

Dr. Leland, in his letter, said the same thing and yet they would have you think that the American Medical Association was pursuing the same course of conduct with reference to G. H. A. that it did with reference to Ross-Loos.

Now, let us take the other one and get rid of that. You will remember that when Dr. Cutter was on the stand they talked a great deal about Mount Sinai in Milwaukee: Do you remember that?

There was a case in which the Milwaukee local county society—in Milwaukee County, I think—and the state society of the State of Wisconsin had affirmed a finding that doctors engaged in a clinic there were guilty of violating the rules and regulations of that county society. Now, we don't know what that organization was. We don't know what the doctors did. We have nothing before us except the opinion of the Judicial Council in which it said that these five men have been given a fair trial before the county society and that the said county society had been affirmed and with reference to them the American Medical Association had nothing to do. It had nothing to do with reference to the expulsion of members from any county society. That initiates in the county and goes on through the state and finally to the Judicial Council. The Judicial Council composed of seven prominent doctors from various sections of the United States sat on that case. They came to the conclusion in that case that these five doctors had a fair trial, and there wasn't anything they could do except affirm the decision.

Now, there were various hospitals in Milwaukee that had these five men, or some of them—I don't know how many—on their staffs. They have accused Dr. Cutter of using the Mundt resolution in order to get rid of the five doctors on the staff of Mt. Sinai, and nothing is more contrary to the facts or truth than that. The Mundt resolution never came into the case, and they know it; and they have no right to argue to you that Dr. Cutter used the Mundt resolution. Those doctors were tried by their brothers in Milwaukee. I don't know anything about Milwaukee, but we do know that the doctors of Milwaukee didn't think those five men were conducting themselves properly, and the state society on appeal didn't think so either; and here were hospitals which had on their staffs five men whom their brothers wouldn't associate with in the practice in which they were then indulging. You remember that the American Medical Association doesn't ask the hospitals to be approved. The American Medical Association doesn't force a hospital to be approved and Dr. Cutter said

"If you don't want to remain on the list of approved hospitals you don't have to remain. We can't do anything about it, but if you want to remain we are not going to publish to the people of the United States that we approve a hospital which has on its staff five men whom their brothers don't think should be there; in the community in which they live."

That is what Dr. Cutter said.

The hospital could have retained those men on its staff if it desired to. There wasn't a single thing the American Medical Association could do about it. Oh, but they say, the approval of the hospitals by the American Medical Association is a thing of great value. Right. If we hadn't been operating as an outstanding organization, with purity of purpose, and sincerity of ideals, then we never could have won the enviable position where hospitals would be running to us saying please approve us. The reason why the hospitals want the American Medical Association to say "We are all right" is because the hospitals know that well informed opinion of the United States shows that the American Medical Association does not put its stamp of approval on any hospital which has the slightest suspicion lodged against it either with respect to the service it renders; the plant it maintains, or the staff which operates therein. That is why. And we have no apologies to make, because Dr. Cutter said to Mt. Sinai Hospital "If you want to keep five men whom all the brother physicians of the city say should not remain on the staff, you may keep them; but I cannot say in honor to the people of the United States 'We approve your conduct in so doing.'" The Mundt resolution therefore had nothing whatever to do with it; and while we are on the Mundt resolution, let's clean that up too.

THE COURT:—Mr. Leahy, would you like a few minutes?

Mr. Leahy:—Yes, your Honor.

(At 11:15 a. m. a brief informal recess was taken, at the conclusion of which the following occurred:)

Mr. Leahy:—If your Honor please, and ladies and gentlemen of the jury, I had just gotten down to disposing of the Mundt Resolution, so called. You remember that comes into the case in this way, in an attempt to show you that the American Medical Association was in a conspiracy to restrain G. H. A., and they accuse Dr. Cutter of having made an inspection of the hospitals in the District of Columbia, which had not been inspected for years, and then in the report of the inspection to the hospitals the inspector attached the Mundt Resolution.

The Mundt Resolution, in substance, was a resolution which was passed in 1934 in the House of Delegates of the American Medical Association; and that resolution provided that they should refer to the appropriate committee the question as to whether or not doctors on the staffs of hospitals approved for intern training should be members of their local societies.

Now, get the distinction between the ordinary hospital and a hospital for intern or resident training. Not all hospitals are hospitals for interns and resident training. Some are for resident training; others are for intern training alone, and some are for both.

A young doctor, after he has graduated from medical school, usually takes an internship. Some of the states, as the testimony shows, require that as a prerequisite to the license to practice. Most of the states require it professionally, because they believe that the young chap who has just come out from the theory of medicine ought to take at least one year of the practice of medicine under the supervision and direction of old practitioners who are on the staffs of hospitals.

I think that in evidence here are the staffs of practically all of the hospitals of the District of Columbia; and they are composed of the finest surgeons and doctors that we have. It is a bit of an honor and distinction for a doctor to be on a staff, that is, the regular staff, because that is the sustaining staff of the hospital. The hospital has a responsibility to those who come to it for treatment. If, for example, any one of us desires to go to a given hospital we like to know that if one of the members of that staff attends us medically or operates on us surgically we are going to get the best medical attention we can get in the District of Columbia. We want to know that we are going to get experienced professional care.

Therefore, any hospital which holds itself out as one which can teach young medical students just out of the medical schools ought to be a hospital which has those on its staff who are capable, able, willing, and have the time and disposition so to treat them.

And just as the American Medical Association has been careful to inspect medical schools to see that they turn out young doctors who are well trained, so they have followed that up by seeing that hospitals which want to teach those young men shall, in turn, have staffs of the quality and character I have just described.

Beyond that, there are hospitals for resident training. The only difference between the young intern and the resident is this: the young intern receives his training generally. The resident is a young man who wants to specialize. Maybe he wants to specialize in obstetrics or in surgery or in some particular branch of surgery. So he will continue his internship further and he will take a residency and then he will receive particular instruction, particular instruction, in the branch of medicine or surgery which he desires to pursue. And the American Medical Association has been careful to see to it that those hospitals which are going to teach specialists shall be equipped to see to it that they are able so to do.

Is there anything wrong about that? Sister Rosa said she believed it was a good thing. Is it not a good thing for you and for me and for all of us that there is some supervising power to pull up the reins of the hospitals if they should begin to get careless? Is it not a good thing that there is some one in authority who can say to the hospitals in an authoritative way, in the sense that they have the ability, learning, experience, and training, "We are not going to approve you for instructing young doctors, because you didn't do this or you didn't do that or you didn't do the other thing; and unless and until you do, you are not going to get the approval which you are seeking"?

Remember, again, the American Medical Association does not ask any hospital to be approved, not any more than the American College of Surgeons. The American College of Surgeons goes right into the operating rooms to see to it that they are kept clean of infection, that the equipment is proper. The American Medical Association takes the hospital as a whole and sees to it that the proper instruction is there for those who seek it.

In 1934 a doctor named Mundt, in order to guarantee for the public good and for the patient that those doctors who did that kind of instruction should at least have the stamp of approval of the doctors in their neighborhood, said it would be a good thing if the hospitals should have on their staffs as the men teaching these younger doctors, members of the local medical society.

What was the purpose and intent of that resolution? It could not have been to restrain G. H. A., could it? It was passed in 1934 when the House of Delegates did not know one thing about G. H. A. They were not talking about clinics. They were not talking about producer and consumer groups. They were not grouping anybody. They were thinking of the patient and the general public health and welfare. And in the report which came out of the committee, the proper reference committee to which it had been referred, they said that the selection of staffs of hospitals was of great importance, and they said, "We have no control over hospitals; we cannot enforce such a resolution, but we can recommend it."

Then there was so much talk about this Mundt Resolution and it was twisted and distorted from the purpose for which it was adopted, in order to make it a dagger thrust at the heart of G. H. A., that we had Dr. Hayden come down. He is a former president of the American Medical Association. Dr. Cutter is secretary. He is on the Council of what they call Medical Education and Hospitals. Dr. Cutter's principal work is to look after medical schools and see that they are brought up to a standard. Dr. Hayden was brought down here for you, so that you would have an authoritative statement of that Council of just what was meant by the Mundt Resolution. He told you that it was an ideal for which they were seeking, hoping that they might attain it some day; that it was an ideal, but that it would be stupid—and that is the adjective he used—it would be stupid to say that they were using it as a threat for all hospitals to comply with.

Do you remember the testimony of Dr. Mitchell? Do you remember that he said that in 1936 the Emergency Hospital had been having so much serious trouble that they finally enacted a rule which required that the members of the staffs of hospitals should be members of their local societies—not of the District of Columbia, but of their own local societies? Why? Because, as he told you, he felt that when a man was a member of his local society he had passed the investigation required by the membership of that society and that there was a bit of a stamp of approval on that man which at least made him *prima facie* available and qualified as a member of the staff.

You men belong to organizations. You do not take in every Tom, Dick and Harry, do you? If somebody is proposed for membership, don't you look him over? Don't you say, first of all, "Well, I don't know. Do we want this chap in here, or don't we? What kind of a man is he?"

The local societies put the doctors through the same test, and if they are doctors who are not living up to standards—I don't care whether you call them ethical or moral—then they will not be admitted to membership in the local society.

Now, let us examine this argument as to whether or not the Mundt Resolution was used by the American Medical Association, through Dr. Cutter or by Dr. Cutter, personally, in order to restrain G. H. A. Once again it is a little bit difficult to discuss this evidence with you under the charge that is made against that man. Up until we had to produce before you the facts, I knew that you were suspicious. I knew that you just wondered "How come? How come that these hospitals were inspected at this time in 1937?" Remember, G. H. A. never opened its doors until November 1. G. H. A. was not in existence as a going institution until November 1. If we had not brought on for you the facts your minds would still be in a state of confusion as to just why those hospitals were inspected.

We brought on for you the inspector who came at that time to inspect these hospitals.

They tried to put into the mind of Dr. Cutter the germ of conspiracy because Major General Ireland, without any suggestion from Cutter at all, wrote Dr. Cutter a letter in March, before anybody had heard of G. H. A. in this wide, wide world, so far as any one of these conspirators, as alleged, was concerned. And Dr. Cutter told you that he made a copy of it for Dr. Woodward, because Dr. Woodward was born and raised in Washington; and he made a copy of it for Dr. Leland because Dr. Leland's department looked over the medical economic matters. Ireland's letter never mentioned G. H. A. It said an H. O. L. C. group.

Following that letter in March there was not any communication to Cutter about it. He put it away in his files and forgot about its existence. He certainly never thought that it would be used for the purpose that they are using it against him now. And Dr. Cutter took that stand on his oath—a man who has been at the head of the Graduate College of Physicians and Surgeons of New York, who has been at the head of the Medical School of Southern California, a man who has for years been trying to take care of the standards of medical schools and colleges—and he said, "I never heard of G. H. A. until October 1937."

Then we went one step further and showed you why the inspection was made. This is just a bit like a pebble in a shoe: it is irritating to think that people would have the temerity to charge these honorable men with being conspirators in the face of the truth which they can show.

Dr. James Cahill, who is the chief of staff of Providence and of Georgetown University hospitals, was trying to get Georgetown and Providence approved for a residency in surgery. Those two hospitals you and I have often thought of as being two as good hospitals as we can boast of in the District of Columbia. I doubt that it would have ever occurred to your mind that when Dr. Cahill asked for the approval of a residency in surgery anybody would have to examine those hospitals. You and I would have said, "Of course those hospitals are two of the finest we have. They have been here before we were born. We unhesitatingly send our friends or our relatives there when they are sick."

But did the American Medical Association take that view? They said, "If you want the approval, fill out the proper form and let us see what you can do in the matter of instruction of these young surgeons that you want the privilege of instructing."

So Dr. Cahill in due course filled out an application, and then, as Dr. Peterson told you, when he could find time to come to the District of Columbia he came to make his inspection. I think it was some time in May. Maybe it was in June. He told you, "I never had heard of G. H. A."

These people think that G. H. A. was the only organization in the wide, wide world to which the entire world paid any attention. Peterson never heard of it. You and I never heard as much about it as we have heard about it in the court room in the last two months.

Dr. Peterson came here to inspect and to determine whether or not a residency should be granted. You remember I read the report of Peterson to you, so much of it as contained his criticisms; and if he did not go through Georgetown and Providence with a fine-tooth comb I am very much mistaken. Why? Was he doing it for any other purpose than to protect those who one day would be operated on by the young resident whom they wanted the privilege of teaching? That is the only purpose he had in mind. He was not thinking about restraining G. H. A. He came here and told Providence Hospital, "Listen. Unless you check up on what you have been doing you will not only not get approval for residency, but the chances are that your right even to teach an intern will be disapproved."

And he told Georgetown the same thing; that they should correct certain deficiencies which were found, in order to make them qualified for the instruction of a young resident.

Three of the hospitals had not been reexamined for a number of years, and while he was in Washington he said, "I will take care of those hospitals while I am here." There are over six thousand hospitals in the United States. They have two or three inspectors, and it is a job, is it not, to inspect six thousand hospitals?

He inspected those hospitals and made a full account of conditions as he found them. One of them is a special hospital—Columbia. That has to do only with residencies for obstetrics. The others he inspected and wherever he found anything wrong he criticized them.

Don't you think it is a good thing, while you and I are asleep, that we have somebody watching over the hospitals and giving reports such as Dr. Peterson gave here? Don't you feel a little safer now to think that there is some one who is pulling up the hospitals of the District of Columbia by the reins and making them hold their heads up higher, or else they won't get the approval of the American Medical Association?

And then on the bottom he wrote: "What possibility is there for your hospital to adopt the principles"—I cannot recall the exact words—"laid down in the Mundt Resolution?" That resolution was passed only and solely for the good of the patient and the public, in order to raise the standards of the hospitals and keep them high. Oh, they say, "Cutter got five hospitals. Warfield got some more on Dec. 1, 1937." Did he? Remember, they charge that the American Medical Association threatened and coerced the hospitals of the District of Columbia when they attached that Mundt Resolution. They received a letter back from Providence in which Providence said it would be a tragedy—I think that is what the Sister wrote—if Providence lost its approval for intern training. Of course it would. The well informed public opinion would know that Providence had deteriorated to the point where it was no longer considered worthy of teaching young men; and the same thing would be true as to the residency. Sister Rosa wrote that everything that was offered by way of criticism would be eradicated just as soon as it could be; and it was. But not until they inspected it again. It took Providence Hospital two years to get residency approval.

Is that a restraint of G. H. A.? If they charged us with restraining Providence Hospital from getting approval, that would be looking like it, would it not? But they checked and double-checked, and we had Sister Rosa come here and she said she did not consider it any threat; she considered it was for the good of the hospital.

And Dr. Caylor came to the stand, who wrote this letter, and he used in it the word "requirement."

"Ah," they said, "now we have proved a conspiracy, because the American Medical Association, in attaching the Mundt Resolution, used it as a requirement."

The American Medical Association had a right to do so if it wanted to. The court will tell you so.

The American Medical Association does not force any hospital on an approved basis. You saw here the mechanics by which a hospital got on the approved list. They ask for it. If I ask any one of you to approve my conduct, will not that one say to me, "Wait a minute. If you want me to approve what you do, you do it this way or that way, because that is the standard I think you should pursue."

The same is said with reference to the American Medical Association in its approval of hospitals; and you will note again in the Caylor letter that once again, in the same way in which they drive the dagger of suspicion into your minds, where they emphasize the word "requirement," they never brought to your attention the word "request"—because in the letter which Caylor wrote he said, "The requirement is the Mundt Resolution, and the board has requested that you will comply with it."

Was there any threat from the board, any coercion on any one? Even if it were a requirement, which it was not, any man on the board could either remain on the board or not, as he saw fit. That was his business. The District of Columbia Medical Society did not interfere. Neither did the American Medical Association. But each one of them said they would gladly become a member of the local medical society.

When Dr. Cahill was on the stand I asked him whether or not the American Medical Association had ever followed up further to find out whether all members of the staff actually were members of the local medical society. He said, no. These people who are now conspirators, this great organization, and Dr. Cutter as secretary of that council was so much of a conspirator that when the Sister wrote to him and said that they had all promised to join, he never tried to find out whether they did or not; and as a matter of fact, Dr. Cahill told you that there were men on the staff of Providence Hospital, even at this time, who are not members of the local medical society.

With reference to Georgetown Hospital, Dr. Cahill thought the Mundt Resolution was a good thing, just as Dr. James Mitchell in 1936 thought it was a good thing, even before Mr. Zimmerman dreamed of G. H. A. Emergency Hospital had put it into effect. I said, "Doctor, as a matter of fact, are all members of Georgetown staff members of the local society?" He said, "Oh, no." But, nevertheless, in October 1937, a month before G. H. A. opened its clinic, Georgetown adopted the principle of the Mundt Resolution, but it said, "Those of you who do not belong, take a year to join." Why? Because there are some young men on the visiting staff or the courtesy staff who perhaps, just starting in the profession, cannot afford to pay dues; they cannot afford to buy *THE JOURNAL*. To these young fellows maybe \$25 or \$30 is a lot of money, and they cannot afford it. Georgetown, under no circumstances, would keep those young men away from the staff because, for good and sufficient reasons, they could not join.

Columbia wrote and said, "We have a man on our staff who has been on there for years, and we won't throw him off." The person who wrote that letter thought it was a demand, and he said, "We will not throw that man off. He has been on our staff and there are reasons why he does not belong to the local medical society; they are good and satisfactory to himself, they are personal, and we will not go behind them."

Just one other thing on that point. You remember that in the spring of 1938 the Medical Board recommended to the board of trustees of Columbia Hospital in this city that they should have a requirement that all members of the staff of Columbia should be members of the local medical society. What did the board of trustees do? They sent it back, saying "We refuse to enact any such legislation."

The next one was George Washington, and we had Dr. Charles Stanley White come here and tell you about that. I said, "Dr. White, are all members of the staff of George Washington University Hospital local medical society members?" He said "We have thirty-three who are not," as I recall it.

Yet they represent to you now that Dr. Cutter forced these hospitals to adopt the Mundt Resolution—at a time when he never had heard of G. H. A.

I think the other hospital was out in Takoma Park. We have not heard much about it; but the same recommendation went to that hospital as went to all the other hospitals, the five that were examined. The same criticisms were made—not in the sense that all the criticisms were identical, but I mean that in each case the purpose of the report was to acquaint the hospital with the defects in the administration of service which existed in the hospital; and you remember that the A. M. A. was fair enough about it so that they submitted a report to the hospital, so that the hospital could come back with its comment or criticisms.

And yet that is picked out as an instance to show that Dr. Cutter was not performing his duty; he was not engaged in the conduct of his office as secretary of that council; he was not doing in Washington what he was doing all over the United States—inspecting hospitals—but that he had the mean, low, immoral purpose of trying to destroy G. H. A., which he never had heard of.

Is not that stretching the case pretty far? Is not that trying to confuse your minds? Why, ladies and gentlemen, if there had been a conspiracy in this case it would not have taken two months to listen to somebody try to prove it. You would not have had to be listening to arguments about inferences. The facts would have been there. They take the suspicious circumstance that Dr. James Cahill, in the Year of our Lord 1937, happened to think that Georgetown and Providence should be approved for a residency in surgery, and from that simultaneous or contemporaneous event they said, "We are going to argue to this jury that they seized on that request in order to bring about a conspiracy to destroy G. H. A."—which had not yet opened up its clinic, and when the examinations were made it had not even had a staff.

Would that convince any reasonable man beyond a reasonable doubt that men who have lived all their lives in honor and decency have suddenly lost all sense of honor and decency and are now going to join in the commission of a crime against the laws of the United States? What manner of men and women do they think the jury is composed of? Do they think that you ladies and gentlemen have lost your sense and reason too, so that you cannot see through this attempt to pervert and distort the ordinary happenings which occur simultaneously and contemporaneously every day, into evidence of a conspiracy?

They said, "We went one step further and all these hospitals got together"; all these hospitals, through their boards of honorable, decent men, who act as the administrative board of

trustees. What did they get out of it, ladies and gentlemen? Maybe some of you have to act in some organizations where you do not receive a farthing in return. You do it because you feel as though you have your place in life, after all; that you are not here just to see whether you can make 5 cents or a dollar every day; that, after all, when it comes to the time when you are leaving this life you would like to feel in your heart, "Well, I have left the world a little bit better in the niche where I was born for my having occupied that niche." And so you go out at night when you are tired and attend a meeting, or you take a membership on a board of this organization or that one. You do not look for compensation in pay. You are only acting because within the heart and breast of every man, every good man or woman, there is that urge to do something for his or her fellow men and women, and you can do it only in the little way in which you are capable and in the place you occupy.

These men did that in these administrative boards. They are composed of our finest citizens. And you are told that those citizens, through their administrative boards, were either coerced or forced or influenced unduly so that they brought all of the hospitals in the District of Columbia into this gigantic conspiracy with all of the doctors in the United States who are members of the A. M. A., and our local doctors through the District Medical Society, to freeze out—whom? Raymond E. Selders.

I do not think counsel would have either the hardihood or the temerity to try to use that particular application as an instrument of assault to strike down the fair reputation of the hospitals of the District of Columbia. I did not think that he would accuse us of so much wrong that he would not leave us even the fragment of a decent motive in considering that application.

Once again we had to go out and get the facts. They were all available; every one of those letters we drew from files which the prosecution had or which were available. Every single letter that we brought in here before you we took from files which lay on the table; and yet they held them back hoping to poison your minds so against the doctors of the District of Columbia and against the hospitals that when I came to speak to you you would be living under such an outrage that you would not even listen to the reason of the facts.

What do you find? Dr. Selders. I am sorry I have to say this. The man is not here. He should have been here. The Government should have brought him here. The Government should have produced him, as it went clear down to Houston, Texas, to bring a man and place him on the witness stand just to identify a signature. And yet they would not bring to you the man who was the principal of the conspiracy that they say we used against him, just as they would not produce Childress, for you to find out whether Dr. Brown was telling the truth as to whether Dr. Neill was offered the Medical Directorship of this organization. They would not bring before you Dr. Selders so that he could answer and stand up and say, "Yes; I got down on my knees to these hospitals and I was refused the right as a surgeon. They crippled the institution which I joined. I could not practice surgery because I had no place where I could practice it."

And then, what do you find out to be the truth? Dr. Brown told you he never employed him as a general surgeon to do general surgery; that when he employed him he employed him to do minor surgery such as is done in a clinic; that he did not consider that he had the qualifications which would give him the privileges of the hospitals of the District of Columbia.

And when Mr. Kirkpatrick was on the witness stand he made this answer, and I want to repeat it to you now. I said, "Mr. Kirkpatrick, did you know anything about the qualifications of Dr. Raymond E. Selders?" He said, "No." I said to him—a trustee in 1937 and president of the organization in 1938—"Did you make an investigation into the qualifications of Dr. Raymond E. Selders?" He said, "No; and I have no apologies to offer."

That man was to take care of the surgical wants of five thousand or six thousand people, and the president of the organization sat up there and boldly accused all of these defendants as being in a conspiracy against them.

He said, "In July we sent another final plea to the hospitals to admit this man."

This man who had but one surgeon to offer these subscribers would inflict on them a man whose qualifications he never knew and about which he was so little interested that he never made an investigation, and he had no apologies to offer.

I think apologies are due to the subscribers of G. H. A. for a lay administration of that character and that type.

Now, what do we find about Raymond E. Selders? I do not like to talk about other men, particularly when they are far away and cannot answer; and I do not like to accuse any witness, or characterize him, who appears on this stand. It is an easy thing, ladies and gentlemen, for a lawyer to stand here and use harsh language and call names. But that is not what you want. You want some help so that when you go out into the jury room, where these questions come up in your minds and you disagree, you will find somebody who maybe can help you to coordinate the evidence in the case so that you can sit down to a deliberate judgment in a most important matter.

You know Dr. Raymond E. Selders is incompetent. You know that he has no more right to enjoy the wide privileges for which he asked permission than I have. That man asked permission to do anything in this wide, wide world with you when you are asleep and there is nobody there to see what is being done. He wanted the privilege of a general surgeon who, without supervision, without anybody there to watch and stand over and see that he was doing the right thing, could operate on any man for any thing, or on any woman, because he asked for the widest privileges as a gynecologist. He wanted the widest privileges that the most capable, able, and experienced surgeon alone enjoys.

And then they laughed at Dr. Mattingly because they said he wrote a letter when he was asking for permission to go before the Grand Jury, and they said he boasted of the fact that he it was who was responsible in his way for Selders' rejection at Sibley Hospital.

Out of the same files we drew Dr. Mattingly's letter. I read it to you on the last day that testimony was taken. It was written on Christmas day, 1937, when, if ever, a day opens and closes when the heart of man is most at peace, when he is least likely to be writing things unfairly. And if you have ever heard a better exposition of the reasons why one doctor, who is a member of the staff of a hospital, disapproved the application of Dr. Raymond E. Selders, then I do not know where to go to find it.

He said, "This man seeks privileges which are wider and broader than any we enjoy here in the District of Columbia, and we do not know him."

As you heard Dr. White say on the stand, when a man makes application for privileges in the District of Columbia hospitals usually somebody knows him, and they will say to Jim or Joe or Charlie, "Do you know this fellow?" "Yes." "How is he?" "He is all right." "Have you ever seen him operate?" "Yes. He is a good man. I have seen him and I know him. He is capable, he is able, he is honest, he is energetic."

But who knew Dr. Selders? Not only did we not know him, but we had difficulty in finding out anything about him. First, when the application was made at Sibley you recall, almost within six or eight weeks, long enough to investigate the references which were given, his application was rejected because they said, "We can't get any replies from your references."

So then Selders wrote his references, I presume, because he then wrote a letter to Dr. Taylor, who is now dead, and he said: "I understand now you have heard from my references. Won't you reconsider?"

Immediately came back the answer that they had read his references and they saw no reason to reconsider.

You remember, with reference to the first application, that we put the Coroner of the District of Columbia on the stand, a man who is now in public office and has been for years, and he checked on the side of his report, "We need more information about this man."

Don't you think that when a hospital is called on to give the right to any man to do anything in that hospital on his own judgment and unsupervised, it is in the interest of the patient—or is it a conspiracy to restrain G. H. A.—that they examine the qualifications of Dr. Selders?

You go down through all the hospitals, and most of them, or a great share of them, took the recommendation of the Washington Academy of Surgery; and the Washington Academy of Surgery made an investigation and reported that in the judgment of those surgeons—and it is composed of the finest surgeons of the District of Columbia—they did not think he was qualified.

And they indicted the Washington Academy of Surgery just because those surgeons, who know better than anybody else whether a surgeon is qualified or not, recommended to the hospitals who sought their advice that they did not think this man was qualified. That judgment was considered so ill-advised, so reckless and so unworthy that they dragged the Washington Academy of Surgery in here as a defendant.

Then, do you recall that when Dr. Borden, who is not a defendant here, was on the stand, who is a member of the Washington Academy of Surgery, he said, as I remember it, that it was a John D. Moore to whom he wrote in Hugo, Oklahoma, and he got a reply back from Dr. Lee in Pennsylvania. We brought Lee down here. You saw him. He is the man who saw Selders; and when the Washington Academy of Surgery asked Dr. Lee for a recommendation, Dr. Lee said, "I understand that they gave him chances in Worcester far beyond what we thought he was capable of."

That was the only letter which we got. And then, in order to disabuse your minds of any possibility of withholding something from you, because the argument would be made, as it was made here yesterday, that we wrote to John D. Moore when we should have written to John T. Moore, we brought down the application which was sent to the Washington Academy of Surgery, showing John D. Moore, and the address that we got was the address to which we wrote in Hugo, Oklahoma.

The statement was made that he did not live in Hugo, Oklahoma. You don't know that and I don't know it—I do, but I cannot tell you. The statement was made that he did not live in Hugo, Oklahoma. There is absolutely no evidence in this case as to where he lived or did not live, and I have just as much right to say that he lived in Hugo, Oklahoma, as some one else has a right to say he did not. I happen to know what the fact is, but I cannot disclose it to you because it was not proved.

Then we finally get to a letter which was characterized to you yesterday as a "muckraking" letter with reference to Dr. Selders. Do you remember, in the Garfield case, where they attacked Eisenman's inter-office communication where Dr. Eisenman said, when he passed on Selders' application to the board, "This is not a run of the mine case" or "run of the mill," or some such phrase as that, and that on the face of it it seemed as though this man had just as much qualifications as some of the others in the hospital, and "therefore if you are going to refuse his application on other grounds than qualifications I wish you would state it so that the administrative board will know."

They offered that in evidence. Why? Oh, that looked just like the kind of a letter they wanted, because then they could argue here that the superintendent of the hospital was bringing it to the attention of the Executive Board that he had qualifications, and yet they rejected him. That letter was right in the same file (indicating). It was written to Mr. Castle and it was criticized and characterized as hearsay upon hearsay, not worthy of credit or belief. We brought Mr. Castle down here before you, and he is a man who has been in public life practically all of his life, and finally held the responsible position of Under Secretary in what is perhaps the most highly respected department in our government—he was Under Secretary of State. That is the type of man he is. He is on the board of directors of Garfield Hospital. He was interested, naturally, in the Selders case because the newspapers, as Dr. Macatee told you, were blasting the hospitals; they were blasting the District of Columbia Medical Society with reference to this man Selders and making accusations just as they have been made to you, and for the first time in this court room the truth has come out, and of course they were wary and chary.

Do you remember that the Washington Academy of Surgery was so careful that they said, "For the sake of the public let us not consider Selders' connection with the G. H. A. at all in this matter?"

Do you recall Dr. MacDonald, the Coroner, when he said that at Casualty Hospital he said to them, "Let us not consider anything about his connection with G. H. A."?

They were hurling charges at the hospitals and the doctors, so they leaned over backward. And then this fine, estimable gentleman, the Under Secretary of State, wrote to this man in Worcester. Was he responsible? He is the president of the Norton Company and he is connected with various hospitals and is, I believe, head of the Worcester Museum. He says:

"Mr. Higgins is a very careful individual who would not write anything which he had not checked on pretty carefully."

Is that the sort of a letter that you can kick around the floor of a court room and say that it is rank hearsay on hearsay?

He told you that Dr. Selders' work at the City Hospital "did not meet with the approval of the superintendent as to the way he handled himself with the interns, nor the approval of the surgical staff as to his accomplishments as a surgeon. The appointment accordingly was not continued after the first year."

He was employed here through an employment agency in Chicago. If he was the surgeon which they try to make out

he was he would not have been in Washington; he would have been in Worcester. But they did not employ him after the first year.

I am not going to repeat the letter, which I am sure you remember, with reference to his sister. But Mr. Higgins adds that "It is quite possible I may be able to get some more detailed information by consulting with the doctors who knew him." He says, however, that "It seems as though the above, for the accuracy of which he vouches, would be about enough to dispose of him both as a surgeon and as a man."

I think it does.

There was a great deal said about the rejection and refusal of other doctors of G. H. A. Remember this—and the court will so instruct you—that hospitals have the right to lay down rules and regulations. You have heard every single doctor tell you that the right to practice medicine in a hospital is not an absolute one; it is a privilege; and therefore a hospital can reject applications. And you saw in the evidence here rejections of applications of other doctors, and some of the members of the District of Columbia Medical Society, and by Dr. Titus, who received another letter from Texas. Dr. Titus was on the committee of the Gynecological Society of the District of Columbia. He told you that there are members of the Gynecological Society themselves who were rejected as applicants on the staffs. There were doctors rejected because of the rules of the hospitals. Notwithstanding all those rules and knowing those rules, these people still kept thrusting on them these applications for Dr. Selders' appointment, although they knew that under the rules, so far as Casualty Hospital, for instance, was concerned, for fifty years he could not have been admitted. And you know from these other letters which I have not the time to read to you he could not have been admitted if he had never seen G. H. A., because he was not qualified to do the things for which he asked the privilege of doing; and even over at Columbia Hospital, when they gave him the privilege of simple obstetrics, he never utilized it.

Do you recall that Kirkpatrick, on that witness stand, told you that they had seventy-five elective operations when he took office in 1938 and that they could not have those seventy-five operations in 1938 because we would not let Selders into the hospitals. Do you remember that testimony? When we got Dr. Price on the witness stand, one of their own members, what did he tell you? Just as Dr. Brown has said, Dr. Selders was not competent to perform the operation "and we did not have the funds with which to perform them," and he was advised by the Medical Director, who then was Dr. Selders, to delay them, hold them off, make excuses. And yet, if we had not found Dr. Price for you, you would still think that we had kept seventy-five people who wanted operations from getting them.

The fact is, there is not a hospital in the District of Columbia that ever refused to admit a patient. They may point to Sibley, when Dr. Taylor sent a memorandum saying that no patient of G. H. A. is to be admitted into the hospital. Three times Dr. Taylor wrote Kirkpatrick and said to Mr. Kirkpatrick, "The question of your association is before our board of directors, and until they act I cannot give you any reply." But there has not been one single instance where a patient has ever been refused hospitalization. On the contrary, the hospitals of the District have stood up to the reputation which they have always enjoyed for their experience and hard work to get along financially; of taking care of every sick person ever brought within their doors.

And that brings me to this last consideration. Not only was the situation that Group Health Association brought before you in connection with Dr. Selders' rejection made much of, but more particularly there were five or six cases instanced where it looked, on the face of things, like the hospitals had sunk so low in this conspiracy that they had actually refused to take care of people hit on the public streets, because they were members of G. H. A.

You will recall that line of testimony, that series of cases, which started, I think, with Miss Abbott, the lady who was struck by an automobile and was brought down to Emergency Hospital. And to me, on the testimony, it seemed as though they did nothing for her as soon as they found she was a member of G. H. A. But on the following day they took an ambulance and carried her to Garfield. You remember that case well, I am sure. I wondered, Is it possible that, after all, this feeling had become so intense that a hospital would not take a woman who had been hurt on the street and give her treatment?

And then we went to look over the files, and out of the same file we got the truth. And that is another pebble in the shoe.

Miss Abbott was brought to Emergency Hospital. She was brought into the hospital and given complete emergency care. We brought you the nurse that took care of her. We brought you the two interns, one of whom we found at Lorton. Do you remember him? We brought him up here to tell you the truth and answer this base, nasty insinuation made against one of the honorable hospitals of this city. Sometimes it is hard to restrain one's self when we hear decent, honest people baselessly charged in such a fashion on such a groundless imputation.

Only yesterday the prosecution told you that the woman was so badly hurt that she had to stay in Garfield Hospital for three weeks. I read you the Garfield chart so you might know how badly that woman was hurt. I thought at first she had a broken leg. I really thought that from the testimony you would find that here was a woman who was struck down on the street, her leg was broken, and she was taken to a hospital and it had refused her hospitalization. Then we find that Miss Abbott wanted Dr. Selders—and if you want to know something about this clinical service, get it from Miss Abbott. At 10 o'clock at night when she needed help, could she find it in G. H. A.? Could they locate Dr. Selders? They phoned until midnight and could not find him. When you need a doctor that is when you want him. They could not find him until the next morning, when he showed up at 10 o'clock. They criticized us because in the opening statement I think I mentioned it was 6 o'clock. But you find that Miss Abbott never had a broken leg. I don't think there was ever anything the matter with her. Don't you remember how I read from the chart, "She slept, she slept, she slept all day"? She stayed there twenty-one days. Why? Because, under the by-laws of G. H. A., she gets twenty-one days' treatment for nothing at the hospital; and she had a good rest.

Then we come to the next one. This is one that I thought was worse than the first, until I found out the truth. That was Mrs. Austin. Here was a poor lady who was struck by an automobile or a trolley car, one or the other, and was brought down to a drug store at 14th and F or 14th and Pennsylvania Avenue, and her daughter actually told you that she never got a bit of treatment, and she took her home, out of Emergency Hospital.

Once again it looked as though Emergency Hospital should be closed. But what did we find to be the facts? First of all, the daughter is a director of G. H. A., and she testified against these men for conspiracy to restrain G. H. A. Dr. Selders had known for months, G. H. A. had known for months, that no privileges in Emergency Hospital could be given anybody who was not a member of the District of Columbia Medical Society, and that that act was passed by the board of directors long before G. H. A. was ever dreamed of; and yet, right in the face of the Emergency Hospital's staff and its rules and regulations, they kept thrusting back into the face of the hospital Dr. Raymond E. Selders, just as now they try to ram him down your throats.

What is the truth about the matter? Mrs. Austin was offered anybody she wanted on that staff, any doctor—and they were the most responsible, reputable, able and experienced in our city. She said, "No; I want Dr. Selders." What happened? Her daughter took her home. I asked her, when she was on the stand, "Did some one from G. H. A. come to see your mother at home?" She said, "Yes."

I said, "Who was it?" She said, "Dr. Halstead."

All this made good subject matter for public comment in the press. When we put the little nurse on the stand, whom we later found out at Walter Reed Hospital—we had to fish around for all these witnesses, nights when you did not know we were working; we had to go out and find them so that you might know the truth. We brought that little nurse here, and we found that Mrs. Austin had walked out of the hospital and never took an ambulance.

Now we come to another case, that of Mr. Hardin. He was the young man who was taken very sick with acute appendicitis. He was treated by a doctor in Arlington County, Virginia. He was taken to Sibley Hospital, and there he was operated on and his life was saved, because he had a serious appendix. He had not been in the hospital five minutes before a G. H. A. man, a brother of Mrs. Hardin, came in and once again started to put the hospital on the spot, making demands right then and there while that man is up in the operating room, being prepared for the operation, and while the surgeon is preparing himself for that operation—demanding Raymond E. Selders, whose privileges had been rejected five months before, be given the privilege to operate on that man.

They had those cases paraded before this jury in an attempt to arouse honest indignation which would naturally arise in

the heart and soul of any fair-minded person to hear of conduct like that, if it were true.

Then, what did we find out about Miss Tew? Miss Tew was another case. She came to Sibley, you remember. It was painted to you yesterday that she came up there and was given morphine and was removed from the hospital under morphine. What is the truth about that?

THE COURT:—You said Sibley Hospital, Mr. Leahy. I think it was Garfield.

MR. LEAHY:—Yes, your Honor. On Jan. 25, 1938 Garfield wrote a letter to Raymond E. Selders saying that the privileges which had hitherto been granted him had been withdrawn pending the determination of the legality of G. H. A. On the 26th of January he took Miss Tew to Garfield, and Garfield Hospital said to him, "Well, perhaps you did not receive the notice. Go right in and take care of her."

Could they be fairer than that? They knew that he had no right in Garfield Hospital to treat patients except in the case of an emergency, and he sent in Miss Tew as an emergency case. You remember that Peggy O'Connor took the witness stand. I thought that Miss Tew had been stricken, like Mr. Hardin, with a bad appendix, but we found that she had been lying home in bed for a week, and the doctor said that it had subsided. But then, once again, knowing that he had no right to do it whatsoever, but trying to get in under the theory of an emergency, he has Miss Tew come to Garfield Hospital for an emergency operation. It was not an emergency operation at all, and it was not an appendix case at all, because on the chart there were written words to the effect that he was going to make a mid-line incision; he was going to explore the abdomen, and while he was doing that he would remove the appendix. Then it was discovered that it was not an emergency case; that Dr. Selders had no privileges there, and they said Miss Tew could take anybody on the staff—"any doctor or surgeon you want is yours, except that we do not permit doctors who are not on the staff to function in the hospital."

But rather than to do that, Miss Tew left the hospital—and they left the testimony. They never told you whether Miss Tew was operated on or what became of her. They wanted to leave it up in the air for suspicion, again, so that you would wonder or think and, thinking, believe that Garfield had ejected a poor girl from its doors who was in a situation of emergency.

And then comes the last one, the Mary Frances Stuart case. That was so bad that Mr. Penniman called up Dr. Neill one afternoon and had him go up on a Saturday afternoon to complain about that case. I thought that Mary Frances Stuart was going to die, before counsel got through telling us about it. And once again we had to find out what it was all about.

She was not a member of G. H. A. at all. She was a laboratory technician at G. H. A. She was taken very sick in her apartment. She advised her room mate or a friend that she wanted Dr. Allen E. Lee. Allen E. Lee came and pronounced it a case for surgical attention. He called Dr. Brown. Dr. Brown said, "Very well. I recommend Dr. Schoenfeld." Allen E. Lee got in touch with Dr. Schoenfeld and they made arrangements to use the hospital. Dr. Lee said he met Dr. Schoenfeld coming down the corridor as he came in the front door; and Mary Frances Stuart was operated on that morning at 11:30. That is the case.

And yet that is the case that Mr. Penniman complained about and would have you believe that some one in the District of Columbia Medical Society had absolutely refused to have anything to do with Mary Frances Stuart. He said something about Dr. Schoenfeld's saying, "If she is your private case I will operate on her; otherwise I will not."

Now, that arrangement was made by Mr. Penniman with the whole troop of the board of trustees of G. H. A. They came to see Dr. Neill to discuss that case, it was so outrageous. The papers were filled with it. They saw to that. They wanted to put the hospital on the spot.

Where does the conspiracy come in? Was there a conspiracy there to ruin the reputation of our hospitals? Were the hospitals trying to maintain the standards which they had always maintained and to enforce rules and regulations which they had always enforced regardless of who the doctor was or to what organization he belonged?

And then Penniman went back and checked with a letter; and when I showed him the letter there was not a word about the Mary Frances Stuart case in there. I said to him, "I thought you went up to talk about that case."

"Well, we did, but we got shunted off on another one, because Dr. Neill said he had never heard about it."

Every little piece of evidence, where it might be possible to urge it against the District of Columbia Medical Society, something that would arouse your honest indignation, they have

culled out over a period of a year or a year and a half and brought before you in order to, if possible, poison your minds.

THE COURT:—We will take our recess now until 1:30. (Whereupon, at 12:30 p. m. a recess was taken until 1:30 p. m. of the same day.)

APRIL 3—AFTER RECESS

(The proceedings were resumed at 1:30 p. m., at the expiration of the recess.)

MR. LEAHY:—If the Court please, and you ladies and gentlemen of the jury, I rather think you will be glad to see me sit down instead of standing here, but there are just a few points I want to cover and I will be through.

You will recall that just before recess for luncheon we discussed the situation with reference to the Washington hospitals. In the argument yesterday you will remember that it was said that the Washington hospitals came into this conspiracy because of the power which the District Medical Society had over the hospitals, through the membership of the Medical Society members on the various staffs of the hospitals; and then having this power they had the machinery by which to enforce it; and, therefore, whereas the hospitals are in the strange and unique position of not being active conspirators in the sense that they willingly joined at the outset, nevertheless they felt the power and compulsion of the District Medical Society to the degree that they elected to become conspirators. I don't know whether you would call it in self defense or because they were afraid. It was said that the staffs of the hospitals would be unmanned and you remember the argument was made that they had that power which for any capricious reason at all the District Medical Society could exercise to the disadvantage of the hospitals.

Now, what was that power? They said that power was the power to approve, and you will recall that just as the American Medical Association approved certain hospitals for intern and resident training, so the District Medical Society was acting for the same restraint in the same sense that they were watching to see to it that the Washington hospitals should not themselves fall from the standards which the hospitals of the District of Columbia should maintain.

After all the only people who really know whether the service in a hospital is good, bad, efficient or otherwise, are those who have been trained, and who know what service is being dispensed in the hospital; and I may state that can be known only to medical men; but the power to approve which the prosecution adopts as evidence of the power of compulsion is something under which they want you to believe the District Medical Society compelled the hospitals of the District to act.

Now, once again, may I impress on you that if there was any indication in this case that the District Medical Society was trying to compel or force or put pressure on that hospital, they would have found it. It wouldn't have been left to a guess; to imagination; to your surmise, and it would not have been left to the able and capable argument of the prosecution to try to make you think it was exercised.

The truth about the matter is that the fact is directly to the contrary. The District Medical Society, throughout this case, was careful to see to it that in its conduct nothing could be charged against it, with any foundation in fact or reason which they have now charged before this jury. The statement has been made that by the capricious exercise of this power of approval they could compel the hospitals to do this or that. But did they exercise that power? Did you hear of a hospital stricken from the approved list by the District Medical Society? Did you hear of any pressure put on any hospital with reference to approval or disapproval? Why, do you think, in all honesty, that men of the type these eight hundred men were, who are in the Medical Society of the District of Columbia, would capriciously disapprove a hospital whose staff is made up mostly of its own members? Didn't you hear Dr. Willson on this stand state to you that in a contest between the District Medical Society and the hospitals men on the staffs of the hospitals would stand back of the hospital. Why? Because the hospital takes care of the sick; you and me. The hospital renders public service and takes care of its patients; and no decent, honorable man would quit the staff of a hospital because forsooth somebody on the District Medical Society, let's say capriciously, would disapprove that hospital.

But now, remember—as I told you—during the course and period of this matter the charge is made that the hospital committee of the District Medical Society was exercising this very pressure of power to approve or disapprove, and holding it as a threat over the heads of the hospitals; and then they said the machinery through which they could operate this power

was this fifth section, which was offered by way of amendment, and they add the white list, which they like to call it, which was an approved list sent out July 29, 1937.

First, let us see whether the evidence anywhere can relieve your minds of any doubt which you may have with reference to this argument on power.

Now, remember the machinery by which this power was to be put into effect was this white list; this amendment to the constitution. Remember further that the doctor who headed up the hospital committee was Dr. Warfield. Remember that the last report of the hospital committee of the District of Columbia was March 28, 1938 in the Executive Committee meeting and April 6 in the District Medical Society meeting. In other words, that report was approved first by the Executive Committee and then by the whole society.

Now, this report was called to your attention; argument was made about it to you yesterday. What about this capricious power of approval? What about this practice of the District Medical Society to approve or disapprove? This is the report:

"The Hospital Committee has purposely avoided the submission of the list of local hospitals for approval of the Medical Society."

They purposely didn't do the very thing which he argues they might have done. The fact is that purposely they did not submit any list for approval to the District Medical Society, so the argument which has been made to you couldn't find a basis in the evidence for making it. What else do they say? Why did they not submit it?

"The eleven local hospitals therefore remained approved by the Medical Society as of Nov. 4, 1936."

And nobody ever heard of G. H. A. before June 1, 1937.

Here is the reason why it avoided the very charge that has been made:

"To have attempted to reapprove these hospitals last fall or this winter"—

the winter of 1937—

"would have detrimentally created conflict between the Medical Society and some of the local hospitals because of attempted enforcement of the provisions of chapter IX, article IV, section 5 of the Constitution of the Medical Society."

Rather than create any conflict; rather than do the very thing which they argue they had the power to do they refused to even approach the question of a conflict with the local hospitals growing out of section 5, which I will come to clear up for you in a few moments.

And what is the last line of that report:

"The Hospital Committee recommends that the Medical Society continue their full cooperation and avoid conflicts with any of the local private hospitals."

Doesn't that sound like a conspiracy? First of all, if they were all in conspiracy they wouldn't be in conflict, because before you can find a conspiracy you must first find agreement, not conflict; and here is the last word that Dr. Warfield writes in his report, because the Hospital Committee went out of existence July 1, 1938. The last admonition which that report leaves with the Medical Society is:

"Cooperate with the hospital; don't have any conflict with them."

Is the District Medical Society now trying to advise their members to act in the public interest, for the good of the people of Washington, or are they trying to create a conspiracy in order to restrain G. H. A.?

Now, let us come to section 5 of this machinery. I think we have heard more of section 5 and the white list than anything else in this case.

What is the white list? In the summer of 1935 there had been some question, as Dr. Willson stated to you on the witness stand, with reference as to how doctors in the District Medical Society could join up with these compensation clinics, which were then coming into operation under the compensation law. It goes back once again to "contract practice," and you will recall that in June 1934 the American Medical Association had expressly held that contract practice was not per se unethical, and they gave as a guide to the members of the American Medical Association ten principles under which members should conduct contract practice. These compensation clinics had contract practice within the limitations discussed in these principles, and from the summer of 1935 down to January 1936 this section 5 was under discussion; and the way the description was phrased in there of these clinics was that where the profits of the clinic did not inure to the benefit of the Medical Association then the contracts between the member of

the Medical Association and the clinic should first be approved. Why? Because, just as Dr. Cabot stated—"I wouldn't permit any interference between doctor and patient; there cannot be any," and, therefore, no third party ought to come in to interfere between doctor and patient.

Here was a clinic making profit out of the use of doctors' services and keeping it for themselves, which is contrary to the public interest, however one might look at it, and we don't have to be a doctor to understand that. There then came an amendment in January 1937. Remember, the District Medical Society never heard of Group Health until June 1937; and then in March came the amendment, and that amendment was that they included within ten miles of the District of Columbia the operation of this section, and that required that any complaint with reference to any doctor connected with any clinic should be determined, not by the Society, and not by anybody but the Executive Committee of the Society.

Now, in January 1937 everything in that amendment had been fixed and settled except the reference to the Executive Committee as the proper committee for entertaining the complaint. That was passed in March 1937, and nobody ever heard of G. H. A. for three months thereafter, and yet they grasp that; they tear it out of the constitution of the District Medical Society, and they say "That is the one you were going to use in order to put into effect the white list, the boycott of G. H. A."

Now, the white list was prepared because, as the District Medical Society had then enacted this amendment to the constitution, as Dr. Willson told you, they authorized an approved list of clinics which had already been investigated and were determined to be operating in accordance with the proper standards in the public interest.

That white list was prepared initially in May 1937. Again I call your attention to the fact that that was six weeks before G. H. A. was ever heard of. Then they say on July 12, when you finally enacted the white list you modified it and you changed the words "connected with" to "employed by"; and they say Dr. Macatee, whom they didn't indict, whom they didn't even name as a conspirator—Dr. Macatee proposed that phrase "employed by" the United States instead of "connected with" the United States, did so in order that it wouldn't include G. H. A.

Now, do you think Dr. Macatee had anything like that in his mind? Do you think Dr. Macatee is some lawyer that sat there and thought "We will put in one of those weasling phrases," so that four months later, when the clinic opened up, the white list should be made to refer to G. H. A.?

And on July 29, in accordance with the resolution they sent to each one of the District Medical Society members the approved list.

They talk about medicine not being in favor of contract practice, and those are eight or nine clinics with some of the finest doctors in Washington connected with that. They even referred to Dr. Neill's connection with one of them. There is one Dr. Charles White is connected with. Eight or nine approved but forsooth we didn't approve G. H. A. How could they? Certainly on July 29 when Group Health didn't have a staff, you couldn't put it on the clinic approved list; and, furthermore, all the letter of July 29 was to each member of the District Medical Society telling them "If you have a contract kindly submit it to us so that we may see whether the contract ought to be approved."

Now, the Court will tell you that unless you find that everything that has been done with reference to Section 5 was done in pursuance to a conspiracy, then this organization, just the same as any other organization to which you might belong, has the right to prescribe its own rules and regulations; it has the right to have its rules and regulations observed by members of the Society. Why? Because no doctor is compelled to become a member of the District Medical Society. Dr. Brown, you recall, stated on the witness stand "I am not a member of the District Medical Society," when he was talking to Dr. Lee and Dr. Scandiffio. He said "They have no jurisdiction over us," and they did not, and have not. They haven't any jurisdiction over anybody who is not a member of the District Medical Society, but they do have jurisdiction over their own members, and they have a right to prescribe rules and regulations. Why?

Because whatever is done by a member of the organization reflects on the organization, and if an organization continues to permit a member to violate its rules and regulations, after all the Society is then put in a position which Dr. Macatee says Garfield would have been put in, of aiding and abetting whoever it was, was the subject matter of the violation; and, therefore, the District Medical Society, having the right to do this, only did what it did, in what it believed to be the proper practice of medicine. It only did what it did ultimately for the good of the patient and the good of the people.

Now, G. H. A. never submitted any contract. You remember I said to Dr. Macatee, after the 29th day of July, "When you left that meeting, saying to those men 'We are asking for information so that we may in turn advise our membership as to what attitude to take in the matter,' did you hear from G. H. A. again?" He said "No, never," and now they complain because they are not on the approved list. They couldn't be on the approved list on July 29 because they didn't exist in fact until November 1; and they couldn't have been on the approved list before that. They could have been on the approved list just the same as the nine other clinics were on the approved list if they submitted their contract for approval, and it was approved. But they refused to do anything in this regard or cooperate in any way, shape or form, just as Dr. Cabot said again, and I repeat: "because the lay body and these private clinics are tempted to interfere on the medical side of the clinic"—a clear distinction between what you find in hospitals where the administrative board of business men takes care of the business of the hospital, but the medical staff of the hospital are given charge of the medical side and conduct of the hospital.

Now, that is section 5. That is the white list.

Oh, but they say, "They sent the white list to the hospitals." There is this power again, and machinery by which it operates. Notwithstanding the fact that in evidence there is the clear refusal to exercise any power of approval in order to avoid any conflict with what? With what the hospitals might do with reference to section 5, and the white list?

And you will note on the white list—I haven't time to read it all over to you—but you will remember the testimony; they approved practically every organization in the District of Columbia, which was then in fact doing what? Practicing medicine; and they approved all the staffs of all the local hospitals. Why then shouldn't the hospitals have the statement made by the medical society that it approved the staff of the local hospitals?

Do you think back there on July 29, when the committee of the District Medical Society was still in force, still trying to get some information which they never could get—two months before G. H. A. ever opened its doors—that they sent that around in some conspiracy to crush or restrain G. H. A., which had not at that time opened its doors? There is a limit even to the stretch of our imagination and we are supposed to base our judgment on facts, and not on guess and surmise.

That is the white list. In their desperation, trying to find something to piece out and make you gentlemen and ladies believe beyond a reasonable doubt a conspiracy in this case exists they have combed the records of the American Medical Association and the District Medical Society, and they have taken every minute and piece of a minute, every word that was said by any man at any time, whether the Society took action on it or not; whether it expressed any opinion on it or not; and they have hurled it at us here as evidence that we were in some gigantic conspiracy, nationwide, with the tremendous power of the American Medical Society and the District Society—all one hundred ten thousand doctors, all of our hospitals and their staffs, medical and administrative, groups of agents and servants—all involved in this gigantic conspiracy to crush an organization which, I repeat, had not yet opened its doors and about which we never said "Boo"; concerning which we never tried to restrain them in the slightest degree. We never did a single thing to prevent them from doing any and everything they wanted to do; and we never did a single thing to restrict a single doctor who was on the staff of G. H. A. They say you did by expelling them. Dr. Scandifio; and with your threatened expulsion of Dr. Lee. Did we?

The Court will tell you that the District Medical Society, so long as it was not engaged in this gigantic conspiracy which they picture, had the right to have these regulations and enforce them. In his application for membership the prospective member agrees to abide by these rules and regulations. Again, the District Medical Society is a voluntary association. Both Dr. Lee and Dr. Scandifio knew that when they came into the Society, and while members of the Society; every rule and regulation. They had received the notification of July 29, and as honorable and decent men just as soon as they chose of their own volition to become a member of the staff of G. H. A., what did they do? They chose to resign. They had the right to do that. They could resign from membership if they wished; and they knew they should. And Dr. Brown, who was not a member of the District Medical Society; who was the Medical Director of G. H. A. told them that is what they should do, and they resigned. And then comes one of the strangest behind-the-scenes attack on the District Medical Society that you have had to listen to as jurors in this case. Right then, Mr. Penniman and Mr. Zimmerman, and a corps of attorneys representing them, felt that once more, if they could, they

would try to put the District Medical Society on the spot; and what did they do? They got together and said to Lee and Scandifio: "Take your resignations back. Write out a contract. Present the contract to the C. C. & I. N. Committee and demand a trial. We will put them on the spot,"—and back came the withdrawals of resignations, almost in identical words. And when Dr. Lee was on the stand I said "Did you get some help there?" He said, "Yes, I did." "Who were you talking to?" "Mr. Penniman and Mr. Zimmerman," and I think he said "Mr. Russell," chief counsel of the H. O. L. C. Just a cleverly worked-out scheme so that the matter could be presented to you ladies and gentlemen as though it was the result of regulations and the white list. They were prepared by lawyers, coached by lawyers, defended by lawyers; and what happened for four days? That is in evidence. Dr. Scandifio, with four lawyers, was tried on the question of his violation of two sections of the District Medical Society regulations.

Do you remember when I read to you the by-laws of G. H. A.? Did you see where G. H. A. was careful to preserve the rights to expel anybody, and who was it who could expel? The board of directors. And for what? For any good reason which the board of directors thought. Any appeal from that? No. Any protection to the subscriber? None.

Here was accorded to the doctors the full protection of their interests as to whether or not they had violated any provisions of the constitution of the Medical Society; and there has never been a final adjudication of that because the evidence is that the appeal has been taken to the American Medical Association Judicial Council and no action has been had on it yet. Why should there be with this furor and these accusations? What could medicine do under such circumstances?

Here they are threatened with the full power of a governmental agency and backed with all the advice of counsel trying at all times to make an embarrassing situation for our doctors. And what have our doctors done? What have they done to Dr. Scandifio now? Then he was on the staff; now he is Medical Director. Have we tried to restrain G. H. A. by making him get off? Have we tried to restrain G. H. A. in breaking up his services? Why, hasn't Willson, Dr. Willson told you that he has turned over his own patients again and again to Dr. Scandifio. Is there any ill will about it? Hasn't he told you that he considered him an able pediatrician, and that he told these young mothers to call him in? "My work is done: I will be glad to have you."

They talk about boycott; about not getting in the hospitals; about not being permitted consultations, and here you have these men, defendants, hospitals, telling you under oath, with no contradiction, the contrary.

Now, then, we come to the last point. They say "If you want to see a conspiracy in full operation just take Dr. Willson's resolution of November 3."

Why, ladies and gentlemen, they talk so much of that resolution they even printed it in the indictment. When you get in the jury room look it over: "Since we have the apparent right of hindering" or something of that sort "G. H. A."

And that they construe to be such material evidence of the conspiracy on the part of the District Medical Society—and how they were going to conspire is not known because a hospital is a private institution and can act individually and did act individually—and then we get the truth once more.

Dr. Willson came here and told you just how section 3 of the resolution of November 3 arose. Conspiracies don't arise in the manner in which they have charged here. Here you have an organization in which two hundred or three hundred are present. Did you ever get in a meeting of that kind where there wouldn't be differences of opinion?

Dr. Sprigg, another defendant, thought the hospitals should be acquainted with the fact that section 5 was somewhere tucked away in the constitution; and asked for cooperation. Now, remember, if we ask anybody to help us we are criminals. Somewhere they have advanced against Hooe that he said "We ought to call the hospitals together." Right in evidence here is proof that G. H. A. called the hospitals together. You remember the discussion of the appointment of the man from Georgetown?

Now, if G. H. A. can call the hospitals together, can't the District Medical Society call the hospitals together? Or is it that all these men have lost all human rights as American citizens so that they cannot discuss with each other what should and should not be done. And Dr. Willson told you he didn't agree with Dr. Sprigg; didn't like the idea and sat down one afternoon hurriedly, scratched together the resolution of November 3, and he called up Dr. Christie. "Do you think if I introduce this that I can check the Sprigg letter?" And "Can I beat Sprigg out in this vote?" And what happened? He

said the closeness of the vote said "I was right." I think he said it was 65 to 53. What did he do? They talk to you about the preamble and the whereases. Get to the real meat of the thing. It was a resolution recommitting the whole idea to committee, so that the committee might study the matter out, and so that there would be no mistake on the part of the District Medical Society, so that they might act as responsible, fair-minded men, and that is where it went; to that committee. And then, even yesterday, counsel for the prosecution admitted that on November 11 the District Hospital Committee recommended out—and I use his adjective—"an innocuous resolution." That is Dr. Warfield's committee; and those are the facts in that connection.

And then here is where Dr. Yager becomes a conspirator. The resolution of Dr. Warfield on November 11 was that the hospitals should take care of G. H. A. patients, but that members of the staffs of the hospitals should be recommended to attend them; just the rule that had been in effect so long in some of the hospitals, and yet they are all charged to be in a gigantic conspiracy because they had these rules; and Dr. Yager says: "Wait a minute, it doesn't appear whether G. H. A. doctors are on the staff. I move this matter be recommended," and he becomes a conspirator for making that statement to recommit it for further study. And Dr. Warfield's committee brought forth the December 1 resolution.

Now, gentlemen, the only way that you can possibly distort the December 1 resolution into any agency for the accomplishment of any conspiracy is by saying that every one of these men have lost their every last good motive, their decency, because in order to avoid the very imputation now hurled at them—these men whom you are asked to brand as conspirators—they start the resolution, emphasizing the purpose of it: "For educational purposes only."

Is that a threat? Wasn't it just as easy for these men, if they wanted to threaten, to tell the hospitals of the District of Columbia what would happen if they didn't do what the District Medical Society wanted them to do. Why is it necessary to distort the language and try to make it read something different from what it is? Dr. Warfield said, "For educational purposes only. We ask that you seriously consider the recommendation of the American Medical Association with regard to membership on the staffs of your hospitals being limited to members of the District Medical Society." And there is where the matter dropped.

You cannot find anything in this evidence where they tried to put that into effect; and the Court will tell you that unless you find they first conspired and then did this thing in pursuance of the conspiracy they were within their rights; they had the same right to try to persuade a hospital that you have or I have to persuade you. They had a right if they believed it in the public interest and for the best interest of the patient to urge that the local hospitals have on their staffs members of the Medical Society,—not by threatening them; not by putting pressure on them—but certainly, as citizens of this country, as decent members of their practicing profession, they had the right to say to the hospitals which they have built; which they protect; in which their life work is done; that they keep going; in which they treat their patients—they had the right to say what they did: "For educational purposes only," and they need have no fear of any lawyer distorting their language or trying to convert what they did into an act of conspiracy.

Why, they would forego everything that is near and dear to them, professionally and personally, and everything decent and honorable in a man if they were men such as you are asked to believe them. I have never heard decent, honorable men have their motives impugned as these motives have been impugned in their effort to build, construct or reconstruct, model or remodel this so-called conspiracy. Out of isolated acts; isolated statements made by members, they have tried to fit them into a framed-up charge of conspiracy, within a frame that does not fit the picture or a picture the frame.

That is the end up until the Warfield report, and this Warfield report is that on which they seek to hold Warfield as a conspirator. Just imagine what Dr. Custis did to become a conspirator. He is a member of the staff of Homeopathic, and he wrote a letter away back in the first week of November to the District Medical Society; and he said "there seems to be some question about the attitude of Homeopathic Hospital with reference to, maybe it is section 5, and in order that you may know how the Homeopathic feels about this, I want to tell you that we voted that we would not have anything to do with any organization which was not approved by your medical society." They didn't have any such rule in effect and you will remember when Colonel Randall was on the stand. They put him on the stand. I said, "Colonel, let's turn over the minutes." We turned

to the minutes which showed the enactment of that resolution. Dr. Custis was there with eight other businessmen. Mark you, those men whose names I read to you. One of them is in this bank over here on the corner of Seventh Street; another is an officer in the McLachlen Banking Company; another is in the real estate business in Washington here.

Now, Dr. Custis proposed this resolution. Colonel Randall disagreed with him. Colonel Randall said he wanted the business of G. H. A.; and they debated the thing back and forth in this meeting; the nine of them; and finally seven of the nine voted one way and two the other way. He said after that we were all one, and Dr. Custis was one of the seven. He is the one who had proposed the resolution; six others on that staff agreed with him, but Dr. Custis is indicted. Is that fair? Custis is indicted because he wrote that letter. Now, that is how far they have combed the testimony in this case to try to find something.

What have they against Dr. Hiram Reed? He sat as a member of the Executive Committee at the trial of Dr. Scandifio. That Executive Committee consisted of, I think, it has been read in evidence, thirteen or fifteen men. The others have not been indicted. The others weren't made conspirators. Some of them they select to be conspirators; some not. Just a whim. Just a whim and you can become a conspirator, sitting over there for two months charged with the violation of the law. Pretty careless and pretty serious thing. I wonder how long you think that an organization could exist so many years and, surely up to this time at least, not have been charged with anything, at least not more than with acts done for the furtherance of their organization and in the public good, will continue to act if they have to act at their peril; if every word they utter, every line they write to the inquiring public or the affiliated societies may be brought up years afterward to charge them as conspirators. Do you want Dr. Cutter to continue inspecting hospitals? Do you want him to continue trying to keep medical standards up in the medical schools? Do you want Dr. West to continue to operate these agencies to see that drugs and food consumed by the public are up to standard; to see that quacks and charlatans do not prey on the people? Do you want the American Medical Association to carry on what it has been doing? How can they carry on under a threat that if whatever they do their motives are to be impugned and questioned and they are to be compelled to sit over there nine weeks to answer charges of doing things which never entered their minds when the acts were done? Those are serious questions connected with charges of this character.

Now, let's go back to this final report: "All of the local hospitals are cooperating with the Medical Society with respect to Group Health Association." Isn't that too bad?

They seize that as evidence that there must be a conspiracy because there is cooperation. How can there be cooperation, ladies and gentlemen, I ask you seriously, in common sense, how can there be any efficiency in the operation of a hospital unless there is cooperation between the doctors and the lay administrators of the hospital? How can a hospital get on without cooperation, and yet if a man reports that the hospitals are cooperating with those people who have made them what they are he as well as the hospitals are charged, not with cooperating to insure better service for the public and medical care but to crush and destroy and restrain G. H. A. Now, the attitude of the hospitals has been shown. After Justice Bailey's decision on the question of legality, application to the hospitals were received by those hospitals and acted on. You heard Dr. Macatee on that stand testify that two applications came before him, and didn't he, as a member of that executive committee tell you that the Executive Committee had passed on those applications favorably; and the sneering imputation was to put into that action "Oh, you were afraid because of that indictment." How did Dr. Macatee know an indictment was coming down, and finally we learn that Garfield, with Dr. Macatee on the Executive Committee, had voted on the application and they did come down, at least one day before this indictment. Now, up to that time the doctors in the District Medical Society and in the American Medical Association here in Washington were in the position which Mr. Drayton stated to you he was in; which Garfield Hospital stated they were in: that during the time the test case was on file here in the District of Columbia to determine whether G. H. A. was legal or not—and you will remember I asked Dr. Cabot when he was on the stand: "Would you recommend a man for the hospital staff where you knew that the organization with which he was connected was then before the court for the purpose of having declared its legality or illegality?" and he said "No. I think I would wait for the result." And that is what they did here. Not that illegality is a defense. Don't think that any of these men had a

right to try to go out and destroy or restrain G. H. A. because they thought it was illegal; because all of us are supposed to know the law, but at the same time if you believe something is illegal then as Dr. Macatee in Garfield said "Let's wait until that action is determined, because we may find ourselves in the position of aiding and abetting an illegal organization; and then we would be in the position of aiders and abettors and subject surely enough to indictment for conspiracy."

Now I am leaving you with the word of assurance I gave you this morning. I told you that the criticism of Dr. Woodward in his article had done nothing but abound to the good of G. H. A. You remember he pointed out the very serious question of legality of G. H. A. from the fact of its practicing medicine and its being an insurance company. You will remember when Penniman was on the stand I showed you that as early as November, one month after the article was published, they had presented an amendment to their by-laws by which they cured the question of the illegality from the insurance standpoint; and again that they filed an amendment on the second day of May, which was read to you here—and perhaps the significance of which you didn't catch—but which and by which they cured the question of illegality, so that when Justice Bailey had the matter to decide in July it was an entirely different G. H. A.

I told you too, when I started this summation for you, that the beginning of this difficulty could be found in the answer made by Dr. Cabot, and that the answer to the doubts that you might have in your mind could be found in the answer of the witness presented on the last day. That witness is Dr. Scandifio himself.

In December 1938 he called on Dr. Wall, his old preceptor and friend, and he spoke to him in the presence of and with Selders and Price; and there he told Dr. Wall on the first occasion that he would like to speak to him again, and Dr. Wall went to Dr. Mallory, the president of the District Medical Society, and he said "Who shall I have from the District Medical Society talk with you?" They said "Dr. Macatee," and there they told him that having become dissatisfied with the work of G. H. A. as Price had, and with the quality of care they were able to give subscribers, they were willing to quit in a body; and if the staff quit that would be the end of G. H. A.

Did the Medical Society ask the staff to quit? There they had a chance not to restrain; they had a chance to crush G. H. A. Did they do it? There is your answer to this charge of conspiracy to restrain. There is your answer to a charge of conspiracy to destroy G. H. A. There is the opportunity presented right in the lap of the District Medical Society to take into its fold the entire staff of G. H. A. and unman the staff, to the destruction of G. H. A. Did they do it, or did they act as they have acted throughout their lives as decent, honorable upright citizens and practitioners of their profession? They said "No," and those men went back to their places. They went back to continue on the work of G. H. A. And just as on the first day you found the reason, on the last day you found the answer to this case; this case which has kept you here for going on nine weeks.

There has been no conspiracy except in the minds of those who would conjure up for some reason, I know not what, this charge to bring defamation and humiliation on these men who have spent their lives trying to do the best they could and now, when they have almost reached the end, they are compelled to face this, an unheard of accusation, under these peculiar and complicated circumstances; and I ask you, as you see them over there, whether or not you have not seen already laid on them the hand of time with an approval for what they have done; with the furrows of time in their checks, cut down in there, laborers for you and me. And I ask you that you send them back with a bit of encouragement to their life work to complete it to its end, and that they may not go down under the shadow of convicts for having violated a law of the United States.

Many of the defendants who have been witnesses have been across the water. Some of them are now engaged in the work of building up the national defense. Do you think men of that ilk and stripe would stand here and violate the law, or do you think they worked as they have worked for you, for me, for us all?

And I ask that by your verdict they be found free of this vile, this unnecessary, this sadistic accusation which would crush them to the grave.

(Thereupon a brief, informal five minute recess was had, at the conclusion of which the proceedings were resumed as follows:)

THE COURT:—Are you ready to proceed, Mr. Lewin?

Mr. Lewin:—Yes, your Honor.

CLOSING ARGUMENT ON BEHALF OF THE UNITED STATES

JOHN H. LEWIN

Mr. Lewin:—May it please the Court, and you ladies and gentlemen of the jury: I am sure you will all be glad to hear that I have an hour and seven minutes only, and whether or not I would like to continue on after that makes no difference, because I will have to stop.

Mr. Leahy's argument was just what I expected it to be—very, very able and persuasive indeed, if you happen to be emotional and if you are willing to shut your minds to your narrow task and to the overwhelming evidence that his clients have supplied.

I warned you yesterday about false issues, and I did it because I knew that no lawyer, even as able as Mr. Leahy, could address you and persuade you against the real issue, because of the lack of evidence in the record to talk about, and so he had to talk to you about false issues in the hope that by appealing to those false issues and to your sympathies you would be led away from the main track.

And so, as I told you yesterday, there is an attack on Group Health Association. It is to be outlawed. Why? The only reason you are in the jury box, he says, is because Mr. Penniman and Mr. Zimmerman exercised some lay interference. I took it down verbatim when he said it. Although the boycott against this organization had been planned and nearly perfected for months, day after day, night after night, and meeting after meeting recorded, before there could be any question of lay interference, before the clinic even opened. And that statement to you is hazarded although there is not a scintilla of evidence of any lay interference whatever. There might have been if Dr. Brown had not been cross examined. There might have been a scintilla, because you remember he said what they wanted was a rubber stamp. But on cross examination he stated that there had not been any interference whatsoever between the doctors and the lay board.

Counsel grabs at Dr. Cabot's testimony, and that dear old Nestor of medicine told you frankly that there was a temptation in group practice on a prepayment basis for lay interference. And there is temptation in the hospitals, no doubt. But is it not a far cry from the existence of temptation and any evidence of the fact? You ladies and gentlemen know, from having heard this evidence, that there is nothing in it, not a thing.

Then he sets up some straw men so that he can have the pleasure of knocking them down, and as you see, he ably knocked them down. He insists on the right of the doctors to like and dislike, approve or disapprove, provided, he says, it does not amount to conspiracy. Well, that is the point. When people dislike to such an extent that they take affirmative action and go out and get help not only from their own members, but independent hospitals, and dictate to them under threat of disciplinary action, if you please, as they did with the resolution against the hospitals, even, that is not simply liking or disliking or approving or disapproving. That comes under his qualification, unless it amounts to a restraint of trade and a combination.

Nobody would have been indicted for liking or disliking in this case. The Grand Jury of the United States had the responsibility for indicting and picking out the people they thought, on the evidence before them, were the ringleaders.

Then he even attacks the Government lawyers. Well, maybe we are fair game too. However, we have lived with you now, face to face, for two months, and you ought to have some kind of an appraisal of us.

He says that the only restraint in this case is the restraint that we put on the evidence. Ladies and gentlemen, that comes from a gentleman who had one calendar month to bring in evidence on his defense, if he had any, and he devoted at least three fourths of the time to reauthenticating, reaffirming and rereading to you ladies and gentlemen the very evidence that the Government had introduced.

He says we are attempting to poison your minds, arouse your passions. I disclaim that. I do not want any emotional verdict at all, and I know you do not. I want an honest, sincere verdict on a conviction. If the evidence is not there, there should not be one. If it is there, there should be. Nothing more, nothing less, no matter who are the defendants.

A doctor is not any more above the Federal law than the poor little cigaret vender or orange vender on the street that Mr. Leahy feels offense at because there is some comparison between the two. There is not a bit of difference.

That charge that we are trying to arouse your passion comes from a man who devoted at least 90 per cent of his time here in a most eloquent appeal, practically a confession, and throwing himself on your sympathies.

He pretends that this is a case brought against the medical profession as a whole, and then he proceeds to defend the medical profession as a whole, when it is nothing of the kind. What does his reference mean with regard to the doctors being present when children are born and being in the presence of death? Does that appeal to logic and to the evidence?

What does he mean when he refers to war records, of a war over twenty years old, and participation in national defense? Is that any issue in this case?

Does he claim that the American Medical Association, this powerful corporation that attends at childbirth and deathbeds is not a corporation of the District of Columbia? Does that have any bearing at all?

Then in a most able way he defends the rights of hospitals to decide for themselves who shall be on their courtesy staffs, forgetting that by bringing this case, by shedding the light of day on these tactics, we are vindicating that right that hospitals have in a far more effective way.

We too say, and have said all along, that hospitals not only have the right but the duty to decide these questions independently, on advice as to standards, if you please, and not under pressure.

Then he goes into an elaborate discussion designed to show that the American Medical Association is not opposed to group practice, forgetting, or wanting you to forget, that no contention of the kind has ever been made. The contention is, and it is borne out by the proof, that they have opposed with all their might, group practice on a prepayment basis; and they have a rule, which they enforce, that prevents them from doing anything except to oppose it. And that is the kind of group practice that Group Health Association employs, and that is the kind that the Ross-Loos clinic is, and that Trinity was, and the Milwaukee Center and the Cincinnati attempt, and all the rest. There is unanimous opposition to that kind of group practice, unless the members of the District of Columbia Medical Society themselves, or the A. M. A., operate those plans and come in on that business. They are the ones and the only ones, because their rule which they enforce to govern plans for low-income groups expressly provides it.

And then he attacks the evidence from his own clients in this case. He attacks it, although no witness that he put on the stand had the temerity to attack those contemporaneous records. One man, and one man only, you remember, qualified two little damaging statements, and when he got through with his qualifications he left you exactly where you were when he started to qualify. That was Dr. Macatee. I read it to you yesterday. He attacks that evidence, although those written records, taken down contemporaneously, jibe with every other piece of evidence and check absolutely with the resolutions adopted, and are approved—read and approved in most cases—always approved—by the Society as its minutes, and sometimes when there is an error in them the error is corrected before it is approved.

I may be able to return again to some of those false issues, but I want now to stress a chain of facts, not manufactured by the Government, not what somebody said and may not have meant, although when we put in the evidence of what they said we put in the fact that it was said over and over and over again, with reference to formal resolutions advisedly and carefully adopted by the full society.

And, ladies and gentlemen, when you come to consider your verdict, and consider it on the evidence, please do not forget the words of this resolution which the Grand Jury set out in the indictment and which was passed by the full vote of the Society—not some gossipy, ill advised statement that might be qualified, but a formal document which they all approved:

"WHEREAS, The Medical Society of the District of Columbia has the apparent means of hindering the successful operation of Group Health Association if it can prevent patients or physicians in its employ being received into local private hospitals; and

"WHEREAS, The Medical Society of the District of Columbia has no direct control over the policies of such hospitals as determined by their lay boards of directors except through control of its own boards serving on their medical staffs"—

And another recital to avoid publicity that they are attempting to enforce section 5; and then this:

"Resolved, That the Hospital Committee be, and is hereby, directed to give careful study and consideration to all phases of this subject and report back to the Society at the earliest practicable date its recommendations as to the best way of bringing this question"—

That is, Group Health—

"to the attention of the Medical Boards and the boards of directors of the various local hospitals in such a manner as to insure the maximum amount of accomplishment with the minimum amount of friction and conflict."

And the author of that said he wanted that because he did not like the other method of doing the same thing, which was by letter.

Don't forget that Warfield reported, and his report did not go far enough to reach what they wanted to do. Mr. Leahy did not make the correct statement of what this defendant proposed, because he proposed, and it was passed, that it be recommitted to the Hospital Committee and assurances obtained that no member of Group Health Association was on the courtesy staffs of the hospitals. That was their job, the job the Society gave the committee to do—to consider that job when it considered the wording of the hospital resolution of December 1, which starts off—

"As an educational policy we recommend the Mundt Resolution rule"—

which had not been enforced in a single hospital up to that time. It had been on the books of Emergency, but not enforced. It had not been on the books of any other single hospital.

Do not forget the reason for those clever words—"as a matter of educational policy," when the whole point of the resolution was to get this result without bringing down adverse publicity, because the public would not stand for it, and without bringing friction between the Medical Society and the hospitals. No. They wanted them to cooperate. To cooperate in what way? Cooperation is not bad, says Mr. Leahy. Oh, no. But he does not read you the next phrase—"cooperate against Group Health Association." That was the kind of cooperation wanted.

Oh, no; it is not a crime to cooperate, provided, as Mr. Leahy says, that you are not conspiring. But when you are cooperating, knowing that you are furthering a conspiracy—and that is what they intended—that is unlawful.

Bear in mind, ladies and gentlemen, the hospitals are not defendants; and in order for you to decide the issue, the only issue, you do not even have to find that the hospitals made their decision with regard to the Group Health doctors solely because of this pressure. All you have got to find is that these defendants plotted and planned to use this pressure against them.

Let us come to the hospital situation again. But before I do that I want to try to leave with you one of the most salient things.

After they had given the Hospital Committee this job and had it started on its work to obtain assurances that no Group Health doctor could be on the staff, what do you think of this frank confession of a defendant in this case, seriously, man to man and man to woman? Here is Dr. Mattingly:

"I frankly admit the following acts of professional leadership successfully accomplished."

Does he leave an implication there for us to draw some invidious inference from? Leadership? He says, further:

"I personally raised the question and forced the issue of compelling wavering and undecided hospitals to deny courtesy privilege to staff members of G. H. A."

Not poor Dr. Selders who is attacked on the basis of those three gossipy letters, but qualified members of Group Health Association. Remember this, if you will. He is not gossiping, not talking ambiguously about some disreputable government attorney in violation of his professional ethics—I mean, professional moralities—trying to distort its meaning. Can the meaning of this be distorted?

"That the proper agency of the Medical Society be instructed to present at our next stated meeting the facts relating to the present status of Group Health physicians at the various Washington hospitals preliminary to appropriate disciplinary action in event any hospital has ignored the Medical Society's wishes in the premises."

Does this case rest simply on distorting inferences?

And then this (indicating) is the result of that very thing. And won't you remember this—Formal action of the Executive Committee and formal action of the District Medical Society at a meeting in April, when Dr. Woodward was sent here to advise. Mr. Leahy says that all he did was to advise counsel, but he was present and heard this formal action taken. Was this some gossipy letter whose meaning has been distorted?

"The Hospital Committee has purposely avoided the submission of a list of local hospitals for approval of the Medical Society. The eleven local hospitals therefore remain approved by the Medical Society as of Nov. 4, 1936."

Why? The rest of it shows they purposely avoided raising the question of approval again, because they wanted to avoid friction and conflict and yet get the same result. And they remained approved, because they obeyed the behest under the threat of disciplinary action against the independent hospitals that owed a duty to the public:

"To have attempted to reapprove these hospitals last fall or this winter would have detrimentally created conflicts between the Medical Society and some of the local hospitals because of attempted enforcement of the provisions of Chapter IX, Article IV, Section 5 of the constitution of the Medical Society."

Now, this is the way he wrote it first:

"In an effort to hinder the operation of Group Health Association, Inc."

And then he crosses it out and puts in:

"maintain the high standards of practice."

And that is the way it appears in the minutes.

Does that throw any light on why Cutter can use soft words when he enforces the Mundt Resolution and yet get the same results as he would if he had used more drastic action, as he said? Does that throw any light on why the December 1 resolution to enforce the Mundt Resolution started out, "As a matter of educational policy," when what they meant was to "hinder the operation of Group Health Association"? Because that was the authority under which this report was prepared. And then they say "maintain the high standards of practice in the local private hospitals, the Medical Society adopted a resolution on Nov. 3, 1937 directing the Hospital Committee to recommend the best way of bringing the questions involved to the attention of the Medical Boards and boards of directors of the various local hospitals to insure the maximum amount of accomplishment with the minimum amount of friction and conflict. On Dec. 1, 1937 the Hospital Committee submitted a resolution, which was adopted, that the Medical Society recommend to the hospitals that they follow the recommendation of the American Medical Association."

That is Cutter's recommendation, the Mundt Resolution that Cutter was obtaining observance of at this very time, from July 1937 to November 1937:

"namely, that each hospital appointee be a member of his or her local medical society and a member of the American Medical Association."

That was to meet Yater's demand that assurances be given that Group Health Association doctors could not be on the staff. This does it. When Lee and Scandiffio are to be expelled, no member of Group Health Association under that resolution can be a member of the courtesy staff of the hospitals.

Then he recites this resolution that I have just recited to you, offered by Mattingly, who was in the position of professional leadership, to raise again and force the issue of requiring recalcitrant hospitals, under threat of disciplinary action, to go along "in event any hospital had ignored the Medical Society's wishes in the premises."

He strikes that out. This (indicating) is dressed up:

"The Hospital Committee reports that, at this time, the majority of local private hospitals contain in their by-laws a provision that a physician in order to practice in the hospital must be a member or qualified for membership in his or her local medical society."

"Only three of the local hospitals (Columbia, Sibley and George Washington) have not followed this recommendation of the American Medical Association."

And he understated the facts, because Columbia had agreed to observe it and George Washington had agreed to observe it.

"All of the local private hospitals are cooperating fully with the Medical Society"—

And there is where Mr. Leahy stopped and asked you whether there was anything wrong with that, without going on to say—

"cooperating fully with the Medical Society in respect to Group Health Association, Inc. At the present time only one of the local hospitals has on its staff list the name of a physician connected with Group Health Association, Inc. This hospital does not revise its staff list annually, as do the other hospitals, but it has assured the chairman of the Hospital Committee that steps have been taken to deny this physician hospital privileges."

"The Hospital Committee urges that the Medical Society continue their full cooperation and avoid conflict with any of the local private hospitals."

Of course, when they had everything their own way, without conflict by this Hospital Committee and by Cutter's recommendations, why should they head into a conflict and bring about adverse publicity which the Willson resolution wanted them to avoid?

I ask you, ladies and gentlemen, if there is any more powerful evidence that you can imagine on the narrow issue of

whether these defendants were planning to restrain Group Health Association, mentioned in these very resolutions, by putting pressure, the threat of disciplinary action, if you please, or cooperation, if you want, on the medical staffs, which are almost entirely composed of their own members—to put pressure on the hospital directors, to prevent not Dr. Selders alone, but all of the G. H. A. staff, whether those doctors on the staff were already members of the courtesy staffs of the hospitals or not?

Let me call to your minds again, so that there will be no mistake, and that this case will not go off on some false issue of what this man Castle writes that some man named Higgins writes that some people around Worcester, unidentified, have whispered about what Dr. Selders' sister said of him—a letter that comes months after they had made their decision at Garfield, and it is based on a recommendation of the Surgical Service and signed by the defendant McGovern, that if they approved this Group Health doctor they would be "aiding and abetting Group Health Association"—and I quote the exact language. Don't let it go off on that issue.

Remember, Dr. Hulburt got the same treatment. His application was tabled at Columbia until he resigned from Group Health, and then he was immediately given privileges; denied the privileges he already had at Georgetown, and as soon as he resigned from Group Health on April 25, he got his privileges in May.

Dr. Price applied to Homeopathic Hospital in the early part of 1938 and never received an answer. Price was admitted to Garfield, not during the period of the indictment, but the medical staff recommended that he be admitted on the day before this indictment comes down, at the end of a long two year period.

Dr. Scandiffio, a member of the staff of Homeopathic Hospital and Sibley Hospital. The superintendent of Homeopathic Hospital said:

"Action awaits the action of the District of Columbia Medical Society."

He was a member of Sibley, and that hospital assured the chairman—and I am not stretching the facts—that "steps will be taken to deny him his privileges there."

Richardson abruptly resigned from Group Health Association, cutting it off from his services on July 15, because he feared the loss of his hospital privileges.

Halstead, applying in August to four or five hospitals, and in October to another one, got no response and no admission.

Sibley Hospital had a list in the admitting office, listing Brown, Wells, Hulburt, Lee and Scandiffio, saying, "These doctors are not to be allowed in at any time."

Am I putting any false construction on the evidence?

And then, even as to Selders—and I am going to say a word for Selders, and I am going to say it from the evidence in this case as I have said everything else; and see what construction you will put on this kind of evidence in the record of Dr. Selders' qualifications as a surgeon.

His reference, Alexander, writes to Casualty Hospital:

"His professional qualifications in surgery are well above the average and ethically and morally he has always been above reproach."

Walter E. Lee writes:

"He completed this basic year (University of Pennsylvania Graduate School) satisfactorily. He then went to Worcester, Massachusetts, and spent a year in clinical training, and I understand his work there was satisfactory to his preceptor."

Would you want any better recommendation than that?

MacIver wrote to Casualty Hospital:

"He participated in the surgical work of the hospital (Worcester City Hospital) considerably and had an opportunity to gain considerable competence."

Then he lists his operations, hundreds of them, and says:

"From the above I think you can conclude that his surgical training is such as to give him competence."

MacIver, again, to Columbia Hospital:

"We find that he was listed to operate on 273 cases, 190 of which may be classed as Major and 83 as Minor. He may have assisted or otherwise participated in considerably more than are shown here. Gynecology is here absorbed in general surgery and one may assume that he had considerable contact, therefore, with gynecological surgery."

Coole, Secretary of the Harris County Medical Society, the society that brought disciplinary proceedings against him because he joined Group Health Association, writes:

"Dr. Selders is a member of this society in good financial standing. His record here is clear and shows that he is academically and professionally well qualified. I have been given to understand that recently

he completed his Master's degree in Surgery at the University of Pennsylvania, which should further qualify him."

And then he concludes, even after that kind of clear statement of his record, and speaking of his connection with Group Health Association—and here is the reason they are opposed to him:

"If the allegations are found to be true, Dr. Selders will be subject to disciplinary action on the part of the Society."

Meaning the Harris County Society.

Eisenman, Superintendent of Garfield Hospital, writing to Surgical Service, pointed out:

"This is not a 'run of mine' case, and your action may be far reaching. Information shows him to have sufficient training for personal recognition, when compared with many now approved for courtesy privileges at Garfield Memorial Hospital."

Better than their own men.

"He is a member in good standing in A. M. A., county and state medical societies in Texas."

And Dr. Henry Rolfe Brown, writing to Penniman, speaks of Selders' general practice, including surgery, in Houston, before he goes West for seven years, and speaks of three hundred and thirty-eight operations which he performed at Worcester Hospital and concludes:

"Dr. Selders is an experienced surgeon and has been in practice for about seven years and is splendidly qualified by his experience as a general surgeon."

Contrast those letters and that record of that absent man with the three letters that they bring against him—Castle's hearsay on hearsay—and I don't take that back for one moment—Berry to Bullard, or Bullock, or whatever his name was, hearsay on hearsay, that gossipy, personality thing, and this man Johnson, who did not know him, but he is sure that he is "likely to get into somebody's hair." Contrast his record as a surgeon, contrast those with the ones I have read to you, which need not be distorted—because I am not that kind of a man; Mr. Leahy seems to think I am. But they do not need to be distorted; they are just as clear as crystal. Contrast those and see whether Selders was turned down on his qualifications. And it doesn't make any difference if he was, as I said yesterday, if he had the qualifications of Sir William Osler, he was face to face with opposition that he could not crack. The stage was set against him by the Mundt Resolution in all these hospitals and by the cooperation that had been obtained under the threat of disciplinary action against the hospitals. Would he have been any more kindly treated than Scandiffo and Hulburt and Richardson and the rest? It is an idle issue, because, when you examine the records of each one of those hospitals—and I was not able to do it yesterday and I will not be able to do it today—you will find that each one of them is opposed to the entire Group Health staff, and each and all of them uniformly are given the same identical treatment.

Can you account for that in any other way than that these defendants, dominating those medical staffs and dominating the chance of those hospitals to be on the registration and on the approved list, exercised that domination as they said they would in order to keep out Group Health Association? Please ask yourselves that question. Along with it, ask yourselves whether I have tortured that written evidence.

Then comes the attack on Mr. Penniman; and this is what the defendants thought of him and of his will to cooperate with them, although when he asked for cooperation they gave him none. When Group Health Association came to them and asked for bread they got a stone, and when they asked for an egg they got a scorpion, because the cards were stacked against them when they came there.

On July 21 the defendants had already learned about Group Health Association, what little they knew about it. All they knew was that it was group practice on a prepayment basis, and that it was unethical and none of the members could have anything to do with it. But he comes there, and you will remember page after page of the record that disclosed how he answered every question propounded to him, and he even told them what was none of their business, and that is that the H. O. L. C. had appropriated a sum of money for two years to help it get started. He even told them that. So he gave them the substance of all of this hullabaloo in regard to the contract, and at the close of the conference this occurred:

"I think that all of us present tonight appreciate just what these gentlemen have done. They have been kind enough, good enough, to come down and meet with us. They have answered all our questions and have not denied us at all, no matter what their own personal feeling may have been concerning some of them."

And then there was a suggestion for another meeting, and that was accepted, although when the defendants' committee came down ostensibly to present some plan of cooperation they had already prejudged the case and decided against them and had withheld information about their so-called principles of medical ethics.

What else do you want to know about Mr. Penniman? You saw him on the stand. There is no evidence against him. There is evidence for him. Dr. McGovern said there was no doubt in his mind that the lay members of the board of directors of Group Health Association "are thoroughly convinced that they are doing a splendid thing for their employees." He was further convinced that they were not doing anything that might be considered unethical by them.

Dr. Macatee urged the Society not to base its opinion on the idea that there are certain scurrilous people who are trying to do a scurrilous thing to the Medical Society and doing it in an underhanded, scheming way.

The counsel for the defendants did not take that good salutary advice. He is willing to plunge out here, without any evidence to support him, and make that kind of a charge.

It was Dr. Macatee's impression, gained from contact with certain individuals, that "they are highly intelligent people who have profoundly studied the subject."

Remember that criticism of poor Mr. Zimmerman, that he went off half cocked and did not take any advice. Do you remember Dr. Cabot's saying that the proper place to get advice on the business side was from a business man, and on the medical side it was from doctors? And do you remember that Zimmerman went to Stanocola and read up on the subject, for his business side, and that he went to the Surgeon General and to Colonel Jones and to Dr. Brown, and to that grand old man, Dr. Cabot, just about the time the clinic opened, for advice on the medical side:

"These people are aware of all the social currents flowing through the country with respect to the relation of the medical profession and the people. They are aware what has been done elsewhere, and the result. My feeling is that it is a group of earnest, rather public-spirited people who are undertaking to do something for the benefit of their associates. They are convinced they have secured what they call competent legal advice, that they are on secure legal ground. They have, by reason of their knowledge of similar projects elsewhere, become convinced that where such organizations spring up they almost constantly receive the antagonism and the animosity of the local medical profession."

Does this begin to account in your minds for why they did not care to hand over their private contracts with the knowledge that Macatee attributes to them? It was Macatee's opinion that their desire to avoid publicity in this matter was due to their knowledge of that fact.

They had knowledge of Ross-Loos and of Milwaukee and of Chicago Medical Center, and Trinity; they had the report back from Jones that the Medical Society would kick out—I use Jones's very words from the witness stand—would kick out of the Society anybody who joined; and they had Mr. Zimmerman's talk with Woodward, who said, according to Mr. Zimmerman, that when the A. M. A. met at Atlantic City it would be the end of Group Health Association. It was a wonder that it was not. Do you agree with Macatee that there might have been some reason why they did not want to hand out the contract? They were regarded as outlaws, and plottings and plannings went on against them at some sixty or seventy meetings, mainly concerned with how they could best oppress Group Health Association. There is page after page after page in the record of plottings on these economic questions. Have you any doubt as to the real reason for this opposition? Their principles of so-called medical ethics? Not what was said on the stand—conduct becoming a gentleman, the Golden Rule and the Ten Commandments. The witness was not thinking of the Ten Commandments Mr. Leahy is thinking about. He was thinking about the Ten Commandments that were inscribed by Moses on the tablets.

Can you find anything about Group Health, its plans, its standards, its activities, its personnel, the way it approached its problems, that by any stretch of the imagination could be unethical in any sense such as the witness described?

What they meant was this. They meant these economic rules, preserving free choice, so that all the doctors in the local medical societies could get in on this plan. Otherwise they were unethical.

Against public policy? They would brand as immoral or as immoral any plan that would seem to cut in on their purse. What did they mean by "public policy"? You remember the article that was written. It was not just a gossip article:

"The effect of the withdrawal from private practice of even one half that number of persons, all of whom are able to pay for service, would materially diminish the incomes of physicians in private practice in the District of Columbia."

And that is stricken out, and this innocuous phrase is used: "against public interest."

That is written in instead.

There is a frank definition of what "public policy" means. And yet it goes down in the article as simply a statement that it is against the public interest, and you are to be led to believe that it is really unethical in the moral sense.

But the frankest people on this subject of the true motive and reason behind this oppression are West, Yater and McGovern.

Counsel for the defendants says Government counsel accused these fine professional men of cheap commercialism. I deny it. They have accused themselves. All I have done is to present the humble message of what they said, to you ladies and gentlemen of the jury.

Woodward writing to Neill says that he sent this article down to Virginia and Maryland suggesting that there is something for them to do, and he says that the members of the Medical Societies in the counties immediately adjacent to Washington have an active personal interest in the matter that physicians in Maryland and Virginia, in the more remote parts of the states, have not.

What is that interest that people in nearby territory have? On the subject of morals? Not at all. On the subject of finances? Oh, yes. Yater says that a system of prepayment immediately fixes medical fee schedules at a reduced scale and to adjust them would be well nigh impossible.

Are they talking about morals, the ten commandments and the Golden Rule? McGovern frankly said that he looked on Group Health Association movement as an organization coming in and interfering with his business. He said he expected to be in practice for some twenty years, and he did not propose, if it could be avoided at all, to have an organization such as was proposed interfere with his work and income.

Have I distorted anything in charging them with cheap commercialism, when I have shown you that there was no moral ground for this opposition, and when I have quoted verbatim from what they said themselves about their purposes?

And so, ladies and gentlemen, let me leave this case with you, with the hope that you will recall, not these side issues, and without emotional feeling, but just quietly and intellectually recall, on the subject of consultation boycott, the instructions

that Neill gave to Thomas Lee that he could not meet him in consultation, notwithstanding the ethics of the A. M. A., because he was a member of Group Health Association's staff.

Remember, on the subject of the staff boycott, the fact that good old Dr. Lee subjected himself to a hearing, charged even after he had resigned, and then induced to resign the very night of the second hearing.

And, ladies and gentlemen, remember, if you remember nothing else on the hospital boycott, how it was pointed out in June and July that members of Group Health could not be put on the courtesy list of hospitals without their connection with Group Health being mentioned; in fact, that it would have to be camouflaged to the nth degree.

And then remember, if you will, this resolution to hinder, not the unsuccessful operation of Group Health Association, but the successful operation of it, which is the only kind of operation that would really cut in on them, if they could prevent them from being received in the local private hospitals; and remember the chain of facts and circumstances that stand uncontradicted, of what they did pursuant to that solemn requirement, and the result which they achieved where they cooperated a hundred per cent successfully.

THE COURT:—Members of the jury, it is too late to submit the case to you today, because necessarily it will take some time to instruct you concerning the law, and in view of the long day which you have had in listening to the arguments of counsel I will postpone it until tomorrow. I know that it is unnecessary to repeat my admonitions to you. I know by your demeanor throughout the case that you have them firmly in your minds. But now, after the arguments and before you finally get together in your deliberations and before you hear the statements of the Court concerning the law, I think it is well to warn you against reaching conclusions until you understand the law of the case, until you are able to sit together and discuss and consider the issues. So, for the present, just keep the matter in abeyance and wait until tomorrow until you leave the court room to consider of your verdict.

You may be excused until tomorrow morning at 10 o'clock.

(Whereupon, at 3:35 p. m. the Court adjourned until tomorrow, Friday, April 4, 1941, at 10 a. m.)

[This completes the proceedings of the trial. The charge to the jury by associate Justice James M. Proctor was published in THE JOURNAL, April 12, p. 1700.]

MEDICAL ECONOMIC ABSTRACTS

CALIFORNIA PHYSICIANS' SERVICE

The report of the first year and a half of operation of the California Physicians' Service ended Dec. 31, 1940 shows that growth in membership has been slower than anticipated. The service has to be sold, which requires time and effort. The contracts are made with groups, a process which often requires long negotiations. At the time the report was issued the membership was somewhat in excess of twenty thousand. This slow growth is not considered wholly undesirable. Many problems have been uncovered in the course of operation, and experiment is less costly with a small than with a large membership. The growth of professional membership has been fairly steady and amounted to five thousand three hundred and eight physicians who had accepted the conditions of practice under the plan at the time the report was issued.

There was considerable expense involved in the organization. This meant that there was a deficit which was replaced from professional membership registration fees and from loans from the California Medical Association. Not until November 1940 did the income meet the costs of administration and the payment of medical fees. A total of \$62,897.55 was taken from the fund provided by the California Medical Association and the registration fees from physicians. The receipts from beneficiary members did not exceed \$10,000 in any one

month until January 1940, but it had reached more than \$35,000 at the close of that year.

Payments to physicians are made on the "unit system," and since June 1940 the value of the unit has become \$1.35. It is realized that this does not represent an adequate payment of physicians, but up to the present the amount of work done by each doctor has not been enough so that this low unit value seriously affects his income. The trustees suggest the following measures governing future operation:

1. In order to secure promptly a sufficient volume of membership to carry overhead, required percentage of participation was established at 40 per cent (for the larger groups). It is well known that, the higher the percentage obtained in any group, the more satisfactory the experience. This percentage is being and will be further increased.
2. For the same reason, the first and easiest groups to be obtained were taken. This has resulted in an unsatisfactory percentage of women. Our enrolment force is now concentrating effort on securing more industrial groups.
3. Medical direction has had to be learned from experience, which has proved expensive to the fund in many instances. This department is now functioning with much greater smoothness than at first and with correspondingly fewer "leaks."
4. Overhead is just under 25 per cent. With steadily increasing membership, this will be reduced. There is no reason to doubt that we can eventually reach an overhead of 10 to 15 per cent. This will automatically increase the unit value. We have passed the experimental stage, to a large extent, with

respect to administrative methods, development of office routines and procedures, and this will contribute too to the lessening of the percentage of revenue required for administration.

5. It is the experience of other service organizations that each new group contracted is more expensive to serve during the first year or two of membership than thereafter. There is every reason to believe that our experience will be similar.

The suggestion is also offered that the example of the Michigan Medical Service be followed and a new type of contract with limited provisions should be offered in order to increase the membership in the lowest income group. Such a contract might cover the professional services of a surgical operation and certain injuries together with hospitalization.

COOPERATIVE PROGRAM IN SCHOOL HEALTH

The first step in a cooperative program in school health care of the St. Louis County Health Department with the Medical Society of St. Louis County was to change a "physical examination" previously conducted largely by lay workers at the school to a "medical examination" conducted by family physicians in their offices. The stereotyped school examination conducted previous to 1937 resulted in the correction of only 3 or 4 per cent of the defects. When the same examination was repeated in successive grades, it was found that about 95 per cent of the old defects still existed, plus some new ones. When the medical examination was transferred to the family physician's office and the presence of the parents was required, corrective treatment followed in a much larger percentage of the cases. In 1939, 91 per cent of the parents accompanied their children to the physician's office.

One hundred and forty-three physicians made these examinations without charge. Parents who were able paid the physician for corrective treatment; those unable to pay could be referred by the physician to the health department, which arranged with the county hospital for necessary care. Medical participation of the family physician in the local health program is extended to contagious disease, tuberculosis, venereal disease and particularly to maternity hygiene. In 1938 and 1939, one thousand two hundred and eighteen deliveries were made without a single maternal death.

OHIO ENABLING ACT FOR MEDICAL SERVICE PLANS

The enabling act sponsored by the Ohio State Medical Association (House Bill 51) to prepare the way for establishment of a plan endorsed at the recent meeting of the house of delegates of that association has now become a law.

Any corporation "desiring to establish, maintain and operate a medical care plan must obtain from the superintendent of insurance a certificate of authority or license to do so." Each such application must contain a full description of the proposed medical care plan and also evidence "that the medical care plan which the corporation proposes to operate, the articles of incorporation and any amendments thereto, and the regulations and by-laws of such corporation have each

been approved by the established medical association, society or academy of each county lying wholly or partly within the territorial boundaries described in the articles of incorporation or any amendments thereto. The term 'established medical association, society or academy,' as used herein, means the medical association, society or academy maintained in the county by a majority of the duly licensed physicians and surgeons residing therein."

This appears to permit the establishment of county plans rather than a single statewide plan. No certificate is to be issued unless written agreement to enter the plan has been obtained from at least one physician for each five hundred subscribers. It is also provided that "the relationship between a duly licensed physician and surgeon rendering professional services under such plan and such subscriber shall constitute the ordinary relationship of physician and patient; and no action based upon or arising out of such relationship shall be maintained against a corporation operating a medical care plan in compliance with the provisions of this act."

The enabling act does not enter into any further details of the type of organization that shall be formed, but the state medical association has developed a rather complete outline of those that it will approve.

TEXAS MEDICAL SERVICE PLAN

An enabling act which the House of Delegates of the State Medical Association of Texas directed its legislative committee to prepare has been introduced into both the House and the Senate of the Texas state legislature. The proposed bill does not set up a fixed plan but rather establishes certain principles and boundary lines for the guidance of county medical societies. It is believed that this law will enable any county society to bring about an organization of physicians to provide medical service for certain income groups on a monthly prepayment basis without disturbing the personal relationship of physicians and patients. No third party will be brought into the picture except for the purpose of distributing money collected on a prepayment basis. The organization will not be under obligation to furnish medical service for anybody. It merely promises to pay the doctor whom the participating patient employs his proportionate share of the money collected for that purpose.

The plan has been in operation on an experimental basis in Dallas County since July 1, 1940, when a charter was obtained from the state department of insurance to operate a plan on a nonprofit basis. The Ford Motor Company with one thousand employees expressed a desire to join in the experiment, and according to the *Dallas Morning News*, over six hundred of these employees were enrolled at a cost basis of \$1.50 a month. This covered sickness or accident with medical services paid for whether in the doctor's office, the patient's home or the hospital. For 50 cents additional, each employee was given a policy by Group Hospital Service which allowed him the services of any hospital he preferred when such need arose.

After six months of operation under the plan, all parties concerned are greatly pleased. The required 60 per cent (six hundred and thirty-four employees) enrolled at first has voluntarily grown to practically 100 per cent, or one thousand, one hundred and thirty-four employees. Approximately 10 per cent have had medical or surgical service. Of this number 12 per cent have had surgical care in the hospitals and the remainder, or 88 per cent, have required medical care outside the hospitals, in the home or office. During the first six months of operation of the plan only forty-four of ninety-six men who have received service lost time from work. There was a decrease of 85 per cent in time lost through sickness over the six months prior

to the plan, and time lost from work on account of sickness has decreased 92 per cent.

Dallas physicians have cooperated wholeheartedly with the plan. There are five hundred and twelve members of the Dallas County Medical Society, and four hundred and eleven of these are registered with the plan. There have been numer-

ous requests from other groups desirous of being enrolled under the plan, and requests have come in from many cities of Texas for information concerning its workings.

The bill that has now been introduced into the legislature will permit the plan to be extended to other counties throughout Texas.

MEDICAL LEGISLATION

MEDICAL BILLS IN CONGRESS

Change in Status.—H. R. 4545 has passed the House, authorizing an appropriation of \$150,000,000 for the construction and operation of necessary community facilities in connection with national defense activities. Under the provisions of the bill the Federal Works Administrator, with the approval of the President, may, among other things, (1) maintain and operate public works and (2) make loans or grants, or both, to public and private agencies for public works and equipment thereof, and make contributions to public or private agencies for the maintenance and operation of public works. The term "public works" is defined to mean any facility useful or necessary for carrying on community life, including schools, waterworks, works for the treatment and purification of water, sewers, sewage, garbage and refuse disposal facilities, public sanitary facilities, "hospitals and other places for the care of the sick," recreational facilities and streets and access roads.

Bill Introduced.—S. 1459, introduced by Senator Reynolds, North Carolina, proposes to establish a Chiropody Corps in the Medical Corps of the Army. Appointments in the Chiropody Corps will be in the grade of first lieutenant originally, and officers of the corps are to be promoted to the grade of captain after three years' service, to the grade of major after twelve years' service, to the grade of lieutenant colonel after twenty years' service and to the grade of colonel after twenty-six years' service. The bill also proposes to establish within the Medical Corps a Chiropody Reserve Corps.

STATE MEDICAL LEGISLATION

Florida

Bills Introduced.—S. 412 proposes to condition the issue of a license to marry on the presentation by each party to the proposed marriage of a certificate of a licensed physician that (1) the party is not epileptic, insane or feeble-minded and is free of pulmonary tuberculosis in a communicable stage and (2) the physician has obtained a smear and specimen of blood from the party, which he has submitted to the Florida State Board of Health and that the state board of health has reported

to the physician that the smear and specimen submitted to it indicates that the party is free from any communicable venereal disease. H. 599 proposes to authorize the Board of County Commissioners of Baker County to levy on taxable property in the county an annual tax in addition to all other taxes not to exceed 2 mills annually, to be used and disbursed by the board of county commissioners to care for indigent inhabitants of the county who are in need of hospitalization and medical care.

Bills Passed.—S. 341 passed the senate, May 5, proposing to require every physician attending a pregnant woman for conditions relating to pregnancy to take or cause to be taken a sample of her blood at the time of the first examination and to submit the sample to an approved laboratory for a standard serologic test for syphilis. S. 360 passed the senate, May 6, proposing to authorize the city of Tallahassee to establish and operate a public municipal hospital and to issue its certificates of indebtedness in such amount not greater than \$400,000 as is necessary to establish and equip the hospital.

Missouri

Bill Introduced.—H. Res. 125 proposes to create a committee to investigate certain abuses alleged to result from the administration of the workmen's compensation act "in that many and sundry insurance companies have a working alliance with several doctors, especially so in the larger industrial areas where a small clique of said doctors now exist." This resolution apparently stems from a recommendation adopted at the last convention of the Missouri State Medical Association that the state workmen's compensation act be amended because "It is not an established fact that the employee has the advantage of an unbiased opinion on the witness stand by a physician who is being used repeatedly and paid by the insurance companies" and because a physician selected by the insurance company is not always the most competent in his community.

Pennsylvania

Bill Introduced.—H. Res. 89 authorizes the speaker to appoint a committee of five members of the house to investigate the maintenance, operation and conduct of all state hospitals.

OFFICIAL NOTES

THE CLEVELAND SESSION

Reservations at Cleveland

Because of the large demand for hotel accommodations during the time of the annual session of the American Medical Association there are few such accommodations left. The Allerton Hotel has completed arrangements to have the Cruise Liner *Secandbee* lie in dock at the foot of East Ninth Street, just one and one-half blocks from the Cleveland Public Auditorium, during the week of the session beginning at 7 a. m. Monday, June 2, and ending at 6 p. m. Friday, June 6.

Accommodations on the boat and rates are as follows:

- A. Inside cabin, running water, 2 berths, \$4.25 a day per cabin.
- B. Outside cabin, running water, 2 berths, \$4.75 a day per cabin.
- C. Outside cabin, private toilet, 2 berths, \$5.75 a day per cabin.
- D. Outside parlors, double bed, bath, \$10 a day per parlor.
- E. Outside parlors, twin beds, couch, bath, \$12 a day per parlor.
- F. Outside parlors, twin beds, couch, bath, private deck, \$15 a day per parlor.

For single occupancy of cabins there will be \$1 reduction on the daily cabin rate. All reservations will be accepted as double

accommodations unless otherwise specified. A "Continental Breakfast" every morning is served to guests without charge. Those desiring to take advantage of accommodations on the *Secandbee* during the week of the session are requested to write to Dr. Edward F. Kieger, 1604 Terminal Tower, Cleveland, Ohio, indicating the kind of accommodations desired, the date of arrival and the names of all those who will accompany them.

RADIO BROADCASTS

The last three programs to be broadcast in the series "Doctors At Work" are as follows:

- May 21. Physician to the Community.
- May 28. Doctors' Hobbies and The Doctor as a Citizen.
- June 4. A. M. A. Convention.

The program is scheduled over the Blue Network of the National Broadcasting Company Wednesdays at 10:30 p. m. eastern daylight saving (9:30 eastern standard) time (9:30 Chicago daylight saving, 8:30 central standard, 7:30 mountain standard, 6:30 Pacific standard time).

Medical News

(PHYSICIANS WILL CONFER A FAVOR BY SENDING FOR THIS DEPARTMENT ITEMS OF NEWS OF MORE OR LESS GENERAL INTEREST: SUCH AS RELATE TO SOCIETY ACTIVITIES, NEW HOSPITALS, EDUCATION AND PUBLIC HEALTH.)

ALABAMA

Annual Clinical Meeting at Tuskegee Institute.—The thirtieth annual clinic and twenty-fourth annual meeting of the John A. Andrew Clinical Society was held at the John A. Andrew Memorial Hospital, Tuskegee Institute, April 6-12. Guest clinicians were Drs. Edward V. L. Brown and Dallas B. Phemister, professors of ophthalmology and surgery, respectively, Department of Medicine, University of Chicago.

Mental Hygiene Program.—Dr. Archibald M. Gaulocher, Wingdale, N. Y., has been added to the staff of the state department of health as associate in charge of the division of mental hygiene. He will cooperate with county medical societies and other groups in the operation of mental hygiene programs in various parts of the state. Dr. Gaulocher graduated at Columbia University College of Physicians and Surgeons, New York, in 1929. He resigned from the Central Islip State Hospital, New York, after serving on the staff for eleven years to join the Alabama department of health.

Correction—Change in Health Officers.—Dr. Isee L. Connell, Birmingham, was recently appointed health officer of Clarke County. This notice was erroneously placed under Mississippi news in THE JOURNAL, May 10, page 2205.

CALIFORNIA

Laboratory Technicians Wanted.—Bacteriology graduates with at least six months' recent technical experience in a recognized public health laboratory are eligible to participate in a civil service examination just announced by the Los Angeles County Civil Service Commission. Applications must be filed by Wednesday May 21 to be considered for the examination. Beginning salary for the positions is \$155 a month. All candidates must possess a California State Public Health Laboratory Technician's Certificate. Additional information can be secured from Room 102, County Hall of Records, Los Angeles.

Society News.—Dr. Morris Fishbein, Editor of THE JOURNAL, Chicago, addressed the Alameda County Medical Association, Oakland, April 21.—Prof. Henrik Dam, Biochemical Institute, University of Copenhagen, recently discussed "Vitamin K—Its Role in Human Pathology and Its Application in Therapeutics" before the Los Angeles Academy of Medicine, successor to the Los Angeles Clinical and Pathological Society.—Dr. Clifford J. Barborka, Chicago, addressed the First District Dental Society in Hollywood, March 21, on nutrition.—A joint meeting of the Los Angeles Cancer Society and the Symposium Society was addressed in Los Angeles, March 26, by Dr. Frederick J. Taussig, St. Louis, on "Iliac Lymphadenectomy for Cervical Cancer."—Dr. Lewis A. Alesen, Los Angeles, discussed "Lesions of the Common Duct" before the San Diego County Medical Society, April 8, in San Diego.

The Langley Porter Clinic.—The cornerstone for a new clinic on the campus of the University of California Medical School, San Francisco, was laid April 5. The clinic, which will cost \$500,000, will be a neuropsychiatric unit of the state department of institutions and will be under the direction of the medical school. It will be named in honor of Dr. Langley Porter, dean emeritus and professor of medicine and lecturer in medical history and bibliography, emeritus, of the medical school. Dr. Aaron J. Rosanoff, director of state institutions, was master of ceremonies. The speakers included Robert Gordon Sproul, Litt.D., president of the University of California, and Dr. Porter. The clinic will have about one hundred beds and an outpatient department and will be used for the care, study and treatment of acute psychiatric cases.

DISTRICT OF COLUMBIA

Psittacosis in Washington.—Psittacosis was reported in an employee in the birdhouse of the National Zoological Park in Washington, according to *Public Health Reports*, April 18. The onset of the disease was noted April 7.

Chicago Physician Named Dean of Howard.—Dr. John W. Lawlah, Chicago, has been appointed dean of Howard University School of Medicine, Washington, to succeed the

late Dr. Numa P. G. Adams. Dr. Lawlah graduated at Rush Medical College, Chicago, in 1932.

Air Survey to Determine Geographic Increase in Population.—Officials of Health Security Administration, sponsored by the Medical Society of the District of Columbia, recently made an air survey of Washington and adjacent areas in Maryland and Virginia to determine in which direction geographically the population is increasing, with the consideration that population trends are an important factor in choosing cities for new hospital facilities. Following presentation of the data collected, a resolution was passed providing for a comprehensive survey of the situation. The master plan would stem from three bases, the first to develop from study of the need of hospitalization. The second base has to do with the existing hospital and allied facilities to meet the needs, while the third base covers financial resources.

Borden Award to Chemist.—Claude S. Hudson, Ph.D., director of the division of chemistry, National Institute of Health, U. S. Public Health Service, Washington, was presented with the Borden Company Award at the meeting of the American Chemical Society in St. Louis, April 7. The award of \$1,000 was established in 1938 to stimulate fundamental research in the chemistry of milk in the United States. Dr. Hudson's address before the chemical society was entitled "Milk Sugar," a subject in which he has been doing research for many years. Dr. Hudson received his doctorate in 1907 at Princeton University. He was with the U. S. Department of Agriculture from 1908 to 1919 and with the Bureau of Standards from 1923 to 1928, when he became director of the division of chemistry of the National Institute of Health.

Campaign Against Venereal Diseases.—Newspapers reported, April 3, that a vigorous program to control venereal diseases would be carried out in the District of Columbia and nearby Virginia and Maryland as well as in neighboring army and navy detachments. Dr. George M. Leiby, director of the bureau of venereal diseases of the District health department, stated, according to the report, that almost nine out of every hundred District selectees were found to be afflicted with syphilis, indicating that ten thousand residents between the ages of 20 and 30 are affected with the disease. The drive will be financed by defense appropriations. Among the initial group whose "contacts" will be tested are eight hundred persons discovered in selective service examinations and one hundred and fifty persons who were found to have the disease when they volunteered as blood donors. Prophylactic stations will be set up in the District as one control measure, it was stated.

GEORGIA

Lectures by Dr. Karsner.—Dr. Howard T. Karsner, professor of pathology, Western Reserve University School of Medicine, Cleveland, lectured in Atlanta recently under the auspices of the Atlanta Clinical Society. His subjects were "Ovarian Tumor with Endocrine Dysfunction," "Hypertension" and "Paget's Disease of the Nipple."

Doctors' Day.—The Atlanta *Constitution* published a special supplement Sunday March 30 in tribute to the observance of Doctors' Day. The eight page supplement was compiled under the auspices of the woman's auxiliary to the Fulton County Medical Society in honor of the society's members. The auxiliary was assisted by the committee on public health and instruction and the committee on public policy and legislation of the society.

Changes in Health Officers.—Dr. Jewel G. Gainey, formerly of Blountstown, Fla., has been named assistant commissioner of health of Muscogee County with offices in Columbus, and Dr. Charles W. Harwell, health commissioner of Crisp County, Cordele. Dr. John R. Cain has been placed in charge of the health unit in Greene County, with headquarters in Greensboro. For the past two years Dr. Cain has been director of the division of industrial hygiene of the Alabama State Department of Health, Montgomery.

Foundation Donates Surgical Wing.—The Joseph B. Whitehead Foundation has made available to the Emory University School of Medicine, Atlanta, a gift of \$550,000 to construct and equip a surgical building. The new six story structure, to be named the Conkey Pate Whitehead Pavilion, will be erected as a wing to the present university hospital and will have five major and five minor operating rooms, roentgen ray facilities, rooms for sixty surgical patients and administrative offices of the medical school. The entrance wing will become the main entrance to the hospital. Dr. Daniel C. Elkin, who occupies the Joseph B. Whitehead chair of surgery, is head of the department of surgery.

ILLINOIS

Outbreak of Dysentery.—About 100 cases of dysentery occurred among the 2,285 residents of Carrollton, the state department of health reported, April 26. Since the department of health reported to local authorities on Aug. 31, 1939 that the local water supply could not be considered safe against possible pollution, the possibility that the outbreak may have been water borne is being investigated. The public water supply at Carrollton is drawn from a limestone spring and is treated only by chlorination. Preliminary tests showed that the drinking water in the week preceding this report did not conform to the drinking water standards of the public health service.

Chicago

Veteran Pharmacist Retires.—Mr. William Gray has retired as head pharmacist at Presbyterian Hospital after thirty-five years' service in that position. He has been succeeded by Malcolm Hutton, who had been assistant pharmacist for twenty-six years. The new assistant pharmacist is Franklin B. West, Belvidere, Ill.

Society News.—The council of the Chicago Medical Society and the council of the Illinois State Medical Society have voted to waive the 1941 dues of members inducted into military training and removed to training camps by the draft, by the National Guard or by virtue of being in the reserve. Any member who forwards a copy of his call to service to the secretary will immediately receive a 1941 membership card. In the event that the dues have already been paid they will be refunded. —The Chicago Ophthalmological Society was addressed, April 21, by Drs. M. Herbert Barker on "Hypertension, with Special Reference to the Renal and Ocular Vessels" and Philip M. J. Corboy, "A Corneoscleral Union for Cataract Operations." —Dr. Samuel M. Feinberg discussed "Drug Allergy: Clinical and Immunologic Considerations" before the Chicago Society of Allergy, April 21.

Surgical Award Announced.—The third annual award of the Chicago Surgical Society was presented at a meeting of the society, May 2, to Dr. Joseph Garrott Allen, research assistant in surgery, University of Chicago Clinics, for his paper entitled "Some Aspects Concerning the Physiology of Prothrombin and Vitamin K." Dr. Allen graduated at Harvard Medical School, Boston, in 1938. The annual prize of \$250 is offered to some young man in Chicago, who is not a member of the Chicago Surgical Society, for meritorious work in one or both of the fields of experimental and clinical surgery. Competitive papers for the 1942 award should be submitted on or before March 1, 1942 to the secretary of the society, without identification marks, accompanied by a sealed envelop bearing on its outside the title of the paper and containing within the name and address of the author. The secretary is Dr. Michael L. Mason, 54 East Erie Street.

INDIANA

Tuberculosis Meeting.—The Indiana Tuberculosis Association held its annual meeting at the Lincoln Hotel, Indianapolis, April 15. The speakers included Drs. Esmond R. Long, Philadelphia, on "Military Service and the Anti-Tuberculosis Campaign"; Henry Kennon Dunham, Cincinnati, "Guiding Epidemiological Principles for Tuberculosis Programs"; Horace M. Banks, Indianapolis, "Pathologic Aspects of the Lung," and Paul M. Harmon, Ph.D., Bloomington, "Physiologic Aspects of the Lung."

Society News.—The Indianapolis Medical Society devoted its meeting, April 15, to a discussion of chemotherapy as applied to pediatrics with the following speakers: Drs. Matthew Winters, Louis H. Segar, Lyman T. Meiks and Gerald F. Kempf. —Dr. Clyde G. Culbertson, Indianapolis, addressed the Northeastern Indiana Academy of Medicine, April 24, in Garrett on "How the Clinical Laboratory Can Help the General Practitioner." —Dr. David A. Boyd Jr., Indianapolis, discussed "Psychologic Trends in Modern Books and Literature" at an open meeting of the Madison County Medical Society, April 21. —Dr. Byrl R. Kirklin, Rochester, Minn., spoke on "Lesions of the Small Bowel" before the Muncie Academy of Medicine, April 8. —The LaPorte County Medical Society was addressed in LaPorte, April 17, by Dr. Raymond W. McNealy, Chicago, on "Management of Gallbladder Disease." —At a meeting of the Gibson County Medical Society in Princeton, April 14, Dr. Garold V. Stryker, St. Louis, spoke on common skin diseases.

IOWA

Annual Renewal Fees Due Before June 1.—All licenses to practice medicine and surgery in Iowa expire annually on June 30. To renew such a license a licentiate must make a written application to the state department of health before June 1, enclosing the renewal fee of \$1. If a license expires by reason of the licentiate's failure to renew it, it can be reinstated without reexamination only on the recommendation of the state department of health and on the payment of the overdue fees.

First Aid Course.—The Fremont County Medical Society, the Sidney Legion Post, the Fremont chapter of the American Red Cross and Fred H. Hill, editor of the *Hamburg Reporter*, sponsored a fifteen week course in first aid and accident prevention recently. Sixty-eight persons received certificates on satisfactory completion of the course, including students, an oil station employee, a school bus driver, a city fireman, telephone company workers, a rural mail carrier, a farmer, foreman, timekeepers and laborers. This was the third such course in Fremont County.

Symposium on Virus Disease.—The Iowa State Medical Society and the Iowa Academy of Science presented the second of their joint symposiums at Simpson College, Indianola, April 25, on virus disease. The speakers were Carl G. Vinson, Ph.D., professor of horticulture, University of Missouri, Columbia, on "The Chemistry of Viruses"; Dr. William M. Hale, professor of bacteriology, State University of Iowa College of Medicine, Iowa City, "Virus Diseases of the Respiratory Tract," and Chester D. Lee, M.S., of the veterinary division of Iowa State College, Ames, "Virus Disease in Animals."

KENTUCKY

Hospital News.—The name of the Danville and Boyle County Hospital, Danville, has been changed to the Ephraim McDowell Hospital in honor of the famous Danville surgeon who performed the first ovariectomy.

Postgraduate Course in Pediatrics.—A course of postgraduate instruction in pediatrics is in progress at the Children's Free Hospital, Louisville, Wednesday mornings from April 23 to June 25. The courses consist of discussion of interesting cases in the hospital, lectures and demonstrations by the staff of the hospital.

Society News.—Dr. Frederick H. Falls, Chicago, addressed the Jefferson County Medical Society, Louisville, March 17, on "Toxemias of Late Pregnancy," under the auspices of the Louisville Obstetrical and Gynecological Society. Drs. Leo W. Zimmerman and Richard Douglas Sanders addressed the society, April 21, on "Clinical Considerations of the Climacterium" and "Carbon Monoxide Asphyxia" respectively. —Dr. Edgar F. Kiser, Indianapolis, addressed the Louisville Medico-Chirurgical Society, April 25, on "Some Early American Medical Publications."

LOUISIANA

State Medical Meeting and Election.—Dr. Emmett L. Irwin, New Orleans, was chosen president-elect of the Louisiana State Medical Society at its annual meeting in Shreveport in April, and Dr. Paul King Rand, Alexandria, was inducted into the presidency. Vice presidents elected were Drs. Robert T. Lucas, Shreveport; Henry B. Alsobrook and Robert F. Sharp, New Orleans. The 1942 meeting will be in New Orleans. This meeting of the state society was dedicated to Dr. Frederick J. Mayer, Opelousas, who has been practicing in Louisiana since his graduation at Tulane University School of Medicine, New Orleans, in 1883. Dr. Mayer served as president of the Attakapas Medical Society, the oldest medical society in the state, in 1885 and as president of the Louisiana State Medical Society, 1913-1914. Among the out of state speakers were:

Dr. Ernest H. Gaither, Baltimore, Important Clinical Considerations of Gallbladder Disease.
Dr. Harvey G. Beck, Baltimore, A Study of the Effects of Combustion Products of Natural Gas on Public Health.
Dr. John D. Camp, Rochester, Minn., Osteoporosis and Its Significance in Relation to Systemic Disease.
Dr. Virgil S. Counsellor, Rochester, Minn., A Consideration of the Fascia of Broad Ligament with Respect to Certain Surgical Procedures on the Pelvis.
Dr. Brian B. Blades, St. Louis, Surgical Treatment of Bronchiectasis.

Dr. Holman Taylor, Fort Worth, Texas, delivered the annual oration of the society.

MASSACHUSETTS

Society News.—Dr. Arthur P. Stout, New York, discussed "Tumors of the Peripheral Nerves" before the New England Pathological Society, April 17.—Dr. Harold J. Harris, Westport, N. Y., discussed brucellosis before the Worcester District Medical Society, April 9, in Worcester.

Personal.—Dr. Merrill Moore has been appointed medical director of the Washingtonian Hospital, Boston.—Dr. Bardwell H. Flower, formerly of Boston, has been appointed superintendent of Worcester State Hospital, Worcester, to succeed Dr. William A. Bryan, who last year became superintendent of Norwich State Hospital, Norwich, Conn.—Dr. Benjamin W. Mandelstam, Bridgewater, has been appointed medical adviser to the Massachusetts Department of Public Welfare, serving in all departments relating to medical care.

Dr. Cannon Receives Friedenwald Medal.—Dr. Walter B. Cannon, George Higginson professor and head of the department of physiology, Harvard Medical School, Boston, is the first recipient of the Friedenwald Medal of the American Gastro-Enterological Association. The medal was presented during the annual meeting in Atlantic City, May 5-6, according to *Science*. Dr. Cannon received the award "in recognition of his pioneer utilization of the x-rays in gastroenterology, and his important contributions to the mechanics of digestion, to the elucidation of the sensations of hunger and thirst, and to the development of the science and practice of gastroenterology." Born in Prairie du Chien, Wis., in 1871, Dr. Cannon graduated at Harvard in 1900 and has held his present professorship since 1906.

MICHIGAN

Nursing School Becomes University Body.—The University Hospital Nursing School, Ann Arbor, established fifty years ago, has been separated from the hospital administration and set up as the University of Michigan School of Nursing with its own governing body, newspapers announced on April 13. The director of the school, Miss Rhoda F. Rettig, was named professor of nursing.

Highland Park Spring Clinic.—The second annual spring clinic of the Highland Park Physicians' Club was conducted at the University Hospital, Ann Arbor, April 9. Participating were:

Drs. Frederick A. Collier, Postoperative Pulmonary Complications: Their Prevention, Recognition and Management.
Dr. Herman Marvin Pollard, The Clinical Syndrome of Gastritis: Causes and Treatment.
Dr. Carl E. Badgley, Injuries of the Elbow Joint.
Drs. Cyrus C. Sturgis and Fred J. Hodges, Medical Roentgen Conference.

Society News.—Dr. Irvine H. Page, Indianapolis, discussed hypertension before the medical section of the Wayne County Medical Society, Detroit, April 14.—The West Side Medical Society was addressed in Detroit, April 16, by Drs. Samuel J. Levin and Frank L. Ryerson on "Eczema and Fungus Allergy" and "Common Diseases of the Fundus of the Eye," respectively. Both are of Detroit.—Dr. Frederick H. Falls, Chicago, discussed "Extrauterine Pregnancy" before the Ingham County Medical Society, Lansing, April 15.—Dr. Robert S. Breakey, Lansing, discussed "Gonococcal Infection in the Female" before the Calhoun County Medical Society, Battle Creek, April 1.

Annual Fracture Day.—The third annual "Fracture Day" will be observed at Hurley Hospital, Flint, on May 21 under the auspices of the Flint regional fracture committee and the Genesee County Medical Society. The following will speak:

Dr. Hardie B. Elliott Jr., Evaluation of Internal Fixation of the Neck of the Femur.
Dr. John H. Curtin, Plaster of Paris Technic.
Dr. Robert B. MacDuff, Pitfalls in X-Ray Diagnosis.
Dr. Raphael W. MacGregor, Fractures of the Spine.
Frederick C. Thorold, D.D.S., Fractures of the Maxilla.
Dr. George J. Curry, Internal Two Plane Fixation of Fractures of Long Bones.
Dr. Leon M. Bogart, The Radiologist in Relation to the Physician.
Dr. Donald R. Brasie, Fractures of the Shoulder Region.
Dr. Jackson E. Livesay, Osteoporosis and Osteogenesis.
Dr. Otto J. Preston, Low Back Pain.

NEW JERSEY

Fifty Year Practitioners Honored.—Twenty members of the Essex County Medical Society who have practiced medicine for fifty years or more were honored at a recent meeting of the society, marking its one hundred and twenty-fifth anniversary. Twelve were present. Scrolls of appreciation were presented to Drs. Edward J. III, Frederick W. Becker, Wells P. Eagleton, Fred Hexamer, Clement Morris, Caldwell

Morrison, Edward M. Zeh Hawkes, William S. Foster and Robert W. Chapman, Newark; James Henry Clark, Levi W. Halsey, Montclair; John H. Bradshaw, Harry E. Matthews and William M. Brien, Orange; Francis B. Lane and William H. Cooke, East Orange; Albion C. Christian, Irvington; Jacob S. Wolfe, Bloomfield; Henry J. F. Wallhauser, Mount Bethel, Pa., and Richard D. Freeman, South Orange.

NEW MEXICO

State Medical Meeting at Raton.—The fifty-ninth annual meeting of the New Mexico Medical Society will be held at the Hotel Yucca, Raton, May 26-28, under the presidency of Dr. William B. Cantrell, Gallup. The speakers will be:

Col. William Lee Hart, M. C., U. S. Army, Fort Sam Houston, Texas, The Medical Reserve Corps.
Dr. Ozro T. Woods, Dallas, Texas, Treatment of Intestinal Obstruction; Cancer of the Uterus and Its Treatment.
Dr. William R. Lovelace II, Rochester, Minn., (four addresses), Surgery of the Thyroid Gland; High Concentrations of Oxygen as a Therapeutic Agent and Methods of Its Administration; Transportation of Patients by Airplane—Indications and Hazards; Use of Sulfonamide Compounds in the Postoperative Treatment of Patients, Particularly Those Who Have Had Emergency Operative Procedures.
Dr. Hiram D. Newton, San Diego, Calif., Cutaneous Manifestations of Syphilis; Cutaneous Complications in Treatment of Syphilis.
Dr. Onis H. Horrall, Chicago, Fractures of the Os Calcis.
Dr. Richard Mays Smith, Dallas, Treatment of Arthritis; Recent Developments in the Treatment of the Pneumonia Patient.
Dr. Constantine F. Kemper, Denver, Twenty Years with the Use of Insulin; Importance of Technic of Weight Reduction.
Dr. James Rudolph Jaeger, Denver, Diagnosis and Treatment of Injuries to the Spine Involving the Spinal Cord and Nerves.
Dr. Louis W. Breck, El Paso, Texas, Treatment of Fractures in the Aged.
Dr. Ralph M. Stuck, Denver, Treatment of Nerve Injuries of the Upper Extremities.
Dr. Harold D. Corbusier, Plainfield, N. J., Medical Preparedness.
Dr. Meldrum K. Wylder, Albuquerque, Behavior Problems of Children.

There will be round table luncheons Monday and Tuesday and motion picture programs each day.

NEW YORK

New State Cardiac Program.—The state department of health announces a program for the care and treatment of children with rheumatic heart disease to be developed under the direction of Dr. David D. Rutstein, assistant professor of medicine, Albany Medical College, Albany. The program will stress the training of physicians in special cardiac clinics. A survey of the possible need and development of cardiac services in various parts of the state will be made, also investigations on the etiology, prevention and treatment of rheumatic fever and an evaluation of methods of treatment. Hospital care for children with early rheumatic fever will be provided through a ninety-six bed service at the New York State Reconstruction Home at West Haverstraw. The hospital service will be under the immediate direction of Dr. Thistle M. McKee. It is also proposed to establish a model cardiac clinic at West Haverstraw.

New York City

Lilly Award to Dr. Rittenberg.—The sixth Eli Lilly and Company award in biologic chemistry was presented at the spring meeting of the American Chemical Society in St. Louis, April 7, to David Rittenberg, Ph.D., instructor in biochemistry, Columbia University College of Physicians and Surgeons, for his work on isotopes as tracers of chemical action. Dr. Rittenberg is 34 years old and received his doctor's degree in 1934 under Prof. Harold C. Urey at Columbia.

Sectional Meeting on Physical Therapy.—The Eastern section of the American Congress of Physical Therapy held its spring session at the New York Polyclinic Medical School and Hospital, April 5. Speakers at the evening session were Drs. Disraeli W. Kobak, Chicago, "Treatment of Intercoastal Neuralgia by Short Wave Diathermy"; Earl C. Elkins, Rochester, Minn., "Skin Temperatures in Relation to Radiant Heat"; Walter M. Solomon, Cleveland, "Gout—A Prevalent Arthritic Disease," and Norman E. Titus, New York, "Present Status of Physical Therapy in the United States Army."

OHIO

State Medical Meeting in Cleveland.—The Ohio State Medical Association will hold its annual session, June 3-4, at the Hotel Cleveland in Cleveland, during the annual session of the American Medical Association. The state association will not present a scientific program and exhibits, but the meeting will consist of two meetings of the house of delegates for the transaction of business and election of officers.

OKLAHOMA

Society News.—Drs. Charles F. Paramore and Edgar E. Rice, Shawnee, discussed obesity at a meeting of the Pottawatomie County Medical Society, Shawnee, April 19.—Drs. Hugh G. Jeter and Wann Langston, Oklahoma City, addressed the Oklahoma County Medical Society, Oklahoma City, recently on laboratory diagnosis and therapy of the anemias.—Drs. Joseph W. Kelso and Charles P. Bondurant, Oklahoma City, addressed the Stephens County Medical Society recently on "Functional Bleeding" and "General Dermatological Conditions" respectively.—A symposium on peptic ulcers was presented before the Pittsburg County Medical Society, McAlester, recently by Drs. Tracey H. McCarley, Claude E. Lively and Will C. Wait, all of McAlester.—Dr. Arthur G. Schoch, Dallas, Texas, addressed the Tulsa County Medical Society, Tulsa, April 28, on arsenotherapy of early syphilis.

OREGON

Personal.—Dr. Thomas D. Robertson, Portland, has been appointed a member of the state board of health to succeed the late Dr. Roy A. Payne for a term ending Jan. 15, 1945.—Dr. Rudolph E. Kleinsorge, Silverton, has been appointed a member of the state board of higher education.—Dr. Blair Holcomb, Portland, has been appointed to the Oregon State Nutrition Committee for Defense.

Special Lectures.—The Oregon Academy of Ophthalmology and Otolaryngology and the University of Oregon Medical School sponsored a series of postgraduate lectures in Portland, March 31 to April 5, with Drs. Harold I. Lillie, Rochester, Minn., and Frank E. Burch, St. Paul, as the speakers.—The Portland Academy of Medicine presented a group of lectures at the University of Oregon Medical School, Portland, May 12-14, with Dr. Virgil H. Moon, Philadelphia, as guest speaker. Dr. Moon's subjects were "Circulatory Failure of Capillary Origin," "Shock: Conditions of Occurrence and Sequelae" and "Shock: Prevention, Early Recognition and Treatment."

PENNSYLVANIA

State Psychiatric Meeting.—The midyear meeting of the Pennsylvania Psychiatric Society was held at the Allentown State Hospital, Allentown, April 10. Speakers were Drs. Harry F. Hoffman and Max Rossman, both of the hospital staff, on "Results of Fever Therapy" and "Childhood Psychoses: Therapeutic Problem" respectively.

Philadelphia

Society News.—Dr. John F. Fulton, New Haven, Conn., addressed the Philadelphia Neurological Society, March 28, on "Physiologic Interpretation of Functions of Basal Ganglia."—Dr. Robert A. Müller, New York, addressed the Philadelphia Rheumatism Society, April 3, on "Role of Physical Therapy in Treatment of Arthritis."—Dr. John B. Price, Norristown, among others, addressed the Philadelphia Laryngological Society, April 1, on "The Autonomic Nervous System and Its Relation to Upper Respiratory Symptoms."—Dr. Erwin O. Strassmann, Houston, Texas, addressed the Obstetrical Society of Philadelphia, April 3, on "The Theca Cone, the Pathmaker of the Ascending Graafian Follicle."—Speakers before the Philadelphia Roentgen Ray Society, April 3, included Drs. Charles A. W. Uhle on "Urological Manifestations of Abdominal Aneurysms"; David M. Davis, "A New Table for Combined Cystoscopy, Roentgenoscopy and Roentgenography," and George W. Chamberlin, "Some Hazards Associated with Roentgen Diagnosis of Urinary Tract Disease."

Pittsburgh

Annual Meeting.—Speakers for the annual meeting of the Allegheny County Medical Society, May 1, were Drs. Marion B. Sulzberger, New York, on "Eczematous Dermatitis—Diagnosis and Management by the General Practitioner"; Norris W. Vaux, Philadelphia, "Importance of Blood Studies During Pregnancy" and Stuart W. Harrington, Rochester, Minn., "Diaphragmatic Hernia." Dr. Edward J. G. Beardsley, Philadelphia, was the guest speaker at the banquet on "What Life Teaches A Doctor."

SOUTH CAROLINA

State Medical Election.—Dr. Thomas A. Pitts, Columbia, was named president-elect of the South Carolina Medical Association at the annual meeting in Greenville, April 15-17, and Dr. George M. Truluck, Orangeburg, was installed as president. Dr. William Frank Strait, Rock Hill, was elected

vice president and Dr. Julian P. Price, Florence, secretary. Offices of the association will be moved to Florence from Seneca, where they were located for about thirty years, during the secretaryship of the late Dr. Edgar A. Hines.

TENNESSEE

Sectional Physical Therapy Meeting.—A meeting of the Southeastern section of the American Congress of Physical Therapy will be held in Chattanooga, May 25-27, at the Hotel Patten. Among the speakers will be:

Drs. Ralph S. Emerson, Roslyn, N. Y., and Kristian G. Hansson, New York, Clinical Application of the Portable Whirlpool Bath.
Dr. John S. Coulter, Chicago, The Scope of Physical Therapy in National Defense.
Dr. Charles I. Singer, Long Beach, N. Y., Application of Climate Therapy to General Medicine.
Dr. Oscar B. Nugent, Chicago, Application of Physical Therapy to the Specialties.
Dr. Max K. Newman, Detroit, Artificial Hypothermia (Freezing Therapy)—Experience with Twenty-Five Cases.
Dr. George W. Owen, Jackson, Miss., Physical Therapeutic Aids in Management of Allergic Conditions.

WISCONSIN

Physicians Honored.—Dr. Emerson A. Fletcher, Milwaukee, was honored at a testimonial dinner recently under the auspices of the Milwaukee Hospital Interns' Association. Dr. Arthur C. Hansen was toastmaster and speakers included Drs. Hans W. Hefke and John S. Gordon, Milwaukee, and Raymond A. Toepfer, West Allis. Dr. Fletcher recently retired after forty-seven years of practice.—Dr. Herman R. Ohswaldt, Oconto Falls, was honored recently when the mayor of the town proclaimed an "Ohswaldt Day." A radio program was broadcast in which friends and patients paid tribute to Dr. Ohswaldt. He is 83 years old and has practiced sixty-two years.

Society News.—Dr. Clifford G. Grulee, Evanston, Ill., addressed the Medical Society of Milwaukee County, Milwaukee, April 11, on "Advantages of Nursing at the Breast."—Dr. William C. Keettel Jr., Madison, addressed the Barron-Washburn-Sawyer-Burnett Counties Medical Society in Rice Lake, April 4, on "Advances in Obstetrics and Gynecology."—Dr. Max J. Fox, Milwaukee, discussed "Infantile Paralysis" before the Fond du Lac County Medical Society, Fond du Lac, March 27.—Dr. Berton J. Branton, Willmar, Minn., and George E. Crossen, M.S., Minneapolis, addressed the Polk County Medical Society in Amery in March, with druggists of the county as guests, on "The Roles of Physician and Pharmacist" and "Interprofessional Relationships" respectively.—Dr. Aubrey H. Pember, Janesville, addressed the Rock County Medical Society, Beloit, March 25, on asthenopia.—Dr. Henry R. Viets, Boston, addressed the University of Wisconsin Medical Society, Madison, April 22, on "Our Present Knowledge of Myasthenia Gravis."

WYOMING

Hospital News.—Dr. Joseph F. Whalen, superintendent of the Wyoming State Hospital, Evanston, resigned, April 30, it is reported.

State Medical Meeting at Casper.—The thirty-eighth annual meeting of the Wyoming State Medical Society will be held at Casper, May 18-20, with headquarters at the Gladstone Hotel. The guest speakers will be:

Dr. Robert D. Schrock, Omaha, Fracture and Dislocations of the Astragalus.
Dr. Robert G. Packard, Denver, Prevention and Treatment of Malunion and Nonunion in Fractures of the Long Bones.
Dr. Robert L. Jackson, Iowa City, Infant Feeding; also Respiratory Infections of Children.
Dr. Luman E. Daniels, Denver, Neurosyphilis, with Emphasis on Its Early Recognition.
Dr. Joseph Raymond Plank, Denver, Treatment of Varicosities and Their Complications.
Dr. Everett D. Plass, Iowa City, Uterine Fibroids; also Hypertension in Pregnancy.
Dr. George P. Lingenfelter, Denver, Some Recent Advances in Dermatology.
Gordon E. Davis, Sc.D., U. S. Public Health Service, Hamilton, Mont., Relapsing Fever.

Dr. Plass will lead a forum discussion on maternal deaths Monday morning, after which there will be a luncheon at the Natrona County Memorial Hospital at which Dr. Earl E. Whedon, Sheridan, will preside over a discussion of subjects presented at the morning session. A golf tournament will be held Sunday at the Casper Country Club and Community Course followed by a smoker in the evening at the Gladstone Hotel.

GENERAL

Medical Library Meeting.—The forty-third annual meeting of the Medical Library Association will be held at the University of Michigan Medical School, Ann Arbor, May 29-31, under the presidency of Col. Harold W. Jones of the Army Medical Library, Washington, D. C. Hotel headquarters will be at the Michigan Union. The program will include papers on the cooperation of libraries, union catalogues, medical history and industrial medicine.

Society News.—Maurice A. Bigelow, Ph.D., New York, was reelected president of the American Eugenics Society at the fifteenth annual meeting in New York March 31. Speakers included Frederick Osborn, New York; Dr. William Allan, Charlotte, N. C.; Dr. Edward J. Humphreys, Thiells, N. Y., of the New York State Department of Mental Health, and Morton D. Schweitzer, Ph.D., New York. The general topic of the conference was "Human Ability—Democracy's Basic Defense."

Infantile Paralysis Pamphlet in Spanish.—The National Foundation for Infantile Paralysis has published a Spanish translation of its recent pamphlet on "The Nursing Care of Patients with Infantile Paralysis" by Jessie L. Stevenson, R.N., consultant in orthopedic nursing for the National Organization for Public Health Nursing. The pamphlet, illustrated with line drawings, was prepared as a part of a project in orthopedic nursing sponsored by the foundation. It is intended to assist the public health nurse and others responsible for home care of patients with infantile paralysis. Copies in either Spanish or English are available free on request from the National Foundation for Infantile Paralysis, 120 Broadway, New York.

Annual Meeting of Diabetes Association.—The first annual session of the American Diabetes Association will be held at the Hotel Hollenden, Cleveland, June 1, under the presidency of Dr. Cecil Striker, Cincinnati. Speakers will be:

- Drs. Charles Best and Reginald E. Haist, Toronto, Ont., The Prevention of Diabetes.
- Dr. I. Arthur Mirsky, Cincinnati, Etiology of Diabetic Acidosis.
- Dr. Seale Harris, Birmingham, Ala., Hyperinsulinism: Induced and Spontaneous Hypoglycemia.
- Dr. Herman O. Mosenthal, New York, Standards of Diabetes Therapy.
- Drs. Julian D. Boyd, Robert L. Jackson and James H. Allen, Iowa City, Avoidance of Degenerative Changes in the Child with Diabetes Mellitus.

Dr. Elliott P. Joslin, Boston, will deliver the Banting Memorial Lecture in the evening on "Diabetes—Yesterday, Today and Tomorrow."

American Therapeutic Society.—The forty-second annual meeting of the American Therapeutic Society will be held in Cleveland at the Hotel Cleveland, May 30-31, under the presidency of Dr. Louis F. Bishop Jr., New York. Among the speakers will be:

- Dr. Oscar B. Hunter, Washington, D. C., Intoxication Tests for Drinking Drivers and Pedestrians.
- Dr. Harold S. Davidson, Atlantic City, N. J., Treatment of Septic Thrombophlebitis with Heparin and Sulfathiazole.
- Dr. Kenneth M. Lewis, New York, Present Status of Chemotherapy in Surgical Infections.
- Dr. Mathew Jay Flipse, Miami, Yellow Bone Marrow—Its Effect on the Leukocytes in the Peripheral Blood in Certain Cases of Leukopenia.
- Dr. Watt W. Eagle, Durham, N. C., Use of Estrogenic Substances in the Treatment of Atrophic Rhinitis.
- Dr. Frank W. Hartman, Detroit, Status of Whole Blood and Plasma Transfusion in Intravenous Therapy.
- Dr. Arthur C. Ernste, Cleveland, Angina Pectoris in Young Persons with Aortic Insufficiency.

Academy of Tuberculosis Physicians.—The annual session of the American Academy of Tuberculosis Physicians will be held at the Hollenden Hotel, Cleveland, June 2, under the presidency of Dr. Oscar S. Levin, Denver, who will speak on "The Specialist in Tuberculosis." Among the speakers will be:

- Lieut. Col. William C. Pollock, M. C., U. S. Army, Tuberculosis Problem During Military Mobilization.
- Col. David Townsend, M. C., U. S. Army, Bristol, Tenn., Post-influenzal Sequelae: Special Reference to the Lungs.
- Dr. Magnus B. Halldorson, Winnipeg, Man., Canada, Immunity in Tuberculosis.
- Lieut. Col. George F. Aycock, M. C., U. S. Army, Voluntary Termination of Artificial Pneumothorax: A Review of 200 Reexpanded Cases.
- Dr. Leroy Elrick, Denver, Coexistence of Chronic Pulmonary Tuberculosis and Syphilitic Aneurysm of the Aorta.
- Dr. Harry J. Corper, Denver, Technicality of the Tuberculin Tests: A Proposed Transdermal or Transcutaneous Test.
- Lieut. Col. Hugh W. Mahon and Capt. John B. Grow, M. C., U. S. Army, Contributory Causes of Death in Patients Suffering from Pulmonary Tuberculosis.

Meeting of Ophthalmologists.—The American Ophthalmological Society will hold its seventy-seventh annual meeting at The Homestead, Hot Springs, Va., May 29-31. Among the speakers will be:

- Drs. Phillip Robb McDonald and Francis Heed Adler, Philadelphia, Studies on Pigmentary Degeneration of the Retina: Role of the Melanophore Hormone of the Pituitary Gland in Pigmentary Degeneration of the Retina.
- Dr. Bernard Samuels, New York, Pathologic Anatomy of the Lens Following Corneal Ulcers and Corneal Scars.
- Dr. Arnold Knapp, New York, On the Operative Treatment of Congenital Subluxation of the Lens.
- Drs. Harry S. Gradle, Chicago, and Hyman Saul Sugar, Detroit, Wound Rupture After Cataract Extraction.
- Dr. Alexander E. MacDonald, Toronto, Ocular Kinetic Righting Reflex.
- Dr. Arthur J. Bedell, Albany, N. Y., Papilledema Without Increased Intracranial Pressure.
- Dr. Philip Meriwether Lewis, Memphis, Tenn., Gonococcal Conjunctivitis: A Comparison of Sulfanilamide, Sulfapyridine and Sulfathiazole in the Treatment of One Hundred and Twenty Cases.

Association for the Surgery of Trauma.—The third annual session of the American Association for the Surgery of Trauma will be held in Montreal, Que., May 29, with headquarters at the Ritz-Carlton Hotel, and May 30-31 at the Seignior Club. Dr. Fraser B. Gurd, Montreal, will deliver his presidential address Friday morning. Included among other speakers will be:

- Dr. Isidore Cohn, New Orleans, Fractures Involving the Elbow Joint.
- Dr. Clay Ray Murray, New York, Conditions Complicating the Treatment of Injuries to the Menisci of the Knee Joint.
- Comdr. Frederick R. Hook, M. C., U. S. Navy, Washington, D. C., Carpal Fractures as Seen in the Naval Service.
- Dr. Carleton Mathewson Jr., San Francisco, A Method of Ambulatory Treatment of Spiral and Oblique Fractures of the Tibia.
- Drs. Henry C. Marble and Edward Hamlin Jr., Boston, Injuries to the Peripheral Nerves.
- Dr. Grover C. Weil, Pittsburgh, The Local Therapeutic Effect of Sulfathiazole.
- Dr. Idys Mims Gage, New Orleans, Subcutaneous Traumatic Injury of the Abdominal Viscera.

American Heart Association.—The seventeenth scientific session of the American Heart Association will be held at the Hotel Statler, Cleveland, May 30-31. The Lewis A. Conner Memorial Lecture will be delivered Friday afternoon by David B. Dill, Ph.D., Cambridge, Mass., on "Effect of Physical Strain and High Altitude on the Heart and Circulation," and the George Brown Memorial Lecture, Saturday afternoon, by Dr. Alfred Blalock, Nashville, Tenn., on "Peripheral Circulatory Failure." Friday evening there will be a round table discussion on "The Soldier and His Heart" with the following speakers: Drs. Paul D. White, Boston; Bernard S. Oppenheimer, New York; Eugene S. Kilgore, San Francisco, and Comdr. John R. Poppen, M. C., U. S. Navy, Washington, D. C. Other speakers will include:

- Dr. Ashton Graybiel, Boston, The Range of the Normal Electrocardiogram Based on the Records of a Thousand Young Aviators.
- Dr. Ignacio Chavez, Mexico, D. F., Incidence of Heart Disease in Mexico.
- Drs. Irving S. Wright, Gerald H. Pratt and Michael Lake, New York, Effect of Ten Years of Occupational Sitting, Standing or Climbing Stairs on the Blood Vessels of the Lower Extremities.
- Louis I. Dublin, Ph.D., New York, Heart Disease and Public Health: Current Trends and Prospects.

Meeting of Chest Physicians.—The seventh annual meeting of the American College of Chest Physicians will be at the Statler Hotel, Cleveland, May 31-June 2, under the presidency of Dr. John H. Peck, Oakdale, Iowa. Included among the speakers will be:

- Dr. Chevalier L. Jackson, Philadelphia, Bronchial Obstruction as an Etiologic and Perpetuating Factor in Emphysema.
- Dr. Frederick H. Falls, Chicago, Pregnancy and Tuberculosis.
- Drs. William E. Ogden, George C. Anglin, William C. Kruger, Toronto, Canada, Foreseeing and Forestalling Tuberculosis: A Ten Year Study.
- Drs. Dean B. Cole, Walter L. Nalls, Richmond, Va., Management of Fluids Complicating Pneumothorax.
- Dr. Ralph C. Matson, Portland, Ore., A New Extrapleural Pack in the Treatment of Pulmonary Tuberculosis.
- Dr. Ralph R. Mellon, Pittsburgh, Some of the Newer Concepts of the Tubercle Bacillus and Its Chemical Susceptibilities.
- Dr. George G. Ornstein, New York, Clinical Aspects of Cancer of the Lungs.
- Dr. Willard Van Hazel, Chicago, Present Day Treatment of Empyema, a Report of Over 500 Cases.

Louis I. Dublin, Ph.D., of the Metropolitan Life Insurance Company, New York, will be the banquet speaker, discussing "The Next Ten Years in Tuberculosis: A Forecast."

CORRECTION

Thiamine Overdosage and Toxicity.—In the communication by Dr. Clarence A. Mills, Cincinnati, in *THE JOURNAL*, May 3, page 2101, the dose mentioned in the second line of the second paragraph should have been 10 mg. instead of 10 Gm.

The Total Casualties of the War

Official figures of the casualties of the war to date have just been published. They are as follows:

	Killed	Wounded
Civilians.....	29,856	40,897
	Killed and Missing	Wounded
Armed forces.....	37,607	25,895

Civilians classified as to men, women and children were:

	Killed	Injured and Detained in Hospital
Men.....	13,712	21,811
Women.....	12,112	15,893
Children under 16.....	3,644	3,193
Unclassified.....	388	
Total.....	29,856	40,897

The Destruction of St. Thomas's Hospital

Of all the great London hospitals, St. Thomas's has suffered most from the air attacks on London. The damage to it is estimated at \$5,000,000. Situated on the bank of the Thames opposite the houses of Parliament, it is possible to give the German bombers, who operate at a great height, credit for attempting to destroy the latter and not the hospital. But it can be said of them, here as elsewhere, that the bombing of hospitals—a thing which they have now done hundreds of times—is part of the practice of "frightfulness" and seems to be followed without any reluctance. Indeed, in the analogous case of hospital ships clearly emblazoned with the Red Cross, we have repeated examples of deliberate bombing.

The normal work of St. Thomas's Hospital has been transferred to the country, to a branch of three hundred and fifty beds in the heart of Surrey. It is built on the hutment plan and has been used as a hospital for Australian troops. The problem of housing the staff is difficult in view of the shortage of accommodation. As a war time measure, nurses and other members of the staff will live in huts. Altogether a staff of more than three hundred will be boarded and maintained. The students will be a few miles away in an old manor house. There will be a special ward for air raid casualties to children. The problem of catering for about one thousand persons transferred to the country will be solved by food convoys, which will travel to and fro from the parent hospital in London. Work at the latter has not entirely ceased. The accommodation for inpatients has been reduced from six hundred and eighty to one hundred beds. The normal outpatient department with its various clinics is being maintained, and casualties, including those from air raids, will be treated.

Polish School of Medicine Opened at Edinburgh University

The Polish School of Medicine, described as "the first demonstration by the scientific world against Hitler's 'new order,'" has been opened at Edinburgh University. The ceremony took place in McEwan Hall with Sir Thomas Holland, vice chancellor, presiding. The school is being provided for the Polish government by the senate of Edinburgh University. The first beneficiaries will be men who have completed their studies in Poland but who, because of the war, did not sit for their final examination. The dean of the Edinburgh Faculty of Law

presented the Polish president for the honorary degree of Doctor of Laws, saying that they admitted him to the roll of honor as a great lawyer, soldier, administrator and patriot. Expressing thanks, President Raczkiewicz said the world today, rent by the disaster of war, was seeking to evolve new forms in national and international relations and to set the ideas of justice and freedom against the spirit of conquest embodied in the "new order." He expressed the unshakable faith of his nation and himself that a world commonwealth based on Christian ethics and observance of international law would be born from the respect of the rights of individuals and nations and the sound cooperation of states in political and economic spheres.

The Danger of a Gas Attack

A gas attack on this country has been expected but has not occurred. Mr. Herbert Stanley Morrison, Home Secretary, stated in the House of Commons that the use of gas is abhorrent to the government and that under no circumstances shall we be the first to employ it. No attention should be paid to any attempt by the enemy to cast doubts on our attitude or to suggest that our defensive measures imply some intention to take the initiative. Unhappily we cannot put any faith in his statement that he will not use gas. His whole record shows that he will stop at nothing, and that if he thinks gas will give an advantage he will use it. Therefore we must be prepared. With the measures of protection now available there is no ground for alarm as to gas attacks, provided the precautions advised are adopted. The government is determined to ensure that the whole population is in a full state of preparedness. Mr. Morrison subsequently gave a broadcast urging every one to carry his gas mask at all times. Properly put on and properly used, it afforded complete protection against every form of war gas that was known. The enemy had declared that he would not use gas, but neutral observers in a good position to form an opinion publicly stated that Germany was making active preparations to use gas. His declarations commanded no confidence anywhere in the world. One of the likeliest reasons that he would was that he might regard gas as his last hope of doing what he had failed to do—to stampede the civilian population.

Mobile Unit for Physical Therapy

Lord Horder, president of the Chartered Society of Massage and Medical Gymnastics, presented, on behalf of subscribers, a physical therapy mobile unit, which is complete with its driver and a skilled masseur, for use in Red Cross work. It makes its own electricity for electrical treatment and will be used for visiting convalescent homes and hospitals in central England. The unit contains all the necessary apparatus for giving electrical and light treatments, such as galvanism, infrared rays, radiant heat, ultraviolet radiation and paraffin-wax baths. The unit is the first of its kind and is to be followed by others.

Smoking and the Use of Makeup by Nurses

Smoking and the use of makeup by nurses have given rise to some trouble. In one case a high military officer, inspecting a civil defense hospital, caused a sensation by expressing disapprobation of the lips of an important lady, a voluntary worker, who supervised the nursing. The outcome has not been published. The British Red Cross Society has been exercised as to these practices and has decided that present day conditions render it unfair to forbid nurses from smoking in uniform on suitable occasions, such as visiting theaters, restaurants and cinemas. But the society strongly discourages its women members from smoking outdoors in public, when in uniform. The same attitude has been taken by the heads of the woman services attached to the fighting forces. With regard to makeup, the society does not object to it when used with discretion.

A Physician Who Became a Great Ornithologist

The death of Dr. C. B. Ticelhurst at the age of 60 years has removed a great ornithologist. Educated at Guy's Hospital, his professional life was spent in general practice except for service in the last war at a military hospital. As an ornithologist he gained an international reputation. He visited many countries and in the course of these travels made an important reference collection of birds. His main interest was with the systematics, geographic distribution, migration and plumage changes of the birds of Palestine and the Indo-Burmese areas. In 1931 he became editor of *Ibis*, the quarterly journal of the British Ornithologists Union. At the time of his death he was engaged in systematic work on the birds of India, Burma and Ceylon.

BUENOS AIRES

(From Our Regular Correspondent)

Feb. 14, 1941.

Chemotherapy of Organic Arsenic Compounds

Arsenic compounds were recently discussed by Dr. Ernst Friedheim, privatdocent in the medical faculty of Geneva, Switzerland, who at present is engaged in scientific research in Buenos Aires, before the Argentine Association of Dermatology and Syphilology. He discussed a new synthetic arsenic compound of which he is the discoverer, namely a sodium salt, 4,4'-dihydro-arsenobenzene-3,3'-bis [(azo-2) naphthol-1-disulfonic acid-4.8]. It is a dark blue violet substance containing 13.8 per cent of arsenic readily soluble in water but insoluble in lipoids. Unlike nearsphenamine, this compound can be produced in a crystalline, analytically pure form. It does not contain the orthoamino-oxyl and the aminomethylene-sulfoxy-late groups which make nearsphenamine an unstable product. It preserves its stability indefinitely in contact with air if kept dry and in a laboratory temperature of from 64 to 82 F. This substance seems to be able to transcend the hematoencephalic and hemato-ocular barrier.

It has already been tried out on trypanosomiasis and in syphilis, both in French and in British colonial possessions. In 41 cases of trypanosomiasis it was able to cause Trypanosoma to disappear from the blood, the lymph nodes and the cerebrospinal fluid. Clinical symptoms rapidly receded. Seventeen cases of syphilis of the skin were treated in Africa and 23 cases in Santiago de Chile. In the State Institute of Bacteriology of Chile the spirocheticidal action of the drug could be observed ultramicroscopically day by day in the dermatologic clinic of Professor Prats. The cases were chancre and papuloerosive cases and were treated with from 0.25 to 0.5 Gm. of the new compound. The effect can be judged from the fact that in 13 cases one injection, in 8 two injections and in 2 cases three injections killed off the spirochetes.

The new drug in somewhat heavier doses (10 per cent) possesses a more rapid spirocheticidal effect (43 per cent) than nearsphenamine. Tolerance of the drug in all cases of syphilis as well as in trypanosomiasis was good.

Professor Baliña, syphilologist, in whose clinic experiments with the new drug are being made, pointed out that the chief value of the drug resided in the fact that cerebromedullary cases of syphilis could be treated with it. If it could actually clear the hematoencephalic barrier and make the fine nerve tissues accessible to therapeutic action it would take the place of pentavalent arsenic compounds and of malaria therapy.

Heart Diseases in Children

Dr. José María Macera, associate professor of pediatrics at the university of Buenos Aires and director of the children's clinic in the Hospital Pirovano and of the medicosocial service of the Public Aid for rheumatic children, studied the problem of heart diseases of school children in collaboration with Dr. Alberto P. Ruchelli. This is the first inclusive contribution

to this problem undertaken in Argentina. In one school district, 201 cases of acquired heart diseases were discovered among the 10,000 children (2.1 per cent). Of these cardiac lesions 50.24 per cent could be attributed to rheumatism. Epistaxis was observed in 25.42 per cent. Primary cardiac rheumatism occurred in 0.64 per cent. To the cases of acquired heart diseases must be added 0.39 per cent of congenital heart trouble. Accidental cardiac murmurs were found in 4.27 per cent of the cases. Children with accidental cardiac murmurs should be examined electrocardiographically. In 3.6 per thousand, the presence of an abnormal congenital communication between the ventricles of the heart was noted (Roger's disease). The authors emphasize the need of vocational guidance for children with cardiac disorders on graduation in order to prevent subsequent disaster. They cite the example set by the United States during the last twenty years.

Pulmonary Carcinoma

Dr. Julio Palacios and Egidio S. Mazzei, associate professors of the First Medical Clinic of the faculty of medicine of Buenos Aires, published a monograph on pulmonary carcinoma, sarcoma and lymphogranuloma, based on 120 cases. Some new forms are described, namely an osteoarthropathy (Pierre-Marie-Bamberger) characterized by hypertrophy: the pseudocardiac, in which the tumor simulates a cardiac lesion (angina pectoris, paroxysmal tachycardia or cardiac insufficiency) and the painful thoracicobronchial syndrome (paralysis brachialis inferior Dejerine-Klumpke and shadow at the apex of the thorax), significant for incipient carcinoma of the apex of the lung. In discussing atelectasis due to bronchial carcinoma the authors stress two signs: tracheal deviation on inspiration in the superior lobe during palpation of the fossa suprasternalis and roentgenologically an undue brightness appearing in the healthy lobe adjoining the atelectatic lobe.

Brief Mention

In Mendoza, capital of the Argentine province of the same name, a department of nutrition has been instituted. This is the only organization of its kind in Argentina outside the well known National Institute of Nutrition in Buenos Aires. It is to combat the extensive malnutrition found in the province as well as goiter conditions.

The third Chilean and American Congress for Surgery met, February 14-18, in Santiago de Chile. Representatives from Chile, Argentina, Peru, Paraguay and Uruguay attended. The themes discussed were head injuries, early diagnosis of carcinoma of the stomach and colon surgery.

Personal

Dr. Alberto Marsal was appointed professor of physiologic chemistry in the faculty of medicine of the University of Córdoba. Under a grant from the Guggenheim Foundation he studied at Harvard, Cornell and Rochester during 1937-1939.

Dr. Vicente Dimitri, who has been director of the neurologic division at the Hospital Alvear since 1917, was appointed professor of neurology at the faculty of medicine of the University of Buenos Aires. He is founder and editor of the *Revista neurológica de Buenos Aires*.

Marriages

CHARLES LEMUEL PRINCE III, Charlottesville, Va., to Miss Katherine Wachob Eaton of Pittsburgh, February 15.

WILLIAM FITZGERALD CAVEDO to Miss Edith Earline Mann, both of Richmond, Va., February 12.

WILLIAM STERRY BRANNING to DR. NANCY BOWMAN WISE, both of Durham, N. C., in February.

EUGENE BOWIE SHEPHERD to Miss Mary Walker Lewis, both of Richmond, Va., February 24.

Deaths

Willis Cohoon Campbell * Memphis, Tenn.; University of Virginia Department of Medicine, Charlottesville, 1904; chairman of the Section on Orthopedic Surgery of the American Medical Association, 1922-1923, and member of its House of Delegates in 1939; past president of the Memphis and Shelby County Medical Society, Clinical Orthopedic Society, South-eastern Surgical Congress, American Academy of Orthopedic Surgeons and the American Orthopedic Association; in 1937 secretary of the American delegation to the International Society of Orthopedic Surgery; member of the Southern Surgical Association and the American Association for the Surgery of Trauma; fellow and member of the board of governors from 1936 to 1939, of the American College of Surgeons; professor of orthopedic surgery, University of Tennessee College of Medicine; chief of staff, Willis C. Campbell Clinic, Crippled Children's Hospital School and Hospital for Crippled Adults; consultant in orthopedic surgery, Baptist Memorial and St. Joseph's hospitals and the United States Marine Hospital; attending orthopedic surgeon, Methodist Hospital; author of "Orthopedics of Childhood," "Injuries and Surgical Diseases of the Joints," "Dislocations of Joints," "Orthopedic Surgery," "Physical Therapy in Bone and Joint Tuberculosis"; aged 60; died, May 4, in St. Luke's Hospital, Chicago.

Frank Clinch Hammond * Philadelphia; Jefferson Medical College of Philadelphia, 1895; instructor of gynecology at his alma mater from 1896 to 1905; honorary dean and professor of gynecology at the Temple University School of Medicine; past president of the Philadelphia County Medical Society, Obstetrical Society of Philadelphia and the Philadelphia Clinical Association; fellow of the American College of Surgeons; in 1925 was appointed editor of the *Atlantic Medical Journal*, predecessor of the *Pennsylvania Medical Journal*, and served until 1941, when he became editor emeritus; in 1918 medical aide to the governor of Pennsylvania; aged 66; visiting obstetrician and gynecologist, Philadelphia General Hospital; visiting gynecologist, Philadelphia Hospital for Contagious Diseases; consulting obstetrician and gynecologist, Jewish Hospital; consulting gynecologist, Newcomb Hospital, Vineland, N. J., Delaware County Hospital, Drexel Hill, Skin and Cancer Hospital, Philadelphia, and the Riverview Hospital, Norristown, Pa.; gynecologist, Temple University Hospital, where he died, April 12.

Charles Waldo Stickle * Brooklyn; University of the City of New York Medical Department, 1893; adjunct clinical professor of otology from 1913 to 1916, clinical professor and professor from 1916 to 1920, clinical professor from 1920 to 1923 and from 1923 to 1930 professor at the Long Island College Hospital; in 1930, when the school became the Long Island College of Medicine, he was made professor of clinical otolaryngology, serving until 1937, when he became emeritus professor; chief of the eye clinic from 1913 to 1916, aural surgeon from 1916 to 1920, otolaryngologist from 1920 to 1924, attending otolaryngologist from 1924 to 1937 and consulting otolaryngologist since 1937, the Long Island College and Coney Island hospitals; attending otologist, Brooklyn Jewish Hospital from 1906 to 1925; attending laryngologist from 1910 to 1920, Methodist Hospital; aged 70; died, March 8, of cerebral thrombosis.

Stewart Ralph Roberts * Atlanta, Ga.; Atlanta College of Physicians and Surgeons, 1900; member of the House of Delegates of the American Medical Association from 1916 to 1920; professor of clinical medicine at the Emory University School of Medicine; fellow and formerly vice president and member of the board of regents of the American College of Physicians; member of the American Clinical and Climatological Association; past president of the Southern Medical Association, Fulton County Medical Society and the American Heart Association; formerly secretary of the Southern Interurban Clinical Society; at one time vice president of the Medical Association of Georgia; served during the World War; on the staffs of the Emory University, Georgia Baptist and the Grady hospitals; author of "Pellagra"; aged 62; died, April 14, of coronary occlusion and hypertension.

David A. Strickler * Denver; Hahnemann Medical College of Philadelphia, 1881; from 1914 to 1923 president of the Federation of State Medical Boards of the United States; member of the National Board of Medical Examiners from

1919 to 1932; member from Jan. 13, 1902 to July 5, 1911 and secretary-treasurer of the state board of medical examiners from July 5, 1911 to July 5, 1927; member of the American Academy of Ophthalmology and Otolaryngology; fellow of the American College of Surgeons; at one time dean and professor of ophthalmology at the Denver College of Physicians and Surgeons; formerly professor of ophthalmology and otolaryngology, University of Minnesota Medical School, Minneapolis; aged 82; died, March 29, in the Mercy Hospital of adenocarcinoma of the hepatic flexure of the colon.

Bryant Davis Wetherell, Boston; Harvard Medical School, Boston, 1918; professor of clinical urology at the Tufts College Medical School; member of the Massachusetts Medical Society; member of the American Urological Association and the New England Dermatological Society; fellow of the American College of Surgeons; associate urologist, Massachusetts General Hospital; genitourinary surgeon, St. Elizabeth's Hospital and Boston Dispensary, Boston, Cambridge (Mass.) Hospital and the Brooks Hospital, Brookline, Mass.; consulting urologist, Massachusetts Eye and Ear Infirmary, Boston, Anna Jaques Hospital, Newburyport, and the Amesbury (Mass.) Hospital; aged 52; died, March 5.

Ralph Hayward Simmons * Lieutenant Colonel, M. C., U. S. Army, Fort Adams, R. I.; Tufts College Medical School, Boston, 1913; member of the American Academy of Ophthalmology and Otolaryngology; fellow of the American College of Surgeons; member of the Massachusetts Medical Society; served during the World War; entered the medical corps of the United States Army as a captain in 1920, in 1929 was promoted to major and in 1937 to lieutenant colonel; aged 51; died, March 13, in the Walter Reed General Hospital, Washington, D. C., of arterial hypertension and cardiac decompensation.

Charles S. Young, Geneseo, Ill.; Detroit College of Medicine, 1896; member of the Illinois State Medical Society; past president of the Henry County Medical Society; past president of the Iowa-Illinois Central District Medical Association, 1918-1919; for many years president of the board of the Henry County Tuberculosis Sanatorium, Rock Island, and the J. C. Hammond City Hospital; health officer of Geneseo from 1912 to 1918; for many years a member of the high school board; local surgeon for the Rock Island Railway; aged 67; died, March 9, of chronic myocarditis.

Thomas Vincent Hynes, New Haven, Conn.; Yale University School of Medicine, New Haven, 1900; member of the Connecticut State Medical Society; fellow of the American College of Surgeons; assistant in obstetrics from 1901 to 1904 and instructor in clinical obstetrics from 1904 to 1918 at his alma mater; on the staff of the New Haven Hospital and St. Raphael Hospital; formerly chief obstetrician and past president of the medical staff of Grace Hospital; aged 67; died, March 31, of coronary thrombosis.

William C. Mitchell, Denver; University of Maryland School of Medicine, Baltimore, 1889; director of laboratories, state board of health; formerly bacteriologist, city board of health; professor of bacteriology at the University of Denver Medical Department, which later became the University of Colorado School of Medicine, where he was professor of bacteriology emeritus; aged 72; died, March 31, in the Mercy Hospital of coronary thrombosis.

Doran Jay Stephens * Rochester, N. Y.; University of Rochester School of Medicine and Dentistry, 1929; assistant professor of medicine at his alma mater; member of the American Society for Clinical Investigation; assistant in medicine, Washington University School of Medicine, and resident physician, Barnes Hospital, St. Louis, 1931-1932; on the staff of the Strong Memorial Hospital; aged 37; died, March 19, of pneumonia.

A. Merrill Miller * Danville, Ill.; Northwestern University Medical School, Chicago, 1901; past president of the Vermilion County Medical Society; fellow of the American College of Surgeons; aged 64; attending surgeon, St. Elizabeth's Hospital; consulting surgeon, Veterans Administration Facility; surgeon, Lakeview Hospital, where he died, March 19, of cerebral hemorrhage.

Loy McAfee, Washington, D. C.; Medical College of Indiana, Indianapolis, 1904; for many years employed as a contract surgeon in the medical service of the United States Army; assistant editor in chief of "The Medical Department of the United States Army in the World War"; aged 72; died, February 17, in the Walter Reed General Hospital of heart disease.

Peter Owen Shea ☉ Worcester, Mass.; College of Physicians and Surgeons, medical department of Columbia College, New York, 1895; veteran of the Spanish-American War; for many years city health officer; at one time a member of the school committee; formerly trustee of the Grafton State Hospital, North Grafton; aged 70; died, March 10, of chronic myocarditis.

Bruce Lichty, Meyersdale, Pa.; University of Pennsylvania Department of Medicine, Philadelphia, 1892; member of the Medical Society of the State of Pennsylvania; served during the World War; for many years member of the board of education and president of the board of health; aged 75; died, March 8, in the Hazel McGilvery Hospital of coronary occlusion.

Elizabeth Hall McCullough ☉ North Bennington, Vt.; Columbia University College of Physicians and Surgeons, New York, 1933; member of the New England Pediatric Society; on the staff of the Henry W. Putnam Memorial Hospital; attending physician, Bennington College Health Service from 1939 to 1941; aged 33; was killed, March 14, in an automobile accident.

Charles Gibson McGaffin, Brooklyn; Albany (N. Y.) Medical College, 1908; member of the American Psychiatric Association and the New England Society of Psychiatry; superintendent of the Coney Island Hospital; formerly superintendent of the New York Children's Hospital, New York; aged 58; died, March 26, of acute coronary occlusion.

Charles Lewis Gaulden ☉ Los Angeles; Tulane University of Louisiana School of Medicine, New Orleans, 1912; fellow of the American College of Surgeons; served during the World War; on the staffs of the Cedars of Lebanon and California hospitals; aged 53; died, March 3.

George B. McKnight, Fond du Lac, Wis.; Hahnemann Medical College and Hospital, Chicago, 1889; formerly health officer; for many years trustee of Sunny View Sanatorium, Winnebago; on the staff of the Fond du Lac County Insane Asylum; aged 77; died, March 5.

George Charles Dittmann, Chicago; College of Physicians and Surgeons, School of Medicine of the University of Illinois, 1902; member of the Illinois State Medical Society; aged 65; died, March 1, in the Swedish Covenant Hospital, of carcinoma of the stomach.

Morris A. Goodstone, Pittsburgh; Western Pennsylvania Medical College, Pittsburgh, 1892; at one time chief of the medical staff and for many years trustee of the Montefiore Hospital; aged 74; died, March 2, of embolus following cholecystoduodenostomy.

Benjamin Newton Novy, Chicago; College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1906; served during the World War; aged 58; died, March 5, in the Michael Reese Hospital of gastric ulcer with hemorrhage.

Robley Dungleison Snively ☉ Philadelphia; Medico-Chirurgical College of Philadelphia, 1895; on the staffs of the Abingdon (Pa.) Memorial Hospital, the Germantown Hospital and the National Stomach Hospital; aged 68; died, March 15, of heart disease.

John Tucker Halsell ☉ Laredo, Texas; Fort Worth School of Medicine, Medical Department of Fort Worth University, 1898; fellow of the American College of Surgeons; veteran of the Spanish-American and World wars; aged 66; died, March 16.

Joseph Hiram Laws ☉ Broken Arrow, Okla.; University of the South Medical Department, Seawee, Tenn., 1899; Vanderbilt University School of Medicine, Nashville, 1900; aged 66; died, February 7, in a hospital at Tulsa of carcinoma of the liver.

John P. Stewart ☉ Frankfort, Ky.; University of Louisville Medical Department, 1893; past president of the Franklin County Medical Society; aged 71; died, March 8, in the Norton Memorial Infirmary, Louisville, of cerebral arteriosclerosis and pneumonia.

James Clarence Cowan, New Haven, Ind.; American College of Medicine and Surgery, Chicago, 1905; member of the Indiana State Medical Association; for many years on the staff of the Lutheran Hospital, Fort Wayne; aged 63; died, March 15.

Henry H. Sugg, Mount Vernon, Ind.; American Medical College, St. Louis, 1890; formerly secretary of the board of health, and county health officer; aged 74; died, March 4, in the Welborn-Walker Hospital, Evansville, of intestinal obstruction.

Lee Everett Strong, Indianapolis; Indiana University School of Medicine, Indianapolis, 1910; member of the Indiana State Medical Association; aged 54; died, March 1, in the Methodist Hospital of hepatic insufficiency and paralytic ileus.

Thomas Lawson Stringer, Algonac, Mich.; University of Toronto Faculty of Medicine, Toronto, Ont., Canada, 1889; Victoria University Medical Department, Coburg, Ont., Canada, 1889; aged 81; died, March 10, of coronary thrombosis.

John S. Pearce, Portales, N. M.; Tulane University of Louisiana School of Medicine, New Orleans, 1895; aged 75; died, February 6, in the Memorial Hospital, Clovis, of septicemia due to ischiorectal abscess.

Harry Sherman Flynn ☉ Providence, R. I.; Harvard Medical School, Boston, 1893; aged 72; died, March 20, in the Rhode Island Hospital of fracture of the neck of the right femur and coronary occlusion.

Carl Niel Larsen, Broomfield, Colo.; Detroit College of Medicine and Surgery, 1915; served during the World War; instructor in physiology at his alma mater, 1916-1917; aged 51; died, February 13.

Thomas Francis Carroll, New York; Harvard Medical School, Boston, 1899; served during the World War; on the staff of the Veterans Administration Facility, Bronx, aged 67; died, February 7.

Israel Samuel Millstone, Gary, Ind.; Cleveland Homeopathic Medical College, 1900; at one time secretary of the board of health of Gary; aged 80; died, March 12, in the Mercy Hospital.

Nathan Barnet Jacobson, Long Beach, N. Y.; Jefferson Medical College of Philadelphia, 1913; aged 53; died, March 9, in Miami Beach, Fla., of chronic valvular disease and pulmonary infarction.

Edgar S. Ferris, New Castle, Ind.; Jefferson Medical College of Philadelphia, 1885; member of the Indiana State Medical Association; aged 76; died, March 17, of cerebral hemorrhage.

Martin Charles Gottschaldt, New York; University of the City of New York Medical Department, 1889; also a dentist; aged 81; died, February 25, of carcinoma of the sigmoid.

Bernard Edward Halligan, Oakland, Calif.; Creighton University School of Medicine, Omaha, 1931; on the staff of the Providence Hospital; aged 36; died, March 17, of Hodgkin's disease.

Frank E. Detrick, Quincy, Ohio; Medical College of Ohio, Cincinnati, 1906; member of the Ohio State Medical Association; aged 64; died, March 4, of epithelioma of the tongue.

Clarendon Atwood Foster, Los Angeles; Harvard Medical School, Boston, 1889; aged 77; died, March 13, in the Good Samaritan Hospital of coronary sclerosis and myocardial infarct.

Thomas Wickett, Hamilton, Ont., Canada; M.B., University of Toronto Faculty of Medicine, 1894; M.D., Trinity Medical College, Toronto, 1894; aged 77; died, January 12.

William H. Hannum, Paw Paw, W. Va.; University of the South Medical Department, Seawee, Tenn., 1898; aged 67; died, March 4, in the Memorial Hospital, Cumberland.

John Wilson Boggess Jr., Guntersville, Ala.; Emory University School of Medicine, Atlanta, 1929; member of the Medical Association of Georgia; aged 37; died, March 15.

James Knox Hall, Lyons, Ga.; Atlanta School of Medicine, 1908; member of the Medical Association of Georgia; aged 62; died, February 25, of angina pectoris and arteriosclerosis.

Mederic Le Moyne, Montreal, Que., Canada; Laval University Medical Faculty, Montreal, 1905; Laval University Faculty of Medicine, Quebec, 1906; died, February 27.

William A. Palmour, Gainesville, Ga.; Atlanta Medical College, 1886; member of the Medical Association of Georgia; for many years mayor; aged 76; died, February 4.

Frederick W. Lang, Marine City, Mich.; McGill University Faculty of Medicine, Montreal, Que., Canada, 1892; health officer; aged 75; died, March 20, of heart disease.

Horatio F. Chisholm, Cleveland; Chattanooga (Tenn.) Medical College, 1894; served during the World War; at one time British vice consul; aged 79; died, March 9.

Louise Krauss Ament, Siloam Springs, Ark. (licensed in Arkansas in 1908); formerly superintendent of the Lutheran Hospital, St. Louis; aged 66; died, February 11.

George Robert Seeber King ☉ Lake Butler, Fla.; College of Physicians and Surgeons, Baltimore, 1901; aged 63; died, February 28, in a hospital at Jacksonville.

Louis Blumenkranz, Chicago; Northwestern University Medical School, Chicago, 1910; aged 52; was killed, March 5, in an automobile accident near Ypsilanti, Mich.

Henry George G. Schmidt, Glendale, Calif.; Rush Medical College, Chicago, 1896; veteran of the Spanish-American and World wars; aged 68; died, February 10.

Darwin Marcel Short ☉ Owensville, Ind.; Western Reserve University School of Medicine, Cleveland, 1936; aged 36; died, February 7, of coronary thrombosis.

George John Ainley Thompson, London, Ont., Canada; Western University Faculty of Medicine, London, 1906; aged 79; died, February 16, in St. Petersburg, Fla.

Stillman B. Montique, Mount Clemens, Mich.; Hahnemann Medical College and Hospital, Chicago, 1895; aged 74; died, February 27, in St. Joseph's Hospital.

William M. Gamble, Centerville, Pa.; Western Pennsylvania Medical College, Pittsburgh, 1891; for many years deputy county coroner; aged 72; died, February 8.

William Woodhouse Scott, Hazelridge, Man., Canada; Manitoba Medical College, 1895; aged 78; died, March 20, of coronary thrombosis and chronic nephritis.

Walter S. Scully, Columbus, Ohio; Starling Medical College, Columbus, 1897; aged 69; died, March 2, in the Grant Hospital of cardiovascular renal disease.

John Wyatt Davis ☉ Lynchburg, Va. (licensed in Virginia in 1899); served during the World War; aged 65; died, February 28, of carcinoma of the lung.

George T. Brown, Atlanta, Ga.; Southern Medical College, Atlanta, 1892; served during the World War; aged 78; died, March 2, of strangulated hernia.

Lucien Smith, Chapin, Ill.; Rush Medical College, Chicago, 1899; served during the World War; aged 65; was found dead, March 12, of coronary occlusion.

John A. Innis, Grand Rapids, Mich.; Michigan College of Medicine and Surgery, Detroit, 1895; aged 71; died, March 17, of organic disease of the heart.

Charles Abram Shultes, Preston Hollow, N. Y.; Albany Medical College, 1898; aged 72; died, February 14, of angina pectoris and essential hypertension.

Samuel Henry Scruggs, Cloutierville, La.; University of Louisville (Ky.) Medical Department, 1888; aged 78; died, February 9, of coronary occlusion.

Louis Francis Lepage, Rimouski, Que., Canada; Laval University Faculty of Medicine, Quebec, 1885; aged 82; died in February of bronchopneumonia.

Thomas L. Phillips ☉ Oneida, Tenn.; Tennessee Medical College, Knoxville, 1908; veteran of the Spanish-American War; aged 61; died, February 11.

John Ransom Kight, Ennis, Texas; Gate City Medical College, Texarkana, Ark., 1904; Birmingham Medical College, 1909; aged 64; died, February 5.

Alexander Munro, Westmount, Que., Canada; McGill University Faculty of Medicine, Montreal, 1876; L.R.C.P., London, 1877; aged 97; died, February 12.

Wilbur Carl Tobey, Spring Valley, Ohio; Eclectic Medical Institute, Cincinnati, 1904; aged 59; died, February 21, of carbon monoxide gas poisoning.

Thomas Morrow McLenahan ☉ Pittsburgh; College of Physicians and Surgeons, Baltimore, 1893; aged 74; died, February 28, of coronary occlusion.

Arthur Lewis Sneed, Kansas City, Mo.; St. Louis College of Physicians and Surgeons, 1900; aged 68; died, February 25, of cardiac decompensation.

James N. Morrison, Benson, Ariz.; Hahnemann Medical College and Hospital, Chicago, 1885; aged 87; died, February 5, of carcinoma of the colon.

Jose Antonio Samaniego, Los Angeles; University of Pennsylvania Department of Medicine, Philadelphia, 1891; aged 72; died, February 25.

R. Frank Stovall ☉ Mimbres, N. M.; University of Louisville (Ky.) Medical Department, 1884; aged 76; died, February 20, of cerebral hemorrhage.

Frank Charles Lavers, New Ross, N. S., Canada; Queen's University Faculty of Medicine, Kingston, Ont., Canada, 1891; aged 75; died, January 16.

Joseph G. Dillon, Fargo, N. D.; Hahnemann Medical College and Hospital, Chicago, 1904; aged 64; died, March 17, of cerebral thrombosis.

Thomas Joseph Kearns, New York; Cornell University Medical College, New York, 1906; aged 59; died, March 19, of coronary thrombosis.

John Wesley Lee Brannon, Atlanta, Ga.; Atlanta Medical College, 1895; aged 67; died, March 15, of multiple sclerosis and myocardial fibrosis.

Sarah A. Davis Bean, Salem, Ore.; American Medical College, St. Louis, 1890; aged 74; died, March 10, of carcinoma of the bladder.

Thomas Francis Desmond, Webster City, Iowa; Rush Medical College, Chicago, 1895; aged 75; died, February 1, of cerebral hemorrhage.

Thomas Burgess, Trenton, Ill.; Rush Medical College, Chicago, 1893; aged 72; died, February 21, in the Deaconess Hospital, St. Louis.

Frederick P. Bellinger, Council Bluffs, Iowa; Albany (N. Y.) Medical College, 1880; aged 80; died, February 19, of bronchopneumonia.

Frederick Lohrstorfer, Port Huron, Mich.; University of Michigan Department of Medicine, Ann Arbor, 1886; aged 77; died, February 17.

Victor Bourgeault, Saskatoon, Sask., Canada; Victoria University Medical Department, Coburg, Ont., 1888; aged 77; died, February 15.

John Havelock Eastwood, Peterborough, Ont., Canada; University of Toronto Faculty of Medicine, 1887; aged 76; died, February 17.

Shea Edward Prince, Shreveport, La.; College of Physicians and Surgeons, Baltimore, 1896; bank president; aged 71; died, February 6.

John Owen McQueen, Summersville, W. Va.; Kentucky School of Medicine, Louisville, 1892; aged 68; died, February 14, of pneumonia.

Walter Ross Lane, Los Angeles; University of Toronto Faculty of Medicine, Toronto, Canada, 1918; aged 47; died, February 26.

Hector McLean Paterson, Rodney, Ont., Canada; University of Toronto Faculty of Medicine, 1895; aged 69; died, February 22.

Irvine John Leatherdale, Jarvis, Ont., Canada; Western University Faculty of Medicine, London, 1915; aged 51; died, February 11.

Joseph Franklin Bond, Wabasha, Minn.; Rush Medical College, Chicago, 1885; aged 78; died, March 27, of coronary thrombosis.

Joseph F. Beakley, Shannon, Texas; College of Physicians and Surgeons, Dallas, Texas, 1907; aged 69; died in February.

Samuel Hodgins Ralston, Pittsburgh; Western Pennsylvania Medical College, Pittsburgh, 1896; aged 72; died, February 13.

Charles Gardner Child Jr., New York; Yale University School of Medicine, New Haven, Conn., 1895; aged 67; died, March 4.

Anna Elizabeth Ellsworth, Wichita, Kan.; Kansas City (Mo.) Homeopathic Medical College, 1896; aged 74; died, February 14.

Harry Thomas O'Connor, Pittsburgh; Western Pennsylvania Medical College, Pittsburgh, 1905; aged 58; died, February 23.

Isaac F. Mallett, Kansas City, Kan. (licensed in Kansas in 1901); aged 84; died, February 23, of myocarditis and hypertension.

Nellie May Johnson, Tulsa, Okla.; Hahnemann Medical College and Hospital, Chicago, 1906; aged 63; died, February 18.

George C. E. Vogler, Frederick, Md.; Baltimore Medical College, 1894; aged 76; died, February 8, of coronary thrombosis.

Ladislav Victor Stranz, Whiting, Ind.; Dunham Medical College, Chicago, 1896; aged 72; was found dead in March.

John O. Scheel, Hamilton, Ohio; Medical College of Ohio, Cincinnati, 1891; aged 83; died, February 6.

Paul Guttman, Kellnersville, Wis.; Milwaukee Medical College, 1902; aged 79; died, February 17.

Correspondence

THE LIBRARY OF SIR D'ARCY POWER

To the Editor:—I find that it is no longer safe to keep my carefully selected medical library under one roof in London at the present time, as my house has been bombed more than once. I have decided, therefore, to sell it within the next few weeks at Messrs. Sotheby's Auction Rooms at 34 New Bond Street, London W/1.

The library includes many autographed copies from my friends in the United States, notably Sir William Osler and Dr. Harvey Cushing, as well as "The Wonderful One-Hoss Shay" given me by Dr. Oliver Wendell Holmes. There is a remarkable collection of the "Regimen Sanitatis Salerni," some sixty editions in English, French and German, dating from before the time of printing until 1915, when it was last printed at Liège during the siege to show the Germans that work was being carried on as before. The object of this collection was to indicate how successive editors had enlarged on it since Arnold de Villanova first dedicated a few hundred verses to the son of William the Conqueror. It consists of a collection of receipts dealing with dietetics and various details appertaining to health, many of which have passed into the folk lore of all European countries. It opens with the statement that Dr. Quiet and Dr. Diet are the best physicians. There is also a unique copy of Dr. Bayley's treatise on eyesight, dated 1595. This small volume he signed in full when he gave it to the Lord Chief Justice of King James I. Its authorship had previously been unknown. There is also a copy of the 1552 edition of the Woman's Book. In addition to these treasures there is a very complete collection of the writings of the great English surgeons from 1565 to the present day.

D'ARCY POWER, F.R.C.S.,
53 Murray Road, Northwood,
Middlesex, England.

MEDICAL JARGON

To the Editor:—I was pleased to note that others besides myself take occasion to point out the extent to which medical jargon is used. Both Dr. Spillman (THE JOURNAL, January 18, p. 247) and Dr. Royster (ibid., March 8, p. 1022) object to confusing abbreviations and contractions, meaningless diction, misuse of words, colloquialism and errors in grammar and rhetoric in medical speech and literature. In the past, McCrae (The Use of Words, THE JOURNAL, July 10, 1915, p. 135), W. W. Keen, Thayer and others did the same.

From time to time I attempt to correct the language of students, but the blame should properly be placed on their instructors, including myself, who themselves are often careless in their speech and writing. I have gathered some of the most glaring abuses and have assembled them in an imaginary medical report as follows. It contains more than seventy-five errors or offenses. I have even included a split infinitive. I had first planned to emphasize the errors in italics, but nearly the whole composition would then have been italicized. To convey the meaning in some places phonetic spelling was needed; abbreviations are translated in the glossary.

So accustomed have physicians become to current lingo that several who read the following essay failed to note much wrong with it other than the misspelling and the absurd medical sequence.

The case was doubtful and looked pretty much like stomach flu or Coke's infection. His white cells weren't high, the polys were o.k. and the lymph glands weren't markedly enlarged. The past history was irrelevant. I did a urine on him but he only had 3 pus cells and no acid-fast organ-

isms. The S.U.S. showed green strep and a few staph. The P.S.P., the B.U.N. and an E.K.G. were negative. The case didn't run a temperature and the blood chemistry was low. He was hospitalized and the G.U. service did a flat plate and a K.U.B. He wasn't cystoscoped and they didn't take a biopsy. The serology was negative. He wasn't luetic or a neuro. There was no question of C.P.C. or aortic regurg. A rectal and a basal rate was done on him. A C.B.C. was done for the C.P.C. None of the findings were helpful. I contacted the surgical staff but the Prof. wouldn't operate the case, because he couldn't locate the pathology. He ordered him prepped for a G.I. series but there were no X-ray changes. He put a Waggonstein down. You don't have an acute abdomen with yer white count normal, and you run a temperature and yer pulse is high. The case was clinicked.

The individual picked up an upper respiratory infection and a strep throat. It went to his left chest and his temp shot up, but I couldn't find any bugs except higher type pneumos and cock-eye of the mouth group in his sputum. He was Schicked and Dicked. I didn't want him to suddenly die on me, so I sedated him with M.S., forced fluids, put him on intravenous glucose, took him off iodides and got ready to transfuse him in case he hemorrhaged from the tissue infection.

Glossary: Coke's infection—tuberculosis.
S.U.S.—stained urinary sediment.
P.S.P.—phenolsulfonphthalein test.
B.U.N.—blood urea nitrogen.
K.U.B.—roentgenogram of the kidney, ureter, bladder.
C.P.C.—chronic passive congestion.
C.B.C.—complete blood count.
C.P.C.—clinical-pathologic conference.
M.S.—morphine sulfate.
Prepped—prepared.
Cock-eye—cocci.
Waggonstein—Wangensteen suction apparatus.

HOBART A. REIMANN, M.D., Philadelphia.

TREATMENT OF DELAYED MENSTRUATION WITH PROSTIGMINE METHYLSULFATE

To the Editor:—To the already published reports and correspondence on the treatment of delayed menstruation with prostigmine methylsulfate we wish to add our experience.

First, a brief comment regarding the communication of Dr. Alexander Winter in THE JOURNAL, Dec. 14, 1940: Although he states that he found four types of reactions, it seems to us that 3 of his patients confirmed the work of Soskin, Wachtel and Hechter, since 1 responded with a flow in forty-eight hours and 2 of those which did not so respond were pregnant. His case 4, which showed a negative Friedman reaction at the time although the patient was pregnant, is only a further confirmation.

Results with Prostigmine Methylsulfate

Patient	Age	Parity	Days Late	Prostigmine Methylsulfate	Response	Pregnant
1. J. G.	25	0	3	1/1 cc.	Positive in 16 hours	No
2. H. B.	21	1	16	1/1 cc. 2/2 cc.	Positive in 48 hours	No
3. D. B.	16	0	8	2/2 cc.	Positive in 24 hours	No
4. A. O.	25	1	8	3/1 cc.	Negative	Yes
5. (a) R. M.	24	0	8	1/1 cc.	Positive in 16 hours	No
5. (b) R. M.	24	0	9	3/1 cc.	Negative	Yes
6. M. S.	30	1	8	3/2 cc.	Negative	Probably

It will be noted that we are reporting results on 6 patients, 1 patient having been seen twice. Four responded by menstruating within forty-eight hours of the last dose, 2 having had one dose each, 1 two doses and 1 three doses. Of the 3 who did not respond, 2 are definitely pregnant clinically, and the third is in all likelihood also pregnant, although we have unfortunately lost sight of her and cannot confirm this impression. When patient 5 was not pregnant her response was

rapid. A few months later pregnancy ensued and the prostigmine did not affect her. We noted no untoward reactions to the drug and in this small group of patients, found it a very satisfactory early test for pregnancy.

CECIL G. SHEPS, M.D.
Winnipeg, Canada.

ZINC AND TISSUE ENZYMES

To the Editor:—In an editorial on "Zinc and Tissue Enzymes," April 19, THE JOURNAL stated that "the demonstration of the presence of zinc in the molecule is of special interest, not only because of the importance of this enzyme in the dynamics of carbon dioxide transport by the blood, but also because this is the first instance of the existence of a biologic compound containing zinc which is important to higher mammals."

Insulin was first obtained in crystalline form by Abel and his co-workers in 1926 from highly purified amorphous preparations. It has since been shown that this hormone is a protein and on hydrolysis yields amino acids, among which are tyrosine, cystine, glutamic acid, leucine, arginine, histidine, lysine, proline and phenylalanine.

Zinc has been found in the pancreas as well as in all commercial preparations of insulin examined by Scott and Fisher.

Scott and Fisher state: "The relation between zinc and insulin in the pancreas should not be overlooked. It might be pointed out that the hormone obviously exists in the pancreas in an inactive state, either as a precursor of insulin or in a combined form. It has been shown in previous communications that zinc is very closely associated with the chemistry of insulin in that the crystallization of insulin is readily effected by this substance. Furthermore, the pancreas is a comparatively rich source of zinc and contains many times the quantity of metal necessary for the crystallization of the insulin available in the gland. In the present communication it has been shown that the addition of this metal to insulin solutions materially affects the rate of action of the insulin. Because of these various facts it is not inconceivable that zinc may be one factor in the control of insulin liberation and its activity in the body."

The manner in which zinc is linked to insulin is not at present clearly understood. Sahyun, however, is of the opinion that at least two types of linkage may exist:

- (1) As a single salt $R(COO)_2Zn$
- (2) As a double salt $R-COO-Zn(X)$

Sahyun states that theoretically the amount of zinc that is assumed to be bound to the insulin molecule is about 0.2 mg. per thousand units.

ZOLTON T. WIRTSCHAFTER, M.D., Cleveland.

IS GLOBIN A HISTONE?

To the Editor:—In recent literature globin insulin has been erroneously referred to as a histone insulin. While there is some similarity between globin and the histones, the differences are so obvious that it is necessary to distinguish between them. For example, the average content of arginine and histidine in eight histones was 24.8 and 4.1 per cent respectively, whereas in globin it is 10.3 and 17.1 per cent (Kossel, Albrecht: The Protamines and the Histones, New York, Longmans, Green & Co., 1928). The histones yield so-called histopeptone when digested with gastric juice, which is not the case with globin. Also histones are toxic, whereas globin is nontoxic. The work by Anson and Mirsky (*J. Gen. Physiol.* 13:469 [March] 1930) has renewed interest in the globins, and more recently Haurowitz and Waelsch (quoted by Kroner, W., in Abderhalden, Emil: *Biochemisches Handlexikon*, Berlin, Julius

Springer, 1933, p. 234), Roche *Essai sur la biochimie générale et comparée des pigments respiratoires*, Paris, Masson & Cie, 1936), Hill and Holden (quoted by Kroner), Strauss and Collier (in Oppenheimer, C.: *Handbuch der Biochemie des Menschen und der Tiere*, ed. 2, Jena, Germany, Gustav Fischer, 1924, vol. 1, p. 668) and others have further extended Kossel's work, mostly from the physicochemical point of view. They found that globin is not a basic but a neutral protein, more similar to the albumins than to the histones, and that correspondingly native globin does not precipitate at its isoelectric point (pH 6.8), as opposed to the histones, which are basic, e. g. thymus histone has an isoelectric point of 8.5.

LOUIS BAUMAN, M.D., New York.

THE GASTROINTESTINAL EXAMINATION

To the Editor:—Dr. Ramsay Spillman's communication published in THE JOURNAL April 19 directs attention to certain fundamental difficulties such as the tendency to consider the roentgenologist as a technician rather than as a consultant.

The matter of medical costs is, of course, another fundamental question. It would seem that the cost of poor results following improper and insufficient treatment based on incorrect or incomplete diagnosis may be found to exceed the cost of better results following proper and sufficient treatment based on more correct and complete diagnosis.

"A proper examination of the complete tract" and of the entire patient will improve results and, by so doing, reduce costs.

GREGORY CONNELL, M.D., Oshkosh, Wis.

Medical Examinations and Licensure

COMING EXAMINATIONS

BOARDS OF MEDICAL EXAMINERS

BOARDS OF EXAMINERS IN THE BASIC SCIENCES

Examinations of boards of medical examiners and boards of examiners in the basic sciences were published in THE JOURNAL, May 10, page 2214.

NATIONAL BOARD OF MEDICAL EXAMINERS

NATIONAL BOARD OF MEDICAL EXAMINERS: Parts I and II. Various centers, June 23-25. Part III. Various centers, June or July. Exec. Sec., Mr. Everett S. Elwood, 225 S. 15th St., Philadelphia.

EXAMINING BOARDS IN SPECIALTIES

AMERICAN BOARD OF ANESTHESIOLOGY: *Written*. Part I. Various centers, Nov. 1. Final date for filing application is Aug. 4. Sec., Dr. Paul M. Wood, 745 Fifth Ave., New York City.

AMERICAN BOARD OF DERMATOLOGY AND SYPHILOLOGY: *Written*. Nov. 3. Final date for filing application is Sept. 23. *Oral*. Dec. 12-13. Final date for filing application is Nov. 8. Sec., Dr. C. Guy Lane, 416 Marlboro St., Boston.

AMERICAN BOARD OF INTERNAL MEDICINE: *Oral*. June, in advance of the meeting of the American Medical Association. *Written*. Oct. 20. Final date for filing application is Sept. 1. Sec., Dr. William S. Middleton, 1301 University Ave., Madison, Wis.

AMERICAN BOARD OF NEUROLOGICAL SURGERY: *Oral*. Philadelphia, June 6-7. Sec., Dr. R. Glen Spurling, 404 Brown Bldg., Louisville, Ky.

AMERICAN BOARD OF OBSTETRICS AND GYNECOLOGY: *Written*. Part I. Group B. Jan 3. *Oral*. Part II. Groups A and B. Atlantic City, May or June. Final date for filing application is 90 days in advance of the examination. Sec., Dr. Paul Titus, 1015 Highland Bldg., Pittsburgh.

AMERICAN BOARD OF OPHTHALMOLOGY: *Oral*. New York, June 2; Portland, July 15; Chicago, Oct. 18. *Written*. March 7, 1942. Sec., Dr. John Green, 6830 Waterman Ave. St. Louis.

AMERICAN BOARD OF ORTHOPAEDIC SURGERY: Washington, January. Final date for filing application is Nov. 1. Sec., Dr. Guy A. Caldwell, 1640 State St., New Orleans, La.

AMERICAN BOARD OF OTOLARYNGOLOGY: Chicago, Oct. 16-18. Final date for filing application is July 1. Sec., Dr. W. P. Wherry, 1509 Medical Arts Bldg., Omaha.

AMERICAN BOARD OF PEDIATRICS: *Oral*. Chicago, May 18, following the Region III meeting of the American Academy of Pediatrics. Boston, Oct. 7-8, immediately following the annual meeting of the American Academy of Pediatrics. *Written*. Locally, Aug. 22. Sec., Dr. C. A. Aldrich, 707 Fullerton Ave., Chicago.

AMERICAN BOARD OF RADIOLOGY: *Oral*. All groups. Cincinnati, Sept. 19-21. Final date for filing application is Aug. 1. Sec., Dr. Byrl R. Kirklint, 102-110 Second Ave., S. W., Rochester, Minn.

AMERICAN BOARD OF SURGERY: Part II. Philadelphia, May 28. Sec., Dr. J. Stewart Rodman, 225 S. Fifteenth St., Philadelphia.

AMERICAN BOARD OF UROLOGY: Chicago, February. Final date for filing application is three months before date of examination. Sec., Dr. Gilbert J. Thomas, 1009 Nicollet Ave., Minneapolis.

Bureau of Legal Medicine and Legislation

MEDICOLEGAL ABSTRACTS

Paternity: Right of Federal Courts to Require Blood Grouping Tests.—A child was born to the plaintiff during the pendency of her suit for maintenance against her husband, the defendant. The defendant, however, denied paternity, charged the plaintiff with adultery and brought a counterclaim for a divorce. Thereafter he asked the United States district court for the District of Columbia to order both parties to the marriage and the child to submit to blood grouping tests. The court granted the order requested and the plaintiff appealed to the United States Court of Appeals for the District of Columbia.

There was no question raised as to the admissibility in evidence of the results of the blood grouping tests as such. The value of such tests, said the Court of Appeals, as proof of nonpaternity is well known. The court relied on the Report of the Committee on Medicolegal Blood Grouping Tests of the American Medical Association (J. A. M. A. 108:2138 [June 19] 1937) to show that such tests, although they cannot prove paternity and cannot always disprove it, can conclusively disprove paternity in a great many cases provided the tests are performed by specially qualified experts. The theory of blood grouping tests is that when the bloods of mother and child belong to certain groups there are certain groups to which the father's blood cannot belong. If the putative father's blood is in such a group he is excluded, that is, he is not the actual father. The committee recommended that where necessary, laws should be passed which would authorize courts to order blood grouping tests in cases of disputed paternity and to receive the results thereof in evidence when they exclude the putative father. Such laws, continued the court, have been enacted in several states, and the use of such tests to disprove paternity, with or without a statute expressly so authorizing, has been approved in a number of court decisions.

Formerly, said the court, federal courts could not subject plaintiffs to a physical examination except in cases arising in states in which such examinations were authorized by statute. This rule of law was changed, however, when rule 35 (a) of the Rules of Civil Procedure for the United States district courts was adopted, which provides:

In an action in which the mental or physical condition of a party is in controversy, the court in which the action is pending may order him to submit to a physical or mental examination by a physician.

The court could not agree with the plaintiff's contention that this rule was unauthorized because it modified the "substantive rights" of the litigants. The rule relates exclusively to the obtaining of evidence and is therefore procedural rather than substantive. Also, the plaintiff's suggestion that the rule should be interpreted as limited in its application to actions for personal injuries did not meet with the court's approval, because such a possibility of limiting the rule must have been considered and rejected by the committee which prepared it. The language used in the rule is unlimited and so the effect of the rule should not be limited to actions of one class.

Furthermore, the court was unable to agree with the plaintiff's further contention that the "physical condition of a party" was not in controversy. According to the Century Dictionary the term "condition" includes or is synonymous with "characteristic." Clearly the characteristics of a person's blood which are expressed in terms of red and white corpuscles, or of hemoglobin, are a part of his "physical condition." In the judgment of the court, characteristics which are expressed in terms of blood groupings are likewise part of a person's "physical condition." The fact that blood grouping remains the same throughout life differentiates it from some aspects of "physical condition" but not from all. The court was also of the opinion that both the plaintiff and the child, as well as the defendant, were parties to the suit within the meaning of rule 35 (a). There are many instances in which a real party in interest is not named as a party in the title of a lawsuit. In the present case the suit for maintenance was

as much for the infant's benefit as for the mother's. In fact, said the court, socially the infant is the most important party. If the infant is the offspring of the defendant, the tests will prove nothing and harm no one; if the defendant is not the father of the infant, then it would be unjust to prevent him from proving that fact by scientific tests. The court concluded that rule 35 (a) was applicable to the present case and that the district court had properly ordered the parties to the marriage and the child to submit to blood grouping tests. Judgment of the district court was therefore affirmed. —*Beach v. Beach*, 114 F. (2d) 479 (1940).

Evidence: Admissibility and Effect of Blood Grouping Tests for Determination of Nonpaternity.—The plaintiff and the defendant were married sometime prior to April 21, 1939, on which date the plaintiff, the wife, filed a petition to require her husband, the defendant, to contribute to her support. At that time she was pregnant, and in September she gave birth to a child. In January 1940 she petitioned the domestic relations court of the city of New York, family court division, Queens County, for an increase of the weekly allowance, which the defendant was paying to her, so that it would include support for the infant. At the hearing on this petition, three months after the birth of the child, the defendant for the first time charged that the plaintiff had had intercourse with another man prior to the marriage and requested a blood test to determine the child's paternity. Subsequently two blood grouping tests were made on samples of blood taken from the plaintiff, the defendant and the infant. At a later hearing on this petition before the domestic relations court, in May 1940, both parties admitted that they had had sexual relations with each other prior to their marriage and that they were married after the plaintiff had told the defendant that she was pregnant by him. The plaintiff, however, denied that she had had relations with any one else and no evidence was produced to contradict that statement. The medical expert who had made the blood grouping tests was permitted to introduce in evidence the results of these tests and to testify that it was highly improbable that the defendant was the father of the infant. The domestic relations court was therefore called on to pass on the admissibility of such testimony.

The medical expert, said the court, admittedly was an authority on the subject of blood grouping. He testified that there are two laws of heredity and two separate blood grouping tests for the determination of nonpaternity based on such laws, the M and N (Landsteiner-Levine) test and the A and B (Bernstein) test. He stated that nonconformity to the first law is considered absolute proof of nonpaternity, while nonconformity to the second law "should perhaps only be considered strong evidence that paternity is very unlikely." He testified that he had performed both tests in this case with the following results: wife—O or MN; husband—AB or N, and infant—O or N. He expressed his opinion that the results of the M and N test did not exclude the defendant as the father of the child but that the results of the A and B test showed that it was highly improbable that the defendant was the infant's father because, according to Bernstein's theory, "a parent of group AB, irrespective of the blood of the other parent, cannot have a child of group O."

The presumption of the legitimacy of a child born during wedlock, said the court, is one of the strongest and most persuasive known to the law and may be overcome only by clear and convincing evidence. Legitimacy is presumed even though the wife is proved to have at times been guilty of infidelity. The court could not agree with the defendant's contention that it should disregard all the affirmative and uncontradictory evidence and consider only the negative evidence of the results of the blood grouping tests because statutes made it mandatory to accept the results of the blood grouping tests, not simply as evidence in the case but as evidence conclusively establishing the fact of nonpaternity. Section 126-a of the Domestic Relations Law provides:

Blood grouping tests. The court, on motion of the defendant, shall order the mother, her child and the defendant to submit to one or more blood grouping tests by a duly qualified physician to determine whether or not the defendant can be excluded as being the father of the child, and the results of such tests may be received in evidence but only in cases where definite exclusion is established.

Section 306-a of the Civil Practice Act contains substantially the same provisions and also provides that "the results of such tests may be received in evidence but only in cases where definite exclusion is established." By clear implication, said the court, the effect of this language is to substitute the medical expert for the court as the determiner of the fact of exclusion of paternity and to declare that the results of the blood grouping test shall be accepted as the fact of exclusion, because according to this language "the exclusion as to paternity is already determined before the facts establishing the exclusion are submitted in evidence." Fingerprints and photographs, continued the court, which do not require involved processes, are not even admitted as conclusive evidence. Why then should blood grouping tests be so admitted when they are based on complicated chemical processes and experimentation, made outside the court room, which involve questions of elemental and complex genetic and biologic processes and are dependent on the proper professional skill of the person carrying out the test, the careful storage and preservation of agents and reagents, the continuous retention of potencies and undiminished attraction of the substances, the vigor or power of resistance of blood serums and blood corpuscles to these chemical properties and many other elements, circumstances and conditions. While the courts are ever receptive to new facts discovered in the constant march of science and discovery, this commendable and sympathetic attitude must always be governed with a prudent and watchful guardianship to assure equal protection to all evidence from whatever source, each standing on the level plane and granite foundation of credibility, certainty and fact. Indeed, it may be seriously questioned whether the "results" of any extended medical experimentation warrant a statutory certification of the efficiency of the chemicals used and of the infallibility of their chemical reaction, or justify a statutory guarantee of the character and skill of the experimenter. In the opinion of the court the results of blood grouping tests, by reason of their involved experimentation, and expert testimony based thereon are entitled to no more credibility than any other evidence. The court suggested that the law should be amended so as to authorize the domestic relations court in its discretion to order the making of a blood grouping test but that as a prerequisite to the issuance of such an order there must be preliminary proof of nonpaternity. Also, the court believed that section 306-a of the Civil Practice Act should be clarified and amended so as to eliminate the implication of certainty of the results of blood grouping tests as to exclusion, if, indeed, the obvious uncertainties of these experimentations at their present stage warrant for them any enhanced place among the rules of evidence. The court concluded, therefore, that the negative expert testimony as to the results of the blood grouping tests "establishing nonpaternity" was insufficient to overcome the affirmative evidence in the case which conclusively established that the defendant was the father of the infant. Accordingly, the court ordered the defendant to pay an increased weekly allowance for support of the infant.—*Harding v. Harding*, 22 N. Y. S. (2d) 810 (New York, 1940).

Liability of Defendant in Personal Injury Claim for Unauthorized Physical Examinations of Plaintiff.—While the plaintiff was confined to her bed because of injuries resulting from a fall in the defendant store, the defendant's physician entered her room on three separate occasions and made physical examinations of her without her consent. The plaintiff subsequently sued the defendant store and its insurance carrier for trespass because of such unauthorized physical examinations and obtained a judgment in her favor. On appeal by the defendants to the court of appeals of Georgia, division 2, the court held that the judgment for the plaintiff was proper because a defendant in a personal injury claim has no absolute right to have a physical examination made of the claimant. The court concluded that the defendants, by forcing such physical examinations on the plaintiff, committed a trespass on the plaintiff for which they were liable. Judgment for the plaintiff was therefore affirmed.—*S. H. Kruss & Co. v. Crouch et al.*; *Liberty Mut. Ins. Co. v. Same*, 5 S. E. (2d) 709 (Ga., 1939).

Current Medical Literature

AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1931 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied by stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (*) are abstracted below.

Colloidal Aluminum Hydroxide for Gastroduodenal Hemorrhage.—During four years Woldman treated 144 patients with massive gastroduodenal hemorrhage by the continuous administration of colloidal aluminum hydroxide. Patients with blood streaked or occasional "coffee ground" vomitus, occult blood in the stools or rare tarry stools are not considered. There were 3 deaths among the series, or a mortality rate of 2 per cent as contrasted with 28 per cent during a similar period at the same hospital preceding continuous administration of colloidal aluminum hydroxide. The method presents certain advantages over other methods of treatment: 1. It is a harmless, nonabsorbable astringent which is capable of hastening clot formation. 2. By virtue of its antacid properties it can prevent the digestion of the clot by continuously neutralizing the excess acid in the stomach, without danger of alkalosis. 3. Because it is a gelatinous substance, it has the additional advantage of mechanically protecting the lesion. 4. As a result of its continuous administration the delicate granulation tissue formed in the process of healing is not destroyed by the accumulation of acid during the night, and thus healing is permitted. The treatment arrests the bleeding and protects the ulcer by facilitating its healing.

Magnesium Trisilicate.—Kraemer compares the neutralizing powers of various antacids used in treating peptic ulcer and discusses the disadvantages of some of them. He believes that a theoretical ideal antacid should possess the following properties: It should be inexpensive, tasteless and not astringent to the mouth mucosa. A small amount of it should neutralize a large amount of acid. It should adsorb pepsin, should be neither constipating nor laxative, should be insoluble so as not to leave the stomach too quickly, should have a prolonged action and should not stimulate a secondary acid rise. Its cation should be unabsorbable so that alkalosis cannot occur. No distressing gases should evolve after its interaction with hydrochloric acid. The author states that magnesium trisilicate N. N. R. approaches this theoretical ideal as closely as any antacid that he used. In susceptible individuals it does have a slight stimulating action on the colon, but he has not encountered the irritating watery movements which so often follow magnesium oxide or carbonate therapy. Magnesium trisilicate has a prolonged neutralizing action in vivo. Many brands offered as magnesium trisilicate do not reach the standards set down by Mutch, who reported that each of seven

brands offered as magnesium trisilicate were different products. Acceptance for N. N. R. should result in a uniformity of the products offered for sale.

Frontal Lobectomy for Brain Tumors.—Stookey and his associates discuss their observations of frontal lobectomy for 11 gliomas of the frontal lobe, 3 of which were glioblastomas and the others astrocytomas. All the patients survived the operation and, with the exception of the 3 patients who had extensive glioblastomas, all are alive and carrying on useful lives. In 6 of the patients with astrocytoma the authors were able to excise the tumor completely and, they hope, effect a cure. In the others the tumor extended beyond the line of excision, either dorsally into the motor area or across the midline into the corpus callosum. They have shown some improvement and have made fair social adjustments. More thorough and painstaking clinical studies are essential to detect absence of the frontal lobe after its removal than necessary to determine the presence of a frontal lobe tumor. The frontal lobes are primarily association centers receiving impulses from all other parts of the brain. They are so connected that the proper function of each is dependent on impulses of a certain order and frequency reaching it through the association paths between the two. The study of the 11 patients consisted of a complete neurologic examination on admission and follow-up by social workers at regular intervals. The conclusion reached is that the patients who had their lesion completely excised, whether from the dominant or the nondominant hemisphere,

were intact with regard to their past and present life. They appeared genuine in their responses, and on nonpsychiatric investigation it would be exceedingly difficult to detect that anything had been wrong. Several of them functioned on a better level than before operation. They showed little impairment of general intelligence, planned and executed household duties competently and were able to sew, market, cook and plan for guests and the like. The common everyday performances were not slowed up. In some instances a lack of distractibility was notable. There was no hesitation in putting into effect a decision, and the decision once made was maintained until executed. There was a complete return of the former emotional tone. Frigidity developed in only 1 patient. Some of the patients showed distinct evidence of a new ability to learn. None showed any loss of inhibition or any spatial disorientation. Among the patients in whom the tumor extended beyond the line of incision the results were different. The patients were shallow emotionally, listless, indifferent and lacking in initiative. Three of the patients were able to care for their homes and children and to adjust themselves mentally if no complex situation arose. They were able to talk intelligently with one or two persons but were unable to carry on a conversation with a number of people or in a crowd. The cases offer confirmatory evidence for the theory that when the lesion was completely removed the intact lobe freed from the distorted impulses due to disease of the opposite side proved able to carry on for all practical purposes as efficiently as before. On the other hand, when only partial removal was effected, though there was some improvement an irritant still remained which interfered with synchronous function of the two lobes.

Subdural Hematoma.—Laudig and his colleagues studied 143 cases of subdural hematoma encountered between July 1934 and July 1939. The cases represent all patients in whom the lesion was verified either by operation or at necropsy. The data indicate that most subdural hemorrhages arise from a laceration of a cortical vessel resulting from trauma to the head. Frequently there is a concomitant traumatic lesion of the brain, and its effects cannot be delineated from those produced by the blood clot in the subdural space. A few severely injured patients will recover after the removal of the subdural hematoma, and generally the recovery can be attributed to the prompt removal of the blood clot. The clinical course of some patients who survive the acute phase of a cerebral insult accompanied by a subdural hematoma suggests that an increase in the size of the subdural collection may occur. Repeated encephalograms, at varying intervals, of patients with a subdural collection have demonstrated a progressive shift of the ventricular system away from the lesion. This shift seems to result from an increase in the volume of the subdural collection. Whenever the diagnosis of subdural hematoma is doubtful, air studies may clarify the issue. Surgical removal of a subdural collection is the only therapy. If feasible, operation should be deferred until the acute effects of the injury to the intracranial structures have moderated. The 143 subdural hematomas were encountered among 10,265 cases of cerebral injuries. The position of a subdural hematoma did not necessarily signify the region from which the bleeding occurred. Many necropsy specimens disclosed a laceration of the temporal and/or the orbital surface of the frontal lobe associated with a sizable hematoma in the parasagittal position, yet there was no injury to the crossing veins in this region nor could attachment of the blood clot to the underlying pia-arachnoid be shown. Thirty-two patients were not operated on. They were all severely injured and died shortly after admission. Their lesions were verified at necropsy. A subdural hematoma was suspected in many, but the general physical states of the patients were such that operation was inadvisable. Sixty-six of the 111 patients operated on recovered. They have been followed by the outpatient department and their sequelae (headache, dizziness, convulsions and the like) have occurred in about the same proportion as that encountered in any group of patients who have sustained moderate to severe trauma to the brain. Three patients were committed to psychiatric care and on the average recovered in one year's time and discharged.

Total Thyroidectomy for Heart Disease.—According to Cutler and Hoerr, 57 total thyroidectomies were performed for heart disease at the Peter Bent Brigham Hospital during 1932, 1933 and 1934. Thirty-two of the patients had intractable angina pectoris and 25 some form of congestive heart failure which did not respond to the usual conservative treatment measures. Sixteen patients survived a five year period, 12 in the angina pectoris group and 4 in the group with congestive failure. All but 1 of the patients were examined by the authors. The 41 patients who did not survive were closely followed by the hospital dispensary, and the data concerning the cause of their death are based on the necropsies of 14; 7 deaths occurred in the hospital, but necropsy was refused and the data for the remaining 20 were compiled from letters from attending physicians or death certificates. There were 5 postoperative deaths; 4 of these and all but 3 of the later deaths were attributable to heart disease. The best results were obtained in patients with angina pectoris. Twenty-six of the 27 patients surviving more than six months were relieved of pain in some degree for six months or longer, and 8 of the 12 who survived for five years had sustained relief. The preoperative evidence of congestive failure or cardiac enlargement of the group was an unfavorable prognostic sign for long survival. Fifteen of the 25 patients with congestive failure lived for six months or more, and 12 of these had relief for six months or longer. Four survived five years; 3 had sustained relief and 2 of these 3 died of congestive failure in the sixth year after operation. Results were better in the group having congestive failure from chronic rheumatic valvular disease than from arteriosclerotic or hypertensive heart disease. The authors conclude that total thyroidectomy in a selected group of patients with intractable angina pectoris is a worth while therapeutic measure.

Tumors of Brain in Aged Persons.—From the records of the Mayo Clinic for the past twenty years, Moersch and his colleagues collected 100 cases of verified cerebral tumors among patients 60 or more years of age. The series excludes patients sent home after roentgen therapy for a supposed tumor, those for whom decompression was performed after a diagnosis of tumor but concerning whom there was no positive diagnosis at biopsy, patients who refused or were advised against operation, patients for whom palliative decompression was performed for a supposed primary or metastatic tumor and patients sent home with a diagnosis of a vascular cerebral lesion, senility, organic dementia or the like but in whom the possibility of such a tumor had to be entertained. Glioblastoma multiforme, meningioma and acoustic neuroma, in the order named, made up 82 per cent of the tumors. The cerebrum was the most common site (69 per cent) of the tumors. As a result of the advancing years, symptoms and signs were exceedingly variable,

resulting in difficult diagnostic problems. Papilledema or visual defects were of important diagnostic aid; however, their absence could not be accepted as proof that a cerebral tumor did not exist. Eighty-six of the 100 patients were operated on and the diagnosis verified by biopsy or postmortem study. The remaining 14 patients died without having had an operation, and postmortem studies verified the diagnosis. Of the 86 patients operated on 37, or 43 per cent, died postoperatively from the results of the operation, postoperative complications or the effects of a rapidly growing tumor. In many of these elderly patients operation was undertaken either in the hope of saving what vision remained or of saving life. Patients without papilledema or other evidence of increased intracranial pressure presented the most serious operative risk. The excellent operative results of younger patients compensate in a measure for the high mortality rate among the aged patients. The average length of life of the 11 patients with glioblastoma multiforme that could be followed up after operation was four months, the postoperative duration of life of the 12 patients with meningiomas was two and a half years and for the 9 with acoustic neuromas it was three and a half years. The authors state that it is possible that some of the patients whom they were unable to follow may have survived for many years. However, in this age group the natural expectancy of life is relatively short, and some of the patients undoubtedly died of causes other than those resulting from the tumor.

Ocular Lymphogranuloma Venereum.—Macnie performed Frei tests on 30 patients with uveitis and keratoconjunctivitis who were suspected of having lymphogranuloma venereum. Four of these gave positive reactions when first tested. In each, pathologic conditions other than the lymphogranuloma venereum were found which could have been etiologic factors in the ocular disease. An experimental study, to confirm the fact that the ocular lesions were due to inoculation of the virus of lymphogranuloma venereum, revealed that 13 of 19 guinea pigs had a conjunctival infection with chemosis of the conjunctiva, associated with infiltration and peripheral vascularization of the cornea in from twenty-four to forty-eight hours after a suspension of mouse brain infected with the virus of lymphogranuloma venereum was injected into the anterior chamber of one eye of each animal. The intensity of the infection increased until a band of vascularized cornea 2 mm. in width surrounded the densely infiltrated central zone, through which the deeper structures of the eye could not be seen. The process reached maximal intensity in from seven to ten days and then slowly subsided. The eye in no instance returned to normal during the ten weeks of observation. The intraocular tension seemed to be low normal in all but 1 of the 13 eyes. In this eye ectasia of the cornea developed. In the 6 remaining eyes there was slight injection at the sites of fixation. This appeared immediately and subsided in from three to five days. In the corneas there also was slight infiltration and this was also gradually absorbed. The infection could not be produced in other guinea pig eyes by transfer of aqueous. Some of the same aqueous inoculated intracerebrally produced the symptoms of lymphogranuloma venereum in white mice. Infected aqueous was introduced into a tissue culture, and an antigen from this culture produced a positive Frei reaction. Tests for cutaneous sensitivity in 9

infected guinea pigs yielded four positive, two doubtful and three negative results. Smears from the iris and posterior surface of the cornea of infected guinea pig eyes, when stained according to the Giemsa method, showed structures of varying size resembling the elementary and initial bodies of trachoma. The author concludes that the virus of lymphogranuloma venereum is one of the causes of the oculoglandular syndrome of Parinaud and may be a cause of other ocular diseases, particularly of inflammations of the uveal tract. It should be considered as a possible causal factor in ocular infections of unknown etiology.

Intimal Hemorrhages and Precipitation of Coronary Thrombi.—Paterson reviews the evidence which supports the hypothesis that the common cause of coronary thrombosis is intimal hemorrhage. The hemorrhages result from the rupture of capillaries which are derived from the coronary lumen. Increased intracapillary pressure, due to persistent hypertension, is a major factor in the formation of intimal hemorrhages and in the precipitation of coronary thrombi. Transient hypertension following violent physical exertion or emotion will have a similar effect, and therefore these activities should be avoided by patients with coronary artery disease. From a study of the relation of vitamin C deficiency to the incidence of coronary thrombosis and the available evidence it appears that increased capillary fragility due to an inadequate concentration of this vitamin in the blood may be a causative factor in some cases of coronary thrombosis. Therefore such patients should be assured of an adequate vitamin C intake. Calcification of atherosclerotic plaques may be a protection against intimal hemorrhages and coronary thrombosis, and an ample calcium intake is therefore also recommended. The evidence shows that hypertension (persistent or transient), increased capillary fragility due to avitaminosis C and inadequate calcification of atheromatous foci are concerned in the formation of intimal hemorrhages.

Artificial Fever, Chemotherapy and Vaccinotherapy for Neurosyphilis.—From October 1937 to January 1940 Marin treated 220 patients suffering from neurosyphilis, chorea, multiple sclerosis, gonorrhea and other diseases with a combination of vaccine, chemotherapy and hyperpyrexia. His treatment consisted of an injection at 7 a. m. (for example on Monday) of trypanamide followed immediately by a session of five hours of artificial fever at 105 F. On Wednesday and Friday the patient is given an injection of fever-producing vaccine (such as pyriker) and of bismuth. Vaccines give an average temperature of 104 F. This procedure is repeated for ten weeks, after which the patient is treated at the outpatient clinic with pentavalents or neoarsphenamine and bismuth compounds. The 220 patients received 1,318 treatments of about five hours each in a total of 7,568 hours. There was 1 death. Among the group there were 137 patients with neurosyphilis, and 89 of these had fifty hours of artificial fever combined with vaccines and chemotherapy. Far from being debilitating, the combined therapy produced general improvement. The majority of the working asymptomatic syphilitic persons could carry on their occupation. Restlessness, insomnia and headaches were lessened or disappeared during the hyperpyrexia or shortly afterward. The weight of many emaciated patients increased. In tabes, lightning pains and vomiting decreased or disappeared. There was improvement in muscular strength or in gait. In dementia paralytica the remissions (complete or incomplete) usually occurred between the fifth and the tenth session of pyrotherapy. In 3 there was a "flare-up" of the delirium by the end of the fiftieth hour; 2 of these had complete remissions during the next two months. The percentage of full remissions (return to former occupation) among the dementia paralytica patients was 54. Of the 89 patients, 39 are eliminated from serologic study; 18 have been under treatment for less than six months and 21 discontinued treatment at the outpatient clinic, followed it irregularly or refused to have a third lumbar puncture (one before the combined treatment, one after and one after adequate outpatient chemotherapy). The 50 patients were under treatment for from six to eighteen months. Although eighteen months of treatment is not long in cases of neurosyphilis, and six months is almost insignificant, the patients are considered as one group. Before treatment there were 68 per cent of strongly positive fluids as compared with 26 per cent after. There are now 22 per cent of negative fluids, whereas there were none before treatment was started. The weakly positive and doubtful fluids, which at the onset were 16 per cent, are now 30 per cent. It is logical to expect that many of these will soon increase the proportion of the negative group. The 11 patients whose spinal fluid became negative did not all present the same degree of abnormality at the onset, nor did they respond evenly to the treatment.

Toxic Hepatitis Due to Sulfanilamide.—Berger and Applebaum report the second fatal case of subacute atrophy of the liver to be cited in the English literature. Permission for necropsy was not obtained, but through a puncture wound several small segments of liver tissue were obtained and the diagnosis was extensive necrosis and replacement fibrosis, with probable toxic hepatitis, subacute yellow atrophy and beginning toxic cirrhosis. From clinical observations the patient apparently had a normal liver by the usual standards of examination, until he began to take sulfanilamide. No other drug was taken, and there was no history of previous contact with hepatic irritants. He ingested 6.6 Gm. of sulfanilamide over three days, and six weeks later 20 Gm. over ten days. This was promptly followed by gastric upset, with nausea and vomiting, and about four days after the drug was discontinued jaundice, enlarged liver and spleen and later ascites developed. A reasonable if not a certain causal relationship can be accepted between the drug and the hepatitis. Further presumptive evidence may be had from the patient's statement that gastric disturbance promptly followed the taking of the tablets and promptly disappeared when discontinued. The case differs from the two fatal cases of hepatitis reported by Bannick, Brown and Foster in that they believed that their patients might possibly have suffered from pre-existing liver damage. It differs also from Garvin's fatal case, in which the hepatitis was complicated by exfoliative dermatitis and anemia, as there were no cutaneous lesions, appreciable anemia or evidence of previous hepatic damage. The possibility of a malignant condition suggested itself, but its absence was ruled out by the enlarged readily palpable spleen on the first admission, and the differential diagnosis in favor of hepatitis and cirrhosis and finally subacute atrophy (necrosis) of the liver was made. This impression was supported by a definite history of sulfanilamide ingestion, absence of malignant cells in the ascitic fluid, the negative peritoneoscopic examination as regards tumors, the interruption in the complete obstruction (evidenced by occasional hydrobilirubin in the stool and urobilinogen in the urine) and the subsequent decrease in the size of the liver. The experience confirms the view of Garvin and others that sulfanilamide should be listed among the agents which may cause severe hepatic damage and emphasizes the fact that it may be fatal. The danger of the indiscriminate use of sulfanilamide thus becomes obvious.

Prevention and Treatment of Shock in Combat Zone.

—Kendrick suggests the following preventive and treatment measures for shock which can be initiated early at the combat zone: At the battalion aid station hemorrhage can be controlled by the application of tight fitting dressings, packing the wounds with sterile gauze, ligating large bleeding points or by the application of tourniquets only when essential. The time of application should be noted on the emergency medical tag. If a sucking wound of the chest is found it should be closed by packing or immediate suturing. Fractures and extremities should be well splinted before the patient is moved. Bayonets, rifles, lumber and rolled blankets are poor substitutes for splints. Men with fractured vertebrae should be transported in hyperextension without an attempt at reduction. From $\frac{1}{4}$ to $\frac{1}{2}$ grain (0.016 to 0.03 Gm.) of morphine sulfate should be given to

control pain. A barbiturate, sodium amylal or pentobarbital sodium in approximately 3 grain (0.2 Gm.) doses should also be given orally. The administration of the drugs should be recorded on the emergency medical tag. Morphine should be withheld from patients with head injuries. Wounded men with no trauma to the abdomen should be given water when it is available. If possible from 50 to 100 cc. of concentrated plasma should be given the severely injured. Its injection at this time will do more to reduce the mortality from shock than any other single factor. Exposure to cold can be prevented by covering patients with blankets. Three blankets can be folded on a litter so as to provide four folds above and four beneath the patient. The supplying of blankets to the battalion aid station is the function of a collecting company and should be continuous. As little clothing as possible should be removed while dressings are applied, to prevent undue exposure. Infection in wounds is best prevented by early chemotherapeutics; therefore a sulfonamide compound in adequate dosage should be given orally and as early as possible and its concentration maintained by repeated doses at intervals of four hours. The effect of the drug is directly proportional to its concentration up to a therapeutic level. Shock is no contraindication to its administration. Dressings should be checked at collecting stations for severe hemorrhages, which, if present, should be controlled. A tourniquet, if applied at the aid station, should be released and reapplied only if necessary. If the patient needs fluids, 100 cc. of concentrated plasma should be injected intravenously. Antitetanic therapy and polyvalent antiperfringens serum should be given subcutaneously. Splints should be checked for proper application and comfort. Hot drinks (cocoa, coffee and tea) should be available except for those patients with abdominal injuries. When the foregoing measures have been performed, the severely injured should be placed in heated ambulances and evacuated to the casualty clearing station. Here wet clothing should be replaced and the patients placed in shock beds, the heads of which are elevated. Heat should be applied by hot water bottles to the axilla and groin. From 250 to 500 cc. of plasma of normal concentration should be given. The amount depends on the response of the patient. A sufficient quantity should be injected to prevent shock. High concentrations of oxygen should be administered by the B. L. B. (Boothby, Lovelace and Bulbulian) oxygen face mask. Hot drinks are indicated except for patients with abdominal injuries. Barbiturate medication should be repeated, especially when operative procedures are to be performed. Morphine sulfate may be repeated. When a surgical hospital or mobile surgical unit is attached to the casualty clearing station the severely injured who require surgical intervention should be operated on as soon as treatment has been effected. These units should carry trained anesthetists. The prognosis of certain types of injury (penetrating wounds of the chest, brain, abdomen and joints) depends and requires early attention before shock and infection ensue.

Blood Plasma.—Elliott and his associates have prepared blood plasma in large quantities in an entirely closed system. A 600 cc. transfuso-vac has been replaced by a 300 cc. centri-vac containing 35 cc. of anticoagulant. Two bottles of blood can be collected from each donor. The blood is collected in a vacuum, and contamination can occur only if the operator is careless in handling the needles. The sealed bottles of blood still under vacuum are stored at refrigerator temperature for one or two days, after which they are centrifugated for about one hour at 2,000 revolutions per minute. After centrifugation they are again refrigerated for a few hours so that the few cells that swirl in the supernatant plasma as the centrifuge comes to rest settle out. The protecting rubber diaphragm is removed from the centri-vacs, the rubber stoppers are sterilized, an air filter is inserted into one of the indentations and a valve is connected with the rubber tubing, which in turn is connected with a long aspirating needle and it is passed through the X mark in the rubber stopper of a plasma-vac. The long needle is thrust through the second indentation of the centri-vac and the plasma is aspirated into the plasma-vac. The second bottle is prepared in a similar manner and the plasma is aspirated. Merthiolate may be added in sufficient quantity so that the final concentration is 1:10,000, by aspirating the desired quantity of 1 per cent merthiolate from a sterile

15 cc. centrifuge tube between aspirations. In the event of war the great need for plasma cannot be supplied by one center. In the United States local voluntary donors can be enlisted through local Red Cross chapters. The machinery has already been set up. Blood can be collected in many hospitals and converted into plasma at central points. Bottles of blood can be shipped by mail, plane and bus and converted into plasma without the loss of a single bottle. The use of plasma as a substitute for whole blood has passed through the experimental stage and its effectiveness in shock, hemorrhage, burns and the hypoproteinemic state is now recognized. Its usefulness during war is being proved in the present conflict. With the technic presented, the authors believe that it should be possible for many institutions to enter into any program for the preparation of plasma in large quantities.

Brucellosis.—Fisher encountered 10 cases of brucellosis within eighteen months. He used sulfanilamide for the treatment of 8 and obtained good results. For the remaining 2 patients triple typhoid vaccine was also used after eight to ten days of sulfanilamide treatment. After two bouts of fever these patients were again given sulfanilamide. The temperature soon dropped to normal and remained there. In 1 patient, sulfapyridine was substituted for sulfanilamide and used in the same manner as in the treatment of pneumonia. The temperature became normal within thirty-six hours and remained there. Sulfanilamide had been used for eight days previously without any change in temperature. Two patients relapsed; in 1 relapse occurred twice, two and three weeks, respectively, after discontinuing sulfanilamide. The sulfanilamide had been used for two weeks during each course of treatment. Relapse in the second case was controlled more easily. Both patients eventually became afebrile. Eight of the 10 patients handled livestock, the 2 others neither handled livestock nor drank milk, and the source of their infection could not be traced. More public health measures may be necessary to curb a further increase of this disease.

Division of Femoral and Iliac Veins for Thrombophlebitis.—Homans states that bland, nonobstructing thrombosis of the leg, whether occurring in active life or during convalescence or invalidism in bed and whether confined to the venous plexuses among the muscles below the knee or also occupying the femoral and even the iliac veins, is a frequent source of pulmonary embolism. This type of thrombosis, though difficult to identify, can often be diagnosed, whether or not embolism has occurred, by a combination of clinical symptoms

with discomfort behind the knee on forced dorsiflexion of the foot. Conservative treatment of the disorder is usually justified, but, when embolism has occurred or when symptoms and signs have recurred at least once, exploration and division of the femoral vein are advisable. Exploration and division of the femoral and iliac veins may also be indicated for peripheral vasospasm, especially when the vein has been the seat of a previous thrombophlebitis, and repeated once or twice in an effort to guard against recurrence of pulmonary embolism. Division of the superficial femoral vein, in the presence of a bland non-obstructing thrombosis below the knee, is rapidly curative. It does not lead to swelling and cyanosis of the leg. Division of the common femoral and profunda veins for a bland non-obstructive thrombosis that occupies the femoral vein causes considerable edema and cyanosis. Division of the superficial femoral, common femoral or even common iliac vein following an old canalized thrombophlebitis causes little disturbance and may, by relief of reflex vasospasm and curtailment of backflow, benefit the venous circulation.

Amphetamine Sulfate for Functional Dysmenorrhea.—Thinking that a therapeutic agent causing relaxation of smooth muscle and increasing the sense of well being might be of value in the treatment of functional dysmenorrhea, Taylor tried amphetamine sulfate. She has used amphetamine sulfate successfully for dysmenorrhea in her practice for three years for 34 women with dysmenorrhea with no underlying responsible gynecologic disorder. Glandular dysfunction and organic lesions, when present, were treated appropriately before treatment with amphetamine sulfate was begun. The patients were given three trial doses of 2.5, 5 and 10 mg. of the drug during intermenstrual periods. A sufficient quantity of the drug for the next menstrual period was then given. No comment on the nature of the medication was made. The patients were instructed to take one 10 mg. tablet of amphetamine sulfate before breakfast for two days before the expected period and the day of the period. The dose was to be repeated if pain was not relieved. They were not permitted to take more than 20 mg. a day, or to take the second tablet after 2 p. m., without permission. The treatment lasted three or four days, depending on the expected duration of symptoms. On alternate periods the patients were unknowingly given placebos or analgesics (salicylates or codeine). No leading questions were asked, but the patients were instructed to describe the symptoms at each menstrual period. Among the 34 patients there were only two untoward reactions. The first was a manic phase induced by a test dose of 5 mg. of the drug in a patient who later was proved to have a manic depressive psychosis. The second was in a patient with anxiety neurosis who refused medication because palpitation occurred with the test dose. There was no indication of tolerance or habit formation. Amphetamine sulfate appeared not to have any effect on the amount of menstrual flow. The drug relieved pain, fatigue and depression of patients in whom other measures had failed. This was confirmed by the substitution of placebos or other medication during alternate periods when symptoms recurred. Of the patients, 40 per cent obtained complete relief and an equal number moderate relief. In 16 per cent the apparent benefit of the drug was not maintained, and 2 patients reported that they were worse under medication. It is concluded that amphetamine sulfate is valuable for treating dysmenorrhea and that it is well adapted to ambulatory patients.

Cancer in the Mentally Ill.—According to Peller and Stephenson, 9,503 patients were admitted to St. Elizabeths Hospital, Washington, D. C., from 1930 through 1939. During this time 4,529 patients were discharged and 2,665 died. The residence of all those who died ranged from a few weeks to almost fifty years. On the average 5,395 patients were on the rolls. During the ten years under consideration 227 patients with cancer were discovered, 189 of whom died in the hospital, 7 were discharged and 31 were still alive on Dec. 31, 1939. A postmortem examination was done of 155 of the cancer deaths. The distribution of the fatal primary cancers, according to site, does not reveal definite deviations from the expectancy. The percentage of cutaneous and lip cancer was much smaller than expected. The ratio of cancer deaths for the period (7.1 per cent) is low; the ratio for the years 1938 to 1940 is higher than for the years 1930 to 1937. The cancer mortality of the white psychotic patients (69 were Negroes) from the area is significantly lower than that of the corresponding white population of New York City. Two thirds of the patients were born in the South; one third were born in the North but lived in the South before admission to the hospital. For the patients born in the South and residing there before admission the mortality was 38.3 per cent less than the expectancy, while for those born farther north but who migrated to the South it was 27 per cent less than the expectancy. The cancer mortality of the psychotic ex-soldiers and of the Negro patients does not deviate from the data calculated on the cancer statistics of the white population of New York City. During the years 1938-1940 the number of cancer deaths exceeded tuberculosis deaths among the residents of St. Elizabeths Hospital; previous to 1938 tuberculosis deaths were more numerous. In 15 of the 94 male cancer patients and in 11 of the 61 female patients examined post mortem no metastases were found. Secondary involvement was most frequent in the lymph glands and liver. The liver of 61 patients (41 male and 20 female) was secondarily involved. The next sites in order of frequency were the lungs (15 cases in males and 14 in females), bones (18 cases), brain, peritoneum, adrenals, pleura and kidneys.

Meulengracht Diet for Bleeding Peptic Ulcer.—During four years Mayer and Lightbody treated 133 patients by the Meulengracht regimen or their modification of the method. All the patients made excellent recoveries. If indicated, various alkaline powders, creamalin, amphotel, iron preparations, liver

extract and vitamin C were given. There were 7 deaths among the 133 patients. Secondary hemorrhage occurred in 14 patients; this includes 2 of the patients who died. Eight patients were continued on the diet in spite of the hemorrhage and made excellent recoveries. The bleeding of 2 patients ceased when the Meulengracht regimen was discontinued and starvation therapy instituted. In 3, secondary bleeding occurred with both the Meulengracht and starvation treatment; 1 of these then had a gastric resection with excellent recovery and the remaining 2 eventually recovered. The diet failed to relieve 4 patients. These patients refused to eat because of abdominal pain after eating; they were then placed on a Sippy diet with relief of pain. A previous history highly suggestive of gastric or duodenal ulcer was given by 113 of the patients, while 64 showed definite roentgen signs. Some degree of anemia, at times requiring blood transfusions, was encountered in most of the patients. The patients improved more rapidly than those treated by the starvation method. This coincides with the experience of Schiodt. The authors feel that the Meulengracht diet has definite merit. Analysis of the deaths discloses that 2 patients had malignant disease, 2 died of cardiac disease while recovering from hemorrhage, 1 died within two days after hospital admission without having eaten any food, 1 died soon after roentgen examination, which seemed to institute an uncontrollable hemorrhage, and 1 died after being on the Meulengracht regimen for twelve days. The failures, secondary hemorrhage and abdominal pains that occurred are frequent complications among patients treated by the usual starvation methods. It was apparent to the authors that the patients tolerated the diet remarkably well, were comfortable, rested easily, required little morphine, usually only at the onset of the treatment, and seldom was it necessary to administer hypnotics. There was no begging for food and water. None of the patients became irrational. Some of the patients had been hospitalized previously for hematemesis and were treated by the starvation method. They all stated that this method was far more agreeable.

*Parathyroid Tumors Causing Hypercalcemia. M. C. Jobe, Denver.—p. 121.

Parathyroid Tumors Causing Hypercalcemia.—Jobe believes that earlier medical literature has been confused and that no doubt parathyroidectomies have been performed needlessly for osseous lesions or Ewing's tumor, for sarcoma of the bone, for metastatic carcinomatosis of the skeleton and especially for Paget's disease. As improved laboratory techniques have developed, agreement is crystallizing that unless hypercalcemia and hypercalciuria with a hypophosphatemia and an increase in plasma phosphatase are associated with roentgen signs of cystic formation in the skeleton or renal calculi and high hypercalcemia one is not justified in subjecting a patient to an exploratory operation for parathyroid tumor. The operation is hazardous. The differential diagnosis between hyperparathyroidism and similar appearing lesions of the skeleton, as Paget's disease, chiefly hinges on a careful history and physical examination and then on the absence of hypercalcemia. No case of Paget's disease has shown a definite hypercalcemia as does a parathyroid adenoma. Although the clinical observations of hyperparathyroidism are becoming more readily recognized, it is hoped that every aid in its diagnosis to rule out other bony lesions will be used. Only when a patient with the foregoing cardinal blood and roentgen changes is found in search for parathyroid tumor justified, otherwise the operation will be greatly abused and end in disappointment.

Vaginal Smears Correlated to Ovarian Function.

Bennett and Russell believe that study of the vaginal smear will aid in the proper diagnosis of many conditions now considered out of the realm of gynecology. They obtain the smear in the following manner: A sterile cotton-tipped applicator is moistened with tap or distilled water and inserted just within the introitus. The specimen is procured by a gentle rotary motion and then it is rolled on a clean slide and the material is allowed to dry at room temperature without fixation. Approximately 15,000 slides have been examined in the authors' clinic since 1935, and the results are as reliable as the fixation method. The vaginal smear of the pregnant woman at eighteen weeks contains many types of bacteria accompanying a luteal domination. However, the smear from her 18 week fetus shows that there is only follicular stimulation. This suggests that the ovaries of the fetus have begun to function and are practically independent of further maternal influence. The 7 lunar month fetus continues to exhibit a follicular stimulation, but the maternal vaginal smear now shows a predominant follicular influence. Smears from a full term baby and the mother on the day of birth give evidence of a similar hormone influence. Daily smears taken from the full term newborn infant show that follicular stimulation gradually decreases until there is no evidence of it by the time the baby is 94 days old. One of the plausible reasons for the high incidence of infections among premature female infants may be attributable to the fact that they are born during the luteal domination period and are not as well prepared for their new environment as the full term baby. No bacteria are found in the vaginal smears from either fetus or newborn infant until they have been exposed to a new environment. Estrogenic determinations of the placental blood from a normal pregnant woman at term recovered at cesarean section substantiate the vaginal smear findings that the parent does not control the ovarian functions of the fetus. The influence on the nursing baby's ovaries by the hormones in maternal milk is negligible, as exemplified by studies of smears from the mother and baby two hundred and twenty days after delivery. The follicular and luteal predominance recur at a definite cyclic period through the remainder of the normal individual's life

until changes of menopause take place. Abnormal ovarian conditions would alter this cyclic pattern. An article concerning these cases is to be published. However, the cycle of the mature female and a diagnosis of abnormal ovarian conditions may be predicted by studying the vaginal smears of the young female previous to the onset of the menses or puberty. Striking examples of pathologic ovarian conditions in the child are the prepubescents who menstruate, the child mothers and perhaps the baby who menstruates because of estrogenic overstimulation. The vaginal smear can aid in medicolegal questions demanding proof of criminal assault. Trauma can be diagnosed readily, and the authors have found spermatozoa in the vaginal smear two days after coitus. The masturbating female has been detected by vaginal smears.

 *Iris Changes in Syphilis: Clinical Survey. J. T. Lowry, Alamogordo, N. M.—p. 14.

Iris Changes in Syphilis.—Lowry describes a change from normal in the iris of syphilitic patients. The pupillary and ciliary zones are normally marked by radial striae, the inner zone being more heavily striated than the outer. The normal brown iris usually presents a smooth anterior surface in which changes in its contour are readily noticed, while normally the blue iris has a more complex pattern and changes in its contour and pattern are not as easily recognized. Basically the iris in patients with syphilis presents the following deviations from the normal: 1. The inner zone in relation to the outer zone is set on a deeper or posterior plane. 2. The line of demarcation between the two zones is more jagged and is not so concentric with the pupillary margin of the iris. 3. The outer segment is irregularly pitted by small oval or pear-shaped depressions whose long axis is perpendicular to the pupillary margin. These are known as the crypts of the iris. They are sometimes seen in normal eyes but in no large numbers. 4. In a large percentage of patients with syphilis the pattern of the iris is almost entirely lost. The anterior surface of the iris is characterized by a bizarre pattern which is easily recognized. It is characterized only by an extreme irregularity. There seems to be no relation between the occurrence of this change and the stage of the infection. Three types of patients were examined for this sign: 43 normal controls, medical students, doctors, nurses and technicians, 96 patients in the outpatient syphilis clinic at Parkland Hospital and 139 general hospital patients. The findings were checked with serologic reports and with the history. Of the last group 41, or 29.5 per cent, had syphilis. Sixteen had a positive iris and a negative Kline test and history. Ten had a negative iris and a positive Kline, Kahn, Wassermann and history. The iris sign gave a correct diagnosis in 81.3 per cent of the hospital patients. Of the normal controls the iris sign gave 6.8 per cent false positives and 93.2 per cent true negatives. The respective figures for the syphilitic group are 17.7 and 82.3 per cent. The number of false positives in the normal control group is much less than in the hospital patients. The reason for this is difficult to explain, but the normal control group was composed of young people in good health and economic status and the hospital group was composed of the general run of patients of a large charity hospital. The survey will be continued, with certain changes of method which may allow more accurate estimation of the probable benefit of the method. The next series will consist of patients known to have syphilis and for whom accurate and extensive records and serologic studies are available. An attempt will be made to correlate the time at which treatment was started, the time of occurrence of iris changes with regard to the stage of the disease, the occurrence of iris changes in congenital syphilis and an attempt to grade the changes in the iris.

Acute Bronchiolitis in Children.—Hubble and Osborn state that, during the first ten weeks of 1940, 50 children with an acute respiratory infection were admitted to the Derbyshire Hospital. Of these 27 were less than 1 year old; 7 children less than 2 years of age died. Six other children were seen in family and consulting practice, and although little was added to the clinical picture, 2 healthy middle-class children respectively 4 and 2 years of age died. This corrects the common impression that fatalities do not occur except in infants or in debilitated children. Not all the children were suffering from acute bronchiolitis. The final diagnosis in some was acute bronchitis and in others bronchopneumonia, but in many there was a phase in the infection when the small bronchioles were filled with exudate. Occasionally the children died in this phase of obstructive dyspnea; some recovered without further extension of the inflammatory process, but more often bronchopneumonia developed, in 3 with a fatal termination. Acute bronchiolitis is rarely seen except when influenza of a respiratory type is epidemic. It is not limited to any age group. The fact that in children less than 2 years of age the attack may be overwhelming may depend on a defective local resistance in the absence of any acquired immunity. Another factor may be the heightened virulence of the organism in its passage through several hosts, for the baby is usually the last member of the household to contract a catarrhal infection. It is most often seen in children of the poorer classes whose lower immunity presumably depends on defective and injudicious feeding, confined living space and closer contact with infections. However, middle class children do not escape. No influenza A virus was recovered by the Medical Research Council workers during the 1940 epidemic, with the exception of 1 specimen brought back from the army in France. The main difference between the lesions observed at necropsy of 2 human cases and those in the experimental animals is the extent of the emphysema. Bronchial obstruction by plugs of mucus are of considerable clinical importance. The onset may be acute, with fever, rapid and labored breathing, cyanosis, severe cough and prostration. More often the child has for a day or two a slight fever, laryngeal cough and some gastrointestinal upset. A laryngeal cough together with soreness over the larynx, hoarseness and sometimes aphonia develop next. Dyspnea and stridor, due to laryngeal spasm, may be present at this stage. From this phase the child may pass suddenly to bronchiolitis. The bronchioles become plugged with exudate and the clinical picture is obstructive dyspnea. If death from obstructive dyspnea occurs, it does so on the second, third or fourth day. More often the fine rales give way to the coarse rales of an ordinary bronchitis when the acute phase is over, and this may persist for a few days. Recovery of patients with a severe infection with obstructive dyspnea depends on their being nursed in warm moist air, with an adequate oxygen supply. Alcohol is the best sedative for children and phenobarbital the second best. No other sedative than alcohol should be used for children with acute bronchiolitis, for if the sedatives depress their respiratory excursions and their coughs are alleviated they die: any derivative of opium may bring a sleep which is final. In the treatment of acute bronchiolitis the four factors which demand separate consideration are the infection, the obstructive dyspnea, the cyanosis and the collapse, and consequently sulfapyridine, steam, oxygen and bronchoscopic aspiration (in the hands of the expert) may be life saving.

Sulfathiazole in Epidemic Meningitis.—Banks states that in America there is a disposition to view with disfavor the employment of sulfathiazole in meningitis because it achieves only a low concentration in the cerebrospinal fluid. He cites Carey's statement that "it should not be used in meningitis, as its concentration in the spinal fluid reaches only from 10 to 30 per cent of that in other body fluids." He hopes to show, however, that this conclusion is contradicted, at least for meningococcal meningitis, by the success obtained in practice, although he admits that Carey's premises are substantially correct. He used sulfathiazole treatment in 96 cases, of which 17 were classified as mild, 50 as moderate, 26 as severe and 3 as very severe. In exactly a third (32 cases) there were petechial or purpuric rashes. The author followed the dosage scheme which he originally adopted for sulfanilamide and later for sulfapyridine in the treatment of meningococcal meningitis. The age group under 2 was given a daily dose of 3 Gm.; from 2 to 5 4.5 Gm.; from 5 to 10, 6 Gm.; from 10 to 15, 7.5 Gm., and over 15, 9 Gm. This scheme was maintained for an initial period of two to three days according to severity; then two thirds of the dose was given for two days and finally one third for a further two days. The period of administration is six to seven days, and the total amount of the drug given is from 40 to 50 Gm. for an adult. The drug is given every four hours during the initial period and thereafter every four or six hours according to convenience. In 52 cases sulfathiazole was used after one or more preliminary doses of sulfapyridine, and in 44 cases sulfathiazole was used alone. The fatality rate in cases treated mainly or wholly with sulfathiazole was 2.1 per cent, which compares favorably with previous series treated with serum and sulfanilamide and with sulfanilamide or sulfapyridine alone or combined. Sulfathiazole, though not yet tested in epidemic conditions, has rapidly cured some extremely acute cases. The evidence so far suggests that it is at least equal in potency to sulfapyridine in meningococcal disease. There is evidence that with adequate dosage bacteriostasis is complete and phagocytosis advanced within twelve to twenty-four hours. Concentration in the cerebrospinal fluid varies from about 15 to 40 per cent of that in the blood and rarely is greater than 1.5 mg. per hundred cubic centimeters even on high dosage. The comparative rarity of nausea, vomiting and dehydration, and the absence of depression and mental confusion, make the treatment with sulfathiazole more pleasant and the management of the case easier than with sulfapyridine. Other toxic effects are also rare. High dosage is well tolerated. One or two intravenous injections of the 5 per cent sodium solution are recommended in all severe cases and when vomiting persists.

*Some Observations on Biochemical Changes Associated with Hemorrhage from Stomach and Duodenum. Marjorie Bick and I. J. Wood.—p. 104.

Biochemical Changes Associated with Gastric and Duodenal Hemorrhage.—Bick and Wood determined the biochemical changes following massive gastric and duodenal hemorrhage. The studies were of a detailed nature of 8 patients and 2 normal control subjects (for three days) and occasional of 5 other patients. The detailed study included the pulse rate, the blood pressure, the hemoglobin value, the blood urea, sugar and chloride levels, the plasma protein content, the serum calcium content and the urinary volume, chloride, dextrose, urea and calcium contents. Observations were also made of the calory intake and on the effects of the intravenous infusion of blood and dextrose saline solution. The blood pressure was usually low after a hemorrhage but rose slowly

after bleeding had ceased. The rise was hastened by blood transfusion. The hemoglobin value was low in all cases, falling both during and immediately after a hemorrhage. It was a valuable guide to the patient's progress. The plasma protein content was lowered, but usually only to a minor degree. The blood urea content was elevated in all cases and appeared to be a good index of the patient's general condition. It was highest when the patient was not only exsanguinated but drowsy, thirsty and dehydrated. The blood chloride content was always low, and it was associated with a pronounced diminution of chloride in the urine. The liberal administration of chloride orally, rectally or intravenously appeared to benefit the patient. Immediately after a massive hematemesis the urinary output was usually diminished; but it rapidly improved after the liberal administration of fluid. To maintain a satisfactory positive fluid balance, intravenous injection of blood or dextrose-saline solution was sometimes necessary. It was often difficult to have patients take an adequate diet; fluids, especially plain cold water, were taken more eagerly. Acidosis, as shown by a diminished alkali reserve, was frequent. The serum calcium content was usually within normal limits. Transfusion of citrated blood elevated the blood pressure and hemoglobin percentage and slightly the plasma chloride and protein levels. The blood urea and serum calcium levels tended to fall. Dextrose-saline solution intravenously increased the plasma chloride content and the urinary output of chloride. The available methods of clinical biochemical analysis were modified so that the numerous determinations could be carried out on the smallest convenient specimen of blood. The studies uphold the contention that patients who have recently had profuse gastric or duodenal hemorrhage are suffering not only from anemia but also from depleted blood volume, starvation, dehydration, chloride and protein deficiency, uremia and acidosis. The object of treatment should therefore attempt to arrest hemorrhage and minimize the likelihood of further bleeding and to forestall any further depletion and to correct that which exists. Should hemorrhage recur in spite of blood transfusions, surgical intervention may give the patient the only chance of survival. The dangers of surgical arrest of hemorrhage are becoming less formidable now that massive blood transfusion is plausible and other restorative measures are available.

 *Modern Therapeutics: XIX. Use of Vitamins in Treatment. II. M. Sinclair.—p. 109.

Vitamins in Treatment.—Sinclair points out not only that vitamins cure certain deficiency diseases but that often slight deficiencies cause many signs and symptoms, often difficult to diagnose, and produce ill health that can be discovered to be related to lack of vitamins only by employing laboratory methods of diagnosis. Such subclinical deficiencies have been shown to be common even in times of peace and are likely to become more common as war progresses. The practitioner now has to be alert to detect mild deficiency. Vitamin deficiencies are seldom single, and to treat a case of multiple deficiency with a pure vitamin is bad therapy. It is important to bear in mind the causes of vitamin deficiencies. A person may partake of a diet that appears well balanced; but the green vegetables may be boiled, perhaps in a copper utensil or with soda, and the water which contains the little vitamin that was not destroyed is thrown away; consequently a deficiency of water soluble vitamins, particularly B₁ and C, may result. The person may have achlorhydria or take alkalis and thereby destroy certain vitamins, or diarrhea may prevent their absorption. Therefore the cause of the deficiency must be determined and then corrected.

Ephedrine and Epinephrine in Acute Pancreatitis.

Jacquet and his associates found that massive doses of ephedrine, sufficiently long continued, not only gave relief from pain and shock of acute pancreatitis but cured as well in cases in which surgical intervention was not resorted to because of complications. In 1 case in which the drug therapy was effective hemorrhagic pleuritis developed within forty-eight hours. Morphine was unavailing. Ephedrine was then administered in two daily doses of 0.04 Gm. each. This at once assuaged pain, shock and pleurisy. However, when the dose was reduced to 0.02 Gm., pain recurred. This happened several times. The original heavy dose was then restored and retained until the patient's condition seemed to warrant diminution of the dose. Altogether 0.94 Gm. was given in the course of twenty-five days. The patient recovered and was well when seen a year later. In 2 other cases ephedrine was likewise able to still pain and control shock, but when recovery was delayed surgical intervention disclosed necrotized tissue in a half liter of blood-colored fluid in the 1 and a hemorrhagic exudate of the peritoneum in the other. According to the authors, dosage with ephedrine must be large, sustained for several days and given parenterally in acute pancreatitis. No intolerance to the drug was observed. The authors report good results obtained by other investigators using epinephrine in acute pancreatitis.

Bone Marrow in Paget's Disease (Osteitis Deformans).

—Tronchetti studied the peripheral and medullary blood of 3 patients with advanced Paget's osteitis deformans. The number of erythrocytes in the peripheral blood was normal or slightly increased. An active erythropoiesis with erythroblastic anaplasia and abundance of reticuloendothelial cells was found in the medullary blood. The type of alterations of the medullary blood did not correspond to that caused by the disease of bones, which are of a type of myeloid hypoplasia or atrophy. A review of the literature on experimental and clinical work concerning blood changes in several diencephalohypophysial disorders convinced him that the alterations seen in the medullary blood in Paget's disease are of diencephalic-hypophysial origin.

 *New Aspects of Pathogenesis of Endometriosis. E. Philipp and H. Huber.—p. 1242.
 *Sudden Death. E. Jeckeln.—p. 1246.

Pathogenesis of Endometriosis.—According to Philipp and Huber, endometriosis develops either by continuous proliferation of the uterine mucosa or more frequently by implantation. In the majority of cases of abdominal endometriosis the origin of the implantation is the endometriosis of the interstitial portion of the tube; in the others the source is the uterine mucosa itself. The implantations of abdominal endometriosis make their way through the tube or they may utilize other available routes. Hematogenic spreading is theoretically possible. The authors on the basis of their investigations arrive at a unitary interpretation of endometriosis. They reject the theory of serosa epithelium in its original and modified form, as well as the assumption that every mesenchyma is capable of forming foci

of endometriosis. They believe that local formation of foci of endometriosis as the result of tissue differentiation is no longer tenable. Their own conception is similar to that of Sampson, who was first to recognize implantation of detached fragments of uterine mucosa as the cause of endometriosis. Sampson's theory met opposition because it erroneously presupposed that cast-off menstrual mucosa was the source. It is the living freshly built-up mucosa which is disseminated. The prerequisites in the majority of cases are the existence of endometriosis in the interstitial portion of the tube and a functioning ovary. Endometriosis does not develop before or after the period of ovarian function, except, perhaps, when ovarian hormones are administered. The importance of hormones in the development of implantation is demonstrated by the fact that they are frequently localized near the ovaries. A favorite location is the ovary itself, where so-called chocolate cysts develop. The authors were able to observe such cysts in various stages of development. They report three cases in which endometrial tissue was present in the corpus luteum. They emphasize that endometriosis owes its development to the special properties of the uterine mucosa: the capacity of the cytogenic stroma to grow into deeper layers and the ability of uterine mucosa to attach itself when carried outside the uterus. The route of spread plays a minor role, dissemination taking place most frequently by way of tubes into the abdominal cavity. Possibility of hematogenic dissemination has been established by microscopic studies. Perfusion of the tissues with ovarian hormones produces more favorable conditions for implantation.

Sudden Death.—On the basis of one hundred and twenty-three necropsies in cases of unexplained sudden death, Jeckeln states that more than two thirds were the result of a cardiac lesion, coronary sclerosis being most frequent. It was six times as frequent in men as in women. Acute infarct resulting from the occlusion of a branch of the coronary was present in only 3 cases to the extent sufficient to explain death, while in 3 others it was complicated by cardiac rupture. Late lesions due to impaired circulation of the myocardium existed in the majority of the cases. Explanation of sudden death becomes difficult when microscopic examination of the heart muscle fails to disclose notable changes. Severe coronary sclerosis and cardiac dilatation are usually found in such cases. The fact that death often followed a sudden exertion suggests that an acute coronary insufficiency developed from the discrepancy between the oxygen supplied to the myocardium and the suddenly increased oxygen demand. There exist cases with myocardial infiltration but without extensive coronary sclerosis. The author describes a case with changes in the coronary vessels, excessive filling of the stomach and changes in the region of the conduction system. Excessive filling of the stomach is frequently encountered in sudden death from heart disease. In some of the sudden cardiac deaths there exist more than one lesion, such as valvular lesions, excessive fat about the heart or cardiac calcifications. In 7 cases sudden death was the result of syphilitic aortitis. Among the 6 cases in which sudden death could be traced to a valvular defect, there were 5 with aortic stenosis and hypertrophy of the left ventricle. In another case death was caused by sudden cardiac decompensation in the presence of mitral stenosis and coronary sclerosis. Extracardiac lesions, particularly chronic disorders in the pulmonary circulation, may also cause sudden death. There were 10 cases of this type. Cardiac decompensation due to hypertension was the cause in 2. In 8 sudden death was the result of disease of the air passages. In 2 cases death was caused by rupture of the aorta, and in 1 by rupture of a dilated splenic artery. Only 3 cases of fatal apoplectic stroke were observed, 1 in a girl of 17 with nephrogenic hypertension. In 2 other young persons status epilepticus was the cause. Ruptured basal aneurysm was detected in 19 cases. The author studied 30 cases of sudden death in children, 6 being stillbirths. Fetal erythroblastosis was the cause of death in 1; in some of the others no cause could be found. Necropsies on 21 infants and young children who had died suddenly disclosed in 2 traumatic brain lesions sustained at birth, in others acute nutritional disturbances, infections, acute respiratory disorders and postdiphtheric cardiac lesions. In 1 boy aged 3 years and 9

months sudden death followed a mild cold; necropsy disclosed acute, suppurating phlegmon of the epiglottis with severe edematous swelling. The author observed this lesion in several children and regards it as a complication of influenzal infection of mucous membranes. Sudden death after slight gastrointestinal symptoms with headache in a boy of 7 proved to be the result of acute poliomyelitis.

Simplification of Evaluation in Determination of Basal Metabolism. W. Holzer.—p. 924.

Mineral Metabolism in Generalized Osteitis Fibrosa Cystica and Parathyroid Tumor.—According to Reuss and Roller, eleven years have elapsed between the suggestion for the removal of a parathyroid tumor in Recklinghausen's osteitis fibrosa and its performance. The operation seemed to have an extraordinary success. Later experience showed that the condition may recur and that nephrolithiasis may develop. The interest seems to have shifted from the pathologic-anatomic aspects of the disease to functional and physiologic features, in particular to the importance of mineral metabolism. The authors made careful studies of the mineral metabolism in a patient in order to detect the effect of the operation on the parathyroids. As early as four hours after the operation the reflexes and muscular irritability were greatly increased. On the day after the operation slight touch elicited muscular spasm in some groups of muscles. In contrast to this increased irritability, the patient slept almost constantly. Postoperative manifestations in their case suggest that either a second parathyroid tumor has formed or that two such tumors existed at the time of operation. The latter assumption does not appear plausible in view of the enormous postoperative decrease in the calcium content. They also consider the possibility of a diffuse hyperplasia of the parathyroids. Results in the case suggest that De Forest's method of medication with irradiated ergosterol is effective only if corresponding quantities of calcium are added. Excessive amounts of irradiated ergosterol might be responsible for the complaints following its administration. Comparison of the clinical manifestations with the results of metabolic studies proved of diagnostic and prognostic value. The authors feel that investigation of the calcium and phosphorus metabolisms will permit of an estimation of the further course of the disease as early as a few days after the operation. The detection and removal of a parathyroid tumor do not signify that the disease has been terminated.

Postpleuritic Tuberculosis: Connection Between Exudative Pleurisy and Pulmonary Tuberculosis. T. Carellas.—p. 245.

Artificial Production of Adhesions Before Suction Drainage.—The first requirement for Monaldi's method of suction drainage, according to Flügge, is that the obliteration of the pleural cavity in the region of the cavity will discharge into

the pleural space and produce empyema. Allowing the pneumothorax to disappear does not guarantee that the pneumothorax space is really closed. Adequate adhesion can be expected only if the pneumothorax subsides with the formation of an exudate. It is advisable to induce an exudate about the cavity whenever a free pleural space exists. At the sanatorium in Davos, injection of talcum into the pleural space has been used in 7 cases, in 5 of which it has since been possible to establish suction drainage. It is possible to produce pleurisy with from 0.5 to 2 cc. of talcum. The pleuritic pains which develop immediately, or a few hours after the introduction of the talcum, may be severe, but they generally subside within two or three days. The resulting exudate is sterile. Its spontaneous absorption is awaited, because the aim is formation of adhesions. Repeated attempts at pneumothorax in various places are important in order to exclude the presence of free pleural spaces. Only in this manner will it be possible to detect small recesses of sacculated pneumothorax and avoid the formation of empyema. The introduction of talcum may have to be repeated, because one insufflation may produce only a local reaction. The author obtained an exudate in 6 of his 7 patients. In one instance dry pleurisy resulted, but this was sufficient to counteract the small residual pneumothorax and suction drainage could be instituted eleven days later.

*Comparative Studies on the Effect of Levulose and Dextrose on Insulin Hypoglycemia. M. Nakayama and M. Murakami.—p. 952.

Levulose and Dextrose in Insulin Hypoglycemia.—Nakayama and Murakami induced hypoglycemia in 1 diabetic and 8 nondiabetic patients and tested the recovery effects of levulose and dextrose administered by mouth in doses of from 30 to 50 Gm. Within thirty minutes after the administration an improvement of subjective symptoms, when levulose was given, appeared only in 2 instances, while dextrose produced the same result in all cases. In the 2 patients who responded favorably to levulose administration, the evidence of improvement appeared more slowly and the normalizing effect on the pulse rate and blood pressure was less distinct than when dextrose was given. Similar observations were also made by intravenous injection of 40 cc. of a 50 per cent solution of either levulose or dextrose. Clinical improvement was noted only in one instance after the injection of levulose, while with dextrose injection the recovery from symptoms of hypoglycemia was effected within the expected time in all cases (4 diabetic and 6 nondiabetic patients). From these observations the authors recommend the use of dextrose in the treatment of insulin hypoglycemia.

*Selective Diet for Bleeding Ulcer Patients. I. O. Neymark.—p. 104.

Selective Diet for Bleeding Ulcer Patients.—Neymark reports observations on 130 patients, 100 of whom entered the hospital after the hemorrhage while 30 entered in the course of bleeding. All the patients were given a liberal diet advocated by Meulengracht and consisting of albumin 90 Gm., fat 110 Gm. and carbohydrates 420 Gm. The effect of hemorrhage on the ulcer symptoms was inconstant and varied. Pain disappeared shortly after the hemorrhage in 23 out of 100, it was considerably lessened in 36, while in 6 the hemorrhage was not preceded by pain. The niche in the roentgenogram was demonstrable in the great majority of the cases in which symptom pain persisted after the hemorrhage. The author believes that the favorable effect of hemorrhage on the ulcer is due to the reduction of the inflammatory state, of the gastritis or duodenitis in the vicinity of ulcer brought about by the diminution in the amount of the

edema, vascular hyperemia and lowering of the tone of the muscularis mucosae. Persistence of pain after hemorrhage suggests the existence of a callous ulcer, marked cellular infiltration of the tissues and fibrous changes in the mucosa. The disappearance of pain after hemorrhage is not the sole criterion of the future behavior of the ulcer. Pathologic changes in the vicinity of the ulcer are not always paralleled by those within the bed of the ulcer. While the edema and induration about the ulcer may diminish, the destructive process may continue in the bed of the ulcer. Such cases are characterized by a progressive fall in the blood hemoglobin and a tendency to gross bleeding at brief intervals despite a liberal diet. These cases are not amenable to conservative treatment and should be referred for surgical intervention. The question of feeding a bleeding patient must be determined on the basis of the clinical picture. Early liberal diet, as advocated by Meulengracht, is indicated in cases in which symptom pain disappears shortly after the hemorrhage. When pain persists, the diet must be more sparing and the food must be liquid or mushy. Repeated blood transfusions and parenteral administration of vitamin C are indicated. In only 3 of the author's 130 cases was operative intervention necessary. He concludes that the diversified diet cannot be applied in all cases. Even among the favorably reacting cases there are a few in which the liberal diet provokes pain. A more restricted diet is required in such cases. The author also feels that, contrary to the opinion of Meulengracht, a liberal diet is not applicable during the first twenty-four hours of hemorrhage.

Total Color Blindness.—According to Holm and Lodberg, total color blindness, which is designated also as monochromasia or achromatopsia, is only one of a group of symptoms, photophobia, nystagmus and considerable amblyopia being associated with it. After reviewing the present status of knowledge on total color blindness and some of the literature, particularly on the heredity, the authors report their own observations among the population of a small Danish island. The inhabitants of this island numbered about 1,600. There were 23 cases of color blindness on this island. The authors examined 18 and obtained as complete and reliable genealogical tables as possible. The conditions on the island favored the manifestation of recessive disease, because the inhabitants rarely left their native soil and a matrimonial union between an islander and a foreigner was frowned on. The result was close relationship among the inhabitants. Although ordinarily color blindness is more frequent in men than in women, among the 23 subjects under consideration there were only 9 men and 14 women. In four groups with known consanguinity there were 5 color blind to 10 normal individuals and in eight groups without known consanguinity there were 17 color blind and 34 normal persons. Thus the ratio was exactly the same, namely 1:2 instead of the theoretical ratio of 1:3. Consequently there is a "great recessive" surplus. The accumulation of cases is easily explained by the special conditions prevailing in the island; it does not detract from the fact that the disorder is scattered and of more or less the same incidence in most countries. This might suggest that the anomaly occurs here and there by mutation of a variable gene, after which it is recessively transmissible. This theory is not refuted by the fact that the cases observed all over the world are much alike, because experimental investigations show that the same mutations do recur.

Book Notices

Accident-and-Health Insurance. By Edwin J. Faulkner, A.B., M.B.A., President, Woodmen Accident Company and Affiliated Companies. Cloth. Price, \$4. Pp. 366. New York & London: McGraw-Hill Book Company, Inc., 1940.

All who have tried to apply the insurance principle to medical care have felt the need of a realistic and comprehensive treatment of the subjects discussed in this work. Hasty experimenting in the disability field brought heavy losses to New York life insurance companies. Incalculable elements are almost innumerable. Definitions of accident and disease are still many and conflicting. "Benefits provided to reimburse the insured for the costs of hospital and medical care represent the greatest variety of practice." The "moral hazard" multiplies these uncertainties. "No single factor equals it in importance in determining the acceptability of a risk." It varies according to age, sex, race, location and occupation, and it changes with the introduction of insurance and other social changes. Rates have so far been made largely by trial and error, and as a result loss ratios have been almost catastrophic. Tables of premiums and indemnities have now been calculated to allow for nearly all these uncertainties, and these tables are apt to surprise some of those who are blithely starting new plans without proper study. "High expenses are characteristic of the disability business." Forty-seven and one-half cents of the health insurance dollar is expected to be expended on costs other than indemnity. These statements tend to blast the optimism of those who look on health insurance as a means of reducing medical costs. Non-profit group hospitalization, state medical society medical service plans and commercial company proposals are all analyzed. Every one who is interested in trying to establish any type of prepayment plan for medical service will find this work indispensable.

Report of the President and of the Treasurer, Carnegie Corporation of New York, for the Year Ended September 30, 1940. Paper. Pp. 183, with 1 illustration. New York, [n. d.].

Pensions for teachers have long been associated in the public mind with the name of Andrew Carnegie, since it was he who first provided the means for such pensions on anything like a national scale. It will be noted with interest that the trustees of the corporation on March 16, 1939 approved and authorized a policy which, humanly speaking, will insure payment in full to the three thousand, four hundred and fifty persons now receiving pensions from the Carnegie Foundation or on its list of pensionables. President Keppel discusses the needs of the Carnegie Institution of Washington, dental medicine, general and higher education, adult education and the interest of the corporation in libraries and in the arts. Most significant, however, are his concluding observations on the relationships of philanthropic foundations to education. He says (page 29, lines 4-11) "... education requires public approval and, if possible, public understanding as well." But although growing public interest is a favorable factor, the author feels that much remains to be done to clear the public mind as to what the public itself wants from education, and what it can reasonably expect, and, by the same token, to clarify the teachers' ideas as to what the processes of formal education can and cannot do to affect the social order. He pleads for a wider and fuller understanding, on the part of students, teachers and the public, of the enormous range in the native abilities of different individuals and in the qualitative differences in the grasps of human beings who constitute our universities and colleges. He continues: "We recognize in our system of professional and vocational training the relationship between what we teach our students and what they must later do to make a living, but we are not nearly so clear as to the relationship between the durable general knowledge and the attitudes which the students acquire throughout their education, and the broad realities and the urgent needs of the adult life they must enter." Summing up, President Keppel says: "In the face of falling income and increasing calls from every source, will foundations be able to find the things to do upon which their particular assets can be brought to bear most

effectively? While they have their limitations, their natural advantages are many. They can move quickly. They can continue their support past the stage of novelty and publicity appeal. They can act with the long view in sight rather than under the pressure of the moment. They can call upon competent and disinterested advice. They can recognize and encourage excellence and the promise of influence and leadership in the individual, the group or the institution. They can find situations which it is to the general interest, but alas nobody's particular business, to clarify by research and experimental demonstrations. It need scarcely be added that no foundation has ever availed itself of these natural advantages to the full. It is equally true, however, that certain of them in the light of their own experience and of a wider public understanding of their responsibilities are each year giving greater weight to these matters in their decisions."

Medical Manual of Chemical Warfare, 1940 [including] "An Atlas of Gas Poisoning." Great Britain War Office. Paper. Price, 75 cents; 2s. 6d.; "Atlas," separately, 1s. Pp. 104; "Atlas," pp. 15, with 10 plates. New York: British Library of Information; London: His Majesty's Stationery Office, 1940.

This manual describes the physical and chemical nature of certain poison gases, their uses in war, the symptoms caused by them, their recognition and the treatment of the lesions produced. The gases are grouped into vesicants, lethal gases, harassing gases and accidental gases. Of the vesicant or blister gases the mustard gas was the most effective chemical agent used in the war of 1914-1918. The fact that there is no immediate irritation of the skin on contact with the liquid or of the eyes or the respiratory tract constitutes one of the more serious dangers of this gas, as contamination may be unsuspected. Signs and symptoms do not begin to appear until after the lapse of some hours, depending on the concentration of the vapor in the atmosphere and the duration of exposure. Contamination of the eye by a spray or a splash represents one of the gravest dangers in the presence of liquid mustard gas, as permanent damage will result. The major protective measure against mustard gas vapor is the gas mask. In the case of contamination with liquid mustard gas, cleansing of the skin may be effected by a bleach treatment utilizing an ointment or a paste containing calcium chloride and by repeated swabbing with gasoline, alcohol, kerosene, carbon tetrachloride or some other solvent of liquid mustard gas. Of the lethal gases phosgene is the most important and the most toxic. It produces edema of the lungs with rapid and shallow breathing and a progressive development of a bluish red cyanosis, which may deepen to intense violet. The treatment consists of rest, warmth, venesection and oxygen. Most drugs were found to be of no special value. A special chapter is devoted to the symptoms and treatment of gas poisoning not used for offensive purposes but sometimes encountered under war conditions. Such poisons are carbon monoxide, nitrous oxide fumes and screening smokes. The manual gives specific information as to the methods of recognizing poisoning with various gases and the immediate treatment.

The Anatomy of the Eye and Orbit Including the Central Connections, Development, and Comparative Anatomy of the Visual Apparatus. By Eugene Wolff, M.B., B.S., F.R.C.S., Ophthalmic Surgeon, Royal Northern Hospital, London. Second edition. Cloth. Price, \$7.50. Pp. 374, with 242 illustrations. Philadelphia: Blakiston Company, 1940.

This concise book on anatomy of the eye, its adnexa and the orbit is an improvement over the first edition, in that not only have sixty-four pages and sixty new illustrations been added but the sections on the visual pathway and its blood supply have been rewritten. Several colored plates, among which are microscopic sections of the retina and optic nerve, have been added. The section on the choroid and retina have been greatly improved, especially the former. The chapters on the bony orbit, embryology and comparative anatomy remain unchanged. In each chapter the author discusses, under the title of practical considerations, the clinical significance of alterations in the various anatomic structures. The final chapters on embryology, postnatal growth and comparative anatomy give a brief adequate survey of the development and growth of the globes and the anatomy of the eyes of lower animals. There is a brief account of the anatomy of the anterior segment as seen with the slit

lamp microscope. The work is recommended as a textbook for graduate study in ophthalmology, though for investigators it cannot replace such textbooks as Whitnall's "Anatomy of the Orbit" or Salzmann's "The Anatomy and Histology of the Human Eyeball."

Vitamins: What They Are and How They Can Benefit You. By Henry Borsook, Ph.D., M.B., Professor of Biochemistry, California Institute of Technology, Pasadena. Cloth. Price, \$2. Pp. 193. New York: Viking Press, 1940.

In the foreword to this volume the author states that his reason for writing the book was to present knowledge of the vitamins "in edible form" and without technical jargon. The author has accomplished this purpose in an exceptionally lucid, informative style. For the physician who is interested in "a Cook's tour" of the vitamin field, as it were, this book is recommended. Tables in the appendix show the adult and child requirements of the various vitamins and the vitamin A, B₁, C and B₂ content of uncooked common foods in international units for vitamins A and B₁ and milligrams for vitamin C and B₂ per common measure or ounce. The material contained in the twelve chapters is conceived and handled in such a manner that the reader obtains a considerable amount of fairly accurate information on the vitamins. There are, however, several misstatements which should be corrected in future editions. For example, on page 116 the discussion of vitamin D milk and the statement "But for children even a daily quart of 'vitamin D' milk will not supply the desirable amount of vitamin" are not in accord with recent evidence. The Council on Foods and Nutrition, after a review of recent available evidence, reaffirmed (THE JOURNAL, February 1, p. 413) its previous conclusion that "For children between infancy and adolescence a daily allowance of 750 to 1,000 cc. (about 1½ to 2 pints) of milk containing from 300 to 400 U. S. P. units of vitamin D permits ample retention of calcium and phosphorus." On page 125 the discussion of vitamin E, which the author implies should be called "the anti-miscarriage vitamin," is also far more ambitious than the evidence warrants. In a report sponsored by the Council on Pharmacy and Chemistry (THE JOURNAL, June 1, 1940, p. 2214) it was stated that the claim that vitamin E is of value in the prevention of habitual abortion cannot be accepted because of lack of convincing clinical evidence. Until this evidence is forthcoming, it is misleading to imply that vitamin E prevents miscarriage.

Biological Stains: A Handbook on the Nature and Uses of the Dyes Employed in the Biological Laboratory. By H. J. Conn, Chairman, Commission on Standardization of Biological Stains. Prepared with the collaboration of J. A. Ambler et al. Revised with the assistance of J. T. Scanlan, Anis P. Bradshaw and Mary A. Darrow and Members of the Executive Committee of the Commission. Fourth edition. Cloth. Price, \$3.40. Pp. 308, with 5 illustrations. Geneva, N. Y.: Blotek Publications, 1940.

As chairman of the Commission on the Standardization of Biological Stains, on which there are representatives of the American Medical Association and other organizations, Dr. Conn can speak authoritatively about dyes. The assistance of J. T. Scanlan, Anis P. Bradshaw, Mary A. Darrow and members of the executive committee of the commission is acknowledged. This edition marks a definite advance achieved by helpful cooperation of the commission with the American Pharmaceutical Association and the Society of American Bacteriologists. The formulas given in it, sponsored by the commission, in the National Formulary published by the association, and in the Manual of Methods for Pure Culture Study of Bacteria published by the society, have been compared and studied critically with the object of supplying identical formulas in all three places. Much confusion will thereby be avoided. This edition, like others before it, is accurate, concise and to the point. Useful information is not hidden by a forest of words. Thirteen dyes not included in the third edition are described. The dyes are classified into eight groups instead of six, and two useful tables have been added as well as some selected references to the literature. Yet the increase in length over the previous edition amounts to only thirty-two pages, which is important, because this standard book will continue to be in demand by many workers in biologic and medical laboratories and will not be limited to libraries because of size and cost.

The Doctor Takes a Holiday: An Autobiographical Fragment. By Mary McKibbin-Harper, M.D. Cloth. Price, \$2.50. Pp. 340, with illustrations. Cedar Rapids: Torch Press, 1941.

This is an informal autobiographic fragment culled from a diary covering nearly two years of travel, another period of four months, and yet other visits in the Near East. The author went to London, Paris, through the Suez Canal, to Egypt, Palestine and India, to which country several chapters of the book are devoted; then to Malaya, China, Japan, Hawaii and San Francisco. She was interested especially in women doctors in these countries and through correspondence had arranged to see certain places and people, although this professional interest was not allowed to interfere with other joys of travel. She describes native customs, religions and superstitions as well as the more obvious and perhaps better known sights to the newcomer. The book is written with a sympathetic understanding of the native customs and environment in which these people live and in which the author was deeply interested.

A Surgeon Reflects. By James Thomas Nix. Cloth. Price, \$1.50. Pp. 115. University: Louisiana State University Press, 1940.

This is a series of informal essays by a doctor with thirty years' experience as a surgeon. Three years ago a tired heart impressed on him the uncertainty of life and the futility of constant overwork. Later he was miraculously saved when an airplane in which he was riding burned. A few months later a more serious illness overtook him, and since then he has spent two days a week in camp in the woods on the lower Mississippi and so finally has had time to reflect.

The second part of this small book comprises essays about the profession: your patients and you, the general practitioner, the doctor and the child, patients are always right, doctors and dentists, medical ethics. The first part comprises essays on subjects that concern almost everybody: hope, solitude, difficulties, calamity, friends, ambition, success, longevity, wives and mothers, death. The preface contains a letter from Dr. Rudolph Matas, formerly the author's teacher and chief. The foreword is by Dr. Morris Fishbein. The essays are short, interesting and well written.

Bacteriology in Neuropsychiatry: A Survey of Investigations Concerned with the Specific Role of Infectious and Immune Processes. By Nicholas Kopeloff, Ph.D., Research Bacteriologist, New York State Psychiatric Institute and Hospital, New York. Cloth. Price, \$4.50. Pp. 316. Springfield, Illinois, & Baltimore: Charles C. Thomas, 1941.

Rarely has there been less excuse for darkening the pages of a book than the contents of this monograph. Most of the book consists of a superficial summary of a little of the related literature. The discussion of the more common infectious diseases of the nervous system, such as syphilis, meningitis and brain abscess, is surprisingly inadequate whether regarded from a clinical, pathologic or bacteriologic point of view. The relationship of some other sections of the book to the nervous system is not established by the text. In chapters XXI, XXII, XXIII, XXIV, XXV, XXVI and XXVII, on focal infection as a possible etiologic agent (in the functional psychoses), auto-intoxication as a possible etiologic agent, tuberculous bacillæmia in schizophrenia, filtrable forms of the tubercle bacillus in schizophrenia, toxins in schizophrenia, bacteria toxins and allergens as possible etiologic agents in epilepsy, and special properties of the blood and serum of psychotic patients, a series of straw men are set up which the author finds no difficulty in knocking down. The book cannot be recommended.

Landmarks and Surface Markings of the Human Body. By L. Bathe Rawling, M.B., B.Ch., F.R.C.S., Consulting Surgeon to St. Bartholomew's Hospital, London. Eighth edition (new terminology). Cloth. Price, \$3. Pp. 98, with 36 illustrations. New York: Paul B. Hoeber, Inc., 1940.

This is a brief volume on topographic anatomy. The terminology employed is that of the British revision of the B.N.A. In the present times, when military surgery is becoming of increasing importance, the handiness of a brief, accurate, topographic anatomic reference work is apparent. It is of special value in reviewing the topographic anatomy of the extremities. The book has to its advantage a brevity and succinctness of description. It can be recommended as an excellent refresher in certain anatomic details.

Queries and Minor Notes

THE ANSWERS HERE PUBLISHED HAVE BEEN PREPARED BY COMPETENT AUTHORITIES. THEY DO NOT, HOWEVER, REPRESENT THE OPINIONS OF ANY OFFICIAL BODIES UNLESS SPECIFICALLY STATED IN THE REPLY. ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT BE NOTICED. EVERY LETTER MUST CONTAIN THE WRITER'S NAME AND ADDRESS, BUT THESE WILL BE OMITTED ON REQUEST.

AORTIC REGURGITATION OF RHEUMATIC OR SYPHILITIC ORIGIN IN BUS DRIVER

To the Editor:—A white man aged 33, driver of a passenger bus, was recently referred for an opinion as to whether he should continue his usual occupation. He stated that he had rheumatic fever at 15. A positive Wassermann reaction, as a result of which he is being adequately treated, was found at age 31 on routine checkup by the company; no history of chancre or generalized rash was obtained. The history was otherwise irrelevant. He presented no evidence of definite cardiac enlargement either clinically or fluoroscopically. There was an aortic systolic murmur with an accentuated aortic second sound; there was a suspicion of a diastolic murmur in the second and third interspaces to the left of the sternum. The presence of these murmurs was confirmed later by sound tracings. A capillary pulse was visible under a glass slide placed on the everted lower lip; there was a rather suggestive Corrigan's pulse. Blood pressure was 138 systolic and 78 diastolic. There was no pulmonary congestion, enlargement of the liver or peripheral edema. The usual cardiac functional tests were normal. In other words, there was no clinical or laboratory evidence of a lack of circulatory efficiency. The other ordinary laboratory tests of the urine and blood were normal. An electrocardiogram showed normal sinus rhythm, left axis deviation, ST intervals slightly elevated in leads 2 and 3, T waves slightly inverted in lead 3 and CF-4 negative. Based on these findings, what would be your opinion? Should this man continue driving the bus?
M.D., Pennsylvania.

ANSWER:—In view of the possibility that the patient has syphilitic aortitis behind his slight aortic regurgitation, it is wiser for him to cease driving the bus. Syphilitic aortitis is prone to increase rather rapidly in degree with increasing aortic regurgitation in the course of a few months to a few years and congestive failure may then ensue. More important, however, if syphilitic aortitis is present, is the hazard of sudden death, largely because of the involvement of the mouths of the coronary arteries.

However, on account of the age, the rheumatic history and the slight degree of aortic regurgitation, there may be a rheumatic rather than syphilitic etiology with valvular insufficiency. Slight degrees of chronic rheumatic heart disease are compatible with full activity and long life.

Observation of this case during the next few years will be of vital importance in differentiating between the two etiologic factors. If at the end of a few years there has been no progress in the condition, a rheumatic causation is almost certainly the correct diagnosis. However, especially because of the importance of protecting the public from any unnecessary hazard, it is now wiser to change the occupation of this man to one that will not endanger the public if a cardiovascular accident should occur.

WASSERMANN-FAST SYPHILIS

To the Editor:—For the past two years I have had a woman aged 23 under almost continuous treatment for syphilis. She came to me two months after exposure, and about one month after she had had symptoms of secondary syphilis. She has had alternating courses of ten injections each of nearsphenamine and bismuth subsalicylate in oil totaling fifty of the former and forty of the latter, given at weekly intervals. At no time has her blood serum reacted negatively, although six months ago a report of 2 plus was received. At present it is still strongly positive. The girl is in better health than she has been at any time for the past two years and presents no signs or symptoms of active infection. Apparently her blood is Wassermann fast, although I believe her to be cured. Please advise as to further treatment and marriage.
M.D., Ohio.

ANSWER:—As a rule a patient responds well to such treatment as outlined when in the secondary stage of syphilis. There must be some explanation for the Wassermann fastness. Is it certain that there is not an involvement of the central nervous system? A lumbar puncture should be made at once, for there is the possibility that that is the explanation for the patient's not reacting more satisfactorily to treatment.

It may be suggested if the lumbar puncture gives negative results that she have another year of continuous treatment, with mapharsen for an arsenical, and that she be given injections of mapharsen, each 40 mg., once in five days for a series of twelve treatments. For the alternate injections bismuth subsalicylate may be used for a course of ten injections. At the end of that time, even if the serum is negative for syphilis, in the succeed-

ing two years she might be given two courses of bismuth a year, and then the positive serologic reaction could be ignored. The chances are that the serologic reaction will gradually change to negative, i. e. provided careful physical examinations, including examination of the cardiovascular system, are negative.

SERUM SICKNESS

To the Editor:—I understand that it is a customary practice in cases of badly lacerated wounds contaminated with soil to give repeated prophylactic injections of tetanus antitoxin every three to seven days until the danger of the development of tetanus is over. Will the repeated injections of horse serum at short intervals, in the average case, keep the patient in a state of constant desensitization to the serum until the normal incubation period of serum sickness has elapsed after the last injection? In other words, can one be sure that this procedure will prevent the onset of serum sickness, with its associated generalized sensitivity, indefinitely so long as these injections are continued at intervals shorter than the incubation time of serum sickness?

T. F. Judefind, M.D., Loma Linda, Calif.

ANSWER:—The incubation period of serum sickness varies from six to twelve days; it may be longer without any known reason; it may be shorter in persons who have previously received injections of normal or immune horse serum, and occasionally without such history. The shorter incubation periods vary from minutes (immediate reaction) to hours or days (accelerated reaction). The length of the incubation period depends within certain limits on the intervals between consecutive injections of serum. Administration of prophylactic injections of tetanus antitoxin at three to seven day intervals will obviously not affect the onset of immediate or accelerated serum reactions with incubation periods shorter than the intervals mentioned. In the case of serum sickness with an incubation period longer than one week, injections given at shorter intervals may in some instances prolong the incubation period by producing a temporary refractory condition, but serum sickness follows eventually.

The procedure as outlined in the query will not prevent the onset of serum sickness indefinitely. Increasing the quantities of injected serum by means of repeated injections may have a tendency to increase the incidence and the severity of serum reactions.

PERTUSSIS VACCINE FOR ASTHMA

To the Editor:—Would you send me any information you may have on the treatment of bronchial asthma in children with whooping cough serum?
J. R. Heafey, M.D., South Norwalk, Conn.

ANSWER:—The only type of case in which there may be reason for considering pertussis vaccine for the treatment of asthma is one in which the patient dates the onset of his asthma to shortly after or during an attack of whooping cough and in which no other adequate cause can be found. Probably about 10 per cent of children relate their first attack of asthma to an infection of the upper part of the respiratory tract. Among such infections, whooping cough is one of the most frequently blamed. In the majority of cases the attack of pertussis is proved to be the precipitating rather than the primary cause of the attack. Most of such children are sensitive to other allergens which are the primary causes of the trouble. In a few cases in which no cause could be determined other than the chronic bronchitis following whooping cough, treatment with pertussis vaccine was given, starting with minute doses and progressively increasing to 500,000 organisms as a final dose, but no beneficial results could be observed. This is in line with the experience of most physicians in the use of vaccine for asthma.

STERILIZATION OF CLINICAL THERMOMETERS

To the Editor:—What type of antiseptic fluid should be used for individual bedside oral thermometers? This is a tuberculosis institution, and we have started keeping the thermometers in small test tubes strapped to the head of the bed. We are wondering if there is a satisfactory solution besides alcohol.
Richard M. Burke, M.D., Clinton, Okla.

ANSWER:—In suggesting a satisfactory fluid for the disinfection of clinical thermometers, a number of things have to be considered. If left at the bedside, the fluid should not be potable, should not be rapidly exhausted by saturation with organic matter or by evaporation, should not be toxic and should not stain or injure the fingers, bed linen or clothing.

For thermometers used by mouth, a 50 per cent solution of isopropyl alcohol is suggested. By it the usual oral flora are killed in less than five minutes. Data regarding the killing of

the tubercle bacillus are not available partly because of the lack of a suitable recovery medium for this organism.

Rectal thermometers present more difficulty. When contaminated by feces they are not sterilized in a reasonably short time by the alcohols, mercurials or other disinfectants safely left at the bedside. It is recommended that after use they be taken to the laboratory or preparation room, where they may be both cleaned and sterilized by soaking for several hours in the potassium dichromate-sulfuric acid mixture commonly used for cleaning chemical glassware. Because of improved methods of testing, confidence in formerly accepted methods of "chemical sterilization" has been destroyed. More research is needed.

ANOSMIA FOLLOWING CEREBRAL INJURY

To the Editor:—A man aged 34 was involved in an automobile accident six weeks ago and as a result of a blow on the head was rendered unconscious for about two hours. On recovering consciousness he suffered constant throbbing headaches for about sixteen days. Vision was blurred in all fields and there was complete absence of the senses of taste and smell. Reflexes were normal; the blood pressure was 120 systolic and 78 diastolic; the heart, lungs and general physical condition were within normal limits. A roentgenogram of the skull and the cervical vertebrae showed no fractures. Lumbar puncture showed an initial pressure of 160, and the fluid was clear. With rest in bed, a diminished intake of fluids and dark glasses were employed, the headaches disappeared and the ocular symptoms all vanished except for a slight blurring in the straight ahead fields. The optic nerve shows no secondary atrophy. However, there has been no sign of returning taste or smell. I would appreciate your opinion as to whether you think these senses will return and also if there is any thing which can be done to hasten their reappearance.

William G. Thompson, M.D., Andover, Mass.

ANSWER.—No statement is made as to the date of the injury. When anosmia is the result of an injury as described, the return of the sense of smell rarely takes place. It is also probable that the loss of smell has to do with the seeming loss of taste. There is no satisfactory treatment for this loss of smell. Probably there was no hemorrhage pressing against the olfactory nerve inside the skull; otherwise blood would probably have been found in the spinal fluid. For that reason the injury to the olfactory nerve was probably at the exit of the nerve from the skull. Potassium iodide in moderate doses may be tried.

HAZARDS OF DEGREASING AGENT

To the Editor:—I will appreciate information regarding a cleaning solution, made by the Mechanical Process Company for cleansing refrigerator plates, called D'Oilene A. Can a patient have symptoms of chronic poisoning, such as nausea, vomiting, headache and general weakness, from handling this solution? What is the composition? M.D., Massachusetts.

ANSWER.—D'Oilene A, manufactured by the Mechanical Process Company of South Orange, N. J., consists chiefly of a chlorinated hydrocarbon similar to carbon tetrachloride. It is a widely used degreasing agent for metal parts and by no means is limited to the cleaning of refrigerator plates. The symptoms described probably represent the acute effects of materials such as D'Oilene A rather than chronic effects.

In acute poisoning, evidences of severe gastrointestinal irritation, hepatitis and possibly nephritis may arise. No work should be performed in vapors of this cleaning agent when the concentration exceeds 200 parts per million of air throughout the shift period, although 1,000 parts per million are not known to be dangerous for short exposures, such as one-half hour. Protection customarily is procured through the use of tanks with water jackets which condense the vapors at a level below the top of the tank. Otherwise, protection may be procured through the installation of appropriate exhaust systems.

IRRITATION OF SKIN FROM SUBSTANCES USED IN WELDING

To the Editor:—I am seeking information on the possibility of severe generalized dermatitis occurring in welders. Various references mention lead poisoning, respiratory disorders and diseases of the eye but nothing concerning dermatitis.

John M. Walker, M.D., Dubuque, Iowa.

ANSWER.—It is claimed that most welders have burns and photoerythema at some time during the course of their trade experience. Dermatitis due to the wearing of various protective equipment, such as leather gauntlets and rubber gloves, has been described. This, however, is a hypersensitivity to the particular article of clothing rather than any to part of the welding process. Certain metals used in welding may volatilize and give rise to cutaneous irritants. This is not usual, however. One could conceive that volatilization and condensation

on the skin or absorption through the respiratory tract of substances either being welded or constituents of the welding process might cause such trouble. The foreign literature makes more mention of such problems than the American, and the problems mentioned are not well founded in many instances.

CHLORIDE CONTENT OF WATER AS INDEX OF POLLUTION

To the Editor:—According to "Standard Methods of Chemical Analysis," by Scott, and to other textbooks, the chloride content of potable water is a good indication of the presence of sewage and one of the best indications as to the possible pollution of that water, especially in places in which the normal chloride content is known and the test is used as a check. I am unable to find any literature on this in the limited references I have available, and I should like to know how reliable this test might be.

David Hoehn, M.D., Fairbanks, Alaska.

ANSWER.—The chloride content of water is not a wholly dependable indication of pollution by sewage. It is true that water high in chlorides must be looked on with suspicion unless satisfactory explanation for the presence of chlorides in quantity can be made, such as proximity of the source to the sea or to some other source of brine. A more reliable index of pollution would be a bacterial analysis for coliform organisms, which are indicative of contamination by sewage. Large quantities of chlorides in water with much free and albuminoid ammonia and nitrites would strongly suggest pollution by sewage.

WATER SOFTENING

To the Editor:—Can you inform me whether or not there is any harm in drinking water that is run through a water softener? Softening, I believe, changes the calcium carbonates to potassium carbonates. Is there a danger of an excess of potassium salts? At one time there was some discussion of potassium salts being the cause of cancer. Is there any truth in this?

Edgar A. Schoenecker, M.D., Lake Mills, Wis.

ANSWER.—In zeolite water softeners the calcium of dissolved calcium bicarbonates is exchanged by sodium in the zeolite. Within normal limits there is usually no objection to this method of softening a domestic water supply. When the amount of dissolved salts is high this exchange may result in the water becoming more chemically active on such metals as aluminum, brass or iron than it was prior to softening. The U. S. Treasury Department standards for drinking and culinary water used on interstate carriers limits the carbonates of sodium and potassium taken together as normal calcium carbonate at 50 parts per million. There is no scientific evidence that potassium salts can cause cancer.

DETERMINATION OF GONADOTROPIC SUBSTANCES IN BLOOD

To the Editor:—I have been attempting the determination of gonadotropic substances in the blood according to the method outlined in Kracke and Parker's Textbook of Clinical Pathology, second edition, page 626. The technic calls for the injection of the serum into immature female white mice from 15 cc. of blood in 0.5 to 1 cc. doses. I presume that it makes no difference whether it is given subcutaneously or intraperitoneally, though I have given it twice daily subcutaneously. This caused the death of the mouse by the second day in the two that have been injected, with no gross changes demonstrable at autopsy. The serum was slightly hemolyzed when used. Can you tell me how we may avoid this?

M.D., Minden, Neb.

ANSWER.—The method recommended in the textbook has been adapted from Fluhmann's technic. Untoward results from injecting 0.5 cc. of serum subcutaneously into the back of the test animal have not been encountered in a considerable experience; 1 cc. occasionally will be injurious. The serum should be fresh and not hemolyzed. In cases of pregnancy it should be diluted with saline solution.

CHRONIC CYSTIC MASTITIS AND BREAST CANCER

To the Editor:—In The Journal, March 15, 1941, page 1186, in answer to a query, the statement is made that, if the clinical diagnosis of chronic cystic mastitis is correct, then one can be reasonably certain that the patient has little chance of having a carcinoma in the breast now or at a later date. On the basis of my observations, published in Surgery, Gynecology and Obstetrics (71:257 [Sept.] 1940) a woman with chronic cystic mastitis (proved by biopsy) has three times as great a chance of developing carcinoma as does the average woman in the Massachusetts population. In women having chronic mastitis and related lesions in the age group from 30 to 49, the breast cancer attack rate is eleven and seven-tenths times greater than it is for the total Massachusetts female population. Consequently I feel that one is forced to the conclusion that the presence of chronic cystic mastitis is conducive to the development of breast cancer.

Shields Warren, M.D., Boston.
